<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond date string.

References [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_date\(\)](#).

**get\_monthname()**

```
template<typename _CharT , typename _InIter = istreambuf_iterator<_CharT>>
iter_type std::time_get<_CharT, _InIter>::get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

#### Returns

Iterator to first char beyond month name.

References [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_monthname\(\)](#).

### get\_time()

```
template<typename _CharT , typename _InIter = istreambuf_iterator<_CharT>>
iter_type std::time_get< _CharT, _InIter >::get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

#### Returns

Iterator to first char beyond time string.

References [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_time\(\)](#).

**get\_weekday()**

```
template<typename _CharT , typename _InIter = istreambuf_iterator<_CharT>>
iter_type std::time_get< _CharT, _InIter >::get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond weekday name.

References `std::time_get< _CharT, _InIter >::do_get_weekday()`.

**get\_year()**

```
template<typename _CharT , typename _InIter = istreambuf_iterator<_CharT>>
iter_type std::time_get< _CharT, _InIter >::get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

## Returns

Iterator to first char beyond year.

References [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_year\(\)](#).

#### 6.981.1 Detailed Description

```
template<typename _CharT, typename _OutIter = ostreambuf_iterator<_CharT>>
class std::time_put<_CharT, _OutIter>
```

Primary class template `time_put`.

This facet encapsulates the code to format and output dates and times according to formats used by `strftime()`.

The `time_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_put` facet.

#### 6.981.2 Member Typedef Documentation

##### `char_type`

```
template<typename _CharT, typename _OutIter = ostreambuf_iterator<_CharT>>
_CharT std::time_put<_CharT, _OutIter>::char_type
```

Public typedefs.

##### `iter_type`

```
template<typename _CharT, typename _OutIter = ostreambuf_iterator<_CharT>>
_OutIter std::time_put<_CharT, _OutIter>::iter_type
```

Public typedefs.

#### 6.981.3 Constructor & Destructor Documentation

##### `time_put()`

```
template<typename _CharT, typename _OutIter = ostreambuf_iterator<_CharT>>
std::time_put<_CharT, _OutIter>::time_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

**~time\_put()**

```
template<typename _CharT , typename _OutIter = ostreambuf_iterator<_CharT>>
virtual std::time_put< _CharT, _OutIter >::~~time_put () [inline], [protected], [virtual]
Destructor.
```

**6.981.4 Member Function Documentation****do\_put()**

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod) const [protected], [virtual]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

[put\(\)](#) for more details.

**Parameters**

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

**Returns**

Iterator after writing.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::widen\(\)](#).

Referenced by [std::time\\_put<\\_CharT, \\_OutIter>::put\(\)](#).

**put() [1/2]**

```
template<typename _CharT , typename _OutIter = ostreambuf_iterator<_CharT>>
iter_type std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod = 0) const [inline]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by [strftime\(\)](#). It does so by returning [time\\_put::do\\_put\(\)](#).

## Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

## Returns

Iterator after writing.

References [std::time\\_put< \\_CharT, \\_OutIter >::do\\_put\(\)](#).

**put()** [2/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    const _CharT * __beg,
    const _CharT * __end) const
```

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format string. The format string is interpreted as by `strftime()`.

## Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

## Returns

Iterator after writing.

### 6.982.1 Detailed Description

template<typename \_CharT, typename \_OutIter = ostreambuf\_iterator<\_CharT>>  
class std::time\_put\_byname<\_CharT, \_OutIter>

class time\_put\_byname [22.2.5.4].

### 6.982.2 Member Function Documentation

#### do\_put()

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put<_CharT, _OutIter>::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod) const [protected], [virtual], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

put() for more details.

#### Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

#### Returns

Iterator after writing.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::widen\(\)](#).

Referenced by [std::time\\_put<\\_CharT, \\_OutIter>::put\(\)](#).

#### put() [1/2]

```
template<typename _CharT , typename _OutIter = ostreambuf_iterator<_CharT>>
iter_type std::time_put<_CharT, _OutIter>::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
```

```
char __format,
char __mod = 0) const [inline], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time\_put::do\_put().

#### Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

#### Returns

Iterator after writing.

References [std::time\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#).

#### put() [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put<_CharT, _OutIter>::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    const _CharT * __beg,
    const _CharT * __end) const [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

#### Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

#### Returns

Iterator after writing.

bool **try\_lock\_until** (const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime)
- void **unlock** ()

### Friends

- class **\_\_timed\_mutex\_impl**< [timed\\_mutex](#) >

### 6.983.1 Detailed Description

The standard timed mutex type.

A non-recursive mutex that supports a timeout when trying to acquire the lock.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.984 std::to\_chars\_result Struct Reference

```
#include <charconv>
```

### Public Attributes

- errc **ec**
- char \* **ptr**

## Friends

- bool **operator==** (const [to\\_chars\\_result](#) &, const [to\\_chars\\_result](#) &)=default

### 6.984.1 Detailed Description

Result type of `std::to_chars`.

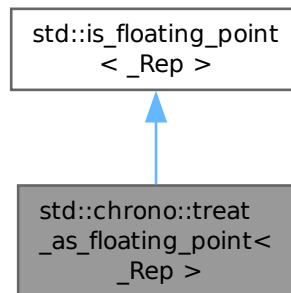

The documentation for this struct was generated from the following file:

- [charconv](#)

## 6.985 `std::chrono::treat_as_floating_point<_Rep>` Struct Template Reference

```
#include <chrono.h>
```

Inheritance diagram for `std::chrono::treat_as_floating_point<_Rep>`:

### 6.985.1 Detailed Description

```
template<typename _Rep>
struct std::chrono::treat_as_floating_point<_Rep>
```

Trait indicating whether to treat a type as a floating-point type.

The chrono library uses this trait to tell whether a `duration` can represent fractional values of the given precision, or only integral values.

You should specialize this trait for your own numeric types that are used with `duration` and can represent non-integral values.

Since

C++11

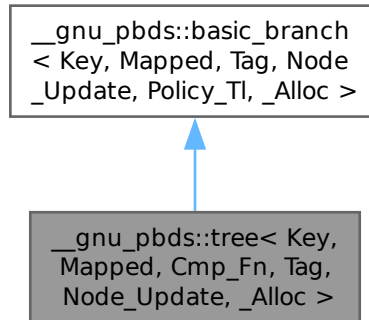

The documentation for this struct was generated from the following file:

- [chrono.h](#)

## 6.986 `__gnu_pbds::tree<Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc>` Class Template Reference

```
#include <assoc_container.hpp>
```

Inheritance diagram for `__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >`:

## Public Types

[tree](#) (It first, It last, const [cmp\\_fn](#) &c)
- [tree](#) & **operator=** (const [tree](#) &other)
- void **swap** ([tree](#) &other)

### 6.986.1 Detailed Description

`template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↵  
tree_tag, template< typename Node_Cltr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class  
Node_Update = null_node_update, typename _Alloc = std::allocator<char>>  
class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >`

A tree-based container.

#### Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Cmp_Fn</i>	Comparison functor.
<i>Tag</i>	Instantiating data structure type, see <code>container_tag</code> .
<i>Node_Update</i>	Updates tree internal-nodes, restores invariants when invalidated. XXX See <code>design::tree-based-containersnode</code> invariants.

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Base tag choices are: `ov_tree_tag`, `rb_tree_tag`, `splay_tree_tag`.

Base is `basic_branch`.

## 6.986.2 Member Typedef Documentation

### `cmp_fn`

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb<
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
Cmp_Fn __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::cmp_fn
Comparison functor type.
```

## 6.986.3 Constructor & Destructor Documentation

### `tree()` [1/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb<
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    const cmp_fn & c) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

### `tree()` [2/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb<
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
template<typename It >
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
    It last) [inline]
```

Constructor taking \_\_iterators to a range of value\_types. The value\_types between `first_it` and `last_it` will be inserted into the container object.

### `tree()` [3/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb<
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
template<typename It >
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
    It last,
    const cmp_fn & c) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects The value\_types between `first_it` and `last_it` will be inserted into the container object. `r_cmp_fn` will be copied by the `cmp_fn` object of the container object.

```

## Public Types

- typedef [tree\\_metadata\\_helper](#)< \_\_node\_u, null\_update >::type **type**

### 6.990.1 Detailed Description

```
template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_Cltr, typename
Const_Iterator, typename Cmp_Fn_, typename _Alloc > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >
```

Tree node metadata dispatch.

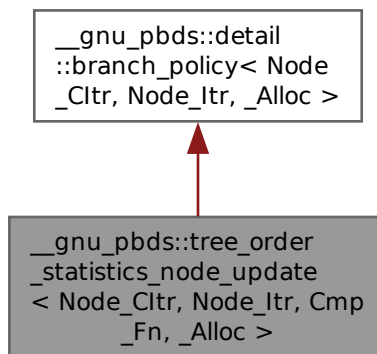

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

### 6.991 \_\_gnu\_pbds::tree\_order\_statistics\_node\_update< Node\_Cltr, Node\_Itr, Cmp\_Fn, \_Alloc > Class Template Reference

```
#include <tree_policy.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::tree\_order\_statistics\_node\_update< Node\_Cltr, Node\_Itr, Cmp\_Fn, \_Alloc >:

## Public Types

- typedef \_Alloc **allocator\_type**
- typedef Cmp\_Fn **cmp\_fn**
- typedef node\_const\_iterator::value\_type **const\_iterator**
- typedef node\_iterator::value\_type **iterator**
- typedef base\_type::key\_const\_reference **key\_const\_reference**
- typedef base\_type::key\_type **key\_type**
- typedef size\_type **metadata\_type**
- typedef Node\_Cltr **node\_const\_iterator**
- typedef Node\_Itr **node\_iterator**
- typedef allocator\_type::size\_type **size\_type**

## Public Member Functions

- iterator `find_by_order` (size\_type)
- const\_iterator `find_by_order` (size\_type) const
- size\_type `order_of_key` (key\_const\_reference) const

## Protected Member Functions

- void `operator()` (node\_iterator, node\_const\_iterator) const

### 6.991.1 Detailed Description

`template<typename Node_CIttr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>`  
`class __gnu_pbds::tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >`

Functor updating ranks of entrees.

### 6.991.2 Member Function Documentation

#### `find_by_order()` [1/2]

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::iterator __gnu_pbds::tree_order_statist
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
    size_type order) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

#### `find_by_order()` [2/2]

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::const_iterator __gnu_pbds::tree_order_s
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
    size_type order) const [inline]
```

Finds an entry by `__order`. Returns a `const_iterator` to the entry with the `__order` order, or a `const_iterator` to the container object's end if order is at least the size of the container object.

#### `operator()`

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
void __gnu_pbds::tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::operator()
(
    node_iterator node_it,
    node_const_iterator end_nd_it) const [inline], [protected]
```

Updates the rank of a node through a `node_iterator` `node_it`; `end_nd_it` is the end node iterator.

#### `order_of_key()`

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::size_type __gnu_pbds::tree_order_statist
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::order_of_key (
    key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For exapmle, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

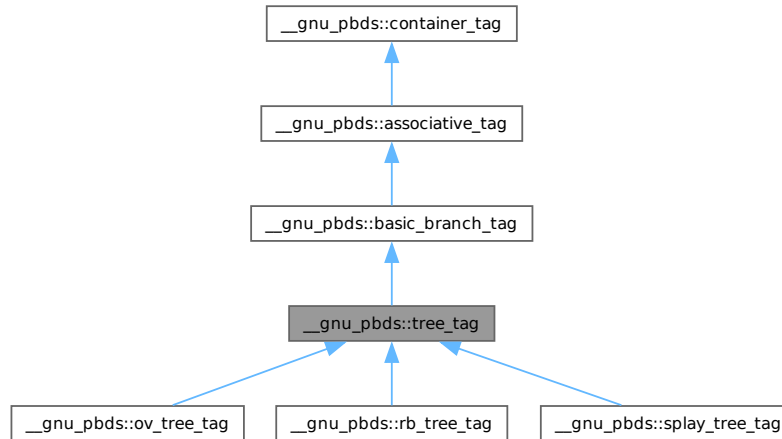

The documentation for this class was generated from the following files:

- [tree\\_policy.hpp](#)
- [bin\\_search\\_tree\\_.hpp](#)
- [ov\\_tree\\_map\\_.hpp](#)

## 6.992 \_\_gnu\_pbds::tree\_tag Struct Reference

## 6.993 \_\_gnu\_pbds::detail::tree\_traits< Key, Data, Cmp\_Fn, Node\_Update, Tag, \_Alloc > Struct Template Reference

### 6.993.1 Detailed Description

```

template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_Cltr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc > class Node_Update, typename Tag, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Data, Cmp_Fn, Node_Update, Tag, _Alloc >

```

Tree traits class, primary template.

The documentation for this struct was generated from the following file:

- [branch\\_policy/traits.hpp](#)

## 6.994 \_\_gnu\_pbds::detail::tree\_traits< Key, Mapped, Cmp\_Fn, Node\_Update, ov\_tree\_tag, \_Alloc > Struct Template Reference

#include <traits.hpp>

## Public Types

- typedef `tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type` `metadata_type`
- typedef `ov_tree_node_const_it< value_type, metadata_type, _Alloc >` `node_const_iterator`
- typedef `ov_tree_node_it< value_type, metadata_type, _Alloc >` `node_iterator`
- typedef `Node_Update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc >` `node_update`
- typedef `__gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * null_node←_update_pointer`

### 6.994.1 Detailed Description

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_Cltr, class Node_Itr,
class Cmp_Fn_, typename _Alloc > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >
```

Tree traits.

### 6.994.2 Member Typedef Documentation

#### `node_const_iterator`

```
template<typename Key , typename Mapped , class Cmp_Fn , template< typename Node_Cltr, class
Node_Itr, class Cmp_Fn_, typename _Alloc > class Node_Update, typename _Alloc >
ov_tree_node_const_it< value_type, metadata_type, _Alloc> __gnu_pbds::detail::tree_traits< Key,
Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

The documentation for this struct was generated from the following file:

- [ov\\_tree\\_map\\_/traits.hpp](#)

## 6.995 `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >` Struct Template Reference

```

### 6.1000.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_Cltr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
```

```
class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >
```

A trie-based container.

#### Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>_ATraits</i>	Element access traits.
<i>Tag</i>	Instantiating data structure type, see <code>container_tag</code> .
<i>Node_Update</i>	Updates trie internal-nodes, restores invariants when invalidated. XXX See <code>design::tree-based-containersnode</code> invariants.

## Template Parameters

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Base tag choice is `pat_trie_tag`.

Base is `basic_branch`.

## 6.1000.2 Member Typedef Documentation

**access\_traits**

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CIttr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>
_ATraits __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::access_traits
Element access traits type.
```

## 6.1000.3 Constructor &amp; Destructor Documentation

**trie()** [1/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CIttr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    const access_traits & t) [inline]
```

Constructor taking some policy objects. `r_access_traits` will be copied by the `_ATraits` object of the container object.

**trie()** [2/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CIttr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last) [inline]
```

Constructor taking \_\_iterators to a range of value\_types. The value\_types between `first_it` and `last_it` will be inserted into the container object.

**trie()** [3/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CIttr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last,
    const access_traits & t) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

#### 6.1005.1 Detailed Description

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >
```

Functor updating ranks of entrees.

#### 6.1005.2 Member Function Documentation

##### **find\_by\_order()** [1/2]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
trie\_order\_statistics\_node\_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::iterator \_\_gnu\_pbds::trie\_order\_stat
Node_CItr, Node_Itr, _ATraits, _Alloc >::find_by_order (
    size_type order) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

##### **find\_by\_order()** [2/2]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
trie\_order\_statistics\_node\_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::const_iterator \_\_gnu\_pbds::trie\_order
Node_CItr, Node_Itr, _ATraits, _Alloc >::find_by_order (
    size_type order) const [inline]
```

Finds an entry by `__order`. Returns a const\_iterator to the entry with the `__order` order, or a const\_iterator to the container object's end if order is at least the size of the container object.

**operator()()**

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::operator() (
    node_iterator nd_it,
    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a `node_iterator` `node_it`; `end_nd_it` is the end node iterator.

**order\_of\_key()**

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type __gnu_pbds::trie_order_stat
Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_key (
    key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For exapmle, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

**order\_of\_prefix()**

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type __gnu_pbds::trie_order_stat
Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_prefix (
    a_const_iterator b,
    a_const_iterator e) const [inline]
```

Returns the order of a prefix within a sequence. For exapmle, if `[b, e]` is the smallest prefix, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

The documentation for this class was generated from the following file:

### 6.1007.1 Detailed Description

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >
```

A node updatator that allows tries to be searched for the range of values that match a certain prefix.

### 6.1007.2 Member Typedef Documentation

#### **a\_const\_iterator**

```
template<typename Node_CIttr , typename Node_Itr , typename _ATraits , typename _Alloc >
access_traits::const_iterator __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::a_const_iterator
Const element iterator.
```

#### **access\_traits**

```
template<typename Node_CIttr , typename Node_Itr , typename _ATraits , typename _Alloc >
_ATraits __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::access_traits
Element access traits.
```

#### **allocator\_type**

```
template<typename Node_CIttr , typename Node_Itr , typename _ATraits , typename _Alloc >
_Alloc __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::allocator_type
_Alloc type.
```

#### **size\_type**

```
template<typename Node_CIttr , typename Node_Itr , typename _ATraits , typename _Alloc >
allocator_type::size_type __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::size_type
Size type.
```

### 6.1007.3 Member Function Documentation

#### `operator>()`

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::operator()
(
    node_iterator node_it,
    node_const_iterator end_nd_it) const [inline], [protected]
```

Called to update a node's metadata.

#### `prefix_range()` [1/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::iterator,
typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::iterator >
__gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::prefix_range (
    a_const_iterator b,
    a_const_iterator e)
```

Finds the iterator range corresponding to all values whose prefixes match [b, e).

#### `prefix_range()` [2/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::const_iterator,
typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::const_iterator >
__gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::prefix_range (
    a_const_iterator b,
    a_const_iterator e) const
```

Finds the const iterator range corresponding to all values whose prefixes match [b, e).

#### `prefix_range()` [3/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::iterator,
typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::iterator >
__gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::prefix_range (
    key_const_reference r_key)
```

Finds the iterator range corresponding to all values whose prefixes match r\_key.

#### `prefix_range()` [4/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::const_iterator,
typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::const_iterator >
__gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::prefix_range (
    key_const_reference r_key) const
```

Finds the const iterator range corresponding to all values whose prefixes match r\_key.

The documentation for this class was generated from the following file:

- [trie\\_policy.hpp](#)

## 6.1008 `__gnu_pbds::trie_string_access_traits`< `String`, `Min_E_Val`, `Max_E_Val`, `Reverse`, `_Alloc` > Struct Template Reference

```
#include <trie_policy.hpp>
```

### Public Types

- enum { `reverse` }
- enum { `min_e_val` , `max_e_val` , `max_size` }
- typedef detail::\_\_conditional\_type< `Reverse`, typenameString::const\_reverse\_iterator, typenameString::const\_iterator >::\_\_type `const_iterator`

- static size\_type `e_pos` (`e_type` `e`)
- static `const_iterator` `end` (`key_const_reference`)

#### 6.1008.1 Detailed Description

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>
struct __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >
```

Element access traits for string types.

#### Template Parameters

<i>String</i>	String type.
<i>Min_E_Val</i>	Minimal element value.
<i>Max_E_Val</i>	Maximum element value.
<i>Reverse</i>	Reverse iteration should be used. Default: false.
<i>_Alloc</i>	Allocator type.

#### 6.1008.2 Member Typedef Documentation

##### `const_iterator`

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>
detail::__conditional_type<Reverse, typenameString::const_reverse_iterator, typenameString::const_iterator>::__type __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator
```

Element const iterator type.

**e\_type**

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__↵
numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__↵
::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc =
std::allocator<char>>
std::iterator_traits<const_iterator>::value_type __gnu_pbds::trie_string_access_traits< String,
Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_type
Element type.
```

**6.1008.3 Member Function Documentation****begin()**

```
template<typename String , typename String::value_type Min_E_Val, typename String::value_type
Max_E_Val, bool Reverse, typename _Alloc >
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_strin
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::begin (
    key_const_reference r_key) [inline], [static]
```

Returns a const\_iterator to the first element of key\_const\_reference agumnet.

**e\_pos()**

```
template<typename String , typename String::value_type Min_E_Val, typename String::value_type
Max_E_Val, bool Reverse, typename _Alloc >
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::size_type __gnu_pbds::trie_string_acc
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_pos (
    e_type e) [inline], [static]
```

Maps an element to a position.

**end()**

```
template<typename String , typename String::value_type Min_E_Val, typename String::value_type
Max_E_Val, bool Reverse, typename _Alloc >
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_strin
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::end (
    key_const_reference r_key) [inline], [static]
```

Returns a const\_iterator to the after-last element of key\_const\_reference argument.

The documentation for this struct was generated from the following file:

- [trie\\_policy.hpp](#)

**6.1009 \_\_gnu\_pbds::trie\_tag Struct Reference**

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::trie_tag`:

#### 6.1009.1 Detailed Description

Basic trie structure.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 6.1010 `__gnu_pbds::detail::trie_traits< Key, Data, _ATraits, Node_Update, Tag, _Alloc >` Struct Template Reference

##### 6.1010.1 Detailed Description

```

template<typename Key, typename Data, typename _ATraits, template< typename Node_Cltr, typename
Node_Itr, typename _ATraits_, typename _Alloc > class Node_Update, typename Tag, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, Data, _ATraits, Node_Update, Tag, _Alloc >

```

Trie traits class, primary template.

The documentation for this struct was generated from the following file:

- [branch\\_policy/traits.hpp](#)

#### 6.1011 `__gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >` Struct Template Reference

```
#include <traits.hpp>
```

### 6.1011.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >
```

Specialization.

### 6.1011.2 Member Typedef Documentation

#### **node\_const\_iterator**

```
template<typename Key , typename Mapped , typename _ATraits , template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
base_type::Node_citer<node, leaf, head, inode, const_iterator, iterator, _Alloc> __gnu_pbds::detail::trie_traits<
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

#### **node\_update**

```
template<typename Key , typename Mapped , typename _ATraits , template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
Node_Update<node_const_iterator, node_iterator, _ATraits, _Alloc> __gnu_pbds::detail::trie_traits<
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_update
```

Type for node update.

#### **synth\_access\_traits**

```
template<typename Key , typename Mapped , typename _ATraits , template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
__gnu_pbds::detail::synth_access_traits<type_traits, false, access_traits> __gnu_pbds::detail::trie_traits<
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::synth_access_traits
```

Type for synthesized traits.

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_/traits.hpp](#)

## 6.1012 `__gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >` Struct Template Reference

```
#include <traits.hpp>
```

### Public Types

- typedef `_ATraits` **access\_traits**
- typedef `base_type::Cltr< node, leaf, head, inode, true >` **const\_iterator**
- typedef `base_type::Cltr< node, leaf, head, inode, false >` **const\_reverse\_iterator**
- typedef `base_type::Head< synth_access_traits, metadata >` **head**
- typedef `base_type::Inode< synth_access_traits, metadata >` **inode**
- typedef `const_iterator` **iterator**

- typedef `trie_node_metadata_dispatch< Key, null_type, _ATraits, Node_Update, _Alloc >::type` **metadata\_type**
- typedef `base_type::Node_base< synth_access_traits, metadata >` **node**
- typedef `base_type::Node_citer< node, leaf, head, inode, const_iterator, iterator, _Alloc >` **node\_const\_iterator**
- typedef `node_const_iterator` **node\_iterator**
- typedef `Node_Update< node_const_iterator, node_iterator, _ATraits, _Alloc >` **node\_update**
- typedef `null_node_update< node_const_iterator, node_const_iterator, _ATraits, _Alloc > * null_node_update` **←\_pointer**
- typedef `const_reverse_iterator` **reverse\_iterator**
- typedef `__gnu_pbds::detail::synth_access_traits< type_traits, true, access_traits >` **synth\_access\_traits**

### 6.1012.1 Detailed Description

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >
```

Specialization.

### 6.1012.2 Member Typedef Documentation

#### **node\_const\_iterator**

```
template<typename Key , typename _ATraits , template< typename Node_CItr, typename Node_Itr,
typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
base_type::Node_citer<node, leaf, head, inode, const_iterator, iterator, _Alloc> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

#### **node\_update**

```
template<typename Key , typename _ATraits , template< typename Node_CItr, typename Node_Itr,
typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
Node_Update<node_const_iterator, node_iterator, _ATraits, _Alloc> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_update
```

Type for node update.

**synth\_access\_traits**

```
template<typename Key , typename _ATraits , template< typename Node_CItr, typename Node_Itr,
typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
__gnu_pbds::detail::synth_access_traits<type_traits, true, access_traits> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::synth_access_traits
```

Type for synthesized traits.

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_/traits.hpp](#)

**6.1013 \_\_gnu\_pbds::trivial\_iterator\_tag Struct Reference**

```
#include <tag_and_trait.hpp>
```

**6.1013.1 Detailed Description**

A trivial iterator tag. Signifies that the iterators has none of std::iterators's movement abilities.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

**6.1014 std::try\_to\_lock\_t Struct Reference**

```
#include <std_mutex.h>
```

**6.1014.1 Detailed Description**

Try to acquire ownership of the mutex without blocking.

The documentation for this struct was generated from the following file:

- [std\\_mutex.h](#)

**6.1015 std::tuple<\_Types> Class Template Reference**

```
#include <tuple>
```

### 6.1016.1 Detailed Description

`template<typename _T1, typename _T2>`  
**class** `std::tuple< _T1, _T2 >`

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.  
The documentation for this class was generated from the following file:

- [tuple](#)

## 6.1017 std::tuple\_element< \_\_i, \_Tp > Struct Template Reference

### 6.1017.1 Detailed Description

`template<size_t __i, typename _Tp>`  
**struct** `std::tuple_element< __i, _Tp >`

Gives the type of the ith element of a given tuple type.  
The documentation for this struct was generated from the following file:

- [utility.h](#)

## 6.1018 std::tuple\_element< 0, pair< \_Tp1, \_Tp2 > > Struct Template Reference

`#include <stl_pair.h>`

### Public Types

- `typedef _Tp1 type`

#### 6.1018.1 Detailed Description

```
template<class _Tp1, class _Tp2>
struct std::tuple_element< 0, pair< _Tp1, _Tp2 > >
```

Partial specialization for std::pair.

The documentation for this struct was generated from the following file:

- [stl\\_pair.h](#)

#### 6.1019 std::tuple\_element< 1, pair< \_Tp1, \_Tp2 > > Struct Template Reference

```
#include <stl_pair.h>
```

##### Public Types

- typedef \_Tp2 type

#### 6.1019.1 Detailed Description

```
template<class _Tp1, class _Tp2>
struct std::tuple_element< 1, pair< _Tp1, _Tp2 > >
```

Partial specialization for std::pair.

The documentation for this struct was generated from the following file:

- [stl\\_pair.h](#)

#### 6.1020 std::tuple\_element< \_\_i, tuple< \_Types... > > Struct Template Reference

```
#include <tuple>
```

##### Public Types

- using type

#### 6.1020.1 Detailed Description

```
template<size_t __i, typename... _Types>
struct std::tuple_element< __i, tuple< _Types... > >
```

Trait to get the lth element type from a tuple.

The documentation for this struct was generated from the following file:

- [tuple](#)

#### 6.1021 std::tuple\_element< \_Ind, array< \_Tp, \_Nm > > Struct Template Reference

```
#include <array>
```

##### Public Types

- using type

## 6.1021.1 Detailed Description

```
template<size_t _Ind, typename _Tp, size_t _Nm>
struct std::tuple_element< _Ind, array< _Tp, _Nm > >
```

Partial specialization for std::array.

The documentation for this struct was generated from the following file:

- [array](#)

## 6.1022 std::tuple\_size&lt; \_Tp &gt; Struct Template Reference

## 6.1022.1 Detailed Description

```
template<typename _Tp>
struct std::tuple_size< _Tp >
```

Finds the size of a given tuple type.

The documentation for this struct was generated from the following file:

- [utility.h](#)

## 6.1023 std::tuple\_size&lt; array&lt; \_Tp, \_Nm &gt; &gt; Struct Template Reference

```
#include <array>
```

Inheritance diagram for std::tuple\_size< array< \_Tp, \_Nm > >:

## Public Types

- typedef [integral\\_constant](#)< size\_t, \_\_v > **type**
- typedef size\_t **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr size\_t **value**

### 6.1023.1 Detailed Description

```
template<typename _Tp, size_t _Nm>
struct std::tuple_size< array< _Tp, _Nm > >
```

Partial specialization for `std::array`.

The documentation for this struct was generated from the following file:

- [array](#)

### 6.1024 std::tuple\_size< pair< \_Tp1, \_Tp2 > > Struct Template Reference

```
#include <stl_pair.h>
```

Inheritance diagram for `std::tuple_size< pair< _Tp1, _Tp2 > >`:

#### Public Types

- typedef [integral\\_constant](#)< size\_t, \_\_v > **type**
- typedef size\_t **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr size\_t **value**

### 6.1024.1 Detailed Description

```
template<class _Tp1, class _Tp2>
struct std::tuple_size< pair< _Tp1, _Tp2 > >
```

Partial specialization for `std::pair`.

The documentation for this struct was generated from the following file:

**6.1026 \_\_gnu\_pbds::detail::entry\_cmp< \_VTp, Cmp\_Fn, \_Alloc, false >::type Struct Reference**

```
#include <entry_cmp.hpp>
```

**Public Member Functions**

- **type** (const Cmp\_Fn &other)
- bool **operator()** (entry lhs, entry rhs) const

### 6.1026.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, false >::type
```

Compare plus entry.

The documentation for this struct was generated from the following file:

- [entry\\_cmp.hpp](#)

## 6.1027 std::type\_index Struct Reference

```
#include <typeindex>
```

### Public Member Functions

- **type\_index** (const [type\\_info](#) &\_\_rhs) noexcept
- **size\_t hash\_code** () const noexcept
- **const char \* name** () const noexcept
- **bool operator!=** (const [type\\_index](#) &\_\_rhs) const noexcept
- **bool operator<** (const [type\\_index](#) &\_\_rhs) const noexcept
- **bool operator<=** (const [type\\_index](#) &\_\_rhs) const noexcept
- **bool operator==** (const [type\\_index](#) &\_\_rhs) const noexcept
- **bool operator>** (const [type\\_index](#) &\_\_rhs) const noexcept
- **bool operator>=** (const [type\\_index](#) &\_\_rhs) const noexcept

### 6.1027.1 Detailed Description

Class `type_index`.

The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (23.6) and in unordered associative containers (23.7).

The documentation for this struct was generated from the following file:

- [typeindex](#)

## 6.1028 std::type\_info Class Reference

```
#include <typeinfo>
```

### Public Member Functions

- virtual [~type\\_info](#) ()
- virtual **bool \_\_do\_catch** (const [type\\_info](#) \*\_\_thr\_type, void \*\*\_\_thr\_obj, unsigned \_\_outer) const
- virtual **bool \_\_do\_upcast** (const \_\_cxxabiv1::\_\_class\_type\_info \*\_\_target, void \*\*\_\_obj\_ptr) const

- **const char \* name** () const noexcept
- **constexpr bool operator==** (const [type\\_info](#) &\_\_arg) const noexcept

### Protected Member Functions

- **type\_info** (const char \* \_\_n)

## Protected Attributes

- `const char * __name`

### 6.1028.1 Detailed Description

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

### 6.1028.2 Constructor & Destructor Documentation

#### `~type_info()`

```
virtual std::type_info::~~type_info () [virtual]
```

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated `type_info` structures in the new-abi.

### 6.1028.3 Member Function Documentation

#### `before()`

```
bool std::type_info::before (
    const type_info & __arg) const [noexcept]
```

Returns true if `*this` precedes `__arg` in the implementation's collation order.

#### `name()`

```
const char * std::type_info::name () const [inline], [noexcept]
```

Returns an *implementation-defined* byte string; this is not portable between compilers!

The documentation for this class was generated from the following file:

- [typeinfo](#)

## 6.1029 `__gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >` Struct Template Reference

```
#include <types_traits.hpp>
```

Inheritance diagram for `__gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >`:

- class **leap\_second**
- const tzdb & **reload\_tzdb** ()
- struct **time\_zone::Impl**
- class **time\_zone\_link**
- struct **tzdb**

### 6.1030.1 Detailed Description

The list of `chrono::tzdb` objects

A single object of this type is constructed by the C++ runtime, and can be accessed by calling `chrono::get_tzdb_list()`.

The front of the list is the current `tzdb` object and can be accessed via `chrono::get_tzdb_list().front()` or `chrono::get_tzdb()` or `*chrono::get_tzdb_list().begin()`.

The `chrono::reload_tzdb()` function will check for a newer version and if found, insert it at the front of the list.

Since

C++20

### 6.1030.2 Member Function Documentation

#### erase\_after()

```
const_iterator std::chrono::tzdb_list::erase_after (
    const_iterator __p)
```

Remove the `tzdb` object *after* the one the iterator refers to.

Calling this function concurrently with any of `front()`, `begin()`, or `end()` does not cause a data race, but in general this function is not thread-safe. The behaviour may be undefined if erasing an element from the list while another thread is calling the same function, or incrementing an iterator into the list, or accessing the element being erased (unless it is accessed through an iterator).

#### Parameters

<code>__p</code>	A dereferenceable iterator.
------------------	-----------------------------

#### Returns

An iterator the element after the one that was erased (or `end()` if there is no such element).

Since

C++20

#### front()

```
const tzdb & std::chrono::tzdb_list::front () const [noexcept]
```

Access the current `tzdb` at the front of the list.

This returns a reference to the same object as `chrono::get_tzdb()`.

**Returns**

A reference to the current tzdb object.

**Since**

C++20

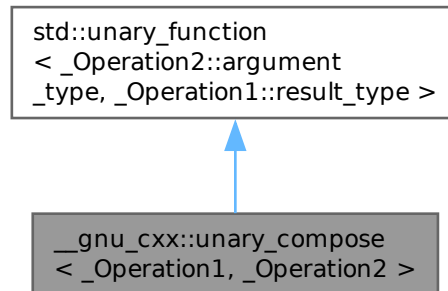

The documentation for this class was generated from the following file:

- [chrono](#)

## 6.1031 `__gnu_cxx::unary_compose<_Operation1, _Operation2 >` Class Template Reference

```
#include <functional>
```

Inheritance diagram for `__gnu_cxx::unary_compose<_Operation1, _Operation2 >`:

## 6.1032 std::unary\_function< \_Arg, \_Result > Struct Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for `std::unary_function< _Arg, _Result >`:

### Public Types

- typedef `_Arg` [argument\\_type](#)
- typedef `_Result` [result\\_type](#)

### 6.1032.1 Detailed Description

```
template<typename _Arg, typename _Result>
struct std::unary_function< _Arg, _Result >
```

Helper for defining adaptable unary function objects.

**Deprecated** Deprecated in C++11, no longer in the standard since C++17.

## 6.1032.2 Member Typedef Documentation

### argument\_type

```
template<typename _Arg , typename _Result >
_Arg std::unary_function< _Arg, _Result >::argument_type
argument_type is the type of the argument
```

### result\_type

```
template<typename _Arg , typename _Result >
_Result std::unary_function< _Arg, _Result >::result_type
result_type is the return type
```

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

## 6.1033 std::unary\_negate< \_Predicate > Class Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for std::unary\_negate< \_Predicate >:

### Public Types

- typedef `_Predicate::argument_type` [argument\\_type](#)
- typedef `bool` [result\\_type](#)

### Public Member Functions

- constexpr **unary\_negate** (const `_Predicate` &\_\_x)
- constexpr `bool` **operator()** (const `typename _Predicate::argument_type` &\_\_x) const

### Protected Attributes

- `_Predicate` **\_M\_pred**

### 6.1033.1 Detailed Description

```
template<typename _Predicate>
class std::unary_negate< _Predicate >
```

One of the [negation functors](#).

### 6.1033.2 Member Typedef Documentation

#### argument\_type

```
_Predicate::argument_type std::unary\_function< _Predicate::argument_type, bool >::argument_type
[inherited]
```

argument\_type is the type of the argument

#### result\_type

```
bool std::unary\_function< _Predicate::argument_type, bool >::result_type [inherited]
result_type is the return type
```

The documentation for this class was generated from the following file:

## 6.1034 \_\_gnu\_parallel::unbalanced\_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for \_\_gnu\_parallel::unbalanced\_tag:

### Public Member Functions

- [\\_ThreadIndex \\_\\_get\\_num\\_threads](#) ()
- void [set\\_num\\_threads](#) ([\\_ThreadIndex](#) \_\_num\_threads)

### 6.1034.1 Detailed Description

Recommends parallel execution using static load-balancing at compile time.

### 6.1034.2 Member Function Documentation

#### \_\_get\_num\_threads()

```
\_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

**Returns**

Desired number of threads.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#).

**set\_num\_threads()**

```
void __gnu_parallel::parallel_tag::set_num_threads (
    __ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

**Parameters**

<code>__num_threads</code>	Desired number of threads.
----------------------------	----------------------------

The documentation for this struct was generated from the following file:

- [tags.h](#)

**6.1035 std::underflow\_error Class Reference**

```
#include <stdexcept>
```

Inheritance diagram for `std::underflow_error`:

**Public Member Functions**

- `underflow_error` (const char \*)
- `underflow_error` (const [string](#) & \_\_arg)
- `underflow_error` (const [underflow\\_error](#) &)=default
- `underflow_error` ([underflow\\_error](#) &&)=default
- `underflow_error` & `operator=` (const [underflow\\_error](#) &)=default
- `underflow_error` & `operator=` ([underflow\\_error](#) &&)=default
- virtual const char \* `what` () const noexcept

### 6.1035.1 Detailed Description

Thrown to indicate arithmetic underflow.

### 6.1035.2 Member Function Documentation

#### `what()`

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), and [std::filesystem::filesystem\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

## 6.1036 `std::underlying_type<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.1036.1 Detailed Description

```
template<typename _Tp>
struct std::underlying_type<_Tp>
```

The underlying type of an enum.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.1037 `std::uniform_int_distribution<_IntType>` Class Template Reference

```
#include <random>
```

### Classes

result_type operator() (_UniformRandomBitGenerator &__urng)`
- `template<typename _UniformRandomBitGenerator >  
result_type operator() (_UniformRandomBitGenerator &__urng, const param_type &__p)`
- `param_type param () const`
- `void param (const param_type &__param)`
- `void reset ()`

## Friends

- `bool operator== (const uniform_int_distribution &__d1, const uniform_int_distribution &__d2)`

### 6.1037.1 Detailed Description

```
template<typename _IntType = int>  
class std::uniform_int_distribution< _IntType >
```

Uniform discrete distribution for random numbers. A discrete random distribution on the range  $[min, max]$  with equal probability throughout the range.

Since

C++11

### 6.1037.2 Member Typedef Documentation

#### result\_type

```
template<typename _IntType = int>  
_IntType std::uniform_int_distribution< _IntType >::result_type  
The type of the range of the distribution.
```

### 6.1037.3 Constructor & Destructor Documentation

#### uniform\_int\_distribution() [1/2]

```
template<typename _IntType = int>  
std::uniform_int_distribution< _IntType >::uniform_int_distribution () [inline]  
Constructs a uniform distribution object.
```

#### uniform\_int\_distribution() [2/2]

```
template<typename _IntType = int>  
std::uniform_int_distribution< _IntType >::uniform_int_distribution (  
    _IntType __a,  
    _IntType __b = __gnu_cxx::__int_traits<_IntType>::__max) [inline], [explicit]  
Constructs a uniform distribution object.
```

### 6.1037.4 Member Function Documentation

#### `max()`

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::max () const [inline]
```

Returns the inclusive upper bound of the distribution range.

#### `min()`

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::min () const [inline]
```

Returns the inclusive lower bound of the distribution range.

#### `operator()()`

```
template<typename _IntType = int>
template<typename _UniformRandomBitGenerator >
result_type std::uniform_int_distribution< _IntType >::operator() (
    _UniformRandomBitGenerator & __urng) [inline]
```

Generating functions.

References `std::uniform_int_distribution<_IntType>::operator()()`.

Referenced by `std::uniform_int_distribution<_IntType>::operator()()`.

#### `param()` [1/2]

```
template<typename _IntType = int>
param_type std::uniform_int_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by `std::operator>>()`.

#### `param()` [2/2]

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

#### `reset()`

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform integer distribution.

### 6.1037.5 Friends And Related Symbol Documentation

#### `operator==`

```
template<typename _IntType = int>
bool operator== (
```

```
const uniform_int_distribution< _IntType > & __d1,
const uniform_int_distribution< _IntType > & __d2) [friend]
```

Return true if two uniform integer distributions have the same parameters.

The documentation for this class was generated from the following file:

- [uniform\\_int\\_dist.h](#)

## 6.1038 std::uniform\_real\_distribution< \_RealType > Class Template Reference

#### 6.1038.1 Detailed Description

```
template<typename _RealType = double>
class std::uniform_real_distribution< _RealType >
```

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Since

C++11

## 6.1038.2 Member Typedef Documentation

### result\_type

```
template<typename _RealType = double>
_RealType std::uniform_real_distribution< _RealType >::result_type
```

The type of the range of the distribution.

## 6.1038.3 Constructor & Destructor Documentation

### uniform\_real\_distribution() [1/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution () [inline]
```

Constructs a uniform\_real\_distribution object.  
The lower bound is set to 0.0 and the upper bound to 1.0

### uniform\_real\_distribution() [2/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution (
    _RealType __a,
    _RealType __b = _RealType(1)) [inline], [explicit]
```

Constructs a uniform\_real\_distribution object.

#### Parameters

 <code>__a</code>	[IN] The lower bound of the distribution.
 <code>__b</code>	[IN] The upper bound of the distribution.

## 6.1038.4 Member Function Documentation

### max()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::max () const [inline]
```

Returns the inclusive upper bound of the distribution range.

### min()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::min () const [inline]
```

Returns the inclusive lower bound of the distribution range.

### operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::uniform_real_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

References [std::uniform\\_real\\_distribution<\\_RealType>::operator\(\)\(\)](#).

Referenced by [std::uniform\\_real\\_distribution<\\_RealType>::operator\(\)\(\)](#).

#### **param()** [1/2]

```
template<typename _RealType = double>
param_type std::uniform_real_distribution<_RealType>::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

#### **param()** [2/2]

```
template<typename _RealType = double>
void std::uniform_real_distribution<_RealType>::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

#### **reset()**

```
template<typename _RealType = double>
void std::uniform_real_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform real distribution.

### 6.1038.5 Friends And Related Symbol Documentation

#### **operator==**

```
template<typename _RealType = double>
bool operator== (
    const uniform_real_distribution<_RealType> & __d1,
    const uniform_real_distribution<_RealType> & __d2) [friend]
```

Return true if two uniform real distributions have the same parameters.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

### 6.1039 std::unique\_lock<\_Mutex> Class Template Reference

### 6.1039.1 Detailed Description

**template<typename \_Mutex>**  
**class std::unique\_lock<\_Mutex>**

A movable scoped lock type.

A [unique\\_lock](#) controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another [unique\\_lock](#) by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.

Since

C++11

### 6.1039.2 Friends And Related Symbol Documentation

#### **swap()**

```
template<typename _Mutex >
void swap (
    unique\_lock< _Mutex > & __x,
    unique\_lock< _Mutex > & __y) [related]
```

Swap overload for `unique_lock` objects.

The documentation for this class was generated from the following file:

- [unique\\_lock.h](#)

### 6.1040.1 Detailed Description

`template<typename _Tp, typename _Dp = default_delete<_Tp>>`

`class std::unique_ptr<_Tp, _Dp>`

A move-only smart pointer that manages unique ownership of a resource.

Since

C++11

### 6.1040.2 Constructor & Destructor Documentation

#### `unique_ptr()` [1/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr<_Tp, _Dp>::unique_ptr () [inline], [constexpr], [noexcept]
```

Default constructor, creates a `unique_ptr` that owns nothing.

#### `unique_ptr()` [2/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr<_Tp, _Dp>::unique_ptr (
    pointer __p) [inline], [explicit], [constexpr], [noexcept]
```

Takes ownership of a pointer.

#### Parameters

<code>__p</code>	A pointer to an object of <code>element_type</code>
------------------	---

The deleter will be value-initialized.

**unique\_ptr()** [3/8]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_copy_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p,
    const deleter_type & __d) [inline], [constexpr], [noexcept]
```

Takes ownership of a pointer.

**Parameters**

$\leftarrow$ _p	A pointer to an object of element_type
$\leftarrow$ _d	A reference to a deleter.

The deleter will be initialized with \_\_d

**unique\_ptr()** [4/8]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_move_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p,
    __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d) [inline], [constexpr],
[noexcept]
```

Takes ownership of a pointer.

**Parameters**

$\leftarrow$ _p	A pointer to an object of element_type
$\leftarrow$ _d	An rvalue reference to a (non-reference) deleter.

The deleter will be initialized with std::move(\_\_d)

**unique\_ptr()** [5/8]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a unique\_ptr that owns nothing.

**unique\_ptr()** [6/8]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Tp, _Dp > && ) [default]
```

Move constructor.

**unique\_ptr()** [7/8]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Up , typename _Ep , typename = _Require< __safe_conversion_up<_Up, _Ep>, __←
conditional_t<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Converting constructor from another type.

Requires that the pointer owned by \_\_u is convertible to the type of pointer owned by this object, \_\_u does not own an array, and \_\_u has a compatible deleter type.

**unique\_ptr()** [8/8]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename >
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    auto_ptr< _Up > && __u) [inline], [noexcept]
```

Converting constructor from auto\_ptr.

**~unique\_ptr()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::~~unique_ptr () [inline], [noexcept]
```

Destructor, invokes the deleter if the stored pointer is not null.

References [std::unique\\_ptr<\\_Tp, \\_Dp>::get\\_deleter\(\)](#), and [std::move\(\)](#).

**6.1040.3 Member Function Documentation****get()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::get () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

Referenced by [std::unique\\_ptr<\\_Tp, \\_Dp>::make\\_unique\\_for\\_overwrite\(\)](#), [std::unique\\_ptr<\\_Tp, \\_Dp>::operator bool\(\)](#), [std::unique\\_ptr<\\_Tp\[\], \\_Dp>::operator bool\(\)](#), [std::unique\\_ptr<\\_Tp, \\_Dp>::operator\\*\(\)](#), [std::unique\\_ptr<\\_Tp, \\_Dp>::operator->\(\)](#), [std::operator<\(\)](#), [std::operator<\(\)](#), [std::operator<\(\)](#), [std::operator==\(\)](#), [std::operator>\(\)](#), [std::operator>\(\)](#), and [std::unique\\_ptr<\\_Tp\[\], \\_Dp>::operator\[\]\(\)](#).

**get\_deleter()** [1/2]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
const deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter () const [inline], [constexpr],
[noexcept]
```

Return a reference to the stored deleter.

**get\_deleter()** [2/2]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter () [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.

Referenced by [std::unique\\_ptr<\\_Tp, \\_Dp>::~~unique\\_ptr\(\)](#), [std::unique\\_ptr<\\_Tp\[\], \\_Dp>::~~unique\\_ptr\(\)](#), [std::unique\\_ptr<\\_Tp, \\_Dp>::operator\\*\(\)](#), and [std::unique\\_ptr<\\_Tp\[\], \\_Dp>::operator\[\]\(\)](#).

**operator bool()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::operator bool () const [inline], [explicit], [constexpr], [noexcept]
```

Return true if the stored pointer is not null.  
References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator\*()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
add_lvalue_reference< element_type >::type std::unique_ptr< _Tp, _Dp >::operator* () const [inline],
[constexpr], [noexcept]
```

Dereference the stored pointer.  
References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator->()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::operator-> () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.  
References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator=()** [1/3]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Reset the unique\_ptr to empty, invoking the deleter if necessary.  
References [std::unique\\_ptr< \\_Tp, \\_Dp >::reset\(\)](#).

**operator=()** [2/3]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
    unique_ptr< _Tp, _Dp > && ) [default]
```

Move assignment operator.  
Invokes the deleter if this object owns a pointer.

**operator=()** [3/3]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Up , typename _Ep >
enable_if< __and< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp, _Dp >::operator= (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Assignment from another type.

**Parameters**

<a href="#">_↵</a>	The object to transfer ownership from, which owns a convertible pointer to a non-array object.
<a href="#">_u</a>	

Invokes the deleter if this object owns a pointer.  
References [std::forward\(\)](#), [std::unique\\_ptr< \\_Tp, \\_Dp >::get\\_deleter\(\)](#), and [std::unique\\_ptr< \\_Tp, \\_Dp >::reset\(\)](#).

**release()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr<_Tp, _Dp>::release () [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.

**reset()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
void std::unique_ptr<_Tp, _Dp>::reset (
    pointer __p = pointer()) [inline], [constexpr], [noexcept]
```

Replace the stored pointer.

**Parameters**

<code>__p</code>	The new pointer to store.
------------------	---------------------------

The deleter will be invoked if a pointer is already owned.

References `std::move()`.

Referenced by `std::unique_ptr<_Tp, _Dp>::operator=()`, `std::unique_ptr<_Tp, _Dp>::operator=()`, `std::unique_ptr<_Tp[], _Dp>::operator=()` and `std::unique_ptr<_Tp[], _Dp>::operator=()`.

**swap()**

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
void std::unique_ptr<_Tp, _Dp>::swap (
    unique_ptr<_Tp, _Dp> &__u) [inline], [constexpr], [noexcept]
```

Exchange the pointer and deleter with another object.

### 6.1041.1 Detailed Description

```
template<typename _Tp, typename _Dp>
class std::unique_ptr<_Tp[], _Dp>
```

A move-only smart pointer that manages unique ownership of an array.

Since

C++11

### 6.1041.2 Constructor & Destructor Documentation

**unique\_ptr()** [1/6]

```
template<typename _Tp, typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr<_Tp[], _Dp>::unique_ptr () [inline], [constexpr], [noexcept]
Default constructor, creates a unique_ptr that owns nothing.
```

**unique\_ptr()** [2/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Vp = _Dp, typename = _DeleterConstraint<_Vp>, typename = typename
enable_if< __safe_conversion_raw<_Up>::value, bool>::type>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p) [inline], [explicit], [constexpr], [noexcept]
```

Takes ownership of a pointer.

**Parameters**

$\leftarrow$ _p	A pointer to an array of a type safely convertible to an array of element_type
--------------------	--

The deleter will be value-initialized.

**unique\_ptr()** [3/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_
raw<_Up>, is_copy_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p,
    const deleter_type & __d) [inline], [constexpr], [noexcept]
```

Takes ownership of a pointer.

**Parameters**

$\leftarrow$ _p	A pointer to an array of a type safely convertible to an array of element_type
$\leftarrow$ _d	A reference to a deleter.

The deleter will be initialized with \_\_d

**unique\_ptr()** [4/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_
raw<_Up>, is_move_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p,
    __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d) [inline], [constexpr],
[noexcept]
```

Takes ownership of a pointer.

**Parameters**

$\leftarrow$ _p	A pointer to an array of a type safely convertible to an array of element_type
$\leftarrow$ _d	A reference to a deleter.

The deleter will be initialized with std::move(\_\_d)

**unique\_ptr()** [5/6]

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    unique_ptr< _Tp[], _Dp > && ) [default]
```

Move constructor.

**unique\_ptr()** [6/6]

```
template<typename _Tp , typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a unique\_ptr that owns nothing.

**~unique\_ptr()**

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::~~unique_ptr () [inline]
```

Destructor, invokes the deleter if the stored pointer is not null.

References `std::unique_ptr< _Tp, _Dp >::get_deleter()`.

**6.1041.3 Member Function Documentation****get()**

```
template<typename _Tp , typename _Dp >
pointer std::unique_ptr< _Tp[], _Dp >::get () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

**get\_deleter()** [1/2]

```
template<typename _Tp , typename _Dp >
const deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter () const [inline], [constexpr],
[noexcept]
```

Return a reference to the stored deleter.

**get\_deleter()** [2/2]

```
template<typename _Tp , typename _Dp >
deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter () [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.

**operator bool()**

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::operator bool () const [inline], [explicit], [constexpr], [noexcept]
```

Return true if the stored pointer is not null.

References `std::unique_ptr< _Tp, _Dp >::get()`.

**operator=()** [1/3]

```
template<typename _Tp , typename _Dp >
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Reset the unique\_ptr to empty, invoking the deleter if necessary.

References [std::unique\\_ptr< \\_Tp, \\_Dp >::reset\(\)](#).

### operator=() [2/3]

```
template<typename _Tp , typename _Dp >
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
    unique_ptr< _Tp[], _Dp > && ) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

### operator=() [3/3]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Ep >
enable_if< __and< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp[], _Dp >::operator= (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Assignment from another type.

#### Parameters

<a href="#"><code>__u</code></a>	The object to transfer ownership from, which owns a convertible pointer to an array object.
----------------------------------	---

Invokes the deleter if this object owns a pointer.

References [std::forward\(\)](#), [std::unique\\_ptr< \\_Tp, \\_Dp >::get\\_deleter\(\)](#), and [std::unique\\_ptr< \\_Tp, \\_Dp >::reset\(\)](#).

### operator[]()

```
template<typename _Tp , typename _Dp >
std::add_lvalue_reference< element_type >::type std::unique_ptr< _Tp[], _Dp >::operator[] (
    size_t __i) const [inline], [constexpr]
```

Access an element of owned array.

References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

### release()

```
template<typename _Tp , typename _Dp >
pointer std::unique_ptr< _Tp[], _Dp >::release () [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.

### reset()

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename = _Require< __or<is_same<_Up, pointer>, __and<is_same<pointer,
element_type*>, is_pointer<_Up>, is_convertible< typename remove_pointer<_Up>::type(*)[], element<
_type(*)[] > > > >>
void std::unique_ptr< _Tp[], _Dp >::reset (
    _Up __p) [inline], [constexpr], [noexcept]
```

Replace the stored pointer.

#### Parameters

<a href="#"><code>__p</code></a>	The new pointer to store.
----------------------------------	---------------------------

The deleter will be invoked if a pointer is already owned.

References [std::move\(\)](#).

### swap()

```
template<typename _Tp , typename _Dp >
void std::unique_ptr< _Tp[], _Dp >::swap (
    unique_ptr< _Tp[], _Dp > & __u) [inline], [constexpr], [noexcept]
```

Exchange the pointer and deleter with another object.

- template<typename , typename , typename >  
class **std::\_Hash\_merge\_helper**

### 6.1043.1 Detailed Description

template<typename \_Key, typename \_Tp, typename \_Hash = hash<\_Key>, typename \_Pred = equal\_to<\_Key>, typename \_Alloc = allocator<std::pair<const \_Key, \_Tp>>>  
class std::unordered\_map<\_Key, \_Tp, \_Hash, \_Pred, \_Alloc >

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Since

C++11

#### Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to hash<_Value>.
<code>_Pred</code>	Predicate function object type, defaults to equal_to<_Value>.
<code>_Alloc</code>	Allocator type, defaults to std::allocator<std::pair<const _Key, _Tp>>.

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is std::pair<const \_Key, \_Tp>.

Base is \_Hashtable, dispatched at compile time via template alias \_\_umap\_hashtable.

### 6.1043.2 Member Typedef Documentation

#### allocator\_type

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
_Hashtable::allocator_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::allocator_type
```

Public typedefs.

#### const\_iterator

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
_Hashtable::const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::const_iterator
```

Iterator-related typedefs.

#### const\_local\_iterator

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
_Hashtable::const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::const_local_iterator
```

Iterator-related typedefs.

**const\_pointer**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
_Hashtable::const_pointer std::unordered\_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_pointer  
Iterator-related typedefs.
```

**const\_reference**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
_Hashtable::const_reference std::unordered\_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_reference  
Iterator-related typedefs.
```

**difference\_type**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
_Hashtable::difference_type std::unordered\_map< _Key, _Tp, _Hash, _Pred, _Alloc >::difference_↵  
type  
Iterator-related typedefs.
```

**hasher**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>

**6.1043.3 Constructor & Destructor Documentation****unordered\_map() [1/7]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map () [default]
Default constructor.
```

**unordered\_map() [2/7]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

## Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

**unordered\_map()** [3/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_map from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_map consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first, __last)`).

**unordered\_map()** [4/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_map()** [5/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

**unordered\_map()** [6/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_map with no elements.

#### Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

#### unordered\_map() [7/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_map from an initializer\_list.

#### Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_map consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

### 6.1043.4 Member Function Documentation

#### at() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::at (
    const key_type & __k) [inline]
```

Access to unordered\_map data.

#### Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

#### Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the unordered\_map.

**Exceptions**

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

**at()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
const mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::at (  
    const key_type & __k) const [inline]
```

Access to unordered\_map data.

**Parameters**

<code>↵ _k</code>	The key for which data should be retrieved.
-----------------------	---

**Returns**

A reference to the data whose key is equal to `__k`, if such a data is present in the unordered\_map.

**Exceptions**

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

**begin()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],  
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_map.

**begin()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered\_map.

**begin()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::begin (  
    size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

**Parameters**

<code>↵ _n</code>	The bucket index.
-----------------------	-------------------

**Returns**

A read/write local iterator.

**begin()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\_↵$ $\_n$	The bucket index.
----------------	-------------------

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_map.

**cbegin()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_map.

**cbegin()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\_↵$ $\_n$	The bucket index.
----------------	-------------------

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],  
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_map.

Referenced by `std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert_or_assign()`, and `std::unordered_map< _Key, _Tp, _Has`

**cend()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (  
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

<code>↵</code>	The bucket index.
<code>n</code>	

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
template<typename _Kt >  
auto std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (  
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

<code>↵</code>	Key of elements to be located.
<code>x</code>	

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

<b>↵</b> <b>_X</b>	Key of elements to be located.
-----------------------	--------------------------------

**Returns**

True if there is any element with the specified key.

**count()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Kt >
auto std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const _Kt & __x) const -> decltype(_M_h._M_count_tr(__x)) [inline]
```

Finds the number of elements.

**Parameters**

<b>↵</b> <b>_X</b>	Key to count.
-----------------------	---------------

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multimap; for unordered\_map the result will either be 0 (not present) or 1 (present).

**count()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

<b>↵</b> <b>_X</b>	Key to count.
-----------------------	---------------

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multimap; for unordered\_map the result will either be 0 (not present) or 1 (present).

**emplace()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_map.

**Parameters**

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map. Insertion requires amortized constant time.

References [std::forward\(\)](#).

**emplace\_hint()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_map.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

**Returns**

An iterator that points to the element with key of the std::pair built from \_\_args (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**empty()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered\_map is empty.

**end()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_map.

**end()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered\_map.

Referenced by [std::unordered\\_map<\\_Key, \\_Tp, \\_Hash, \\_Pred, \\_Alloc >::extract\(\)](#).

**end()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

**Parameters**

<a href="#">_↔</a>	The bucket index.
<a href="#">_n</a>	

**Returns**

A read/write local iterator.

**end()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

<a href="#">_↔</a>	The bucket index.
<a href="#">_n</a>	

**Returns**

A read-only local iterator.

**equal\_range()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
template<typename _Kt >  
auto std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (  
    const _Kt & __x) -> decltype(_M_h._M_equal_range_tr(__x))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>↵ __x</code>	Key to be located.
------------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

**equal\_range()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
template<typename _Kt >  
auto std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (  
    const _Kt & __x) const -> decltype(_M_h._M_equal_range_tr(__x))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>↵ __x</code>	Key to be located.
------------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

**equal\_range()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
std::pair< iterator, iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_↵  
range (  
    const key_type & __x)    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered\_multimap.

**equal\_range() [4/4]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< const_iterator, const_iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered\_multimap.

**erase() [1/4]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>_↵</code>	Key of element to be erased.
<code>_X</code>	

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an unordered\_map. For an unordered\_map the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (  
    const_iterator __first,  
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_map`.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_map`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (  
    const_iterator __position) [inline]
```

Erases an element from an `unordered_map`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (  
    iterator __position) [inline]
```

Erases an element from an `unordered_map`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**extract()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
node_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key) [inline]
```

Extract a node.

**extract()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
node_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos) [inline]
```

Extract a node.

References [std::unordered\\_map<\\_Key, \\_Tp, \\_Hash, \\_Pred, \\_Alloc >::end\(\)](#).

**find()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt >
auto std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x) -> decltype(_M_h._M_find_tr(__x)) [inline]
```

Tries to locate an element in an `unordered_map`.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt >
auto std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x)) [inline]
```

Tries to locate an element in an `unordered_map`.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find() [3/4]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an `unordered_map`.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find() [4/4]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_map`.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered\_map.

**hash\_function()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
hasher std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_map was constructed.

**insert()** [1/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _InputIterator >
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

**insert()** [2/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, pair< iterator, bool > > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

**Parameters**

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	--

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**insert()** [3/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

**Parameters**

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	--

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map.

Insertion requires amortized constant time.

**insert()** [4/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

**Parameters**

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

**Returns**

An iterator that points to the element with key of \_\_x (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**insert()** [5/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
```

```
const_iterator __hint,
const value_type & __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

#### insert() [6/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

References [std::move\(\)](#).

#### insert() [7/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator ,
    node_type && __nh) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

**insert()** [8/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the unordered\_map.

**Parameters**

↵	A std::initializer_list<value_type> of elements to be inserted.
_↵	
↵	
_↵	
/	

Complexity similar to that of the range constructor.

**insert()** [9/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
insert_return_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

**insert()** [10/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

**Parameters**

_↵	Pair to be inserted (see std::make_pair for easy creation of pairs).
_X	

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map.

Insertion requires amortized constant time.

References [std::move\(\)](#).

**insert\_or\_assign()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Obj >
```

```
pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert_or_assign (
    const key_type & __k,
    _Obj && __obj) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

#### Parameters

<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

#### Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map. If the pair was already in the unordered\_map, the .second of the pair is assigned from \_\_obj.

Insertion requires amortized constant time.

References [std::unordered\\_map<\\_Key, \\_Tp, \\_Hash, \\_Pred, \\_Alloc >::cend\(\)](#), and [std::forward\(\)](#).

#### insert\_or\_assign() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Obj >
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert_or_assign (
    const_iterator __hint,
    const key_type & __k,
    _Obj && __obj) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the unordered_map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

#### Returns

An iterator that points to the element with key of \_\_x (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does.

If the pair was already in the unordered map, the .second of the pair is assigned from \_\_obj. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**key\_eq()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
key_equal std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_map was constructed.

**load\_factor()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const [inline],  
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],  
[noexcept]
```

Returns the maximum number of buckets of the unordered\_map.

**max\_load\_factor() [1/2]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],  
[noexcept]
```

Returns a positive number that the unordered\_map tries to keep the load factor less than or equal to.

**max\_load\_factor() [2/2]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (  
    float __z) [inline]
```

Change the unordered\_map maximum load factor.

**Parameters**

<code>_↵</code>	The new maximum load factor.
<code>_z</code>	

**max\_size()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],  
[noexcept]
```

Returns the maximum size of the unordered\_map.

**operator=()** [1/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_map list assignment operator.

**Parameters**

↵	An initializer_list.
_↵	
↵	
_↵	
/	

This function fills an unordered\_map with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_map and that the resulting unordered\_map's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**operator[]()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    const key_type & __k) [inline]
```

Subscript ( [] ) access to unordered\_map data.

**Parameters**

_↵ _k	The key for which data should be retrieved.
----------	---

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

**operator[]()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (   
    key_type && __k) [inline]
```

Subscript ( [] ) access to unordered\_map data.

**Parameters**

<code>_↵ _k</code>	The key for which data should be retrieved.
------------------------	---

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

References [std::move\(\)](#).

**rehash()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (   
    size_type __n) [inline]
```

May rehash the unordered\_map.

**Parameters**

<code>_↵ _n</code>	The new number of buckets.
------------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered\_map maximum load factor.

**reserve()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (   
    size_type __n) [inline]
```

Prepare the unordered\_map for a specified number of elements.

**Parameters**

<code>_↵ _n</code>	Number of elements required.
------------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

**size()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_map.

**swap()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::swap (
    unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_map.

**Parameters**

<code>↵</code>	An unordered_map of the same element and allocator types.
<code>_X</code>	

This exchanges the elements between two unordered\_map in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

**try\_emplace() [1/2]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
pair< iterator, bool > std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::try_emplace (
    const key_type & __k,
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_map.

**Parameters**

<code>__k</code>	Key to use for finding a possibly existing pair in the unordered_map.
<code>__args</code>	Arguments used to generate the .second for a new pair instance.

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map. If a pair is not inserted, this function has no effect.

Insertion requires amortized constant time.

References [std::unordered\\_map<\\_Key, \\_Tp, \\_Hash, \\_Pred, \\_Alloc >::cend\(\)](#), and [std::forward\(\)](#).

**try\_emplace() [2/2]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::try_emplace (
```

```
const_iterator __hint,
const key_type & __k,
_Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the <code>unordered_map</code> .
<code>__args</code>	Arguments used to generate the <code>.second</code> for a new pair instance.

#### Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. However, if insertion did not take place, this function has no effect. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

### 6.1044.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = std::hash<_Key>, typename _Pred = std::equal_↵
_to<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
class std::__debug::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
```

Class std::unordered\_multimap with safety/checking/debug instrumentation.  
The documentation for this class was generated from the following file:

- [debug/unordered\\_map](#)

`class std::_Hash_merge_helper`

### 6.1045.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Since

C++11

## Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap () [default]
Default constructor.
```

### unordered\_multimap() [2/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

#### Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

### unordered\_multimap() [3/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
template<typename _InputIterator >
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multimap from a range.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first, __last)`).

#### unordered\_multimap() [4/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

#### unordered\_multimap() [5/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

#### unordered\_multimap() [6/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_multimap with no elements.

#### Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

**unordered\_multimap()** [7/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multimap from an initializer\_list.

**Parameters**

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_multimap consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

**6.1045.4 Member Function Documentation****begin()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

**begin()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered\_multimap.

**begin()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

**Parameters**

<code>__↵</code>	The bucket index.
<code>__n</code>	

**Returns**

A read/write local iterator.

**begin()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (   
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

<code>_↔</code> <code>_n</code>	The bucket index.
------------------------------------	-------------------

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const [inline],  
[noexcept]
```

Returns the number of buckets of the `unordered_multimap`.

**cbegin()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],  
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_multimap`.

**cbegin()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (   
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

<code>_↔</code> <code>_n</code>	The bucket index.
------------------------------------	-------------------

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multimap.

Referenced by [std::unordered\\_multimap<\\_Key, \\_Tp, \\_Hash, \\_Pred, \\_Alloc >::insert\(\)](#).

**cend()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

<a href="#">_↵</a>	The bucket index.
<a href="#">_n</a>	

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Kt >
auto std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

<a href="#">_↵</a>	Key of elements to be located.
<a href="#">_x</a>	

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (  
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

<div><div><div><div><div><div><span><span></span></span></div></div></div><div><div><div><span></span></div><div><span><span><span>↵</span></span></span></div></div></div></div></div></div> <div><div><div><span></span></div><div><span><span><span>X</span></span></span></div></div></div>
---

**Returns**

True if there is any element with the specified key.

**count()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
template<typename _Kt >  
auto std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::count (  
    const _Kt & __x) const -> decltype(_M_h._M_count_tr(__x)) [inline]
```

Finds the number of elements.

**Parameters**

<div><div><div><div><div><div><span><span></span></span></div></div></div><div><div><div><span></span></div><div><span><span><span>↵</span></span></span></div></div></div></div></div></div> <div><div><div><span></span></div><div><span><span><span>X</span></span></span></div></div></div>
---

**Returns**

Number of elements with specified key.

**count()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::count (  
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

<div><div><div><div><div><div><span><span></span></span></div></div></div><div><div><div><span></span></div><div><span><span><span>↵</span></span></span></div></div></div></div></div></div> <div><div><div><span></span></div><div><span><span><span>X</span></span></span></div></div></div>
---

**Returns**

Number of elements with specified key.

**emplace()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_multimap.

**Parameters**

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

**Returns**

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered\_multimap.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**emplace\_hint()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_multimap.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

**Returns**

An iterator that points to the element with key of the std::pair built from `__args`.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**empty()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered\_multimap is empty.

**end()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multimap.

**end()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered\_multimap.

Referenced by `std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::extract()`.

**end()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

**Parameters**

<code>_↵</code>	The bucket index.
<code>_n</code>	

**Returns**

A read/write local iterator.

**end()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

<code>_↵</code>	The bucket index.
<code>_n</code>	

**Returns**

A read-only local iterator.

**equal\_range()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt >
auto std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __x) -> decltype(_M_h._M_equal_range_tr(__x))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<b>↵</b> <b>_X</b>	Key to be located.
-----------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt >
auto std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __x) const -> decltype(_M_h._M_equal_range_tr(__x))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<b>↵</b> <b>_X</b>	Key to be located.
-----------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, iterator > std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >↵
::equal_range (
    const key_type & __x)    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<b>↵</b> <b>_X</b>	Key to be located.
-----------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< const_iterator, const_iterator > std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _↵
Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>_↵</code> <code>_X</code>	Key to be located.
------------------------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**erase()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>_↵</code> <code>_X</code>	Key of elements to be erased.
------------------------------------	-------------------------------

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multimap`.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_multimap`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an `unordered_multimap`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**extract()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
node_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key) [inline]
```

Extract a node.

**extract()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
node_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos) [inline]
```

Extract a node.

References `std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end()`.

**find()** [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Kt >
auto std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x) -> decltype(_M_h._M_find_tr(__x)) [inline]
```

Tries to locate an element in an `unordered_multimap`.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Kt >
auto std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x)) [inline]
```

Tries to locate an element in an `unordered_multimap`.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (  
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_multimap.

**Parameters**

<code>_↔</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_multimap`.

**Parameters**

<code>_↔</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the `unordered_multimap`.

**hash\_function()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_multimap` was constructed.

**insert()** [1/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

**insert()** [2/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

## Parameters

<code>↵</code> <code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------------------------	--

## Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**insert()** [3/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

## Parameters

<code>↵</code> <code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------------------------	--

## Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

**insert()** [4/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
```

```

_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x) [inline]

```

Inserts a `std::pair` into the `unordered_multimap`.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

#### `insert()` [5/10]

```

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]

```

Inserts a `std::pair` into the `unordered_multimap`.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

#### `insert()` [6/10]

```

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh) [inline]

```

Re-insert an extracted node.

References [std::move\(\)](#).

**insert()** [7/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

References [std::move\(\)](#).

**insert()** [8/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the unordered\_multimap.

**Parameters**

<code>↵</code> <code>↵</code> <code>↵</code> <code>↵</code> <code>/</code>	A std::initializer_list<value_type> of elements to be inserted.
--	---

Complexity similar to that of the range constructor.

**insert()** [9/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh) [inline]
```

Re-insert an extracted node.

References [std::unordered\\_multimap<\\_Key,\\_Tp,\\_Hash,\\_Pred,\\_Alloc>::cend\(\)](#), and [std::move\(\)](#).

**insert()** [10/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

**Parameters**

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

References [std::move\(\)](#).

**key\_eq()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const [inline]
Returns the key comparison object with which the unordered_multimap was constructed.
```

**load\_factor()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the `unordered_multimap`.

**max\_load\_factor()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the `unordered_multimap` tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_multimap maximum load factor.

#### Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

#### max\_size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_multimap.

#### operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

#### operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_multimap list assignment operator.

#### Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered\_multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_multimap and that the resulting unordered\_multimap's size is the same as the number of elements assigned.

#### operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**rehash()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (   
    size_type __n) [inline]
```

May rehash the unordered\_multimap.

**Parameters**

<code>↵ _n</code>	The new number of buckets.
-----------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered\_multimap maximum load factor.

**reserve()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (   
    size_type __n) [inline]
```

Prepare the unordered\_multimap for a specified number of elements.

**Parameters**

<code>↵ _n</code>	Number of elements required.
-----------------------	------------------------------

Same as rehash(ceil(n / max\_load\_factor())).

**size()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline],  
[noexcept]
```

Returns the size of the unordered\_multimap.

**swap()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (   
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_multimap.

**Parameters**

<code>↵ _x</code>	An unordered_multimap of the same element and allocator types.
-----------------------	--

This exchanges the elements between two unordered\_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

class std::\_Hash\_merge\_helper

### 6.1047.1 Detailed Description

template<typename \_Value, typename \_Hash = hash<\_Value>, typename \_Pred = equal\_to<\_Value>, typename \_Alloc = allocator<\_Value>>

class std::unordered\_multiset<\_Value, \_Hash, \_Pred, \_Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Since

C++11

#### Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

### 6.1047.2 Member Typedef Documentation

#### allocator\_type

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::allocator_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::allocator_type
```

Public typedefs.

#### const\_iterator

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::const_iterator
```

Iterator-related typedefs.

#### const\_local\_iterator

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::const_local_iterator
```

Iterator-related typedefs.

**const\_pointer**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_pointer std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::const_pointer
Iterator-related typedefs.
```

**const\_reference**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_reference std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::const_↵
reference
Iterator-related typedefs.
```

**difference\_type**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::difference_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::difference_↵
_type
Iterator-related typedefs.
```

**hasher**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hasher
Public typedefs.
```

**iterator**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::iterator
Iterator-related typedefs.
```

**key\_equal**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_equal
Public typedefs.
```

**key\_type**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::key_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_type
Public typedefs.
```

**local\_iterator**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
_Hashtable::local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::local_iterator
```

Iterator-related typedefs.

### pointer

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
_Hashtable::pointer std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::pointer
```

Iterator-related typedefs.

### reference

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
_Hashtable::reference std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reference
```

Iterator-related typedefs.

### size\_type

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
_Hashtable::size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size_type
```

Iterator-related typedefs.

### value\_type

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
_Hashtable::value_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::value_type
```

Public typedefs.

## 6.1047.3 Constructor & Destructor Documentation

### unordered\_multiset() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset () [default]
```

Default constructor.

### unordered\_multiset() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

#### Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.

## Parameters

<code>__eq/</code>	A key equality functor.
<code>__a</code>	An allocator object.

**unordered\_multiset()** [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq/ = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multiset from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq/</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_multiset consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

**unordered\_multiset()** [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_multiset()** [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

**unordered\_multiset()** [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
```

```

initializer_list< value_type > __l,
size_type __n = 0,
const hasher & __hf = hasher(),
const key_equal & __eq1 = key_equal(),
const allocator_type & __a = allocator_type() [inline]

```

Builds an unordered\_multiset from an initializer\_list.

#### Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_multiset consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

#### unordered\_multiset() [7/7]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const allocator_type & __a) [inline], [explicit]

```

Creates an unordered\_multiset with no elements.

#### Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

### 6.1047.4 Member Function Documentation

#### begin() [1/4]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]

```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

#### begin() [2/4]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]

```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

#### begin() [3/4]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]

```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\leftarrow$	The bucket index.
<i>n</i>	

**Returns**

A read-only local iterator.

**begin()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\leftarrow$	The bucket index.
<i>n</i>	

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_multiset.

**cbegin()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

**cbegin()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\leftarrow$	The bucket index.
<i>n</i>	

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

Referenced by [std::unordered\\_multiset< \\_Value, \\_Hash, \\_Pred, \\_Alloc >::insert\(\)](#).

**cend()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

$\leftarrow$	The bucket index.
<code>__n</code>	

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_multiset.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

$\leftarrow$	Key of elements to be located.
<code>__X</code>	

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

	Key of elements to be located.
	

**Returns**

True if there is any element with the specified key.

**count()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
    const _Kt & __x) const -> decltype(_M_h._M_count_tr(__x)) [inline]
```

Finds the number of elements.

**Parameters**

	Element to located.
	

**Returns**

Number of elements with specified key.

**count()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

	Element to located.
	

**Returns**

Number of elements with specified key.

**emplace()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Builds and insert an element into the unordered\_multiset.

**Parameters**

<code>__args</code>	Arguments used to generate an element.
---------------------	--

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**emplace\_hint()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**empty()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered\_multiset is empty.

**end()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

**end()** [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

Referenced by [std::unordered\\_multiset< \\_Value, \\_Hash, \\_Pred, \\_Alloc >::extract\(\)](#).

**end()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

<a href="#"></a>	The bucket index.
<a href="#"></a>	

**Returns**

A read-only local iterator.

**end()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

<a href="#"></a>	The bucket index.
<a href="#"></a>	

**Returns**

A read-only local iterator.

**equal\_range()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __x) -> decltype(_M_h._M_equal_range_tr(__x))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __x) const -> decltype(_M_h._M_equal_range_tr(__x))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const key_type & __x)    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**erase()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multiset`.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_multiset`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an `unordered_multiset`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**extract()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key) [inline]
```

Extract a node.

**extract()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos) [inline]
```

Extract a node.

References [std::unordered\\_multiset< \\_Value, \\_Hash, \\_Pred, \\_Alloc >::end\(\)](#).

**find()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x) -> decltype(_M_h._M_find_tr(__x)) [inline]
```

Tries to locate an element in an `unordered_multiset`.

**Parameters**

<a href="#"></a>	Element to be located.
<a href="#"></a>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x)) [inline]
```

Tries to locate an element in an `unordered_multiset`.

**Parameters**

<a href="#"></a>	Element to be located.
<a href="#"></a>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::find (  
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_multiset.

**Parameters**

<code>_↔</code>	Element to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_multiset`.

**Parameters**

<code>_↔</code>	Element to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the `unordered_multiset`.

**hash\_function()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_multiset` was constructed.

**insert()** [1/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that inserts a range of elements.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

**insert()** [2/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Inserts an element into the unordered\_multiset.

## Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

## Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

**insert()** [3/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Inserts an element into the unordered\_multiset.

## Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

## Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.assoc.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.assoc.html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [4/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

**insert()** [5/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

References [std::move\(\)](#).

**insert()** [6/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Inserts a list of elements into the unordered\_multiset.

**Parameters**

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

**insert()** [7/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh) [inline]
```

Re-insert an extracted node.

References [std::unordered\\_multiset< \\_Value, \\_Hash, \\_Pred, \\_Alloc >::end\(\)](#), and [std::move\(\)](#).

**insert()** [8/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

<a href="#"></a>	Element to be inserted.
<a href="#">_X</a>	

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

References [std::move\(\)](#).

**key\_eq()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_multiset was constructed.

**load\_factor()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered\_multiset.

**max\_load\_factor()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_multiset tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_multiset maximum load factor.

**Parameters**

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

**max\_size()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_multiset.

**operator=()** [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_multiset list assignment operator.

**Parameters**

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered\_multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_multiset and that the resulting unordered\_multiset's size is the same as the number of elements assigned.

### operator=() [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

### rehash()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_multiset.

#### Parameters

$\leftarrow$ __n	The new number of buckets.
---------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered\_multiset maximum load factor.

### reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_multiset for a specified number of elements.

#### Parameters

$\leftarrow$ __n	Number of elements required.
---------------------	------------------------------

Same as rehash(ceil(n / max\_load\_factor())).

### size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_multiset.

### swap()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::swap (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_multiset.

## Parameters

<code>_↔</code>	An unordered_multiset of the same element and allocator types.
<code>_X</code>	

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

The documentation for this class was generated from the following file:

- [unordered\\_set.h](#)

### 6.1049.1 Detailed Description

`template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>`

`class std::unordered_set< _Value, _Hash, _Pred, _Alloc >`

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Since

C++11

#### Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a `container`, and `unordered associative container`

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

### 6.1049.2 Member Typedef Documentation

#### `allocator_type`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::allocator_type
Public typedefs.
```

#### `const_iterator`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::const_iterator
Iterator-related typedefs.
```

**const\_local\_iterator**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::const_↵
local_iterator
```

Iterator-related typedefs.

**const\_pointer**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_pointer std::unordered_set< _Value, _Hash, _Pred, _Alloc >::const_pointer
```

Iterator-related typedefs.

**const\_reference**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::const_reference std::unordered_set< _Value, _Hash, _Pred, _Alloc >::const_reference
```

Iterator-related typedefs.

**difference\_type**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::difference_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::difference_type
```

Iterator-related typedefs.

**hasher**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hasher
```

Public typedefs.

**iterator**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::iterator
```

Iterator-related typedefs.

**key\_equal**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_equal
```

Public typedefs.

**key\_type**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::key_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_type
```

Public typedefs.

### local\_iterator

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::local_iterator
Iterator-related typedefs.
```

### pointer

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::pointer std::unordered_set< _Value, _Hash, _Pred, _Alloc >::pointer
Iterator-related typedefs.
```

### reference

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::reference std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reference
Iterator-related typedefs.
```

### size\_type

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size_type
Iterator-related typedefs.
```

### value\_type

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
_Hashtable::value_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::value_type
Public typedefs.
```

## 6.1049.3 Constructor & Destructor Documentation

### unordered\_set() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set () [default]
Default constructor.
```

### unordered\_set() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

## Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

**unordered\_set()** [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_set from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_set consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first, __last)`).

**unordered\_set()** [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_set()** [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

**unordered\_set()** [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_set with no elements.

#### Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

#### unordered\_set() [7/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_set from an initializer\_list.

#### Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_set consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

### 6.1049.4 Member Function Documentation

#### begin() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

#### begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

#### begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\leftarrow$ _n	The bucket index.
--------------------	-------------------

**Returns**

A read-only local iterator.

**begin()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\leftarrow$ _n	The bucket index.
--------------------	-------------------

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_set.

**cbegin()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

**cbegin()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

$\leftarrow$ _n	The bucket index.
--------------------	-------------------

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

**cend()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

$\leftarrow$	The bucket index.
$n$	

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set<_Value, _Hash, _Pred, _Alloc>::contains (
    const _Kt & __k) const -> decltype(_M_h._M_find_tr(__k), void(), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

$\leftarrow$	Key of elements to be located.
$x$	

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

	Key of elements to be located.
	

**Returns**

True if there is any element with the specified key.

**count()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
    const _Kt & __k) const -> decltype(_M_h._M_count_tr(__k)) [inline]
```

Finds the number of elements.

**Parameters**

	Element to located.
	

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multisets; for unordered\_set the result will either be 0 (not present) or 1 (present).

**count()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

	Element to located.
	

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multisets; for unordered\_set the result will either be 0 (not present) or 1 (present).

**emplace()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert an element into the unordered\_set.

**Parameters**

<code>__args</code>	Arguments used to generate an element.
---------------------	--

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**emplace\_hint()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to insert an element into the unordered\_set.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant time.

References [std::forward\(\)](#).

**empty()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered\_set is empty.

#### end() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

#### end() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

Referenced by [std::unordered\\_set< \\_Value, \\_Hash, \\_Pred, \\_Alloc >::extract\(\)](#).

#### end() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

$\leftarrow$	The bucket index.
$n$	

#### Returns

A read-only local iterator.

#### end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

$\leftarrow$	The bucket index.
$n$	

#### Returns

A read-only local iterator.

**equal\_range()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __k) -> decltype(_M_h._M_equal_range_tr(__k))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

	Key to be located.
	

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

**equal\_range()** [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __k) const -> decltype(_M_h._M_equal_range_tr(__k))    [inline]
```

Finds a subsequence matching given key.

**Parameters**

	Key to be located.
	

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

**equal\_range()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range
(
    const key_type & __x)    [inline]
```

Finds a subsequence matching given key.

**Parameters**

	Key to be located.
	

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

**equal\_range()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::
::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

**erase()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_set`.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**extract()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key) [inline]
```

Extract a node.

**extract()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos) [inline]
```

Extract a node.

References `std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end()`.

**find()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __k) -> decltype(_M_h._M_find_tr(__k)) [inline]
```

Tries to locate an element in an `unordered_set`.

**Parameters**

<code>__k</code>	Element to be located.
<code>__X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __k) const -> decltype(_M_h._M_find_tr(__k)) [inline]
```

Tries to locate an element in an `unordered_set`.

**Parameters**

<code>__k</code>	Element to be located.
<code>__X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::find (  
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_set.

**Parameters**

<code>_↔</code>	Element to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find() [4/4]**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_set`.

**Parameters**

<code>_↔</code>	Element to be located.
<code>_X</code>	

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Returns the allocator object used by the `unordered_set`.

**hash\_function()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_set` was constructed.

**insert() [1/8]**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

**insert()** [2/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert an element into the unordered\_set.

## Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

**insert()** [3/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Attempts to insert an element into the unordered\_set.

## Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

## Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [4/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

References [std::move\(\)](#).

**insert()** [5/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator ,
    node_type && __nh) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

**insert()** [6/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the `unordered_set`.

**Parameters**

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

**insert()** [7/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
insert_return_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

**insert()** [8/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

<code>__x</code>	Element to be inserted.
------------------	-------------------------

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

References [std::move\(\)](#).

**key\_eq()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the `unordered_set` was constructed.

**load\_factor()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline], [noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],
[noexcept]
```

Returns the maximum number of buckets of the `unordered_set`.

**max\_load\_factor()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_set tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_set maximum load factor.

**Parameters**

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

**max\_size()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the unordered\_set.

**operator=()** [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_set list assignment operator.

**Parameters**

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered\_set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_set and that the resulting unordered\_set's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**rehash()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_set.

**Parameters**

$\leftrightarrow$	The new number of buckets.
$n$	

Rehash will occur only if the new number of buckets respect the unordered\_set maximum load factor.

**reserve()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_set for a specified number of elements.

**Parameters**

$\leftrightarrow$	Number of elements required.
$n$	

Same as rehash(ceil(n / max\_load\_factor())).

**size()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_set.

**swap()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (
    unordered_set< _Value, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_set.

## Parameters

<code>_↔_X</code>	An unordered_set of the same element and allocator types.
-------------------	---

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

The documentation for this class was generated from the following file:

### 6.1050.1 Detailed Description

A non-thread-safe memory resource that manages pools of fixed-size blocks.

Since

C++17

### 6.1050.2 Member Function Documentation

#### `do_allocate()`

```
void * std::pmr::unsynchronized_pool_resource::do_allocate (
    size_t __bytes,
    size_t __alignment) [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### `do_deallocate()`

```
void std::pmr::unsynchronized_pool_resource::do_deallocate (
    void * __p,
    size_t __bytes,
    size_t __alignment) [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### `do_is_equal()`

```
bool std::pmr::unsynchronized_pool_resource::do_is_equal (
    const memory\_resource & __other) const [inline], [override], [protected], [virtual],
[noexcept]
```

Implements [std::pmr::memory\\_resource](#).

The documentation for this class was generated from the following file:

- [memory\\_resource](#)

## 6.1051 `std::unwrap_ref_decay<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### Public Types

- using `type`

### 6.1051.1 Detailed Description

```
template<typename _Tp>
struct std::unwrap_ref_decay<_Tp>
```

Decay type and if it's a `reference_wrapper`, unwrap it

Since

C++20

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.1052 `std::unwrap_reference<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### Public Types

- using `type`

#### 6.1052.1 Detailed Description

```
template<typename _Tp>
struct std::unwrap_reference<_Tp>
```

Unwrap a reference\_wrapper

Since

C++20

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.1053 `std::uses_allocator< typename, typename >` Struct Template Reference

#### 6.1053.1 Detailed Description

```
template<typename, typename>
struct std::uses_allocator< typename, typename >
```

Declare `uses_allocator` so it can be specialized in `<queue>` etc.

The documentation for this struct was generated from the following file:

- [memoryfwd.h](#)

## 6.1054 `std::uses_allocator< tuple<_Types...>, _Alloc >` Struct Template Reference

```
#include <tuple>
```

Inheritance diagram for `std::uses_allocator< tuple<_Types...>, _Alloc >`:

## Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr \_Tp **value**

### 6.1054.1 Detailed Description

**template**<typename... \_Types, typename \_Alloc>  
**struct** std::uses\_allocator< tuple< \_Types... >, \_Alloc >

Partial specialization for tuples.

The documentation for this struct was generated from the following file:

- [tuple](#)

## 6.1055 std::chrono::utc\_clock Class Reference

```
#include <chrono>
```

## Public Types

- using **duration**
- using **period**
- using **rep**
- using **time\_point**

## Static Public Member Functions

- template<typename \_Duration >  
static [utc\\_time](#)< [common\\_type\\_t](#)< \_Duration, [seconds](#) > > **from\_sys** (const [sys\\_time](#)< \_Duration > &\_\_t)
- static [time\\_point](#) **now** ()
- template<typename \_Duration >  
static [sys\\_time](#)< [common\\_type\\_t](#)< \_Duration, [seconds](#) > > **to\_sys** (const [utc\\_time](#)< \_Duration > &\_\_t)

## Static Public Attributes

- static constexpr bool **is\_steady**

### 6.1055.1 Detailed Description

A clock that measures Universal Coordinated Time (UTC).

The epoch is 1970-01-01 00:00:00.

Since

C++20

The documentation for this class was generated from the following file:

- [chrono](#)

## 6.1056 std::valarray<\_Tp> Class Template Reference

```
#include <valarray>
```

### Public Types

- typedef `_Tp` **value\_type**

### Public Member Functions

- struct `_Array<_Tp>`

### 6.1056.1 Detailed Description

**template<typename \_Tp>**  
**class std::valarray<\_Tp>**

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

#### Template Parameters

<code>_Tp</code>	Type of object in the array.
------------------	------------------------------

### 6.1056.2 Constructor & Destructor Documentation

#### **valarray()** [1/3]

```
template<typename _Tp >
std::valarray<_Tp>::valarray (
    const _Tp * __restrict__,
    size_t )
```

Construct an array initialized to the first  $n$  elements of  $t$ .

#### **valarray()** [2/3]

```
template<typename _Tp >
std::valarray<_Tp>::valarray (
    const valarray<_Tp> & )
```

Copy constructor.

#### **valarray()** [3/3]

```
template<typename _Tp >
std::valarray<_Tp>::valarray (
    valarray<_Tp> && ) [noexcept]
```

Move constructor.

### 6.1056.3 Member Function Documentation

#### **operator"!"()**

```
template<typename _Tp >
_UnaryOp< __logical_not >::_Rt std::valarray<_Tp>::operator! () const
```

Return a new valarray by applying unary ! to each element.

#### **operator%=( )** [1/2]

```
template<typename _Tp >
valarray<_Tp> & std::valarray<_Tp>::operator%= (
    const _Tp & )
```

Set each element  $e$  of array to  $e \% t$ .

**operator%=( ) [2/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator%= (
    const valarray< _Tp > & )
```

Modulo elements of array by corresponding elements of *v*.

**operator&=( ) [1/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const _Tp & )
```

Set each element *e* of array to *e* & *t*.

**operator&=( ) [2/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const valarray< _Tp > & )
```

Logical and corresponding elements of *v* with elements of array.

**operator\*=( ) [1/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const _Tp & )
```

Multiply each element of array by *t*.

**operator\*=( ) [2/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const valarray< _Tp > & )
```

Multiply elements of array by corresponding elements of *v*.

**operator+()**

```
template<typename _Tp >
_UnaryOp< __unary_plus >::_Rt std::valarray< _Tp >::operator+ () const
```

Return a new valarray by applying unary + to each element.

**operator+=( ) [1/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const _Tp & )
```

Add *t* to each element of array.

**operator+=( ) [2/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const valarray< _Tp > & )
```

Add corresponding elements of *v* to elements of array.

**operator-()**

```
template<typename _Tp >
_UnaryOp< __negate >::_Rt std::valarray< _Tp >::operator- () const
Return a new valarray by applying unary - to each element.
```

**operator-=() [1/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const _Tp & )
Subtract t to each element of array.
```

**operator-=() [2/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const valarray< _Tp > & )
Subtract corresponding elements of v from elements of array.
```

**operator/=(1/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const _Tp & )
Divide each element of array by t.
```

**operator/=(2/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const valarray< _Tp > & )
Divide elements of array by corresponding elements of v.
```

**operator<<=(1/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const _Tp & )
Left shift each element e of array by t bits.
```

**operator<<=(2/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const valarray< _Tp > & )
Left shift elements of array by corresponding elements of v.
```

**operator>>=(1/2]**

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const _Tp & )
Right shift each element e of array by t bits.
```

**operator>>=()** [2/2]

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const valarray< _Tp > & )
```

Right shift elements of array by corresponding elements of *v*.

**operator^=()** [1/2]

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const _Tp & )
```

Set each element *e* of array to  $e \wedge t$ .

**operator^=()** [2/2]

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const valarray< _Tp > & )
```

Logical xor corresponding elements of *v* with elements of array.

**operator" |=()** [1/2]

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const _Tp & )
```

Set each element *e* of array to  $e \mid t$ .

**operator" |=()** [2/2]

```
template<typename _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const valarray< _Tp > & )
```

Logical or corresponding elements of *v* with elements of array.

**operator~()**

```
template<typename _Tp >
_UnaryOp< __bitwise_not >::_Rt std::valarray< _Tp >::operator~ () const
```

Return a new valarray by applying unary  $\sim$  to each element.

The documentation for this class was generated from the following files:

#### 6.1058.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector< _Tp, _Alloc >
```

A standard container which offers fixed time access to individual elements in any order.

Since

C++98

## Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

## 6.1058.2 Constructor &amp; Destructor Documentation

**vector()** [1/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector () [default]
```

Creates a vector with no elements.

**vector()** [2/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    const allocator_type & __a) [inline], [explicit], [constexpr], [noexcept]
```

Creates a vector with no elements.

## Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

**vector()** [3/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    size_type __n,
    const allocator_type & __a = allocator_type()) [inline], [explicit], [constexpr]
```

Creates a vector with default constructed elements.

## Parameters

<code>__n</code>	The number of elements to initially create.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` default constructed elements.

**vector()** [4/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    size_type __n,
```

```
const value_type & __value,
const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Creates a vector with copies of an exemplar element.

#### Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` copies of `__value`.

#### vector() [5/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    const vector<_Tp, _Alloc > & __x) [inline], [constexpr]
```

Vector copy constructor.

#### Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied (i.e. `capacity() == size()` in the new vector).

The newly-created vector uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

References `std::vector<_Tp, _Alloc >::begin()`, and `std::vector<_Tp, _Alloc >::end()`.

#### vector() [6/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    vector<_Tp, _Alloc > && ) [default], [noexcept]
```

Vector move constructor.

The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

#### vector() [7/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    const vector<_Tp, _Alloc > & __x,
    const __type_identity_t< allocator_type > & __a) [inline], [constexpr]
```

Copy constructor with alternative allocator.

#### vector() [8/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    vector<_Tp, _Alloc > && __rv,
    const __type_identity_t< allocator_type > & __m) [inline], [constexpr], [noexcept]
```

Move constructor with alternative allocator.

**vector()** [9/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Builds a vector from an initializer list.

**Parameters**

<code>__l</code>	An initializer_list.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements in the initializer\_list `__l`.

This will call the element type's copy constructor N times (where N is `__l.size()`) and do no memory reallocation.

**vector()** [10/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
std::vector< _Tp, _Alloc >::vector (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Builds a vector from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements from `[first,last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is `distance(first,last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

References [std::\\_\\_iterator\\_category\(\)](#).

**~vector()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::~~vector () [inline], [constexpr], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::\\_Destroy\(\)](#).

**6.1058.3 Member Function Documentation****\_M\_allocate\_and\_copy()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator >
pointer std::vector< _Tp, _Alloc >::_M_allocate_and_copy (
```

```

        size_type __n,
        _ForwardIterator __first,
        _ForwardIterator __last) [inline], [constexpr], [protected]

```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

### **\_M\_range\_check()**

```

template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::_M_range_check (
    size_type __n) const [inline], [constexpr], [protected]

```

Safety check used only from at().

References [std::vector<\\_Tp, \\_Alloc >::size\(\)](#).

Referenced by [std::vector<\\_Tp, \\_Alloc >::at\(\)](#), and [std::vector<\\_Tp, \\_Alloc >::at\(\)](#).

### **assign()** [1/3]

```

template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
void std::vector< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last) [inline], [constexpr]

```

Assigns a range to a vector.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a vector with copies of the elements in the range [`__first`,`__last`).

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

References [std::\\_iterator\\_category\(\)](#).

### **assign()** [2/3]

```

template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
    initializer_list< value_type > __l) [inline], [constexpr]

```

Assigns an initializer list to a vector.

#### Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**assign()** [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val) [inline], [constexpr]
```

Assigns a given value to a vector.

**Parameters**

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**at()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::at (
    size_type __n) [inline], [constexpr]
```

Provides access to the data contained in the vector.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

**Returns**

Read/write reference to data.

**Exceptions**

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

References `std::vector< _Tp, _Alloc >::_M_range_check()`.

**at()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::at (
    size_type __n) const [inline], [constexpr]
```

Provides access to the data contained in the vector.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

**Returns**

Read-only (constant) reference to data.

## Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

References [std::vector< \\_Tp, \\_Alloc >::\\_M\\_range\\_check\(\)](#).

**back()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::back () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the vector.

References `std::vector<_Tp, _Alloc>::end()`.

**back()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc >::back () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the last element of the vector.

References `std::vector<_Tp, _Alloc>::end()`.

Referenced by `std::piecewise_constant_distribution<_RealType>::max()`, and `std::piecewise_linear_distribution<_RealType>::max()`.

**begin()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::begin () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

**begin()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::begin () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by std::vector< \_Tp, \_Alloc >::vector(), std::match\_results< \_Bi\_iter, \_Alloc >::begin(), std::vector< \_Tp, \_Alloc >::crend(),  
std::vector< \_Tp, \_Alloc >::empty(), std::vector< \_Tp, \_Alloc >::erase(), std::vector< \_Tp, \_Alloc >::erase(), std::vector< \_Tp, \_Alloc >  
std::vector< \_Tp, \_Alloc >::front(), std::vector< \_Tp, \_Alloc >::insert(), std::vector< \_Tp, \_Alloc >::insert(), std::vector< \_Tp, \_Alloc >::  
\_\_gnu\_parallel::multiway\_merge\_exact\_splitting(), std::operator<(), std::operator==( ), std::vector< \_Tp, \_Alloc >::rend(),  
and std::vector< \_Tp, \_Alloc >::rend().

## capacity()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::capacity () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns the total number of elements that the vector can hold before needing to allocate more memory.

## cbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector<_Tp, _Alloc>::cbegin () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::insert()`, `std::vector<_Tp, _Alloc>::insert()`, and `std::vector<_Tp, _Alloc>::insert()`.

### **cend()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector<_Tp, _Alloc>::cend () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

### **clear()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::clear () [inline], [constexpr], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### **crbegin()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::crbegin () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References `std::vector<_Tp, _Alloc>::end()`.

### **crend()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::crend () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References `std::vector<_Tp, _Alloc>::begin()`.

### **data()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
_Tp * std::vector<_Tp, _Alloc>::data () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

### **emplace()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
```

```
iterator std::vector<_Tp, _Alloc>::emplace (
    const_iterator __position,
    _Args &&... __args) [inline], [constexpr]
```

Inserts an object in vector before specified iterator.

#### **Parameters**

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__args</code>	Arguments.

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

References [std::forward\(\)](#).

**empty()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
bool std::vector<_Tp, _Alloc>::empty () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns true if the vector is empty. (Thus begin() would equal end().)

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#), and [std::vector<\\_Tp, \\_Alloc>::end\(\)](#).

Referenced by [std::piecewise\\_constant\\_distribution<\\_RealType>::densities\(\)](#), [std::piecewise\\_linear\\_distribution<\\_RealType>::densities\(\)](#), [std::match\\_results<\\_Bi\\_iter, \\_Alloc>::end\(\)](#), [std::piecewise\\_constant\\_distribution<\\_RealType>::intervals\(\)](#), [std::piecewise\\_linear\\_distribution<\\_RealType>::intervals\(\)](#), [std::discrete\\_distribution<\\_IntType>::max\(\)](#), [std::piecewise\\_constant\\_distribution<\\_RealType>::max\(\)](#), [std::piecewise\\_linear\\_distribution<\\_RealType>::max\(\)](#), [std::piecewise\\_constant\\_distribution<\\_RealType>::min\(\)](#), [std::piecewise\\_linear\\_distribution<\\_RealType>::min\(\)](#), [std::discrete\\_distribution<\\_IntType>::probabilities\(\)](#), [std::match\\_results<\\_Bi\\_iter, \\_Alloc>::ready\(\)](#), and [std::match\\_results<\\_Bi\\_iter, \\_Alloc>::ready\(\)](#).

**end()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector<_Tp, _Alloc>::end () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

**end()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::end () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Referenced by [std::vector<\\_Tp, \\_Alloc>::vector\(\)](#), [std::vector<\\_Tp, \\_Alloc>::back\(\)](#), [std::vector<\\_Tp, \\_Alloc>::back\(\)](#), [std::vector<\\_Tp, \\_Alloc>::cbegin\(\)](#), [std::vector<\\_Tp, \\_Alloc>::empty\(\)](#), [std::match\\_results<\\_Bi\\_iter, \\_Alloc>::end\(\)](#), [\\_\\_gnu\\_parallel::multiway\\_merge\\_exact\\_splitting\(\)](#), [std::operator<\(\)](#), [std::operator==\(\)](#), [std::vector<\\_Tp, \\_Alloc>::push\\_back\(\)](#), [std::vector<\\_Tp, \\_Alloc>::rbegin\(\)](#), [std::vector<\\_Tp, \\_Alloc>::rbegin\(\)](#), and [std::vector<\\_Tp, \\_Alloc>::resize\(\)](#).

**erase()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::erase (
    const_iterator __first,
    const_iterator __last) [inline], [constexpr]
```

Remove a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

**Returns**

An iterator pointing to the element pointed to by `__last` prior to erasing (or `end()`).

This function will erase the elements in the range `[__first, __last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#), and [std::vector<\\_Tp, \\_Alloc>::cbegin\(\)](#).

**erase()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::erase (
    const_iterator __position) [inline], [constexpr]
```

Remove element at given position.

**Parameters**

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

**Returns**

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#), and [std::vector<\\_Tp, \\_Alloc>::cbegin\(\)](#).

**front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::front () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the vector.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#).

**front()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc>::front () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#).

Referenced by [std::piecewise\\_constant\\_distribution<\\_RealType>::min\(\)](#), and [std::piecewise\\_linear\\_distribution<\\_RealType>::min\(\)](#).

**get\_allocator()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::_Vector_base<_Tp, _Alloc>::get_allocator () const [inline], [constexpr],
[noexcept]
```

Get a copy of the memory allocation object.

Referenced by [std::match\\_results<\\_Bi\\_iter, \\_Alloc>::get\\_allocator\(\)](#).

**insert()** [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>>
iterator std::vector<_Tp, _Alloc >::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last) [inline], [constexpr]
```

Inserts a range into the vector.

**Parameters**

<code>__position</code>	A const_iterator into the vector.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

**Returns**

An iterator that points to the inserted data.

This function will insert copies of the data in the range [`__first`,`__last`) into the vector before the location specified by *pos*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::\\_\\_iterator\\_category\(\)](#), [std::vector<\\_Tp, \\_Alloc >::begin\(\)](#), and [std::vector<\\_Tp, \\_Alloc >::cbegin\(\)](#).

**insert()** [2/5]

```
template<typename _Tp , typename _Alloc >
vector<_Tp, _Alloc >::iterator vector::insert (
    const_iterator __position,
    const value_type & __x) [constexpr]
```

Inserts given value into vector before specified iterator.

**Parameters**

<code>__position</code>	A const_iterator into the vector.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::begin\(\)](#), [std::cbegin\(\)](#), [std::end\(\)](#), and [std::move\(\)](#).

**insert()** [3/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc >::insert (
    const_iterator __position,
    initializer_list<value_type> __l) [inline], [constexpr]
```

Inserts an initializer\_list into the vector.

**Parameters**

<code>__position</code>	An iterator into the vector.
<code>__l</code>	An initializer_list.

This function will insert copies of the data in the initializer\_list *l* into the vector before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#), and [std::vector<\\_Tp, \\_Alloc>::cbegin\(\)](#).

**insert() [4/5]**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x) [inline], [constexpr]
```

Inserts a number of copies of given data into the vector.

**Parameters**

<code>__position</code>	A const_iterator into the vector.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#), and [std::vector<\\_Tp, \\_Alloc>::cbegin\(\)](#).

**insert() [5/5]**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::insert (
    const_iterator __position,
    value_type && __x) [inline], [constexpr]
```

Inserts given rvalue into vector before specified iterator.

**Parameters**

<code>__position</code>	A const_iterator into the vector.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::move\(\)](#).

**max\_size()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::max_size () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns the size() of the largest possible vector.

Referenced by `std::match_results<_Bi_iter, _Alloc>::max_size()`.

**operator=()** [1/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
vector & std::vector< _Tp, _Alloc >::operator= (
    const vector< _Tp, _Alloc > & __x) [constexpr]
```

Vector assignment operator.

**Parameters**

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied. Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
vector & std::vector< _Tp, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline], [constexpr]
```

Vector list assignment operator.

**Parameters**

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
vector & std::vector< _Tp, _Alloc >::operator= (
    vector< _Tp, _Alloc > && __x) [inline], [constexpr], [noexcept]
```

Vector move assignment operator.

**Parameters**

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). Afterwards `__x` is a valid, but unspecified vector.

Whether the allocator is moved depends on the allocator traits.

References [std::move\(\)](#).

### **operator[]()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::operator[] (
    size_type __n) const [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

#### Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

#### Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

### **operator[]()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::operator[] (
    size_type __n) [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

#### Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

#### Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Referenced by [std::match\\_results< \\_Bi\\_iter, \\_Alloc >::operator\[\]\(\)](#).

### **pop\_back()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::pop_back () [inline], [constexpr], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

**push\_back()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::push_back (
    const value_type & __x) [inline], [constexpr]
```

Add data to the end of the vector.

**Parameters**

	Data to be added.
<code>__x</code>	

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

References [std::vector<\\_Tp, \\_Alloc>::end\(\)](#).

**rbegin()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References [std::vector<\\_Tp, \\_Alloc>::end\(\)](#).

**rbegin()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rbegin () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References [std::vector<\\_Tp, \\_Alloc>::end\(\)](#).

**rend()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::rend () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#).

**rend()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rend () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#).

**reserve()**

```
template<typename _Tp , typename _Alloc >
void vector::reserve (
    size_type __n) [constexpr]
```

Attempt to preallocate enough memory for specified number of elements.

#### Parameters

<code>_↔ _n</code>	Number of elements required.
------------------------	------------------------------

#### Exceptions

<code>std::length_error</code>	If <i>n</i> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

References [std::\\_Destroy\(\)](#), and [std::size\(\)](#).

#### **resize()** [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
    size_type __new_size) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

#### Parameters

<code>__new_size</code>	Number of elements the vector should contain.
-------------------------	---

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

References [std::vector< \\_Tp, \\_Alloc >::size\(\)](#).

Referenced by [\\_\\_gnu\\_parallel::\\_\\_shrink\\_and\\_double\(\)](#), and [\\_\\_gnu\\_parallel::multiway\\_merge\\_exact\\_splitting\(\)](#).

#### **resize()** [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
    size_type __new_size,
    const value_type & __x) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

#### Parameters

<code>__new_size</code>	Number of elements the vector should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

References [std::vector< \\_Tp, \\_Alloc >::end\(\)](#), and [std::vector< \\_Tp, \\_Alloc >::size\(\)](#).

**shrink\_to\_fit()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::shrink_to_fit () [inline], [constexpr]
```

A non-binding request to reduce capacity() to size().

**size()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::size () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns the number of elements in the vector.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_shrink\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_shrink\\_and\\_double\(\)](#), [std::vector< \\_Tp, \\_Alloc >::M\\_range\\_check\(\)](#), [std::match\\_results< \\_Bi\\_iter, \\_Alloc >::empty\(\)](#), [\\_\\_gnu\\_parallel::list\\_partition\(\)](#), [std::discrete\\_distribution< \\_IntType >::max\(\)](#), [std::operator==\(, std::vector< \\_Tp, \\_Alloc >::resize\(\), std::vector< \\_Tp, \\_Alloc >::resize\(\), and std::match\\_results< \\_Bi\\_iter, \\_Alloc >::](#)

**swap()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::swap (
    vector< _Tp, _Alloc > & __x) [inline], [constexpr], [noexcept]
```

Swaps data with another vector.

**Parameters**

<a href="#">_↔</a>	A vector of the same element and allocator types.
<a href="#">_X</a>	

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(v1,v2) will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::match\\_results< \\_Bi\\_iter, \\_Alloc >::swap\(\)](#).

### 6.1059.1 Detailed Description

```
template<typename _Alloc>
class std::vector< bool, _Alloc >
```

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Since

C++98

#### Template Parameters

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

See also

[vector](#) for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

The documentation for this class was generated from the following files:

### 6.1062.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
class std::wbuffer_convert< _Codecvt, _Elem, _Tr >
```

Buffer conversions.

### 6.1062.2 Member Typedef Documentation

#### **\_\_streambuf\_type**

```
template<typename _CharT , typename _Traits >
basic_streambuf<char_type, traits_type> std::basic_streambuf< _CharT, _Traits >::__streambuf_↵
type [inherited]
This is a non-standard type.
```

#### **char\_type**

```
template<typename _CharT , typename _Traits >
_CharT std::basic_streambuf< _CharT, _Traits >::char_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **int\_type**

```
template<typename _CharT , typename _Traits >
traits_type::int_type std::basic_streambuf< _CharT, _Traits >::int_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **off\_type**

```
template<typename _CharT , typename _Traits >
traits_type::off_type std::basic_streambuf< _CharT, _Traits >::off_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **pos\_type**

```
template<typename _CharT , typename _Traits >
traits_type::pos_type std::basic_streambuf< _CharT, _Traits >::pos_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **traits\_type**

```
template<typename _CharT , typename _Traits >
_Traits std::basic_streambuf< _CharT, _Traits >::traits_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

### 6.1062.3 Constructor & Destructor Documentation

#### **wbuffer\_convert()** [1/2]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert () [inline]
```

Default constructor.

### `wbuffer_convert()` [2/2]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert (
    streambuf * __bytebuf,
    _Codecvt * __pcvt = new _Codecvt,
    state_type __state = state_type()) [inline], [explicit]
```

Constructor.

#### Parameters

<code>__bytebuf</code>	The underlying byte stream buffer.
<code>__pcvt</code>	The facet to use for conversions.
<code>__state</code>	Initial conversion state.

Takes ownership of `__pcvt` and will delete it in the destructor.

References `std::basic_streambuf<_CharT, _Traits>::setg()`, and `std::basic_streambuf<_CharT, _Traits>::setp()`.

## 6.1062.4 Member Function Documentation

### `eback()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

### `egptr()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`.

### `epptr()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

### **gbump()**

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

#### **Parameters**

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the read position without returning any data.

### **getloc()**

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::getloc () const [inline], [inherited]
```

Locale access.

#### **Returns**

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

### **gptr()**

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow()`.

### **imbue()**

```
template<typename _CharT , typename _Traits >
virtual void std::basic_streambuf< _CharT, _Traits >::imbue (
    const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

## Parameters

<code>__loc</code>	A new locale.
--------------------	---------------

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

## Note

Base class version does nothing.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, and `std::basic_filebuf<char_type, traits_type>`.

**in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

## Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**overflow()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow (
    typename _Wide_streambuf::int_type __c) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

## Parameters

<code>__c</code>	An additional character to consume.
------------------	-------------------------------------

## Returns

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

## Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::basic_streambuf<_CharT, _Traits>::sputc()`.

**pbackfail()**

```
template<typename _CharT , typename _Traits >
virtual int_type std::basic_streambuf< _CharT, _Traits >::pbackfail (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

<code>__c</code>	The character to be inserted back into the sequence.
------------------	--

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented in [\\_\\_gnu\\_cxx::stdio\\_sync\\_filebuf< \\_CharT, \\_Traits >](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >](#), [std::basic\\_filebuf< \\_CharT, std::char\\_traits< \\_CharT > >](#), [std::basic\\_filebuf< char\\_type, traits\\_type >](#), and [std::basic\\_stringbuf< \\_CharT, traits\\_type, std::stringbuf::mode >](#).

**pbase()**

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

**pbump()**

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the write position without returning any data.

**pptr()**

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

**pubimbue()**

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

<code>__loc</code>	The new locale.
--------------------	-----------------

**Returns**

The previous locale.

Calls the derived imbue(\_\_loc).

**pubseekoff()**

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

<code>__off</code>	Offset.
<code>__way</code>	Value for ios_base::seekdir.
<code>__mode</code>	Value for ios_base::openmode.

Calls virtual seekoff function.

**pubseekpos()**

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

<code>__sp</code>	Position
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual `seekpos` function.

**pubsetbuf()**

```
template<typename _CharT , typename _Traits >
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

**pubsync()**

```
template<typename _CharT , typename _Traits >
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual `sync` function.

Referenced by `std::basic_istream< _CharT, _Traits >::sync()`, and `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync()`.

**sbumpc()**

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_istream< _CharT, char_traits< _CharT > >::get()`, `std::basic_istream< _CharT, _Traits >::ignore()`, `std::istreambuf_iterator< _CharT, _Traits >::operator++()`, `std::istreambuf_iterator< _CharT, _Traits >::operator++()`, and `std::basic_istream< _CharT, char_traits< _CharT > >::sync()`.

**seekoff()**

```
template<typename _CharT , typename _Traits >
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_stringbuf< _CharT`

**seekpos()**

```
template<typename _CharT , typename _Traits >
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_stringbuf< _CharT, _Traits >`.

**setbuf()**

```
template<typename _CharT , typename _Traits >
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
    char_type * ,
    streamsize ) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

**Note**

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_stringbuf< _CharT, _Traits >`.

**setg()**

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

<code>__gbeg</code>	A pointer.
<code>__gnext</code>	A pointer.
<code>__gend</code>	A pointer.

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr >::wbuffer_convert()`.

**setp()**

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

<code>__pbeg</code>	A pointer.
<code>__pend</code>	A pointer.

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by [std::wbuffer\\_convert< \\_Codecv, \\_Elem, \\_Tr >::wbuffer\\_convert\(\)](#).

**sgetc()**

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sgetc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by [std::basic\\_istream< \\_CharT, \\_Traits >::get\(\)](#), [std::basic\\_istream< \\_CharT, char\\_traits< \\_CharT > >::get\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::ignore\(\)](#), [std::istreambuf\\_iterator< \\_CharT, \\_Traits >::operator++\(\)](#), [std::istreambuf\\_iterator< \\_CharT, \\_Traits >::operator++\(\)](#), and [std::basic\\_istream< \\_CharT, char\\_traits< \\_CharT > >::readsome\(\)](#).

**sgetn()**

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

<code>__s</code>	A buffer area.
<code>__n</code>	A count.

Returns `xsgetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf<_CharT, _Traits>::showmanyc() [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

**Returns**

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_stringbuf<_CharT, _Traits>`.

**snextc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc() [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<_CharT, char_traits<_CharT>>::get()`, `std::basic_istream<_CharT, char_traits<_CharT>>::ignore()`, `std::basic_istream<_CharT, char_traits<_CharT>>::operator>>()`, and `std::basic_istream<_CharT, char_traits<_CharT>>::putback()`.

**sputbackc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

<code>__c</code>	The character to push back.
------------------	-----------------------------

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

**sputc()**

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

<code>__c</code>	A character to output.
------------------	------------------------

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Referenced by `std::ostreambuf_iterator< _CharT, _Traits >::operator=()`, and `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow()`.

**sputn()**

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

<code>__s</code>	A buffer read area.
<code>__n</code>	A count.

One of two public output functions.

Returns `xputn(__s,__n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**state()**

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
state_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::state () const [inline], [noexcept]
```

The conversion state following the last conversion.

**sungetc()**

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

**sync()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
int std::wbuffer_convert<_Codecvt, _Elem, _Tr>::sync () [inline], [protected], [virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::basic_streambuf<_CharT, _Traits>::pubsync()`.

**uflow()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf<_CharT, _Traits>::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`.

**underflow()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow () [inline],
[protected], [virtual]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::basic_streambuf<_CharT, _Traits>::egptr()`, and `std::basic_streambuf<_CharT, _Traits>::gptr()`.

**xsggetn()**

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::xsggetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to assign.

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, and `std::basic_filebuf< char_type, traits_type >`.

References `std::min()`.

**xsputn()**

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::xsputn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to write.

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, and `std::basic_filebuf< char_type, traits_type >`.

References `std::min()`.

### 6.1063.1 Detailed Description

`template<typename _Tp>`  
**class** `std::weak_ptr`<\_Tp>

A non-owning observer for a pointer owned by a `shared_ptr`.

Since

C++11

A `weak_ptr` provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a `shared_ptr`.

Unlike a raw pointer, a `weak_ptr` can be converted to a new `shared_ptr` that shares ownership with every other `shared_ptr` that already owns the pointer. In other words you can upgrade from a non-owning "weak" reference to an owning `shared_ptr`, without having access to any of the existing `shared_ptr` objects.

Also unlike a raw pointer, a `weak_ptr` does not become "dangling" after the object it points to has been destroyed. Instead, a `weak_ptr` becomes *expired* and can no longer be converted to a `shared_ptr` that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.

### 6.1064.1 Detailed Description

**template<typename \_RealType = double>**  
**class std::weibull\_distribution<\_RealType>**

A weibull\_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

Since

C++11

## 6.1064.2 Member Typedef Documentation

### result\_type

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::result_type
```

The type of the range of the distribution.

## 6.1064.3 Member Function Documentation

### a()

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::a () const [inline]
```

Return the *a* parameter of the distribution.

### b()

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::b () const [inline]
```

Return the *b* parameter of the distribution.

### max()

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.  
References [std::numeric\\_limits< \\_Tp >::max\(\)](#).

### min()

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

### operator>()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::weibull_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

References [std::weibull\\_distribution< \\_RealType >::operator>\(\)\(\)](#).

Referenced by [std::weibull\\_distribution< \\_RealType >::operator>\(\)\(\)](#).

### param() [1/2]

```
template<typename _RealType = double>
param_type std::weibull_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.  
Referenced by [std::operator>>\(\)](#).

### param() [2/2]

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

#### `reset()`

```
template<typename _RealType = double>
void std::weibull_distribution<_RealType>::reset () [inline]
Resets the distribution state.
```

### 6.1064.4 Friends And Related Symbol Documentation

#### `operator==`

```
template<typename _RealType = double>
bool operator== (
    const weibull_distribution<_RealType> & __d1,
    const weibull_distribution<_RealType> & __d2) [friend]
```

Return true if two Weibull distributions have the same parameters.

The documentation for this class was generated from the following files:

### 6.1065.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, type-
name _Byte_alloc = allocator<char>>
class std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >
```

String conversions.

### 6.1065.2 Constructor & Destructor Documentation

#### wstring\_convert() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert () [inline]
Default constructor.
```

#### wstring\_convert() [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt) [inline], [explicit]
Constructor.
```

#### Parameters

<code>__pcvt</code>	The facet to use for conversions.
---------------------	-----------------------------------

Takes ownership of `__pcvt` and will delete it in the destructor.

#### wstring\_convert() [3/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt,
    state_type __state) [inline]
Construct with an initial conversion state.
```

#### Parameters

<code>__pcvt</code>	The facet to use for conversions.
<code>__state</code>	Initial conversion state.

Takes ownership of `__pcvt` and will delete it in the destructor. The object's conversion state will persist between conversions.

**wstring\_convert()** [4/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    const byte_string & __byte_err,
    const wide_string & __wide_err = wide_string()) [inline], [explicit]
```

Construct with error strings.

**Parameters**

<code>__byte_err</code>	A string to return on failed conversions.
<code>__wide_err</code>	A wide string to return on failed conversions.

**6.1065.3 Member Function Documentation****converted()**

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
size_t std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::converted () const
[inline], [noexcept]
```

The number of elements successfully converted in the last conversion.

**from\_bytes()** [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    char __byte) [inline]
```

Convert from bytes.

References [std::wstring\\_convert< \\_Codecvt, \\_Elem, \\_Wide\\_alloc, \\_Byte\\_alloc >::from\\_bytes\(\)](#).

Referenced by [std::wstring\\_convert< \\_Codecvt, \\_Elem, \\_Wide\\_alloc, \\_Byte\\_alloc >::from\\_bytes\(\)](#), [std::wstring\\_convert< \\_Codecvt, \\_Elem, \\_Wide\\_alloc, \\_Byte\\_alloc >::from\\_bytes\(\)](#), and [std::wstring\\_convert< \\_Codecvt, \\_Elem, \\_Wide\\_alloc, \\_Byte\\_alloc >::from\\_bytes\(\)](#).

**from\_bytes()** [2/4]

```

### 7.2.1 Detailed Description

The header provides an interface to the C++ ABI.

### 7.2.2 Function Documentation

#### `__cxa_demangle()`

```
char * __cxxabiv1::__cxa_demangle (
    const char * __mangled_name,
    char * __output_buffer,
    size_t * __length,
    int * __status)
```

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

#### Parameters

<code>__mangled_name</code>	A NUL-terminated character string containing the name to be demangled.
<code>__output_buffer</code>	A region of memory, allocated with malloc, of * <code>__length</code> bytes, into which the demangled name is stored. If <code>__output_buffer</code> is not long enough, it is expanded using realloc. <code>__output_buffer</code> may instead be NULL; in that case, the demangled name is placed in a region of memory allocated with malloc.

## Parameters

<code>__length</code>	If <code>__length</code> is non-null, the length of the buffer containing the demangled name is placed in <code>*__length</code> .
<code>__status</code>	If <code>__status</code> is non-null, <code>*__status</code> is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: <i>mangled_name</i> is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

## Returns

A pointer to the start of the NUL-terminated demangled name, or NULL if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in `__gnu_cxx::__verbose_terminate_handler`.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext\\_demangling.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html) for other examples of use.

## Note

The same demangling functionality is available via `libiberty` (`<libiberty/demangle.h>` and `libiberty.h`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

- const nothrow\_t **std::nothrow**

### 7.5.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic\\_memory.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html) for more.

### 7.5.2 Function Documentation

#### **operator new()**

```
void * operator new (
    std::size_t ) [nodiscard]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 7.150.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<deque>`.

### 7.150.2 Macro Definition Documentation

#### `_GLIBCXX_DEQUE_BUF_SIZE`

```
#define _GLIBCXX_DEQUE_BUF_SIZE
```

This function controls the size of memory nodes.

#### Parameters

<code>__size</code>	The size of an element.
---------------------	-------------------------

#### Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

### 7.186.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

## 7.187 valarray\_array.h File Reference

### 7.192.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

## 7.193 cassert File Reference

### 7.193.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.194 ccomplex File Reference

### Macros

- `#define _GLIBCXX_CCOMPLEX`

### 7.194.1 Detailed Description

This is a Standard C++ Library header.

## 7.195 tr1/complex File Reference

### Macros

- `#define _GLIBCXX_TR1_CCOMPLEX`

### 7.195.1 Detailed Description

This is a TR1 C++ Library header.

## 7.196 cctype File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CCTYPE`

#### 7.196.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `ctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.197 tr1/cctype File Reference

### Macros

- `#define _GLIBCXX_TR1_CCTYPE`

#### 7.197.1 Detailed Description

This is a TR1 C++ Library header.

## 7.198 cerrno File Reference

### Macros

- `#define _GLIBCXX_CERRNO`
- `#define errno`

#### 7.198.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.199 cfenv File Reference

### Macros

- `#define _GLIBCXX_CFENV`

#### 7.199.1 Detailed Description

This is a Standard C++ Library header.

## 7.200 tr1/cfenv File Reference

### Macros

- `#define _GLIBCXX_TR1_CFENV`

### 7.200.1 Detailed Description

This is a TR1 C++ Library header.

## 7.201 cfloat File Reference

### Macros

- `#define _GLIBCXX_CFLOAT`
- `#define DECIMAL_DIG`
- `#define FLT_EVAL_METHOD`

### 7.201.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.202 tr1/cfloat File Reference

### Macros

- `#define _GLIBCXX_TR1_CFLOAT`

### 7.202.1 Detailed Description

This is a TR1 C++ Library header.

## 7.203 charconv File Reference

### Classes

- struct [std::from\\_chars\\_result](#)
- struct [std::to\\_chars\\_result](#)

### Namespaces

### 7.204.1 Detailed Description

This is a Standard C++ Library header.

## 7.205 experimental/chrono File Reference

### Namespaces

- namespace `std`
- namespace `std::chrono`

## Macros

- `#define _GLIBCXX_EXPERIMENTAL_CHRONO`

## Variables

- `template<typename _Rep >`  
`constexpr bool std::chrono::experimental::treat_as_floating_point_v`

### 7.205.1 Detailed Description

This is a TS C++ Library header.

## 7.206 cinttypes File Reference

### Macros

- `#define _GLIBCXX_CINTTYPES`

### 7.206.1 Detailed Description

This is a Standard C++ Library header.

## 7.207 tr1/cinttypes File Reference

### Macros

- `#define _GLIBCXX_TR1_CINTTYPES`

### 7.207.1 Detailed Description

This is a TR1 C++ Library header.

## 7.208 ciso646 File Reference

### 7.208.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `iso646.h`, which is empty in C++.

## 7.209 climits File Reference

### Macros

- `#define _GLIBCXX_CLIMITS`
- `#define LLONG_MAX`
- `#define LLONG_MIN`
- `#define ULLONG_MAX`

### 7.209.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `limits.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.210 tr1/climits File Reference

### Macros

- `#define _GLIBCXX_TR1_CLIMITS`

#### 7.210.1 Detailed Description

This is a TR1 C++ Library header.

## 7.211 clocale File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CLOCALE`

#### 7.211.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `locale.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.212 cmath File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define __cpp_lib_hypot`
- `#define __cpp_lib_interpolate`
- `#define _GLIBCXX_CMATH`
- `#define _GLIBCXX_INCLUDE_NEXT_C_HEADERS`

### Functions

This is a Standard C++ Library header.

## 7.219 Concepts

Here is a list of all documented concepts with brief descriptions:

<a href="#"><code>std::assignable_from</code></a>	
[ <a href="#"><code>concept.assignable</code></a> ], <a href="#">concept assignable_from</a>	773
<a href="#"><code>std::common_reference_with</code></a>	
[ <a href="#"><code>concept.commonref</code></a> ], <a href="#">concept common_reference_with</a>	773
<a href="#"><code>std::common_with</code></a>	
[ <a href="#"><code>concept.common</code></a> ], <a href="#">concept common_with</a>	774
<a href="#"><code>std::constructible_from</code></a>	
[ <a href="#"><code>concept.constructible</code></a> ], <a href="#">concept constructible_from</a>	774
<a href="#"><code>std::convertible_to</code></a>	
[ <a href="#"><code>concept.convertible</code></a> ], <a href="#">concept convertible_to</a>	774
<a href="#"><code>std::copy_constructible</code></a>	
[ <a href="#"><code>concept.copyconstructible</code></a> ], <a href="#">concept copy_constructible</a>	775
<a href="#"><code>std::default_initializable</code></a>	
[ <a href="#"><code>concept.defaultinitializable</code></a> ], <a href="#">concept default_initializable</a>	775
<a href="#"><code>std::derived_from</code></a>	
[ <a href="#"><code>concept.derived</code></a> ], <a href="#">concept derived_from</a>	775
<a href="#"><code>std::destructible</code></a>	
[ <a href="#"><code>concept.destructible</code></a> ], <a href="#">concept destructible</a>	775
<a href="#"><code>std::equivalence_relation</code></a>	
[ <a href="#"><code>concept.equiv</code></a> ], <a href="#">concept equivalence_relation</a>	776
<a href="#"><code>std::indirectly_comparable</code></a>	
[ <a href="#"><code>alg.req.ind.cmp</code></a> ], <a href="#">concept indirectly_comparable</a>	776
<a href="#"><code>std::indirectly_copyable</code></a>	
[ <a href="#"><code>alg.req.ind.copy</code></a> ], <a href="#">concept indirectly_copyable</a>	776
<a href="#"><code>std::indirectly_movable</code></a>	
[ <a href="#"><code>alg.req.ind.move</code></a> ], <a href="#">concept indirectly_movable</a>	776
<a href="#"><code>std::indirectly_readable</code></a>	
Requirements for types that are readable by applying operator*	776
<a href="#"><code>std::indirectly_swappable</code></a>	
[ <a href="#"><code>alg.req.ind.swap</code></a> ], <a href="#">concept indirectly_swappable</a>	777
<a href="#"><code>std::indirectly_writable</code></a>	
Requirements for writing a value into an iterator's referenced object	777
<a href="#"><code>std::invocable</code></a>	
[ <a href="#"><code>concept.invocable</code></a> ], <a href="#">concept invocable</a>	777
<a href="#"><code>std::mergeable</code></a>	
[ <a href="#"><code>alg.req.mergeable</code></a> ], <a href="#">concept mergeable</a>	778

<a href="#"><code>std::move_constructible</code></a>	
[concept.moveconstructible], concept <code>move_constructible</code>	778
<a href="#"><code>std::permutable</code></a>	
[alg.req.permutable], concept <code>permutable</code>	778
<a href="#"><code>std::predicate</code></a>	
[concept.predicate], concept <code>predicate</code>	778
<a href="#"><code>std::ranges::bidirectional_range</code></a>	
A range for which <code>ranges::begin</code> returns a bidirectional iterator	779
<a href="#"><code>std::ranges::borrowed_range</code></a>	
[range.range] The <code>borrowed_range</code> concept	779
<a href="#"><code>std::ranges::common_range</code></a>	
A range for which <code>ranges::begin</code> and <code>ranges::end</code> return the same type	779
<a href="#"><code>std::ranges::contiguous_range</code></a>	
A range for which <code>ranges::begin</code> returns a contiguous iterator	779
<a href="#"><code>std::ranges::forward_range</code></a>	
A range for which <code>ranges::begin</code> returns a forward iterator	779
<a href="#"><code>std::ranges::input_range</code></a>	
A range for which <code>ranges::begin</code> returns an input iterator	780
<a href="#"><code>std::ranges::output_range</code></a>	
A range for which <code>ranges::begin</code> returns an output iterator	780
<a href="#"><code>std::ranges::random_access_range</code></a>	
A range for which <code>ranges::begin</code> returns a random access iterator	780
<a href="#"><code>std::ranges::range</code></a>	
[range.range] The <code>range</code> concept	780
<a href="#"><code>std::ranges::sized_range</code></a>	
[range.sized] The <code>sized_range</code> concept	781
<a href="#"><code>std::ranges::view</code></a>	
[range.view] The <code>ranges::view</code> concept	781
<a href="#"><code>std::ranges::viewable_range</code></a>	
A range which can be safely converted to a view	781
<a href="#"><code>std::regular_invocable</code></a>	
[concept.regularinvocable], concept <code>regular_invocable</code>	781
<a href="#"><code>std::relation</code></a>	
[concept.relation], concept <code>relation</code>	782
<a href="#"><code>std::same_as</code></a>	
[concept.same], concept <code>same_as</code>	782
<a href="#"><code>std::sortable</code></a>	
[alg.req.sortable], concept <code>sortable</code>	782

<a href="#">std::strict_weak_order</a>	
[concept.strictweakorder], concept strict_weak_order	782
<a href="#">std::uniform_random_bit_generator</a>	
Requirements for a uniform random bit generator	782
<a href="#">std::weakly_incrementable</a>	
Requirements on types that can be incremented with ++	783

#### 7.221.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.222 csignal File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSIGNAL`

#### 7.222.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.223 cstdalign File Reference

### Macros

- `#define _GLIBCXX_CSTDALIGN`

#### 7.223.1 Detailed Description

This is a Standard C++ Library header.

## 7.224 cstdarg File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTDARG`
- `#define va_end(ap)`

#### 7.224.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.225 tr1/cstdarg File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDARG`

#### 7.225.1 Detailed Description

This is a TR1 C++ Library header.

## 7.226 cstdlib File Reference

### Macros

- `#define _GLIBCXX_CSTDBOOL`

### 7.226.1 Detailed Description

This is a Standard C++ Library header.

## 7.227 tr1/cstdlib File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDBOOL`

### 7.227.1 Detailed Description

This is a TR1 C++ Library header.

## 7.228 cstdint File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define __cpp_lib_byte`
- `#define _GLIBCXX_CSTDDEF`

### Typedefs

- `template<typename _IntegerType >`  
`using std::\_\_byte\_op\_t`

### Enumerations

- enum class [std::byte](#) : unsigned char

### Functions

- `constexpr byte std::operator& (byte __l, byte __r) noexcept`
- `constexpr byte & std::operator&= (byte &__l, byte __r) noexcept`
- `template<typename _IntegerType >`  
`constexpr __byte_op_t<_IntegerType> std::operator<< (byte __b, _IntegerType __shift) noexcept`
- `template<typename _IntegerType >`  
`constexpr __byte_op_t<_IntegerType> & std::operator<<= (byte &__b, _IntegerType __shift) noexcept`
- `template<typename _IntegerType >`  
`constexpr __byte_op_t<_IntegerType> std::operator>> (byte __b, _IntegerType __shift) noexcept`
- `template<typename _IntegerType >`  
`constexpr __byte_op_t<_IntegerType> & std::operator>>= (byte &__b, _IntegerType __shift) noexcept`
- `constexpr byte std::operator^ (byte __l, byte __r) noexcept`
- `constexpr byte & std::operator^= (byte &__l, byte __r) noexcept`
- `constexpr byte std::operator| (byte __l, byte __r) noexcept`
- `constexpr byte & std::operator|= (byte &__l, byte __r) noexcept`

- constexpr [byte](#) `std::operator~` ([byte](#) \_\_b) noexcept
- template<typename \_IntegerType >  
constexpr \_IntegerType `std::to_integer` (\_\_byte\_op\_t< \_IntegerType > \_\_b) noexcept

### 7.228.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `stdint.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.229 cstdint File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTDINT`

### 7.229.1 Detailed Description

This is a Standard C++ Library header.

## 7.230 tr1/cstdint File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CSTDINT`

### 7.230.1 Detailed Description

This is a TR1 C++ Library header.

## 7.231 cstdio File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTDIO`

### 7.231.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.232 tr1/cstdio File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDIO`

### 7.232.1 Detailed Description

This is a TR1 C++ Library header.

## 7.233 cstdlib File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTDLIB`
- `#define _GLIBCXX_INCLUDE_NEXT_C_HEADERS`

### Functions

- `ldiv_t std::div (long __i, long __j) noexcept`

### 7.233.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.234 tr1/cstdlib File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDLIB`

### 7.234.1 Detailed Description

This is a TR1 C++ Library header.

## 7.235 cstring File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTRING`

## Functions

- `void * std::memchr (void *__s, int __c, size_t __n)`
- `char * std::strchr (char *__s, int __n)`
- `char * std::strpbrk (char *__s1, const char *__s2)`
- `char * std::strrchr (char *__s, int __n)`
- `char * std::strstr (char *__s1, const char *__s2)`

### 7.235.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.236 `ctgmath` File Reference

### Macros

- `#define _GLIBCXX_CTGMATH`

### 7.236.1 Detailed Description

This is a Standard C++ Library header.

## 7.237 `tr1/ctgmath` File Reference

### Macros

- `#define _GLIBCXX_TR1_CTGMATH`

### 7.237.1 Detailed Description

This is a TR1 C++ Library header.

## 7.238 `ctime` File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CTIME`

### 7.238.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.239 `tr1/ctime` File Reference

### Macros

- `#define _GLIBCXX_TR1_CTIME`

### 7.239.1 Detailed Description

This is a TR1 C++ Library header.

## 7.240 `cuchar` File Reference

### Macros

- `#define _GLIBCXX_CUCHAR`

### 7.240.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `uchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.241 `wchar` File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CWCHAR`

### Functions

- `wchar_t* std::wcschr (wchar_t *__p, wchar_t __c)`
- `wchar_t* std::wcspbrk (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t* std::wcsrchr (wchar_t *__p, wchar_t __c)`
- `wchar_t* std::wcsstr (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t* std::wmemchr (wchar_t *__p, wchar_t __c, size_t __n)`

### 7.241.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.242 `tr1/cwchar` File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CWCHAR`

### 7.242.1 Detailed Description

This is a TR1 C++ Library header.

## 7.243 `cwctype` File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CWCTYPE`

#### 7.243.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.244 `tr1/cwctype` File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CWCTYPE`

#### 7.244.1 Detailed Description

This is a TR1 C++ Library header.

## 7.245 `assertions.h` File Reference

### Macros

- `#define __glibcxx_requires_non_empty_range(_First, _Last)`
- `#define __glibcxx_requires_nonempty()`
- `#define __glibcxx_requires_subscript(_N)`
- `#define _GLIBCXX_DEBUG_ASSERT(_Condition)`
- `#define _GLIBCXX_DEBUG_ONLY(_Statement)`
- `#define _GLIBCXX_DEBUG_PEDASSERT(_Condition)`

#### 7.245.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

### 7.250.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

### 7.250.2 Macro Definition Documentation

#### `__glibcxx_check_erase`

```
#define __glibcxx_check_erase(  
    _Position)
```

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

#### `__glibcxx_check_erase_after`

```
#define __glibcxx_check_erase_after(  
    _Position)
```

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

#### `__glibcxx_check_erase_range`

```
#define __glibcxx_check_erase_range(  
    _First,  
    _Last)
```

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

#### `__glibcxx_check_erase_range_after`

```
#define __glibcxx_check_erase_range_after(  
    _First,  
    _Last)
```

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

**\_\_glibcxx\_check\_heap\_pred**

```
#define __glibcxx_check_heap_pred(  
    _First,  
    _Last,  
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

**\_\_glibcxx\_check\_insert**

```
#define __glibcxx_check_insert(  
    _Position)
```

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

**\_\_glibcxx\_check\_insert\_after**

```
#define __glibcxx_check_insert_after(  
    _Position)
```

Verify that we can insert into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

**\_\_glibcxx\_check\_insert\_range**

```
#define __glibcxx_check_insert_range(  
    _Position,  
    _First,  
    _Last,  
    _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

**\_\_glibcxx\_check\_insert\_range\_after**

```
#define __glibcxx_check_insert_range_after(  
    _Position,  
    _First,  
    _Last,  
    _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

**\_\_glibcxx\_check\_partitioned\_lower**

```
#define __glibcxx_check_partitioned_lower(  
    _First,
```

```

    _Last,
    _Value)

```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

#### **\_\_glibcxx\_check\_partitioned\_lower\_pred**

```

#define __glibcxx_check_partitioned_lower_pred(
    _First,
    _Last,
    _Value,
    _Pred)

```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

#### **\_\_glibcxx\_check\_partitioned\_upper\_pred**

```

#define __glibcxx_check_partitioned_upper_pred(
    _First,
    _Last,
    _Value,
    _Pred)

```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

#### **\_\_glibcxx\_check\_sorted\_pred**

```

#define __glibcxx_check_sorted_pred(
    _First,
    _Last,
    _Pred)

```

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

#### **\_GLIBCXX\_DEBUG\_VERIFY\_COND\_AT**

```

#define _GLIBCXX_DEBUG_VERIFY_COND_AT(
    _Cond,
    _ErrMsg,
    _File,
    _Line,
    _Func)

```

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

### 7.266.1 Detailed Description

This is a Standard C++ Library header.

## 7.267 debug/deque File Reference

### Classes

- class `std::__debug::deque< _Tp, _Allocator >`

## Namespaces

- namespace [std](#)
- namespace [std::\\_\\_debug](#)

## Macros

- `#define _GLIBCXX_DEBUG_DEQUE`

## Functions

- `template<typename _InputIterator , typename _ValT = typename iterator_traits<_InputIterator>::value_type, typename _Allocator = allocator<_ValT>, typename = _RequireInputIter<_InputIterator>, typename = _RequireAllocator<_Allocator>>>`  
`std::__debug::deque ( _InputIterator, _InputIterator, _Allocator=_Allocator()) -> deque< _ValT, _Allocator >`
- `template<typename _Tp, typename _Allocator = allocator<_Tp>, typename = _RequireAllocator<_Allocator>>>`  
`std::__debug::deque (size_t, _Tp, _Allocator=_Allocator()) -> deque< _Tp, _Allocator >`

## 7.301 binary\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binary\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_ASSERT_VALID(X)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_DEBUG_VERIFY(_Cond)`
- `#define PB_DS_ENTRY_CMP_DEC`
- `#define PB_DS_RESIZE_POLICY_DEC`

### 7.301.1 Detailed Description

Contains an implementation class for a binary heap.

## 7.302 `binary_heap_/const_iterator.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binary\\_heap\\_const\\_iterator\\_< Value\\_Type, Entry, Simple, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_BIN_HEAP_CIT_BASE`

### 7.302.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

## 7.303 `left_child_next_sibling_heap_/const_iterator.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_const\\_iterator\\_< Node, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_BASIC_HEAP_CIT_BASE`
- `#define PB_DS_CLASS_C_DEC`

### 7.303.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

## 7.304 `unordered_iterator/const_iterator.hpp` File Reference

### 7.304.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.

This file is intended to be included inside a class definition, with `PB_DS_CLASS_C_DEC` defined to the name of the enclosing class.

## **7.305 bin\_search\_tree\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.305.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

## **7.306 binary\_heap\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.306.1 Detailed Description**

Contains an implementation class for binary\_heap\_.

## **7.307 binomial\_heap\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.307.1 Detailed Description**

Contains an implementation for binomial\_heap\_.

## **7.308 binomial\_heap\_base\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.308.1 Detailed Description**

Contains an implementation class for a base of binomial heaps.

## **7.309 left\_child\_next\_sibling\_heap\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.309.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## **7.310 ov\_tree\_map\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.310.1 Detailed Description**

Contains an implementation class for ov\_tree\_.

## **7.311 pairing\_heap\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.311.1 Detailed Description**

Contains an implementation class for a pairing heap.

## **7.312 pat\_trie\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.312.1 Detailed Description**

Contains an implementation class for pat\_trie.

## **7.313 rb\_tree\_map\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.313.1 Detailed Description**

Contains an implementation for rb\_tree\_.

## **7.314 rc\_binomial\_heap\_/constructors\_destructor\_fn\_imps.hpp File Reference**

### **7.314.1 Detailed Description**

Contains an implementation for rc\_binomial\_heap\_.

**7.315 splay\_tree\_/constructors\_destructor\_fn\_imps.hpp File Reference****7.315.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

**7.316 thin\_heap\_/constructors\_destructor\_fn\_imps.hpp File Reference****7.316.1 Detailed Description**

Contains an implementation for thin\_heap\_.

**7.317 bin\_search\_tree\_/debug\_fn\_imps.hpp File Reference****7.317.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

**7.318 binary\_heap\_/debug\_fn\_imps.hpp File Reference****7.318.1 Detailed Description**

Contains an implementation class for a binary\_heap.

**7.319 binomial\_heap\_/debug\_fn\_imps.hpp File Reference****7.319.1 Detailed Description**

Contains an implementation for binomial\_heap\_.

**7.320 binomial\_heap\_base\_/debug\_fn\_imps.hpp File Reference****7.320.1 Detailed Description**

Contains an implementation class for a base of binomial heaps.

**7.321 cc\_hash\_table\_map\_/debug\_fn\_imps.hpp File Reference****7.321.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

**7.322 gp\_hash\_table\_map\_/debug\_fn\_imps.hpp File Reference****7.322.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s debug-mode functions.

**7.323 left\_child\_next\_sibling\_heap\_/debug\_fn\_imps.hpp File Reference****7.323.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

**7.324 list\_update\_map\_/debug\_fn\_imps.hpp File Reference****7.324.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

## 7.325 ov\_tree\_map\_/debug\_fn\_imps.hpp File Reference

### 7.325.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 7.326 pairing\_heap\_/debug\_fn\_imps.hpp File Reference

### 7.326.1 Detailed Description

Contains an implementation class for a pairing heap.

## 7.327 pat\_trie\_/debug\_fn\_imps.hpp File Reference

### 7.327.1 Detailed Description

Contains an implementation class for pat\_trie\_.

## 7.328 rb\_tree\_map\_/debug\_fn\_imps.hpp File Reference

### 7.328.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 7.329 rc\_binomial\_heap\_/debug\_fn\_imps.hpp File Reference

### 7.329.1 Detailed Description

Contains an implementation for rc\_binomial\_heap\_.

## 7.330 splay\_tree\_/debug\_fn\_imps.hpp File Reference

### 7.330.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 7.331 thin\_heap\_/debug\_fn\_imps.hpp File Reference

### 7.331.1 Detailed Description

Contains an implementation for thin\_heap\_.

## 7.332 entry\_cmp.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::entry\\_cmp<\\_VTp, Cmp\\_Fn, \\_Alloc, false>](#)
- struct [\\_\\_gnu\\_pbds::detail::entry\\_cmp<\\_VTp, Cmp\\_Fn, \\_Alloc, true>](#)
- struct [\\_\\_gnu\\_pbds::detail::entry\\_cmp<\\_VTp, Cmp\\_Fn, \\_Alloc, false>::type](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.332.1 Detailed Description

Contains an implementation class for a binary\_heap.

### 7.333 `entry_pred.hpp` File Reference

#### Classes

- struct [\\_\\_gnu\\_pbds::detail::entry\\_pred<\\_VTp, Pred, \\_Alloc, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::entry\\_pred<\\_VTp, Pred, \\_Alloc, true >](#)

#### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.333.1 Detailed Description

Contains an implementation class for a `binary_heap`.

### 7.334 `bin_search_tree_/erase_fn_imps.hpp` File Reference

#### 7.334.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

### 7.335 `binary_heap_/erase_fn_imps.hpp` File Reference

#### 7.335.1 Detailed Description

Contains an implementation class for a `binary_heap`.

### 7.336 `binomial_heap_base_/erase_fn_imps.hpp` File Reference

#### 7.336.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

### 7.337 `cc_hash_table_map_/erase_fn_imps.hpp` File Reference

#### 7.337.1 Detailed Description

Contains implementations of `cc_ht_map_`'s erase related functions.

### 7.338 `gp_hash_table_map_/erase_fn_imps.hpp` File Reference

#### 7.338.1 Detailed Description

Contains implementations of `gp_ht_map_`'s erase related functions.

### 7.339 `left_child_next_sibling_heap_/erase_fn_imps.hpp` File Reference

#### 7.339.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

### 7.340 `list_update_map_/erase_fn_imps.hpp` File Reference

#### 7.340.1 Detailed Description

Contains implementations of `lu_map_`.

## **7.341 `ov_tree_map_/erase_fn_imps.hpp` File Reference**

### **7.341.1 Detailed Description**

Contains an implementation class for `ov_tree_`.

## **7.342 `pairing_heap_/erase_fn_imps.hpp` File Reference**

### **7.342.1 Detailed Description**

Contains an implementation class for a pairing heap.

## **7.343 `pat_trie_/erase_fn_imps.hpp` File Reference**

### **7.343.1 Detailed Description**

Contains an implementation class for `pat_trie`.

## **7.344 `rb_tree_map_/erase_fn_imps.hpp` File Reference**

### **7.344.1 Detailed Description**

Contains an implementation for `rb_tree_`.

## **7.345 `rc_binomial_heap_/erase_fn_imps.hpp` File Reference**

### **7.345.1 Detailed Description**

Contains an implementation for `rc_binomial_heap_`.

## **7.346 `splay_tree_/erase_fn_imps.hpp` File Reference**

### **7.346.1 Detailed Description**

Contains an implementation class for `splay_tree_`.

## **7.347 `thin_heap_/erase_fn_imps.hpp` File Reference**

### **7.347.1 Detailed Description**

Contains an implementation for `thin_heap_`.

## **7.348 `bin_search_tree_/find_fn_imps.hpp` File Reference**

### **7.348.1 Detailed Description**

Contains an implementation class for `bin_search_tree_`.

## **7.349 `binary_heap_/find_fn_imps.hpp` File Reference**

### **7.349.1 Detailed Description**

Contains an implementation class for a `binary_heap`.

## **7.350 `binomial_heap_base_/find_fn_imps.hpp` File Reference**

### **7.350.1 Detailed Description**

Contains an implementation class for a base of binomial heaps.

**7.351 cc\_hash\_table\_map\_/find\_fn\_imps.hpp File Reference****7.351.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s find related functions.

**7.352 gp\_hash\_table\_map\_/find\_fn\_imps.hpp File Reference****7.352.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s find related functions.

**7.353 list\_update\_map\_/find\_fn\_imps.hpp File Reference****7.353.1 Detailed Description**

Contains implementations of lu\_map\_.

**7.354 pairing\_heap\_/find\_fn\_imps.hpp File Reference****7.354.1 Detailed Description**

Contains an implementation class for a pairing heap.

**7.355 pat\_trie\_/find\_fn\_imps.hpp File Reference****7.355.1 Detailed Description**

Contains an implementation class for pat\_trie.

**7.356 rb\_tree\_map\_/find\_fn\_imps.hpp File Reference****7.356.1 Detailed Description**

Contains an implementation for rb\_tree\_.

**7.357 splay\_tree\_/find\_fn\_imps.hpp File Reference****7.357.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

**7.358 thin\_heap\_/find\_fn\_imps.hpp File Reference****7.358.1 Detailed Description**

Contains an implementation for thin\_heap\_.

**7.359 bin\_search\_tree\_/info\_fn\_imps.hpp File Reference****7.359.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

**7.360 binary\_heap\_/info\_fn\_imps.hpp File Reference****7.360.1 Detailed Description**

Contains an implementation class for a binary\_heap.

## **7.361 cc\_hash\_table\_map\_/info\_fn\_imps.hpp File Reference**

### **7.361.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s entire container info related functions.

## **7.362 gp\_hash\_table\_map\_/info\_fn\_imps.hpp File Reference**

### **7.362.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s entire container info related functions.

## **7.363 left\_child\_next\_sibling\_heap\_/info\_fn\_imps.hpp File Reference**

### **7.363.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## **7.364 list\_update\_map\_/info\_fn\_imps.hpp File Reference**

### **7.364.1 Detailed Description**

Contains implementations of lu\_map\_.

## **7.365 ov\_tree\_map\_/info\_fn\_imps.hpp File Reference**

### **7.365.1 Detailed Description**

Contains an implementation class for ov\_tree\_.

## **7.366 pat\_trie\_/info\_fn\_imps.hpp File Reference**

### **7.366.1 Detailed Description**

Contains an implementation class for pat\_trie.

## **7.367 rb\_tree\_map\_/info\_fn\_imps.hpp File Reference**

### **7.367.1 Detailed Description**

Contains an implementation for rb\_tree\_.

## **7.368 splay\_tree\_/info\_fn\_imps.hpp File Reference**

### **7.368.1 Detailed Description**

Contains an implementation.

## **7.369 bin\_search\_tree\_/insert\_fn\_imps.hpp File Reference**

### **7.369.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

## **7.370 binary\_heap\_/insert\_fn\_imps.hpp File Reference**

### **7.370.1 Detailed Description**

Contains an implementation class for a binary\_heap.

**7.371 binomial\_heap\_base\_/insert\_fn\_imps.hpp File Reference****7.371.1 Detailed Description**

Contains an implementation class for a base of binomial heaps.

**7.372 cc\_hash\_table\_map\_/insert\_fn\_imps.hpp File Reference****7.372.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s insert related functions.

**7.373 gp\_hash\_table\_map\_/insert\_fn\_imps.hpp File Reference****7.373.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s insert related functions.

**7.374 left\_child\_next\_sibling\_heap\_/insert\_fn\_imps.hpp File Reference****7.374.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

**7.375 list\_update\_map\_/insert\_fn\_imps.hpp File Reference****7.375.1 Detailed Description**

Contains implementations of lu\_map\_.

**7.376 ov\_tree\_map\_/insert\_fn\_imps.hpp File Reference****7.376.1 Detailed Description**

Contains an implementation class for ov\_tree\_.

**7.377 pairing\_heap\_/insert\_fn\_imps.hpp File Reference****7.377.1 Detailed Description**

Contains an implementation class for a pairing heap.

**7.378 rb\_tree\_map\_/insert\_fn\_imps.hpp File Reference****7.378.1 Detailed Description**

Contains an implementation for rb\_tree\_.

**7.379 rc\_binomial\_heap\_/insert\_fn\_imps.hpp File Reference****7.379.1 Detailed Description**

Contains an implementation for rc\_binomial\_heap\_.

**7.380 splay\_tree\_/insert\_fn\_imps.hpp File Reference****7.380.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

## 7.381 thin\_heap\_/insert\_fn\_imps.hpp File Reference

### 7.381.1 Detailed Description

Contains an implementation for thin\_heap\_.

## 7.382 bin\_search\_tree\_/iterators\_fn\_imps.hpp File Reference

### 7.382.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

## 7.383 binary\_heap\_/iterators\_fn\_imps.hpp File Reference

### 7.383.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 7.384 cc\_hash\_table\_map\_/iterators\_fn\_imps.hpp File Reference

### 7.384.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s iterators related functions, e.g., begin().

## 7.385 left\_child\_next\_sibling\_heap\_/iterators\_fn\_imps.hpp File Reference

### 7.385.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 7.386 list\_update\_map\_/iterators\_fn\_imps.hpp File Reference

### 7.386.1 Detailed Description

Contains implementations of lu\_map\_.

## 7.387 ov\_tree\_map\_/iterators\_fn\_imps.hpp File Reference

### 7.387.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 7.388 pat\_trie\_/iterators\_fn\_imps.hpp File Reference

### 7.388.1 Detailed Description

Contains an implementation class for pat\_trie.

## 7.389 binary\_heap\_/point\_const\_iterator.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binary\\_heap\\_point\\_const\\_iterator\\_< Value\\_Type, Entry, Simple, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.389.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

## 7.390 `left_child_next_sibling_heap_/point_const_iterator.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_node\\_point\\_const\\_iterator\\_< Node, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

### 7.390.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

## 7.391 `unordered_iterator/point_const_iterator.hpp` File Reference

### 7.391.1 Detailed Description

Contains an iterator class returned by the tables' const find and insert methods.

- This file is intended to be included inside a class definition, with `PB_DS_CLASS_C_DEC` defined to the name of the enclosing class.

## 7.392 `bin_search_tree_/policy_access_fn_imps.hpp` File Reference

### 7.392.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 7.393 `binary_heap_/policy_access_fn_imps.hpp` File Reference

### 7.393.1 Detailed Description

Contains an implementation class for a `binary_heap`.

## 7.394 `cc_hash_table_map_/policy_access_fn_imps.hpp` File Reference

### 7.394.1 Detailed Description

Contains implementations of `cc_ht_map_`'s policy access functions.

## 7.395 `gp_hash_table_map_/policy_access_fn_imps.hpp` File Reference

### 7.395.1 Detailed Description

Contains implementations of `gp_ht_map_`'s policy access functions.

## 7.396 left\_child\_next\_sibling\_heap\_/policy\_access\_fn\_imps.hpp File Reference

### 7.396.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 7.397 ov\_tree\_map\_/policy\_access\_fn\_imps.hpp File Reference

### 7.397.1 Detailed Description

Contains an implementation class for ov\_tree.

## 7.398 pat\_trie\_/policy\_access\_fn\_imps.hpp File Reference

### 7.398.1 Detailed Description

Contains an implementation class for pat\_trie.

## 7.399 resize\_policy.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::resize\\_policy<\\_Tp>](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.399.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 7.400 bin\_search\_tree\_/split\_join\_fn\_imps.hpp File Reference

### 7.400.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

## 7.401 binary\_heap\_/split\_join\_fn\_imps.hpp File Reference

### 7.401.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 7.402 binomial\_heap\_base\_/split\_join\_fn\_imps.hpp File Reference

### 7.402.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 7.403 ov\_tree\_map\_/split\_join\_fn\_imps.hpp File Reference

### 7.403.1 Detailed Description

Contains an implementation class for ov\_tree\_.

**7.404 pairing\_heap\_/split\_join\_fn\_imps.hpp File Reference****7.404.1 Detailed Description**

Contains an implementation class for a pairing heap.

**7.405 rb\_tree\_map\_/split\_join\_fn\_imps.hpp File Reference****7.405.1 Detailed Description**

Contains an implementation for rb\_tree\_.

**7.406 rc\_binomial\_heap\_/split\_join\_fn\_imps.hpp File Reference****7.406.1 Detailed Description**

Contains an implementation for rc\_binomial\_heap\_.

**7.407 splay\_tree\_/split\_join\_fn\_imps.hpp File Reference****7.407.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

**7.408 thin\_heap\_/split\_join\_fn\_imps.hpp File Reference****7.408.1 Detailed Description**

Contains an implementation for thin\_heap\_.

**7.409 binary\_heap\_/trace\_fn\_imps.hpp File Reference****7.409.1 Detailed Description**

Contains an implementation class for a binary\_heap\_.

**7.410 cc\_hash\_table\_map\_/trace\_fn\_imps.hpp File Reference****7.410.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s trace-mode functions.

**7.411 gp\_hash\_table\_map\_/trace\_fn\_imps.hpp File Reference****7.411.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s trace-mode functions.

**7.412 left\_child\_next\_sibling\_heap\_/trace\_fn\_imps.hpp File Reference****7.412.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

**7.413 list\_update\_map\_/trace\_fn\_imps.hpp File Reference****7.413.1 Detailed Description**

Contains implementations of lu\_map\_.

## 7.414 pat\_trie\_/trace\_fn\_imps.hpp File Reference

### 7.414.1 Detailed Description

Contains an implementation class for pat\_trie\_.

## 7.415 rc\_binomial\_heap\_/trace\_fn\_imps.hpp File Reference

### 7.415.1 Detailed Description

Contains an implementation for rc\_binomial\_heap\_.

## 7.416 thin\_heap\_/trace\_fn\_imps.hpp File Reference

### 7.416.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 7.417 binomial\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binomial\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

- #define **PB\_DS\_CLASS\_T\_DEC**

### 7.418.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 7.419 `branch_policy.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::branch\\_policy< Node\\_Cltr, Node\\_Itr, \\_Alloc >](#)
- struct [\\_\\_gnu\\_pbds::detail::branch\\_policy< Node\\_Cltr, Node\\_Cltr, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.419.1 Detailed Description

Contains a base class for branch policies.

## 7.420 `null_node_metadata.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::dumnode\\_const\\_iterator< Key, Data, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.420.1 Detailed Description

Contains an implementation class for tree-like classes.

## 7.421 `cc_ht_map_.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::cc\\_ht\\_map< Key, Mapped, Hash\\_Fn, Eq\\_Fn, \\_Alloc, Store\\_Hash, Comb\\_Hash\\_Fn, Resize\\_Policy >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CC_HASH_NAME`
- `#define PB_DS_CC_HASH_TRAITS_BASE`

- `#define PB_DS_GEN_POS`
- `#define PB_DS_HASH_EQ_FN_C_DEC`
- `#define PB_DS_RANGED_HASH_FN_C_DEC`

#### 7.421.1 Detailed Description

Contains an implementation class for `cc_ht_map_`.

## 7.422 `cmp_fn_imps.hpp` File Reference

### 7.422.1 Detailed Description

Contains implementations of `cc_ht_map_`'s entire container comparison related functions.

## 7.423 `cond_key_dtor_entry_dealtor.hpp` File Reference

### Classes

- class `__gnu_pbds::detail::cond_dealtor< HT_Map >`

### Namespaces

- namespace `__gnu_pbds`

### 7.423.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

## 7.424 `cc_hash_table_map_/constructor_destructor_fn_imps.hpp` File Reference

### 7.424.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

## 7.425 `gp_hash_table_map_/constructor_destructor_fn_imps.hpp` File Reference

### 7.425.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

## 7.426 `list_update_map_/constructor_destructor_fn_imps.hpp` File Reference

## 7.427 `cc_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp` File Reference

### 7.427.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

## 7.428 `gp_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp` File Reference

### 7.428.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

## 7.429 `cc_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp` File Reference

### 7.429.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

### **7.430 `gp_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp` File Reference**

#### **7.430.1 Detailed Description**

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

### **7.431 `cc_hash_table_map_/debug_no_store_hash_fn_imps.hpp` File Reference**

#### **7.431.1 Detailed Description**

Contains implementations of `cc_ht_map_`'s debug-mode functions.

### **7.432 `gp_hash_table_map_/debug_no_store_hash_fn_imps.hpp` File Reference**

#### **7.432.1 Detailed Description**

Contains implementations of `gp_ht_map_`'s debug-mode functions.

### **7.433 `cc_hash_table_map_/debug_store_hash_fn_imps.hpp` File Reference**

#### **7.433.1 Detailed Description**

Contains implementations of `cc_ht_map_`'s debug-mode functions.

### **7.434 `gp_hash_table_map_/debug_store_hash_fn_imps.hpp` File Reference**

#### **7.434.1 Detailed Description**

Contains implementations of `gp_ht_map_`'s debug-mode functions.

### **7.435 `entry_list_fn_imps.hpp` File Reference**

#### **7.435.1 Detailed Description**

Contains implementations of `cc_ht_map_`'s entry-list related functions.

### **7.436 `cc_hash_table_map_/erase_no_store_hash_fn_imps.hpp` File Reference**

#### **7.436.1 Detailed Description**

Contains implementations of `cc_ht_map_`'s erase related functions, when the hash value is not stored.

### **7.437 `gp_hash_table_map_/erase_no_store_hash_fn_imps.hpp` File Reference**

#### **7.437.1 Detailed Description**

Contains implementations of `gp_ht_map_`'s erase related functions, when the hash value is not stored.

### **7.438 `cc_hash_table_map_/erase_store_hash_fn_imps.hpp` File Reference**

#### **7.438.1 Detailed Description**

Contains implementations of `cc_ht_map_`'s erase related functions, when the hash value is stored.

**7.439 gp\_hash\_table\_map\_/erase\_store\_hash\_fn\_imps.hpp File Reference****7.439.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s erase related functions, when the hash value is stored.

**7.440 cc\_hash\_table\_map\_/find\_store\_hash\_fn\_imps.hpp File Reference****7.440.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s find related functions, when the hash value is stored.

**7.441 gp\_hash\_table\_map\_/find\_store\_hash\_fn\_imps.hpp File Reference****7.441.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s insert related functions, when the hash value is stored.

**7.442 cc\_hash\_table\_map\_/insert\_no\_store\_hash\_fn\_imps.hpp File Reference****7.442.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s insert related functions, when the hash value is not stored.

**7.443 gp\_hash\_table\_map\_/insert\_no\_store\_hash\_fn\_imps.hpp File Reference****7.443.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s insert related functions, when the hash value is not stored.

**7.444 cc\_hash\_table\_map\_/insert\_store\_hash\_fn\_imps.hpp File Reference****7.444.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s insert related functions, when the hash value is stored.

**7.445 gp\_hash\_table\_map\_/insert\_store\_hash\_fn\_imps.hpp File Reference****7.445.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s find related functions, when the hash value is stored.

**7.446 cc\_hash\_table\_map\_/resize\_fn\_imps.hpp File Reference****7.446.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s resize related functions.

**7.447 gp\_hash\_table\_map\_/resize\_fn\_imps.hpp File Reference****7.447.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s resize related functions.

**7.448 cc\_hash\_table\_map\_/resize\_no\_store\_hash\_fn\_imps.hpp File Reference****7.448.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s resize related functions, when the hash value is not stored.

## 7.449 `gp_hash_table_map_/resize_no_store_hash_fn_imps.hpp` File Reference

### 7.449.1 Detailed Description

Contains implementations of `gp_ht_map_'s` resize related functions, when the hash value is not stored.

## 7.450 `cc_hash_table_map_/resize_store_hash_fn_imps.hpp` File Reference

### 7.450.1 Detailed Description

Contains implementations of `cc_ht_map_'s` resize related functions, when the hash value is stored.

## 7.451 `gp_hash_table_map_/resize_store_hash_fn_imps.hpp` File Reference

### 7.451.1 Detailed Description

Contains implementations of `gp_ht_map_'s` resize related functions, when the hash value is stored.

## 7.452 `size_fn_imps.hpp` File Reference

### 7.452.1 Detailed Description

Contains implementations of `cc_ht_map_'s` entire container size related functions.

## 7.453 `cond_dealtor.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::cond\\_dealtor< HT\\_Map >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.453.1 Detailed Description

Contains a conditional deallocator.

## 7.454 `container_base_dispatch.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, cc\\_hash\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, gp\\_hash\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, list\\_update\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, ov\\_tree\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, pat\\_trie\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, rb\\_tree\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, splay\\_tree\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, cc\\_hash\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, gp\\_hash\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, list\\_update\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, ov\\_tree\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, pat\\_trie\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, rb\\_tree\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, splay\\_tree\\_tag, Policy\\_TI >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_ASSERT_VALID(X)`
- `#define PB_DS_CHECK_KEY_DOES_NOT_EXIST(_Key)`
- `#define PB_DS_CHECK_KEY_EXISTS(_Key)`
- `#define PB_DS_DATA_FALSE_INDICATOR`
- `#define PB_DS_DATA_TRUE_INDICATOR`
- `#define PB_DS_DEBUG_VERIFY(_Cond)`
- `#define PB_DS_EP2VP(X)`
- `#define PB_DS_EP2VP(X)`
- `#define PB_DS_V2F(X)`
- `#define PB_DS_V2F(X)`
- `#define PB_DS_V2S(X)`
- `#define PB_DS_V2S(X)`

### 7.454.1 Detailed Description

Contains associative container dispatching.

## 7.455 debug\_map\_base.hpp File Reference

### 7.455.1 Detailed Description

Contains a debug-mode base for all maps.

## 7.456 eq\_by\_less.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::eq\\_by\\_less< Key, Cmp\\_Fn >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.456.1 Detailed Description

Contains an equivalence function.

## 7.457 hash\_eq\_fn.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::hash\\_eq\\_fn< Key, Eq\\_Fn, \\_Alloc, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::hash\\_eq\\_fn< Key, Eq\\_Fn, \\_Alloc, true >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.457.1 Detailed Description

Contains 2 equivalence functions, one employing a hash value, and one ignoring it.

## 7.458 `find_no_store_hash_fn_imps.hpp` File Reference

### 7.458.1 Detailed Description

Contains implementations of `gp_ht_map_'s` find related functions, when the hash value is not stored.

## 7.459 `gp_ht_map_.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::gp\\_ht\\_map< Key, Mapped, Hash\\_Fn, Eq\\_Fn, \\_Alloc, Store\\_Hash, Comb\\_Probe\\_Fn, Probe\\_Fn, Resize](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_GP_HASH_NAME`
- `#define PB_DS_GP_HASH_TRAITS_BASE`
- `#define PB_DS_HASH_EQ_FN_C_DEC`
- `#define PB_DS_RANGED_PROBE_FN_C_DEC`

### 7.459.1 Detailed Description

Contains an implementation class for general probing hash.

## 7.460 `iterator_fn_imps.hpp` File Reference

### 7.460.1 Detailed Description

Contains implementations of `gp_ht_map_'s` iterators related functions, e.g., `begin()`.

## 7.461 `direct_mask_range_hashing_imp.hpp` File Reference

### 7.461.1 Detailed Description

Contains a range-hashing policy implementation

## 7.462 `direct_mod_range_hashing_imp.hpp` File Reference

### 7.462.1 Detailed Description

Contains a range-hashing policy implementation

## 7.463 `linear_probe_fn_imp.hpp` File Reference

### 7.463.1 Detailed Description

Contains a probe policy implementation

## 7.464 mask\_based\_range\_hashing.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::mask\\_based\\_range\\_hashing< Size\\_Type >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.464.1 Detailed Description

Contains a range hashing policy base.

## 7.465 mod\_based\_range\_hashing.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::mod\\_based\\_range\\_hashing< Size\\_Type >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.465.1 Detailed Description

Contains a range hashing policy base.

## 7.466 probe\_fn\_base.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::probe\\_fn\\_base< \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.466.1 Detailed Description

Contains a probe policy base.

## 7.467 quadratic\_probe\_fn\_imp.hpp File Reference

#### 7.467.1 Detailed Description

Contains a probe policy implementation

## 7.468 ranged\_hash\_fn.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::ranged\\_hash\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Hash\\_Fn, false >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_hash\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Hash\\_Fn, true >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_hash\\_fn< Key, null\\_type, \\_Alloc, Comb\\_Hash\\_Fn, false >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_hash\\_fn< Key, null\\_type, \\_Alloc, Comb\\_Hash\\_Fn, true >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`

### 7.468.1 Detailed Description

Contains a unified ranged hash functor, allowing the hash tables to deal with a single class for ranged hashing.

## 7.469 `ranged_probe_fn.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::ranged\\_probe\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Probe\\_Fn, Probe\\_Fn, false >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_probe\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Probe\\_Fn, Probe\\_Fn, true >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_probe\\_fn< Key, null\\_type, \\_Alloc, Comb\\_Probe\\_Fn, null\\_type, false >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`

### 7.469.1 Detailed Description

Contains a unified ranged probe functor, allowing the probe tables to deal with a single class for ranged probing.

## 7.470 `sample_probe_fn.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_probe\\_fn](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.470.1 Detailed Description

Contains a sample probe policy.

## 7.471 sample\_range\_hashing.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_range\\_hashing](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.471.1 Detailed Description

Contains a range hashing policy.

## 7.472 sample\_ranged\_hash\_fn.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_ranged\\_hash\\_fn](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.472.1 Detailed Description

Contains a ranged hash policy.

## 7.473 sample\_ranged\_probe\_fn.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_ranged\\_probe\\_fn](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.473.1 Detailed Description

Contains a ranged probe policy.

## 7.474 left\_child\_next\_sibling\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap< Value\\_Type, Cmp\\_Fn, Node\\_Metadata, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

#### 7.474.1 Detailed Description

Contains an implementation class for a basic heap.

### 7.475 `left_child_next_sibling_heap_/node.hpp` File Reference

#### Classes

- struct [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_node\\_ < \\_Value, \\_Metadata, \\_Alloc >](#)

#### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.475.1 Detailed Description

Contains an implementation struct for this type of heap's node.

### 7.476 `rb_tree_map_/node.hpp` File Reference

#### Classes

- struct [\\_\\_gnu\\_pbds::detail::rb\\_tree\\_node\\_ < Value\\_Type, Metadata, \\_Alloc >](#)

#### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.476.1 Detailed Description

Contains an implementation for `rb_tree_`.

### 7.477 `splay_tree_/node.hpp` File Reference

#### Classes

- struct [\\_\\_gnu\\_pbds::detail::splay\\_tree\\_node\\_ < Value\\_Type, Metadata, \\_Alloc >](#)

#### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.477.1 Detailed Description

Contains an implementation struct for `splay_tree_`'s node.

### 7.478 `entry_metadata_base.hpp` File Reference

#### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.478.1 Detailed Description

Contains an implementation for a list update map.

## 7.479 lu\_map\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::lu\\_map< Key, Mapped, Eq\\_Fn, \\_Alloc, Update\\_Policy >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_LU_NAME`
- `#define PB_DS_LU_TRAITS_BASE`

#### 7.479.1 Detailed Description

Contains a list update map.

## 7.480 lu\_counter\_metadata.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::lu\\_counter\\_metadata< Size\\_Type >](#)
- class [\\_\\_gnu\\_pbds::detail::lu\\_counter\\_policy\\_base< Size\\_Type >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.480.1 Detailed Description

Contains implementation of a lu counter policy's metadata.

## 7.481 sample\_update\_policy.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::sample\\_update\\_policy](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.481.1 Detailed Description

Contains a sample policy for list update containers.

## 7.482 ov\_tree\_map\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::ov\\_tree\\_map< Key, Mapped, Cmp\\_Fn, Node\\_And\\_It\\_Traits, \\_Alloc >::cond\\_dtor< Size\\_Type >](#)
- class [\\_\\_gnu\\_pbds::detail::ov\\_tree\\_map< Key, Mapped, Cmp\\_Fn, Node\\_And\\_It\\_Traits, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CONST_NODE_ITERATOR_NAME`
- `#define PB_DS_OV_TREE_NAME`
- `#define PB_DS_OV_TREE_TRAITS_BASE`

#### 7.482.1 Detailed Description

Contains an implementation class for `ov_tree`.

### 7.483 `pairing_heap_.hpp` File Reference

#### Classes

- class [\\_\\_gnu\\_pbds::detail::pairing\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_P_HEAP_BASE`

#### 7.483.1 Detailed Description

Contains an implementation class for a pairing heap.

### 7.484 `insert_join_fn_imps.hpp` File Reference

#### 7.484.1 Detailed Description

Contains an implementation class for `pat_trie`.

### 7.485 `pat_trie_.hpp` File Reference

#### Classes

- class [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_map< Key, Mapped, Node\\_And\\_It\\_Traits, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

**Macros**

- `#define PB_DS_ASSERT_NODE_VALID(X)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_PAT_TRIE_NAME`
- `#define PB_DS_PAT_TRIE_TRAITS_BASE`
- `#define PB_DS_RECURSIVE_COUNT_LEAFS(X)`

**7.485.1 Detailed Description**

Contains an implementation class for a patricia tree.

**7.486 pat\_trie\_base.hpp File Reference****Classes**

- class [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_base::\\_Clter< Node, Leaf, Head, Inode, Is\\_Forward\\_Iterator >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- #define **PB\_DS\_ASSERT\_VALID(X)**
- #define **PB\_DS\_DEBUG\_VERIFY(\_Cond)**

#### 7.490.1 Detailed Description

Contains an pqiative container dispatching base.

## 7.491 rb\_tree\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::rb\\_tree\\_map< Key, Mapped, Cmp\\_Fn, Node\\_And\\_It\\_Traits, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_RB_TREE_BASE`
- `#define PB_DS_RB_TREE_BASE_NAME`
- `#define PB_DS_RB_TREE_NAME`
- `#define PB_DS_STRUCT_ONLY_ASSERT_VALID(X)`

### 7.491.1 Detailed Description

Contains an implementation for Red Black trees.

## 7.492 rc.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::rc< \\_Node, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.492.1 Detailed Description

Contains a redundant (binary counter).

## 7.493 rc\_binomial\_heap.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::rc\\_binomial\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_RC_C_DEC`

### 7.493.1 Detailed Description

Contains an implementation for redundant-counter binomial heap.

## 7.494 cc\_hash\_max\_collision\_check\_resize\_trigger\_imp.hpp File Reference

### 7.494.1 Detailed Description

Contains a resize trigger implementation.

## 7.495 [hash\\_exponential\\_size\\_policy\\_imp.hpp](#) File Reference

### 7.495.1 Detailed Description

Contains a resize size policy implementation.

## 7.496 [hash\\_load\\_check\\_resize\\_trigger\\_imp.hpp](#) File Reference

### 7.496.1 Detailed Description

Contains a resize trigger implementation.

## 7.497 [hash\\_load\\_check\\_resize\\_trigger\\_size\\_base.hpp](#) File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::hash\\_load\\_check\\_resize\\_trigger\\_size\\_base< Size\\_Type, true >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.497.1 Detailed Description

Contains an base holding size for some resize policies.

## 7.498 [hash\\_prime\\_size\\_policy\\_imp.hpp](#) File Reference

### 7.498.1 Detailed Description

Contains a resize size policy implementation.

## 7.499 [hash\\_standard\\_resize\\_policy\\_imp.hpp](#) File Reference

### 7.499.1 Detailed Description

Contains a resize policy implementation.

## 7.500 [sample\\_resize\\_policy.hpp](#) File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_resize\\_policy](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.500.1 Detailed Description

Contains a sample resize policy for hash tables.

## 7.501 [sample\\_resize\\_trigger.hpp](#) File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_resize\\_trigger](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.501.1 Detailed Description

Contains a sample resize trigger policy class.

## 7.502 sample\_size\_policy.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_size\\_policy](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.502.1 Detailed Description

Contains a sample size resize-policy.

## 7.503 splay\_fn\_imps.hpp File Reference

### 7.503.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 7.504 splay\_tree\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::splay\\_tree\\_map< Key, Mapped, Cmp\\_Fn, Node\\_And\\_It\\_Traits, \\_Alloc >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_ASSERT_BASE_NODE_CONSISTENT(_Node)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_S_TREE_BASE`
- `#define PB_DS_S_TREE_BASE_NAME`
- `#define PB_DS_S_TREE_NAME`

### 7.504.1 Detailed Description

Contains an implementation class for splay trees.

## 7.505 `standard_policies.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::default\\_comb\\_hash\\_fn](#)
- struct [\\_\\_gnu\\_pbds::detail::default\\_eq\\_fn< Key >](#)
- struct [\\_\\_gnu\\_pbds::detail::default\\_hash\\_fn< Key >](#)
- struct [\\_\\_gnu\\_pbds::detail::default\\_probe\\_fn< Comb\\_Probe\\_Fn >](#)
- struct [\\_\\_gnu\\_pbds::detail::default\\_resize\\_policy< Comb\\_Hash\\_Fn >](#)
- struct [\\_\\_gnu\\_pbds::detail::default\\_trie\\_access\\_traits< std::basic\\_string< Char, Char\\_Traits, std::allocator< char > > >](#)
- struct [\\_\\_gnu\\_pbds::detail::default\\_update\\_policy](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define __dtrie_alloc`
- `#define __dtrie_string`

### Enumerations

- enum { `default_store_hash` }

#### 7.505.1 Detailed Description

Contains standard policies for containers.

#### 7.505.2 Enumeration Type Documentation

##### anonymous enum

anonymous enum

Enumeration for default behavior of stored hash data.

## 7.506 `thin_heap_.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::thin\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_ASSERT_AUX_NULL(X)`
- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_BASE_T_P`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

### Enumerations

- enum { `num_distinct_rank_bounds` }

## Variables

- static const std::size\_t [\\_\\_gnu\\_pbds::detail::g\\_a\\_rank\\_bounds](#) [num\_distinct\_rank\_bounds]

### 7.506.1 Detailed Description

Contains an implementation class for a thin heap.

## 7.507 tree\_policy/node\_metadata\_selector.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::tree\\_metadata\\_helper< Node\\_Update, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::tree\\_metadata\\_helper< Node\\_Update, true >](#)
- struct [\\_\\_gnu\\_pbds::detail::tree\\_node\\_metadata\\_dispatch< Key, Data, Cmp\\_Fn, Node\\_Update, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.507.1 Detailed Description

Contains an implementation class for trees.

## 7.508 trie\_policy/node\_metadata\_selector.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::trie\\_metadata\\_helper< Node\\_Update, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::trie\\_metadata\\_helper< Node\\_Update, true >](#)
- struct [\\_\\_gnu\\_pbds::detail::trie\\_node\\_metadata\\_dispatch< Key, Data, Cmp\\_Fn, Node\\_Update, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.508.1 Detailed Description

Contains an implementation class for tries.

## 7.509 tree\_policy/order\_statistics\_imp.hpp File Reference

### 7.509.1 Detailed Description

Contains forward declarations for order\_statistics\_key

## 7.510 trie\_policy/order\_statistics\_imp.hpp File Reference

### 7.510.1 Detailed Description

Contains forward declarations for order\_statistics\_key

## 7.511 sample\_tree\_node\_update.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_tree\\_node\\_update< Const\\_Node\\_Iter, Node\\_Iter, Cmp\\_Fn, \\_Alloc >](#)

**Namespaces**

- namespace [\\_\\_gnu\\_pbds](#)

**7.511.1 Detailed Description**

Contains a samle node update functor.

**7.512 tree\_trace\_base.hpp File Reference****7.512.1 Detailed Description**

Contains tree-related policies.

**7.513 prefix\_search\_node\_update\_imp.hpp File Reference****7.513.1 Detailed Description**

Contains an implementation of prefix\_search\_node\_update.

**7.514 sample\_trie\_access\_traits.hpp File Reference****Classes**

- struct [\\_\\_gnu\\_pbds::sample\\_trie\\_access\\_traits](#)

**Namespaces**

- namespace [\\_\\_gnu\\_pbds](#)

**7.514.1 Detailed Description**

Contains a sample probe policy.

**7.515 sample\_trie\_node\_update.hpp File Reference****Classes**

- class [\\_\\_gnu\\_pbds::sample\\_trie\\_node\\_update< Node\\_Cltr, Node\\_Itr, \\_ATraits, \\_Alloc >](#)

**Namespaces**

- namespace [\\_\\_gnu\\_pbds](#)

**7.515.1 Detailed Description**

Contains a samle node update functor.

**7.516 trie\_policy\_base.hpp File Reference****Classes**

- class [\\_\\_gnu\\_pbds::detail::trie\\_policy\\_base< Node\\_Cltr, Node\\_Itr, \\_ATraits, \\_Alloc >](#)

**Namespaces**

- namespace [\\_\\_gnu\\_pbds](#)

**Macros**

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

**7.516.1 Detailed Description**

Contains an implementation of `trie_policy_base`.

**7.517 trie\_string\_access\_traits\_imp.hpp File Reference****7.517.1 Detailed Description**

Contains a policy for extracting character positions from a string for a vector-based PATRICIA tree

**7.518 type\_utils.hpp File Reference****Namespaces**

- namespace [\\_\\_gnu\\_pbds](#)

**Macros**

- `#define PB_DS_STATIC_ASSERT(UNIQUE, E)`

**Typedefs**

- `typedef std::tr1::integral_constant< int, 0 > __gnu_pbds::detail::false_type`
- `typedef std::tr1::integral_constant< int, 1 > __gnu_pbds::detail::true_type`

**7.518.1 Detailed Description**

Contains utilities for handling types. All of these classes are based on Modern C++ by Andrei Alexandrescu.

**7.519 types\_traits.hpp File Reference****Classes**

- `struct __gnu_pbds::detail::maybe_null_type< Key, Mapped, _Alloc, Store_Hash >`
- `struct __gnu_pbds::detail::maybe_null_type< Key, null_type, _Alloc, Store_Hash >`
- `struct __gnu_pbds::detail::no_throw_copies< Key, Mapped >`
- `struct __gnu_pbds::detail::no_throw_copies< Key, null_type >`
- `struct __gnu_pbds::detail::rebind_traits< _Alloc, T >`
- `struct __gnu_pbds::detail::select_value_type< Key, Mapped >`

- `struct __gnu_pbds::detail::stored_hash< _Th >`
- `struct __gnu_pbds::detail::stored_value< _Tv >`
- `struct __gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >`

**Namespaces**

- namespace [\\_\\_gnu\\_pbds](#)

### 7.519.1 Detailed Description

Contains a traits class of types used by containers.

## 7.520 iterator.hpp File Reference

### 7.520.1 Detailed Description

Contains an iterator\_ class used for ranging over the elements of the table.

This file is intended to be included inside a class definition, with PB\_DS\_CLASS\_C\_DEC defined to the name of the enclosing class.

## 7.521 point\_iterator.hpp File Reference

### 7.521.1 Detailed Description

Contains an iterator class returned by the tables' find and insert methods.

This file is intended to be included inside a class definition, with PB\_DS\_CLASS\_C\_DEC defined to the name of the enclosing class.

## 7.522 exception.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::container\\_error](#)
- struct [\\_\\_gnu\\_pbds::insert\\_error](#)

### 7.530.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

Provides reusable `_Pointer_adapter` for assisting in the development of custom pointer types that can be used with the standard containers via the `allocator::pointer` and `allocator::const_pointer` typedefs.

## 7.531 pool\_allocator.h File Reference

### Classes

- class `__gnu_cxx::__pool_alloc< _Tp >`
- class `__gnu_cxx::__pool_alloc_base`

### Namespaces

- namespace `__gnu_cxx`

### Functions

- `template<typename _Tp >`  
`bool __gnu_cxx::operator== (const __pool_alloc< _Tp > &, const __pool_alloc< _Tp > &)`

### 7.531.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 7.532 rb\_tree File Reference

### Classes

- struct `__gnu_cxx::rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc >`

## Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

## Macros

- `#define _RB_TREE`

### 7.532.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

## 7.533 rc\_string\_base.h File Reference

### Classes

- class [\\_\\_gnu\\_cxx::\\_\\_rc\\_string\\_base<\\_CharT, \\_Traits, \\_Alloc>](#)

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

### 7.533.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/vstring.h>`.

## 7.534 rope File Reference

### Classes

- class [\\_\\_gnu\\_cxx::rope<\\_CharT, \\_Alloc>](#)

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)
- namespace [\\_\\_gnu\\_cxx::\\_\\_detail](#)
- namespace [std](#)
- namespace [std::tr1](#)

### Macros

- `#define __GC_CONST`
- `#define __ROPE_DEFINE_ALLOC(_Tp, __name)`
- `#define __ROPE_DEFINE_ALLOC(_Tp, __name)`
- `#define __ROPE_DEFINE_ALLOCS(__a)`
- `#define __STATIC_IF_SGI_ALLOC`
- `#define __STL_FREE_STRING(__s, __l, __a)`
- `#define __STL_ROPE_FROM_UNOWNED_CHAR_PTR(__s, __size, __a)`
- `#define _ROPE`

### Typedefs

- typedef [rope<char>](#) [\\_\\_gnu\\_cxx::crope](#)
- typedef [rope<wchar\\_t>](#) [\\_\\_gnu\\_cxx::wrope](#)

## Enumerations

- enum { **\_S\_max\_rope\_depth** }

### 7.541.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

## 7.542 `type_traits.h` File Reference

### Namespaces

### 7.561.1 Detailed Description

This is a Standard C++ Library header.

## 7.562 iostream File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_ISTREAM`

### Variables

- static `ios_base::Init` **`std::__ioinit`**

### Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- [ostream](#) `std::cerr`
- [istream](#) `std::cin`
- [ostream](#) `std::clog`
- [ostream](#) `std::cout`
- [wostream](#) `std::wcerr`
- [wistream](#) `std::wcin`
- [wostream](#) `std::wclog`
- [wostream](#) `std::wcout`

### 7.562.1 Detailed Description

This is a Standard C++ Library header.

### 7.580.1 Detailed Description

This is a TS C++ Library header.

### 7.580.2 Function Documentation

#### `get_default_resource()`

```
memory_resource * std::experimental::fundamentals_v2::pmr::get_default_resource () [inline],
[noexcept]
```

Get the current default resource.

#### `set_default_resource()`

```
memory_resource * std::experimental::fundamentals_v2::pmr::set_default_resource (
    memory_resource * __r) [inline], [noexcept]
```

Change the default resource and return the previous one.

## 7.581 memory\_resource File Reference

### Classes

- `#define _GLIBCXX_MEMORY_RESOURCE`

## Functions

- `memory_resource * std::pmr::get_default_resource () noexcept`
- `memory_resource * std::pmr::new_delete_resource () noexcept`
- `memory_resource * std::pmr::null_memory_resource () noexcept`
- `memory_resource * std::pmr::set_default_resource (memory_resource * __r) noexcept`

### 7.581.1 Detailed Description

This is a Standard C++ Library header.

This header declares the `pmr` (`std::pmr`) memory resources.

### 7.581.2 Function Documentation

#### `get_default_resource()`

`memory_resource * std::pmr::get_default_resource () [noexcept]`

Get the current default memory resource pointer.

#### `null_memory_resource()`

`memory_resource * std::pmr::null_memory_resource () [nodiscard], [noexcept]`

A `pmr::memory_resource` that always throws `bad_alloc`

#### `set_default_resource()`

`memory_resource * std::pmr::set_default_resource (memory_resource * __r) [noexcept]`

Replace the default memory resource pointer.

### 7.587.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 7.591.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

## 7.592 `algbase.h` File Reference

### 7.592.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algobase.h` header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

#### 7.593.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

### 7.597.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

### 7.597.2 Macro Definition Documentation

#### **`_GLIBCXX_CALL`**

```
#define _GLIBCXX_CALL(  
    __n)
```

Macro to produce log message when entering a function.

#### Parameters

<code>__n</code>	Input size.
------------------	-------------

#### See also

`_GLIBCXX_VERBOSE_LEVEL`

Referenced by `__gnu_parallel::__find_template()`, `__gnu_parallel::__find_template()`, `__gnu_parallel::__find_template()`, `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_parallel::__merge_advance()`, `__gnu_parallel::__parallel_n`, `__gnu_parallel::__parallel_partial_sum()`, `__gnu_parallel::__parallel_partition()`, `__gnu_parallel::__parallel_random_shuffle_drs()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort_qs()`, `__gnu_parallel::__parallel_sort_qsb()`, `__gnu_parallel::__parallel_unique_copy()`, `__gnu_parallel::__search_template()`, `__gnu_parallel::__sequential_multiway_merge()`, `__gnu_parallel::__multiseq_partition()`, `__gnu_parallel::__multiseq_selection()`, `__gnu_parallel::__multiway_merge()`, `__gnu_parallel::__multiway_merge_3_variant()`, `__gnu_parallel::__multiway_merge_4_variant()`, `__gnu_parallel::__multiway_merge_loser_tree()`, `__gnu_parallel::__multiway_merge_loser_tree_sentinel()`, `__gnu_parallel::__multiway_merge_lo`, `__gnu_parallel::__multiway_merge_sentinels()`, `__gnu_parallel::__parallel_multiway_merge()`, and `__gnu_parallel::__parallel_sort_mwms()`.

#### **`_GLIBCXX_PARALLEL_ASSERTIONS`**

```
#define _GLIBCXX_PARALLEL_ASSERTIONS
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Referenced by `__gnu_parallel::__qsb_local_sort_with_helping()`.

#### **`_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`**

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the L1 cache for `gnu_↵` `parallel::__parallel_random_shuffle()`.

#### **`_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`**

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the TLB for `gnu_parallel_↵` `::__parallel_random_shuffle()`.

#### **`_GLIBCXX_SCALE_DOWN_FPU`**

```
#define _GLIBCXX_SCALE_DOWN_FPU
```

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

## **`_GLIBCXX_VERBOSE_LEVEL`**

```
#define _GLIBCXX_VERBOSE_LEVEL
```

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

## **7.598 `equally_split.h` File Reference**

### **Namespaces**

- namespace [`\_\_gnu\_parallel`](#)

### **Functions**

- `#define \_GLIBCXX\_TREE\_DYNAMIC\_BALANCING`
- `#define \_GLIBCXX\_TREE\_FULL\_COPY`
- `#define \_GLIBCXX\_TREE\_INITIAL\_SPLITTING`

### **7.599.1 Detailed Description**

Defines on whether to include algorithm variants.

Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

### **7.599.2 Macro Definition Documentation**

## **`_GLIBCXX_BAL_QUICKSORT`**

```
#define _GLIBCXX_BAL_QUICKSORT
```

Include parallel dynamically load-balanced quicksort.

See also

[`\_\_gnu\_parallel::\_Settings::sort\_algorithm`](#)

**\_GLIBCXX\_FIND\_CONSTANT\_SIZE\_BLOCKS**

#define \_GLIBCXX\_FIND\_CONSTANT\_SIZE\_BLOCKS  
Include the equal-sized blocks variant for std::find.

See also

\_\_gnu\_parallel::\_Settings::find\_algorithm

**\_GLIBCXX\_FIND\_EQUAL\_SPLIT**

#define \_GLIBCXX\_FIND\_EQUAL\_SPLIT  
Include the equal splitting variant for std::find.

See also

\_\_gnu\_parallel::\_Settings::find\_algorithm

**\_GLIBCXX\_FIND\_GROWING\_BLOCKS**

#define \_GLIBCXX\_FIND\_GROWING\_BLOCKS  
Include the growing blocks variant for std::find.

See also

\_\_gnu\_parallel::\_Settings::find\_algorithm

**\_GLIBCXX\_MERGESORT**

#define \_GLIBCXX\_MERGESORT  
Include parallel multi-way mergesort.

See also

\_\_gnu\_parallel::\_Settings::sort\_algorithm

**\_GLIBCXX\_QUICKSORT**

#define \_GLIBCXX\_QUICKSORT  
Include parallel unbalanced quicksort.

See also

\_\_gnu\_parallel::\_Settings::sort\_algorithm

**\_GLIBCXX\_TREE\_DYNAMIC\_BALANCING**

#define \_GLIBCXX\_TREE\_DYNAMIC\_BALANCING  
Include the dynamic balancing variant for \_Rb\_tree::insert\_unique(\_Iter beg, \_Iter \_\_end).

See also

\_\_gnu\_parallel::\_Rb\_tree

## **`_GLIBCXX_TREE_FULL_COPY`**

`#define _GLIBCXX_TREE_FULL_COPY`

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

See also

`__gnu_parallel::_Rb_tree`

## **`_GLIBCXX_TREE_INITIAL_SPLITTING`**

`#define _GLIBCXX_TREE_INITIAL_SPLITTING`

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

### 7.608.1 Detailed Description

Functions to find elements of a certain global `__rank` in multiple sorted sequences. Also serves for splitting such sequence sets.

The algorithm description can be found in

P. J. Varman, S. D. Scheufler, B. R. Iyer, and G. R. Ricard. Merging Multiple Lists on Hierarchical-Memory Multiprocessors. *Journal of Parallel and Distributed Computing*, 12(2):171-177, 1991.

This file is a GNU parallel extension to the Standard C++ Library.

### 7.609.1 Detailed Description

Implementation of sequential and parallel multiway merge.

Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

## 7.609.2 Macro Definition Documentation

### GLIBCXX\_PARALLEL\_LENGTH

```
#define _GLIBCXX_PARALLEL_LENGTH(
```

```
    __s)
```

Length of a sequence described by a pair of iterators.

### 7.623.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

## 7.624 settings.h File Reference

### Classes

- struct `__gnu_parallel::_Settings`

### Namespaces

- namespace `__gnu_parallel`

### Macros

- `#define _GLIBCXX_PARALLEL_CONDITION(__c)`

### 7.624.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

### 7.624.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

- a. `force_sequential`, meaning the sequential algorithm is executed.
- b. `force_parallel`, meaning the parallel algorithm is executed.
- c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

### 7.624.3 Macro Definition Documentation

#### `_GLIBCXX_PARALLEL_CONDITION`

```
#define _GLIBCXX_PARALLEL_CONDITION(  
    __c)
```

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

#### Parameters

<code>__gnu_parallel::__c</code>	A condition that is convertible to bool that is overruled by <code>__gnu_parallel::Settings::algorithm_strategy</code> . Usually a decision based on the input size.
----------------------------------	--

`constexpr bool std::experimental::ratio_not_equal_v`

### 7.634.1 Detailed Description

This is a TS C++ Library header.

## 7.635 ratio File Reference

### Classes

- struct [std::ratio< \\_Num, \\_Den >](#)
- struct [std::ratio\\_equal< \\_R1, \\_R2 >](#)
- struct [std::ratio\\_greater< \\_R1, \\_R2 >](#)
- struct [std::ratio\\_greater\\_equal< \\_R1, \\_R2 >](#)
- struct [std::ratio\\_less< \\_R1, \\_R2 >](#)
- struct [std::ratio\\_less\\_equal< \\_R1, \\_R2 >](#)
- struct [std::ratio\\_not\\_equal< \\_R1, \\_R2 >](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_RATIO`

### Typedefs

- typedef [ratio< 1, 1000000000000000000 >](#) **std::atto**
- typedef [ratio< 1, 100 >](#) **std::centi**
- typedef [ratio< 10, 1 >](#) **std::deca**
- typedef [ratio< 1, 10 >](#) **std::deci**
- typedef [ratio< 1000000000000000000, 1 >](#) **std::exa**
- typedef [ratio< 1, 1000000000000000 >](#) **std::femto**
- typedef [ratio< 1000000000, 1 >](#) **std::giga**
- typedef [ratio< 100, 1 >](#) **std::hecto**
- typedef [ratio< 1000, 1 >](#) **std::kilo**
- typedef [ratio< 1000000, 1 >](#) **std::mega**
- typedef [ratio< 1, 1000000 >](#) **std::micro**
- typedef [ratio< 1, 1000 >](#) **std::milli**
- typedef [ratio< 1, 1000000000 >](#) **std::nano**

- typedef [ratio](#)< 1000000000000000, 1 > **std::peta**
- typedef [ratio](#)< 1, 1000000000000000 > **std::pico**
- template<typename \_R1 , typename \_R2 >  
using [std::ratio\\_add](#)
- template<typename \_R1 , typename \_R2 >  
using [std::ratio\\_divide](#)
- template<typename \_R1 , typename \_R2 >  
using [std::ratio\\_multiply](#)
- template<typename \_R1 , typename \_R2 >  
using [std::ratio\\_subtract](#)
- typedef [ratio](#)< 1000000000000000, 1 > **std::tera**

## Variables

- template<typename \_R1 , typename \_R2 >  
constexpr bool **std::ratio\_equal\_v**
- template<typename \_R1 , typename \_R2 >  
constexpr bool **std::ratio\_greater\_equal\_v**
- template<typename \_R1 , typename \_R2 >  
constexpr bool **std::ratio\_greater\_v**
- template<typename \_R1 , typename \_R2 >  
constexpr bool **std::ratio\_less\_equal\_v**
- template<typename \_R1 , typename \_R2 >  
constexpr bool **std::ratio\_less\_v**
- template<typename \_R1 , typename \_R2 >  
constexpr bool **std::ratio\_not\_equal\_v**

### 7.635.1 Detailed Description

This is a Standard C++ Library header.

## 7.636 tr2/ratio File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr2](#)

### 7.636.1 Detailed Description

This is a TR2 C++ Library header.

## 7.637 experimental/regex File Reference

### Namespaces

- namespace [std](#)
- namespace [std::experimental](#)

### Macros

- #define **\_GLIBCXX\_EXPERIMENTAL\_REGEX**

## Typedefs

- typedef [match\\_results](#)< const char \* > **std::experimental::fundamentals\_v2::pmr::cmatch**
- template<typename [\\_BidirectionalIterator](#) >  
using **std::experimental::fundamentals\_v2::pmr::match\_results**
- typedef [match\\_results](#)< string::const\_iterator > **std::experimental::fundamentals\_v2::pmr::smatch**
- typedef [match\\_results](#)< const wchar\_t \* > **std::experimental::fundamentals\_v2::pmr::wcmatch**
- typedef [match\\_results](#)< wstring::const\_iterator > **std::experimental::fundamentals\_v2::pmr::wsmatch**

### 7.637.1 Detailed Description

This is a TS C++ Library header.

## 7.638 [regex](#) File Reference

### Namespaces

- namespace [std](#)

### Macros

- #define [\\_GLIBCXX\\_REGEX](#)

## Typedefs

- using **std::pmr::cmatch**
- template<typename [\\_BidirectionalIterator](#) >  
using **std::pmr::match\_results**
- using **std::pmr::smatch**
- using **std::pmr::wcmatch**
- using **std::pmr::wsmatch**

### 7.638.1 Detailed Description

This is a Standard C++ Library header.

## 7.639 [scoped\\_allocator](#) File Reference

### Classes

- class [std::scoped\\_allocator\\_adaptor](#)< [\\_OuterAlloc](#), [\\_InnerAllocs](#) >

### Namespaces

- namespace [std](#)

### Macros

- #define [\\_SCOPED\\_ALLOCATOR](#)

### 7.639.1 Detailed Description

This is a Standard C++ Library header.

## 7.640 semaphore File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define __cpp_lib_semaphore`
- `#define _GLIBCXX_SEMAPHORE`

### Typedefs

- using `std::binary_semaphore`

#### 7.640.1 Detailed Description

This is a Standard C++ Library header.

## 7.641 debug/set File Reference

### Namespaces

- namespace [std](#)
- namespace [std::\\_\\_debug](#)

### Macros

- `#define _GLIBCXX_DEBUG_SET`

#### 7.641.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

## 7.642 experimental/set File Reference

### Namespaces

- namespace [std](#)
- namespace [std::experimental](#)

### Macros

- `#define _GLIBCXX_EXPERIMENTAL_SET`

### Typedefs

- `template<typename _Key, typename _Compare = less<_Key>>  
using std::experimental::fundamentals\_v2::pmr::multiset`
- `template<typename _Key, typename _Compare = less<_Key>>  
using std::experimental::fundamentals\_v2::pmr::set`

### Functions

- `template<typename _Key, typename _Compare, typename _Alloc, typename _Predicate >  
void std::experimental::erase\_if (multiset< _Key, _Compare, _Alloc > &__cont, _Predicate __pred)`
- `template<typename _Key, typename _Compare, typename _Alloc, typename _Predicate >  
void std::experimental::erase\_if (set< _Key, _Compare, _Alloc > &__cont, _Predicate __pred)`

### 7.642.1 Detailed Description

This is a TS C++ Library header.

## 7.643 set File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_SET`

### Typedefs

- `template<typename _Key, typename _Cmp = std::less<_Key>>  
using std::pmr::multiset`
- `template<typename _Key, typename _Cmp = std::less<_Key>>  
using std::pmr::set`

### Functions

- `template<typename _Key, typename _Compare, typename _Alloc, typename _Predicate >  
multiset<_Key, _Compare, _Alloc >::size_type std::erase_if (multiset<_Key, _Compare, _Alloc > &__cont,  
_Predicate __pred)`
- `template<typename _Key, typename _Compare, typename _Alloc, typename _Predicate >  
set<_Key, _Compare, _Alloc >::size_type std::erase_if (set<_Key, _Compare, _Alloc > &__cont, _Predicate  
__pred)`

### 7.643.1 Detailed Description

This is a Standard C++ Library header.

## 7.644 shared\_mutex File Reference

### Classes

- class [std::shared\\_lock<\\_Mutex >](#)
- class [std::shared\\_mutex](#)
- class [std::shared\\_timed\\_mutex](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define __cpp_lib_shared_mutex`
- `#define __cpp_lib_shared_timed_mutex`
- `#define _GLIBCXX_SHARED_MUTEX`

### 7.644.1 Detailed Description

This is a Standard C++ Library header.

## 7.645 source\_location File Reference

### Classes

- struct [std::source\\_location](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define __cpp_lib_source_location`
- `#define _GLIBCXX_SRCLOC`

#### 7.645.1 Detailed Description

This is a Standard C++ Library header.

## 7.646 span File Reference

### Namespaces

- namespace [std](#)
- namespace [std::\\_\\_detail](#)

### Macros

- `#define __cpp_lib_span`
- `#define _GLIBCXX_SPAN`

### Functions

- `template<typename _Type, size_t _Extent>`  
`span< const byte, _Extent==dynamic_extent ? dynamic_extent : _Extent *sizeof(_Type)> std::as_bytes (span< _Type, _Extent > __sp) noexcept`
- `template<typename _Type, size_t _Extent>`  
`requires (!is_const_v<_Type>)`  
`span< byte, _Extent==dynamic_extent ? dynamic_extent : _Extent *sizeof(_Type)> std::as_writable_bytes (span< _Type, _Extent > __sp) noexcept`
- `template<contiguous_iterator _Iter, typename _End >`  
`std::span (_Iter, _End) -> span< remove\_reference\_t< iter_reference_t< _Iter > > >`
- `template<ranges::contiguous_range _Range>`  
`std::span (_Range &&) -> span< remove\_reference\_t< ranges::range_reference_t< _Range & > > >`
- `template<typename _Type, size_t _ArrayExtent>`  
`std::span (_Type(&)[_ArrayExtent]) -> span< _Type, _ArrayExtent >`
- `template<typename _Type, size_t _ArrayExtent>`  
`std::span (array< _Type, _ArrayExtent > &) -> span< _Type, _ArrayExtent >`
- `template<typename _Type, size_t _ArrayExtent>`  
`std::span (const array< _Type, _ArrayExtent > &) -> span< const _Type, _ArrayExtent >`

## Variables

- `template<typename _Tp >`  
`constexpr bool std::__detail::__is_span`
- `template<typename _Tp, size_t _Num>`  
`constexpr bool std::__detail::__is_span< span< _Tp, _Num > >`
- `template<typename _Tp >`  
`constexpr bool std::__detail::__is_std_array`
- `constexpr size_t std::dynamic_extent`
- `template<typename _ElementType, size_t _Extent>`  
`constexpr bool std::ranges::enable_borrowed_range< span< _ElementType, _Extent > >`
- `template<typename _ElementType, size_t _Extent>`  
`constexpr bool std::ranges::enable_view< span< _ElementType, _Extent > >`

### 7.646.1 Detailed Description

This is a Standard C++ Library header.

## 7.647 sstream File Reference

### Classes

- class [std::basic\\_istringstream](#)< [\\_CharT](#), [\\_Traits](#), [\\_Alloc](#) >
- class [std::basic\\_ostringstream](#)< [\\_CharT](#), [\\_Traits](#), [\\_Alloc](#) >
- class [std::basic\\_stringbuf](#)< [\\_CharT](#), [\\_Traits](#), [\\_Alloc](#) >
- class [std::basic\\_stringstream](#)< [\\_CharT](#), [\\_Traits](#), [\\_Alloc](#) >

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_LVAL_REF_QUAL`
- `#define _GLIBCXX_SSTREAM`
- `#define _GLIBCXX_SSTREAM_ALWAYS_INLINE`

### Functions

- `template<class _CharT, class _Traits, class _Allocator >`  
`void std::swap (basic\_istringstream< \_CharT, \_Traits, \_Allocator > &__x, basic\_istringstream< \_CharT, \_Traits, \_Allocator > &__y)`
- `template<class _CharT, class _Traits, class _Allocator >`  
`void std::swap (basic\_ostringstream< \_CharT, \_Traits, \_Allocator > &__x, basic\_ostringstream< \_CharT, \_Traits, \_Allocator > &__y)`
- `template<class _CharT, class _Traits, class _Allocator >`  
`void std::swap (basic\_stringbuf< \_CharT, \_Traits, \_Allocator > &__x, basic\_stringbuf< \_CharT, \_Traits, \_Allocator > &__y) noexcept(noexcept(__x.swap(__y)))`
- `template<class _CharT, class _Traits, class _Allocator >`  
`void std::swap (basic\_stringstream< \_CharT, \_Traits, \_Allocator > &__x, basic\_stringstream< \_CharT, \_Traits, \_Allocator > &__y)`

### 7.647.1 Detailed Description

This is a Standard C++ Library header.

## 7.648 stack File Reference

### Macros

- `#define _GLIBCXX_STACK`

### 7.648.1 Detailed Description

This is a Standard C++ Library header.

## 7.649 stdatomic.h File Reference

### 7.649.1 Detailed Description

This is a Standard C++ Library header.

## 7.650 stdexcept File Reference

### Classes

- class [std::domain\\_error](#)
- class [std::invalid\\_argument](#)
- class [std::length\\_error](#)
- class [std::logic\\_error](#)
- class [std::out\\_of\\_range](#)
- class [std::overflow\\_error](#)
- class [std::range\\_error](#)
- class [std::runtime\\_error](#)
- class [std::underflow\\_error](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_STDEXCEPT`

### Typedefs

- typedef [basic\\_string](#)< char > [std::\\_\\_sso\\_string](#)

### 7.650.1 Detailed Description

This is a Standard C++ Library header.

## 7.651 stdlib.h File Reference

### 7.651.1 Detailed Description

This is a Standard C++ Library header.

## 7.652 stop\_token File Reference

### Classes

- struct [std::nostopstate\\_t](#)
- class [std::stop\\_callback<\\_Callback>](#)
- class [std::stop\\_source](#)
- class [std::stop\\_token](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define __cpp_lib_jthread`
- `#define _GLIBCXX_STOP_TOKEN`

### Functions

- `template<typename _Callback>`  
`std::stop_callback` ([stop\\_token](#), `_Callback`) -> `stop_callback<_Callback>`

### Variables

- `constexpr` [nostopstate\\_t](#) `std::nostopstate`

#### 7.652.1 Detailed Description

This is a Standard C++ Library header.

## 7.653 streambuf File Reference

### Classes

- class [std::basic\\_streambuf<\\_CharT, \\_Traits>](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBXX_STREAMBUF`
- `#define _IsUnused`

### Functions

- `template<typename _CharT, typename _Traits>`  
`streamsize` `std::copy_streambufs_eof` ([basic\\_streambuf<\\_CharT, \\_Traits>](#) \*`__sbin`, [basic\\_streambuf<\\_CharT, \\_Traits>](#) \*`__sbout`, `bool` &`__ineof`)
- `template<>` `streamsize` `std::copy_streambufs_eof` ([basic\\_streambuf<char>](#) \*`__sbin`, [basic\\_streambuf<char>](#) \*`__sbout`, `bool` &`__ineof`)
- `template<>` `streamsize` `std::copy_streambufs_eof` ([basic\\_streambuf<wchar\\_t>](#) \*`__sbin`, [basic\\_streambuf<wchar\\_t>](#) \*`__sbout`, `bool` &`__ineof`)

### 7.653.1 Detailed Description

This is a Standard C++ Library header.

## 7.654 debug/string File Reference

### Classes

- class [\\_\\_gnu\\_debug::basic\\_string<\\_CharT, \\_Traits, \\_Allocator>](#)
- struct [std::hash<\\_\\_gnu\\_debug::basic\\_string<\\_CharT>>](#)

### Namespaces

- namespace [\\_\\_gnu\\_debug](#)
- namespace [std](#)

### Macros

- `#define __glibcxx_check_string(_String)`
- `#define __glibcxx_check_string_constructor(_Str)`
- `#define __glibcxx_check_string_len(_String, _Len)`
- `#define __glibcxx_check_string_n_constructor(_Str, _Size)`

### 7.670.1 Detailed Description

This is a TS C++ Library header.

This header defines variable templates for the C++14 type traits.

Equivalent variable templates are defined in namespace `std` since C++17.

See also

[variable\\_templates](#)

Since

C++14

- `typedef __SIZE_TYPE__ std::size_t`

### Functions

- `constexpr bool std::__is_constant_evaluated () noexcept`
- `void std::__terminate () noexcept`

#### 7.690.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<version>`.

## 7.691 c++io.h File Reference

### Namespaces

- namespace [std](#)

### Typedefs

- `typedef FILE std::__c_file`
- `typedef __gthread_mutex_t std::__c_lock`

#### 7.691.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ios>`.

## 7.692 c++locale.h File Reference

### Namespaces

- namespace [std](#)

## Macros

- `#define _GLIBCXX_C_LOCALE_GNU`
- `#define _GLIBCXX_NUM_CATEGORIES`

## Typedefs

- `typedef __locale_t std::__c_locale`

## Functions

- `int std::__convert_from_v (const __c_locale &__cloc, char *__out, const int __size, const char *__fmt,...)`

### 7.692.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 7.693 `c++locale_internal.h` File Reference

### Namespaces

- namespace [std](#)

### Functions

- Catalogs & `std::get_catalogs ()`

### 7.693.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 7.694 `parallel/compatibility.h` File Reference

### Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

### Functions

- `template<typename _Tp >`  
`_Tp __gnu_parallel::__add_omp (volatile _Tp *__ptr, _Tp __addend)`
- `template<typename _Tp >`  
`bool __gnu_parallel::__cas_omp (volatile _Tp *__ptr, _Tp __comparand, _Tp __replacement)`

`_Tp __gnu_parallel::__fetch_and_add (volatile _Tp *__ptr, _Tp __addend)`
- `void __gnu_parallel::__yield ()`

### 7.694.1 Detailed Description

Compatibility layer, mostly concerned with atomic operations.

This file is a GNU parallel extension to the Standard C++ Library and contains implementation details for the library's internal use.

## 7.695 x86\_64-pc-linux-gnu/bits/compatibility.h File Reference

### 7.695.1 Detailed Description

This is an internal header file, included by other library sources. You should not attempt to use it directly.

## 7.696 cpu\_defines.h File Reference

### 7.696.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

## 7.697 ctype\_base.h File Reference

### Classes

- struct [std::ctype\\_base](#)

### Namespaces

- namespace [std](#)

### 7.697.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 7.698 ctype\_inline.h File Reference

### Namespaces

- namespace [std](#)

### 7.698.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 7.699 cxxabi\_tweaks.h File Reference

### Macros

- `#define _GLIBCXX_CXA_VEC_CTOR_RETURN(x)`
- `#define _GLIBCXX_GUARD_BIT`
- `#define _GLIBCXX_GUARD_PENDING_BIT`
- `#define _GLIBCXX_GUARD_SET(x)`
- `#define _GLIBCXX_GUARD_TEST(x)`
- `#define _GLIBCXX_GUARD_WAITING_BIT`

### Typedefs

- `typedef void __cxxabiv1::__cxa_cdtor_return_type`
- `typedef void __cxxabiv1::__cxa_vec_ctor_return_type`

## Variables

- `__extension__` typedef int `__cxxabiv1::__guard`

### 7.699.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<cxxabi.h>`.

## 7.700 `error_constants.h` File Reference

### Namespaces

- namespace [std](#)

### Enumerations
