4.409.3.3 `template<typename _CharT> virtual char std::__ctype_abstract_base<_CharT>::do_narrow (char_type __c, char __dfault) const` [protected], [pure virtual]

Narrow char_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See [codecvt](#) for that.

Parameters

<code>__c</code>	The char_type to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted char.

Implemented in [std::ctype< wchar_t >](#), [std::ctype< _CharT >](#), and [std::ctype< char_type >](#).

Referenced by `std::__ctype_abstract_base< wchar_t >::narrow()`, and `std::ctype< char >::narrow()`.

4.409.3.4 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base< _CharT >::do_narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const` [protected], [pure virtual]

Narrow `char_type` array to `char`.

This virtual function converts each `char_type` in the range `[__lo, __hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implemented in [std::ctype< wchar_t >](#), [std::ctype< _CharT >](#), and [std::ctype< char_type >](#).

4.409.3.5 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base< _CharT >::do_scan_is (mask __m, const char_type * __lo, const char_type * __hi) const` [protected], [pure virtual]

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo, __hi)` for which `is(__m, c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else __hi.

Implemented in [std::ctype<wchar_t>](#), [std::ctype<_CharT>](#), and [std::ctype<char_type>](#).

Referenced by [std::__ctype_abstract_base<wchar_t>::narrow\(\)](#), and [std::__ctype_abstract_base<wchar_t>::scan_is\(\)](#).

4.409.3.6 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base<_CharT>::do_scan_not (mask __m, const char_type* __lo, const char_type* __hi) const` [protected], [pure virtual]

Find char_type not matching mask.

This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __hi.

Implemented in [std::ctype<wchar_t>](#), [std::ctype<_CharT>](#), and [std::ctype<char_type>](#).

Referenced by [std::__ctype_abstract_base<wchar_t>::narrow\(\)](#), and [std::__ctype_abstract_base<wchar_t>::scan_not\(\)](#).

4.409.3.7 `template<typename _CharT> virtual char_type std::__ctype_abstract_base<_CharT>::do_tolower (char_type __c) const` [protected], [pure virtual]

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

\leftrightarrow _c	The char_type to convert.
-------------------------	---------------------------

Returns

The lowercase char_type if convertible, else __c.

Implemented in [std::ctype< wchar_t >](#), [std::ctype< _CharT >](#), and [std::ctype< char_type >](#).

Referenced by [std::__ctype_abstract_base< wchar_t >::narrow\(\)](#), [std::ctype< char >::table\(\)](#), [std::__ctype_abstract_base< wchar_t >::tolower\(\)](#), and [std::ctype< char >::tolower\(\)](#).

4.409.3.8 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base< _CharT >::do_tolower (char_type * __lo, const char_type * __hi) const` [protected], [pure virtual]

Convert array to lowercase.

This virtual function converts each char_type in the range [[__lo](#),[__hi](#)) to lowercase if possible. Other elements remain untouched.

[do_tolower\(\)](#) is a hook for a derived facet to change the behavior of lowercasing. [do_tolower\(\)](#) must always return the same result for the same input.

Parameters

\leftrightarrow _lo	Pointer to start of range.
\leftrightarrow _hi	Pointer to end of range.

Returns

[__hi](#).

Implemented in [std::ctype< wchar_t >](#), [std::ctype< _CharT >](#), and [std::ctype< char_type >](#).

4.409.3.9 `template<typename _CharT> virtual char_type std::__ctype_abstract_base< _CharT >::do_toupper (char_type __c) const` [protected], [pure virtual]

Convert to uppercase.

This virtual function converts the char_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

[do_toupper\(\)](#) is a hook for a derived facet to change the behavior of uppercasing. [do_toupper\(\)](#) must always return the same result for the same input.

Parameters

\leftrightarrow _c	The char_type to convert.
-------------------------	---------------------------

Returns

The uppercase char_type if convertible, else __c.

Implemented in [std::ctype<wchar_t>](#), [std::ctype<_CharT>](#), and [std::ctype<char_type>](#).

Referenced by [std::__ctype_abstract_base<wchar_t>::narrow\(\)](#), [std::ctype<char>::table\(\)](#), [std::__ctype_abstract_base<wchar_t>::toupper\(\)](#), and [std::ctype<char>::toupper\(\)](#).

4.409.3.10 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base<_CharT>::do_toupper (char_type * __lo, const char_type * __hi) const` [protected], [pure virtual]

Convert array to uppercase.

This virtual function converts each char_type in the range [`__lo`,`__hi`) to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

\leftrightarrow __lo	Pointer to start of range.
\leftrightarrow __hi	Pointer to end of range.

Returns

`__hi`.

Implemented in [std::ctype<wchar_t>](#), [std::ctype<_CharT>](#), and [std::ctype<char_type>](#).

4.409.3.11 `template<typename _CharT> virtual char_type std::__ctype_abstract_base<_CharT>::do_widen (char __c) const` [protected], [pure virtual]

Widen char.

This virtual function converts the char to char_type using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>_↵</code>	The char to convert.
<code>_c</code>	

Returns

The converted `char_type`

Implemented in [std::ctype< wchar_t >](#), [std::ctype< _CharT >](#), and [std::ctype< char_type >](#).

Referenced by `std::__ctype_abstract_base< wchar_t >::narrow()`, `std::__ctype_abstract_base< wchar_t >::widen()`, and `std::ctype< char >::widen()`.

```
4.409.3.12 template<typename _CharT> virtual const char* std::__ctype_abstract_base< _CharT >::do_widen ( const char
* __lo, const char * __hi, char_type * __to ) const [protected], [pure virtual]
```

Widen char array.

This function converts each char in the input to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>_↵</code> <code>_lo</code>	Pointer to start range.
<code>_↵</code> <code>_hi</code>	Pointer to end of range.
<code>_↵</code> <code>_to</code>	Pointer to the destination array.

Returns

`__hi`.

Implemented in [std::ctype< wchar_t >](#), [std::ctype< _CharT >](#), and [std::ctype< char_type >](#).

```
4.409.3.13 template<typename _CharT> bool std::__ctype_abstract_base< _CharT >::is ( mask __m, char_type __c )
const [inline]
```

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_↵ type>::do_is()`.

Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0.`

Definition at line 162 of file locale_facets.h.

Referenced by `std::ctype<char>::is()`, `std::isalnum()`, `std::isalpha()`, `std::iscntrl()`, `std::isdigit()`, `std::isgraph()`, `std::islower()`, `std::isprint()`, `std::ispunct()`, `std::isspace()`, `std::isupper()`, and `std::isxdigit()`.

4.409.3.14 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is (const char_type * __lo, const char_type * __hi, mask * __vec) const [inline]`

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi.`

Definition at line 179 of file locale_facets.h.

4.409.3.15 `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow (char_type __c, char __dfault) const [inline]`

Narrow char_type to char.

This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file `locale_facets.h`.

```
4.409.3.16 template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::narrow ( const
char_type * __lo, const char_type * __hi, char __dfault, char * __to ) const [inline]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, `dfault` is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 346 of file `locale_facets.h`.

```
4.409.3.17 template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_is ( mask __m,
const char_type * __lo, const char_type * __hi ) const [inline]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to matching char_type if found, else __hi.

Definition at line 195 of file locale_facets.h.

Referenced by std::ctype<char>::is().

4.409.3.18 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not (mask __m,
const char_type * __lo, const char_type * __hi) const [inline]`

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to non-matching char if found, else __hi.

Definition at line 211 of file locale_facets.h.

Referenced by std::ctype<char>::scan_is().

4.409.3.19 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower (char_type __c)
const [inline]`

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The lowercase `char_type` if convertible, else `__c`.

Definition at line 254 of file `locale_facets.h`.

Referenced by `std::tolower()`.

4.409.3.20 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower (char_type
*__lo, const char_type * __hi) const [inline]`

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 269 of file `locale_facets.h`.

4.409.3.21 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper (char_type __c)
const [inline]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

Referenced by `std::toupper()`.

4.409.3.22 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper (char_type
* __lo, const char_type * __hi) const [inline]`

Convert array to uppercase.

This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>::do_toupper(lo, hi).

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 240 of file locale_facets.h.

4.409.3.23 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen (char __c) const
[inline]`

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

4.409.3.24 `template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen (const char * __lo,
const char * __hi, char_type * __to) const [inline]`

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>_↔ _lo</code>	Pointer to start of range.
<code>_↔ _hi</code>	Pointer to end of range.
<code>_↔ _to</code>	Pointer to the destination array.

Returns

`__hi`.

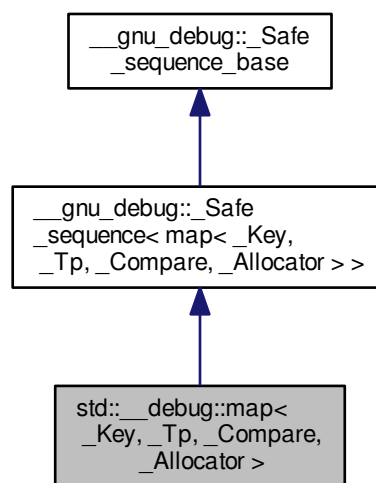

Definition at line 305 of file `locale_facets.h`.

4.410.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp>>>
class std::__debug::map<_Key, _Tp, _Compare, _Allocator >
```

Class std::map with safety/checking/debug instrumentation.

Definition at line 43 of file debug/map.h.

4.410.2 Member Function Documentation

4.410.2.1 void __gnu_debug::Safe_sequence_base::M_attach (_Safe_iterator_base * __it, bool __constant)
[inherited]

Attach an iterator to this sequence.

4.410.2.2 void __gnu_debug::Safe_sequence_base::M_attach_single (_Safe_iterator_base * __it, bool __constant) throw)
[inherited]

Likewise but not thread safe.

4.410.2.3 void __gnu_debug::Safe_sequence_base::M_detach (_Safe_iterator_base * __it) [inherited]

Detach an iterator from this sequence

4.410.2.4 void __gnu_debug::Safe_sequence_base::M_detach_all () [protected], [inherited]

Detach all iterators, leaving them singular.

4.410.2.5 void __gnu_debug::Safe_sequence_base::M_detach_single (_Safe_iterator_base * __it) throw)
[inherited]

Likewise but not thread safe.

4.410.2.6 void __gnu_debug::Safe_sequence_base::M_detach_singular () [protected], [inherited]

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.410.2.7 __gnu_cxx::mutex& __gnu_debug::Safe_sequence_base::M_get_mutex () throw) [protected],
[inherited]

For use in _Safe_sequence.

4.410.2.8 void __gnu_debug::Safe_sequence_base::M_invalidate_all() const [inline],[inherited]

Invalidates all iterators.

Definition at line 242 of file safe_base.h.

References __gnu_debug::Safe_iterator_base::M_attach(), __gnu_debug::Safe_iterator_base::M_attach_single(), __gnu_debug::Safe_iterator_base::M_detach(), and __gnu_debug::Safe_iterator_base::M_detach_single().

4.410.2.9 void __gnu_debug::Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::M_invalidate_if(_Predicate __pred) [inherited]

Invalidates all iterators *x* that reference this sequence, are not singular, and for which __pred(*x*) returns true. __pred will be invoked with the normal iterators nested in the safe ones.

4.410.2.10 void __gnu_debug::Safe_sequence_base::M_revalidate_singular() [protected],[inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.410.2.11 void __gnu_debug::Safe_sequence_base::M_swap(_Safe_sequence_base & __x) [protected],[inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.410.2.12 void __gnu_debug::Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::M_transfer_from_if(_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > > & __from, _Predicate __pred) [inherited]

Transfers all iterators *x* that reference *from* sequence, are not singular, and for which __pred(*x*) returns true. __pred will be invoked with the normal iterators nested in the safe ones.

4.410.3 Member Data Documentation

4.410.3.1 _Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_const_iterators [inherited]

The list of constant iterators that reference this container.

Definition at line 184 of file safe_base.h.

4.410.3.2 _Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_iterators [inherited]

The list of mutable iterators that reference this container.

Definition at line 181 of file safe_base.h.

4.410.3.3 `unsigned int __gnu_debug::Safe_sequence_base::M_version` [mutable],[inherited]

The container version number. This number may never be 0.

Definition at line 187 of file `safe_base.h`.

4.411.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp>>>
class std::__debug::multimap< _Key, _Tp, _Compare, _Allocator >
```

Class std::multimap with safety/checking/debug instrumentation.

Definition at line 43 of file debug/multimap.h.

4.411.2 Member Function Documentation

4.411.2.1 [void](#) [__gnu_debug::Safe_sequence_base::M_attach](#) ([_Safe_iterator_base](#) * __it, [bool](#) __constant)
[[inherited](#)]

Attach an iterator to this sequence.

4.411.2.2 void __gnu_debug::Safe_sequence_base::M_attach_single (_Safe_iterator_base * __it, bool __constant) throw)
[inherited]

Likewise but not thread safe.

4.411.2.3 void __gnu_debug::Safe_sequence_base::M_detach (_Safe_iterator_base * __it) [inherited]

Detach an iterator from this sequence

4.411.2.4 void __gnu_debug::Safe_sequence_base::M_detach_all () [protected],[inherited]

Detach all iterators, leaving them singular.

4.411.2.5 void __gnu_debug::Safe_sequence_base::M_detach_single (_Safe_iterator_base * __it) throw)
[inherited]

Likewise but not thread safe.

4.411.2.6 void __gnu_debug::Safe_sequence_base::M_detach_singular () [protected],[inherited]

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.411.2.7 __gnu_cxx::mutex& __gnu_debug::Safe_sequence_base::M_get_mutex () throw) [protected],
[inherited]

For use in _Safe_sequence.

4.411.2.8 void __gnu_debug::Safe_sequence_base::M_invalidate_all () const [inline],[inherited]

Invalidates all iterators.

Definition at line 242 of file safe_base.h.

References __gnu_debug::Safe_iterator_base::M_attach(), __gnu_debug::Safe_iterator_base::M_attach_single(),
__gnu_debug::Safe_iterator_base::M_detach(), and __gnu_debug::Safe_iterator_base::M_detach_single().

4.411.2.9 void __gnu_debug::Safe_sequence< multimap< _Key, _Tp, _Compare, _Allocator > >::M_invalidate_if (
_Predicate __pred) [inherited]

Invalidates all iterators x that reference this sequence, are not singular, and for which __pred(x) returns true.
__pred will be invoked with the normal iterators nested in the safe ones.

4.411.2.10 void __gnu_debug::Safe_sequence_base::M_revalidate_singular () [protected],[inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.411.2.11 void __gnu_debug::Safe_sequence_base::M_swap (_Safe_sequence_base & __x) [protected],[inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.411.2.12 void __gnu_debug::Safe_sequence<multimap<_Key,_Tp,_Compare,_Allocator>>::M_transfer_from_if (_Safe_sequence<multimap<_Key,_Tp,_Compare,_Allocator>> & __from, _Predicate __pred) [inherited]

Transfers all iterators *x* that reference *from* sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

4.411.3 Member Data Documentation

4.411.3.1 _Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_const_iterators [inherited]

The list of constant iterators that reference this container.

Definition at line 184 of file safe_base.h.

4.411.3.2 _Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_iterators [inherited]

The list of mutable iterators that reference this container.

Definition at line 181 of file safe_base.h.

4.411.3.3 unsigned int __gnu_debug::Safe_sequence_base::M_version [mutable],[inherited]

The container version number. This number may never be 0.

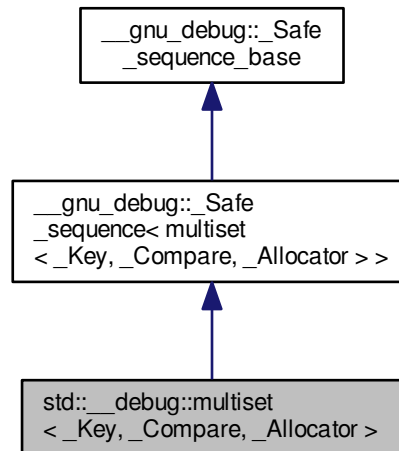

Definition at line 187 of file safe_base.h.

[inherited]

Attach an iterator to this sequence.

4.413.2.2 void [__gnu_debug::Safe_sequence_base::M_attach_single](#) ([_Safe_iterator_base](#) * __it, bool __constant) throw()
[inherited]

Likewise but not thread safe.

4.413.2.3 void __gnu_debug::Safe_sequence_base::M_detach (_Safe_iterator_base * __it) [inherited]

Detach an iterator from this sequence

4.413.2.4 void __gnu_debug::Safe_sequence_base::M_detach_all () [protected],[inherited]

Detach all iterators, leaving them singular.

4.413.2.5 void __gnu_debug::Safe_sequence_base::M_detach_single (_Safe_iterator_base * __it) throw)
[inherited]

Likewise but not thread safe.

4.413.2.6 void __gnu_debug::Safe_sequence_base::M_detach_singular () [protected],[inherited]

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.413.2.7 __gnu_cxx::mutex& __gnu_debug::Safe_sequence_base::M_get_mutex () throw) [protected],
[inherited]

For use in _Safe_sequence.

4.413.2.8 void __gnu_debug::Safe_sequence_base::M_invalidate_all () const [inline],[inherited]

Invalidates all iterators.

Definition at line 242 of file safe_base.h.

References __gnu_debug::Safe_iterator_base::M_attach(), __gnu_debug::Safe_iterator_base::M_attach_single(), __gnu_debug::Safe_iterator_base::M_detach(), and __gnu_debug::Safe_iterator_base::M_detach_single().

4.413.2.9 void __gnu_debug::Safe_sequence< set< _Key, _Compare, _Allocator > >::M_invalidate_if (_Predicate
__pred) [inherited]

Invalidates all iterators x that reference this sequence, are not singular, and for which __pred(x) returns true. __pred will be invoked with the normal iterators nested in the safe ones.

4.413.2.10 void __gnu_debug::Safe_sequence_base::M_revalidate_singular () [protected],[inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.413.2.11 void __gnu_debug::_Safe_sequence_base::_M_swap (_Safe_sequence_base & __x) [protected],
[inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.413.2.12 void __gnu_debug::_Safe_sequence<set<_Key, _Compare, _Allocator >>::_M_transfer_from_if (
_Safe_sequence<set<_Key, _Compare, _Allocator >> & __from, _Predicate __pred) [inherited]

Transfers all iterators *x* that reference *from* sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

4.413.3 Member Data Documentation

4.413.3.1 _Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]

The list of constant iterators that reference this container.

Definition at line 184 of file `safe_base.h`.

4.413.3.2 _Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]

The list of mutable iterators that reference this container.

Definition at line 181 of file `safe_base.h`.

4.413.3.3 unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable],[inherited]

The container version number. This number may never be 0.

Definition at line 187 of file `safe_base.h`.

4.416 std::__detail::_Default_ranged_hash Struct Reference

4.416.1 Detailed Description

Default ranged hash function H. In principle it should be a function object composed from objects of type H1 and H2 such that $h(k, N) = h2(h1(k), N)$, but that would mean making extra copies of h1 and h2. So instead we'll just use a tag to tell class template hashtable to do that composition.

Definition at line 457 of file hashtable_policy.h.

4.425 `std::__detail::_Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __cache_hash_code >` Struct Template Reference

4.425.1 Detailed Description

```
template<typename _Key, typename _Value, typename _ExtractKey, typename _H1, typename _H2, typename _Hash, bool __cache_hash_code↵
hash_code>
struct std::__detail::_Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __cache_hash_code >
```

Primary class template `_Hash_code_base`.

Encapsulates two policy issues that aren't quite orthogonal. (1) the difference between using a ranged hash function and using the combination of a hash function and a range-hashing function. In the former case we don't have such things as hash codes, so we have a dummy type as placeholder. (2) Whether or not we cache hash codes. Caching hash codes is meaningless if we have a ranged hash function.

We also put the key extraction objects here, for convenience. Each specialization derives from one or more of the template parameters to benefit from Ebo. This is important as this type is inherited in some cases by the `_Local_iterator_base` type used to implement `local_iterator` and `const_local_iterator`. As with any iterator type we prefer to make it as small as possible.

Primary template is unused except as a hook for specializations.

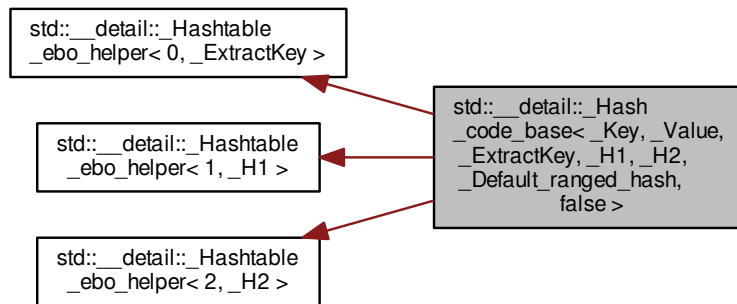

Definition at line 1057 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

4.434.1 Detailed Description

```
template<typename _NodeAlloc>
struct std::__detail::__Hashtable_alloc< _NodeAlloc >
```

This type deals with all allocation and keeps an allocator instance through inheritance to benefit from EBO when possible.

Definition at line 106 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

- [hashtable_policy.h](#)

4.435.1 Detailed Description

template<typename _Key, typename _Value, typename _ExtractKey, typename _Equal, typename _H1, typename _H2, typename _Hash, typename _Traits>

struct std::__detail::__Hashtable_base< _Key, _Value, _ExtractKey, _Equal, _H1, _H2, _Hash, _Traits >

Primary class template `_Hashtable_base`.

Helper class adding management of `_Equal` functor to `_Hash_code_base` type.

Base class templates are:

- `__detail::__Hash_code_base`
- `__detail::__Hashtable_ebo_helper`

Definition at line 58 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

- [hashtable_policy.h](#)

4.436 std::__detail::_Hashtable_ebo_helper< _Nm, _Tp, __use_ebo > Struct Template Reference

4.436.1 Detailed Description

```
template<int _Nm, typename _Tp, bool __use_ebo = !_is_final(_Tp) && __is_empty(_Tp)>
struct std::__detail::_Hashtable_ebo_helper< _Nm, _Tp, __use_ebo >
```

Primary class template _Hashtable_ebo_helper.

Helper class using EBO when it is not forbidden (the type is not final) and when it is worth it (the type is empty.)

Definition at line 977 of file hashtable_policy.h.

The documentation for this struct was generated from the following file:

- [hashtable_policy.h](#)

- `using __unique_keys = __bool_constant< _Unique_keys >`

4.439.1 Detailed Description

```
template<bool _Cache_hash_code, bool _Constant_iterators, bool _Unique_keys>
struct std::__detail::_Hashtable_traits< _Cache_hash_code, _Constant_iterators, _Unique_keys >
```

`struct _Hashtable_traits`

Important traits for hash tables.

Template Parameters

<code>_Cache_hash_code</code>	Boolean value. True if the value of the hash function is stored along with the value. This is a time-space tradeoff. Storing it may improve lookup speed by reducing the number of times we need to call the <code>_Equal</code> function.
<code>_Constant_iterators</code>	Boolean value. True if iterator and <code>const_iterator</code> are both constant iterator types. This is true for <code>unordered_set</code> and <code>unordered_multiset</code> , false for <code>unordered_map</code> and <code>unordered_multimap</code> .
<code>_Unique_keys</code>	Boolean value. True if the return value of <code>_Hashtable::count(k)</code> is always at most one, false if it may be an arbitrary number. This is true for <code>unordered_set</code> and <code>unordered_map</code> , false for <code>unordered_multiset</code> and <code>unordered_multimap</code> .

4.449.1 Detailed Description

```
template<typename _Key, typename _Value, typename _ExtractKey, typename _H1, typename _H2, typename _Hash>
struct std::__detail::__Local_iterator_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, true >
```

Partial specialization used when nodes contain a cached hash code.

Definition at line 1344 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

- [hashtable_policy.h](#)

4.450 `std::__detail::__Map_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >` Struct Template Reference

Inheritance diagram for `std::__detail::__Map_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >`:

4.450.1 Detailed Description

```
template<typename _Key, typename _Value, typename _Alloc, typename _ExtractKey, typename _Equal, typename _H1, typename _H2,
typename _Hash, typename _RehashPolicy, typename _Traits, bool _Unique_keys = _Traits::__unique_keys::value>
struct std::__detail::_Map_base<_Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >
```

Primary class template `_Map_base`.

If the hashtable has a value type of the form `pair<T1, T2>` and a key extraction policy (`_ExtractKey`) that returns the first part of the pair, the hashtable gets a `mapped_type` typedef. If it satisfies those criteria and also has unique keys, then it also gets an operator[].

Definition at line 532 of file `hashtable_policy.h`.

4.460.1 Detailed Description

```
template<typename _CharT>
class std::__detail::_Scanner<_CharT>
```

Scans an input range for regex tokens.

The `_Scanner` class interprets the regular expression pattern in the input range passed to its constructor as a sequence of parse tokens passed to the regular expression compiler. The sequence of tokens provided depends on the flag settings passed to the constructor: different regular expression grammars will interpret the same input pattern in syntactically different ways.

Definition at line 201 of file `regex_scanner.h`.

4.460.2 Member Enumeration Documentation

4.460.2.1 enum std::__detail::_ScannerBase::_TokenT [inherited]

Token types returned from the scanner.

4.469.1 Detailed Description

```
template<typename _Tp, typename _Alloc>
class std::_Deque_base<_Tp, _Alloc>
```

Deque base class. This class provides the unified face for deque's allocation. This class's constructor and destructor allocate and deallocate (but do not initialize) storage. This makes exception safety easier.

Nothing in this class ever constructs or destroys an actual Tp element. (Deque handles that itself.) Only/All memory management is performed here.

Definition at line 444 of file stl_deque.h.

4.469.2 Member Function Documentation

4.469.2.1 `template<typename _Tp, typename _Alloc> void std::_Deque_base<_Tp, _Alloc>::_M_initialize_map (size_t __num_elements)` [protected]

Layout storage.

Parameters

<code>__num_elements</code>	The count of T's for which to allocate space at first.
-----------------------------	--

Returns

Nothing.

The initial underlying memory layout is a bit complicated...

Definition at line 587 of file `stl_deque.h`.

References `std::max()`.

4.470.1 Detailed Description

```
template<typename _Tp, typename _Ref, typename _Ptr>
struct std::_Deque_iterator< _Tp, _Ref, _Ptr >
```

A deque::iterator.

Quite a bit of intelligence here. Much of the functionality of deque is actually passed off to this class. A deque holds two of these internally, marking its valid range. Access to elements is done as offsets of either of those two, relying on operator overloading in this class.

All the functions are op overloads except for _M_set_node.

Definition at line 106 of file stl_deque.h.

4.470.2 Member Function Documentation

4.470.2.1 `template<typename _Tp, typename _Ref, typename _Ptr> void std::_Deque_iterator< _Tp, _Ref, _Ptr >::_M_set_node (_Map_pointer __new_node) [inline], [noexcept]`

Prepares to traverse new_node. Sets everything except _M_cur, which should therefore be set by the caller immediately afterwards, based on _M_first and _M_last.

Definition at line 238 of file stl_deque.h.

4.480.1 Detailed Description

```
template<typename _Key, typename _Value, typename _Alloc, typename _ExtractKey, typename _Equal, typename _H1, typename _H2,
typename _Hash, typename _RehashPolicy, typename _Traits>
class std::_Hashtable<_Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits >
```

Primary class template `_Hashtable`.

Template Parameters

<code>_Value</code>	CopyConstructible type.
<code>_Key</code>	CopyConstructible type.
<code>_Alloc</code>	An allocator type ([lib.allocator.requirements]) whose <code>_Alloc::value_type</code> is <code>_Value</code> . As a conforming extension, we allow for <code>_Alloc::value_type != _Value</code> .
<code>_ExtractKey</code>	Function object that takes an object of type <code>_Value</code> and returns a value of type <code>_Key</code> .
<code>_Equal</code>	Function object that takes two objects of type <code>k</code> and returns a bool-like value that is true if the two objects are considered equal.
<code>_H1</code>	The hash function. A unary function object with argument type <code>_Key</code> and result type <code>size_t</code> . Return values should be distributed over the entire range <code>[0, numeric_limits<size_t>:max()]</code> .
<code>_H2</code>	The range-hashing function (in the terminology of Tavori and Dreizin). A binary function object whose argument types and result type are all <code>size_t</code> . Given arguments <code>r</code> and <code>N</code> , the return value is in the range <code>[0, N)</code> .
<code>_Hash</code>	The ranged hash function (Tavori and Dreizin). A binary function whose argument types are <code>_Key</code> and <code>size_t</code> and whose result type is <code>size_t</code> . Given arguments <code>k</code> and <code>N</code> , the return value is in the range <code>[0, N)</code> . Default: <code>hash(k, N) = h2(h1(k), N)</code> . If <code>_Hash</code> is anything other than the default, <code>_H1</code> and <code>_H2</code> are ignored.
<code>_RehashPolicy</code>	Policy class with three members, all of which govern the bucket count. <code>_M_next_bkt(n)</code> returns a bucket count no smaller than <code>n</code> . <code>_M_bkt_for_elements(n)</code> returns a bucket count appropriate for an element count of <code>n</code> . <code>_M_need_rehash(n_bkt, n_elt, n_ins)</code> determines whether, if the current bucket count is <code>n_bkt</code> and the current element count is <code>n_elt</code> , we need to increase the bucket count. If so, returns <code>make_pair(true, n)</code> , where <code>n</code> is the new bucket count. If not, returns <code>make_pair(false, <anything>)</code>
<code>_Traits</code>	Compile-time class with three boolean <code>std::integral_constant</code> members: <code>__cache_hash_code</code> , <code>__constant_iterators</code> , <code>__unique_keys</code> .

Each `_Hashtable` data structure has:

- `_Bucket[] _M_buckets`
- `_Hash_node_base _M_before_begin`
- `size_type _M_bucket_count`
- `size_type _M_element_count`

with `_Bucket` being `_Hash_node*` and `_Hash_node` containing:

- `_Hash_node* _M_next`

- `Tp _M_value`
- `size_t _M_hash_code` if `cache_hash_code` is true

In terms of Standard containers the hashtable is like the aggregation of:

- `std::forward_list<_Node>` containing the elements
- `std::vector<std::forward_list<_Node>::iterator>` representing the buckets

The non-empty buckets contain the node before the first node in the bucket. This design makes it possible to implement something like `std::forward_list::insert_after` on container insertion and `std::forward_list::erase_after` on container erase calls. `_M_before_begin` is equivalent to `std::forward_list::before_begin`. Empty buckets contain `nullptr`. Note that one of the non-empty buckets contains `&_M_before_begin` which is not a dereferenceable node so the node pointer in a bucket shall never be dereferenced, only its next node can be.

Walking through a bucket's nodes requires a check on the hash code to see if each node is still in the bucket. Such a design assumes a quite efficient hash functor and is one of the reasons it is highly advisable to set `__cache_hash_code` to true.

The container iterators are simply built from nodes. This way incrementing the iterator is perfectly efficient independent of how many empty buckets there are in the container.

On insert we compute the element's hash code and use it to find the bucket index. If the element must be inserted in an empty bucket we add it at the beginning of the singly linked list and make the bucket point to `_M_before_begin`. The bucket that used to point to `_M_before_begin`, if any, is updated to point to its new before begin node.

On erase, the simple iterator design requires using the hash functor to get the index of the bucket to update. For this reason, when `__cache_hash_code` is set to false the hash functor must not throw and this is enforced by a static assertion.

Functionality is implemented by decomposition into base classes, where the derived `_Hashtable` class is used in `_Map_base`, `_Insert`, `_Rehash_base`, and `_Equality` base classes to access the "this" pointer. `_Hashtable_base` is used in the base classes as a non-recursive, fully-completed-type so that detailed nested type information, such as iterator type and node type, can be used. This is similar to the "Curiously Recurring Template Pattern" (CRTP) technique, but uses a reconstructed, not explicitly passed, template pattern.

Base class templates are:

- `__detail::_Hashtable_base`
- `__detail::_Map_base`
- `__detail::_Insert`
- `__detail::_Rehash_base`
- `__detail::_Equality`

4.489.1 Detailed Description

```
template<typename _Tp>
class std::allocator<_Tp>
```

The *standard* allocator, as per [20.4].

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt04ch11.html> for further details.

Template Parameters

<code>_Tp</code>	Type of allocated object.
------------------	---------------------------

Definition at line 92 of file `allocator.h`.

The documentation for this class was generated from the following file:

4.492.1 Detailed Description

```
template<typename _Alloc>
struct std::allocator_traits<_Alloc>
```

Uniform interface to all allocator types.

Definition at line 80 of file bits/alloc_traits.h.

4.492.2 Member Typedef Documentation

4.492.2.1 template<typename _Alloc> typedef _Alloc std::allocator_traits<_Alloc>::allocator_type

The allocator type.

Definition at line 83 of file bits/alloc_traits.h.

4.492.2.2 template<typename _Alloc> typedef __const_pointer std::allocator_traits<_Alloc>::const_pointer

The allocator's const pointer type.

`Alloc::const_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<const value_type>`

Definition at line 113 of file bits/alloc_traits.h.

4.492.2.3 template<typename _Alloc> typedef __const_void_pointer std::allocator_traits<_Alloc>::const_void_pointer

The allocator's const void pointer type.

`Alloc::const_void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<const void>`

Definition at line 135 of file bits/alloc_traits.h.

4.492.2.4 template<typename _Alloc> typedef __difference_type std::allocator_traits<_Alloc>::difference_type

The allocator's difference type.

`Alloc::difference_type` if that type exists, otherwise `pointer_traits<pointer>::difference_type`

Definition at line 146 of file bits/alloc_traits.h.

4.492.2.5 template<typename _Alloc> typedef __pointer std::allocator_traits<_Alloc>::pointer

The allocator's pointer type.

`Alloc::pointer` if that type exists, otherwise `value_type*`

Definition at line 102 of file bits/alloc_traits.h.

4.492.2.6 `template<typename _Alloc> typedef __propagate_on_container_copy_assignment std::allocator_traits< _Alloc >::propagate_on_container_copy_assignment`

How the allocator is propagated on copy assignment.

`Alloc::propagate_on_container_copy_assignment` if that type exists, otherwise `false_type`

Definition at line 169 of file `bits/alloc_traits.h`.

4.492.2.7 `template<typename _Alloc> typedef __propagate_on_container_move_assignment std::allocator_traits< _Alloc >::propagate_on_container_move_assignment`

How the allocator is propagated on move assignment.

`Alloc::propagate_on_container_move_assignment` if that type exists, otherwise `false_type`

Definition at line 181 of file `bits/alloc_traits.h`.

4.492.2.8 `template<typename _Alloc> typedef __propagate_on_container_swap std::allocator_traits< _Alloc >::propagate_on_container_swap`

How the allocator is propagated on swap.

`Alloc::propagate_on_container_swap` if that type exists, otherwise `false_type`

Definition at line 192 of file `bits/alloc_traits.h`.

4.492.2.9 `template<typename _Alloc> typedef __size_type std::allocator_traits< _Alloc >::size_type`

The allocator's size type.

`Alloc::size_type` if that type exists, otherwise `make_unsigned<difference_type>::type`

Definition at line 157 of file `bits/alloc_traits.h`.

4.492.2.10 `template<typename _Alloc> typedef _Alloc::value_type std::allocator_traits< _Alloc >::value_type`

The allocated type.

Definition at line 85 of file `bits/alloc_traits.h`.

4.492.2.11 `template<typename _Alloc> typedef __void_pointer std::allocator_traits< _Alloc >::void_pointer`

The allocator's void pointer type.

`Alloc::void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<void>`

Definition at line 124 of file `bits/alloc_traits.h`.

4.492.3 Member Function Documentation

4.492.3.1 `template<typename _Alloc> static pointer std::allocator_traits< _Alloc >::allocate (_Alloc & __a, size_type __n) [inline],[static]`

Allocate memory.

Parameters

$_a$	An allocator.
$_n$	The number of objects to allocate space for.

Calls `a.allocate(n)`

Definition at line 356 of file `bits/alloc_traits.h`.

4.492.3.2 `template<typename _Alloc> static pointer std::allocator_traits<_Alloc>::allocate (_Alloc & __a, size_type __n, const_void_pointer __hint) [inline],[static]`

Allocate memory.

Parameters

<code>__a</code>	An allocator.
<code>__n</code>	The number of objects to allocate space for.
<code>__hint</code>	Aid to locality.

Returns

Memory of suitable size and alignment for n objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

Definition at line 371 of file `bits/alloc_traits.h`.

4.492.3.3 `template<typename _Alloc> template<typename _Tp, typename... _Args> static auto std::allocator_traits<_Alloc>::construct (_Alloc & __a, _Tp * __p, _Args &&... __args) -> decltype(_S_construct(__a, __p, std::forward<_Args>(__args)...)) [inline],[static]`

Construct an object of type `_Tp`.

Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to memory of suitable size and alignment for <code>Tp</code>
<code>__args</code>	Constructor arguments.

Calls `__a.construct(__p, std::forward<Args>(__args)...) if that expression is well-formed, otherwise uses placement-new to construct an object of type _Tp at location __p from the arguments __args...`

Definition at line 397 of file `bits/alloc_traits.h`.

4.492.3.4 `template<typename _Alloc> static void std::allocator_traits<_Alloc>::deallocate (_Alloc & __a, pointer __p, size_type __n) [inline],[static]`

Deallocate memory.

Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to the memory to deallocate.
<code>__n</code>	The number of objects space was allocated for.

Calls `a.deallocate(p, n)`

Definition at line 382 of file `bits/alloc_traits.h`.

4.492.3.5 `template<typename _Alloc> template<typename _Tp> static void std::allocator_traits<_Alloc>::destroy (_Alloc & __a, _Tp* __p) [inline],[static]`

Destroy an object of type `_Tp`.

Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to the object to destroy

Calls `__a.destroy(__p)` if that expression is well-formed, otherwise calls `__p->~_Tp()`

Definition at line 410 of file `bits/alloc_traits.h`.

4.492.3.6 `template<typename _Alloc> static size_type std::allocator_traits<_Alloc>::max_size (const _Alloc & __a) [inline],[static],[noexcept]`

The maximum supported allocation size.

Parameters

<code>__a</code>	An allocator.
------------------	---------------

Returns

`__a.max_size()` or `numeric_limits<size_type>::max()`

Returns `__a.max_size()` if that expression is well-formed, otherwise returns `numeric_limits<size_↵type>::max()`

Definition at line 421 of file `bits/alloc_traits.h`.

4.492.3.7 `template<typename _Alloc> static _Alloc std::allocator_traits< _Alloc >::select_on_container_copy_construction (const _Alloc & __rhs) [inline], [static]`

Obtain an allocator to use when copying a container.

Parameters

<code>__rhs</code>	An allocator.
--------------------	---------------

Returns

`__rhs.select_on_container_copy_construction()` or `__rhs`

Returns `__rhs.select_on_container_copy_construction()` if that expression is well-formed, otherwise returns `__rhs`

Definition at line 433 of file `bits/alloc_traits.h`.

4.493.3 Member Function Documentation

4.493.3.1 `template<typename _Tp> static pointer std::allocator_traits< allocator< _Tp > >::allocate (allocator_type
&__a, size_type __n) [inline],[static]`

Allocate memory.

Parameters

\leftrightarrow _a	An allocator.
\leftrightarrow _n	The number of objects to allocate space for.

Calls `a.allocate(n)`

Definition at line 487 of file `bits/alloc_traits.h`.

4.493.3.2 `template<typename _Tp> static pointer std::allocator_traits< allocator<_Tp>>::allocate (allocator_type &_a, size_type _n, const_void_pointer __hint) [inline],[static]`

Allocate memory.

Parameters

__a	An allocator.
__n	The number of objects to allocate space for.
__hint	Aid to locality.

Returns

Memory of suitable size and alignment for *n* objects of type `value_type`

Returns `a.allocate(n, hint)`

Definition at line 501 of file `bits/alloc_traits.h`.

4.493.3.3 `template<typename _Tp> template<typename _Up, typename... _Args> static void std::allocator_traits< allocator<_Tp>>::construct (allocator_type &_a, _Up * __p, _Args &&... __args) [inline],[static]`

Construct an object of type `_Up`.

Parameters

__a	An allocator.
__p	Pointer to memory of suitable size and alignment for <code>Tp</code>
__args	Constructor arguments.

Calls `__a.construct(__p, std::forward<Args>(__args)...)`

Definition at line 526 of file `bits/alloc_traits.h`.

4.493.3.4 `template<typename _Tp> static void std::allocator_traits< allocator< _Tp > >::deallocate (allocator_type & __a, pointer __p, size_type __n) [inline],[static]`

Deallocate memory.

Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to the memory to deallocate.
<code>__n</code>	The number of objects space was allocated for.

Calls `a.deallocate(p, n)`

Definition at line 513 of file `bits/alloc_traits.h`.

4.493.3.5 `template<typename _Tp> template<typename _Up> static void std::allocator_traits< allocator< _Tp > >::destroy (allocator_type & __a, _Up * __p) [inline],[static]`

Destroy an object of type `_Up`.

Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to the object to destroy

Calls `__a.destroy(__p)`.

Definition at line 538 of file `bits/alloc_traits.h`.

4.493.3.6 `template<typename _Tp> static size_type std::allocator_traits< allocator< _Tp > >::max_size (const allocator_type & __a) [inline],[static],[noexcept]`

The maximum supported allocation size.

Parameters

<code>__a</code>	An allocator.
------------------	---------------

Returns

`__a.max_size()`

Definition at line 547 of file `bits/alloc_traits.h`.

```
4.493.3.7  template<typename _Tp > static allocator_type std::allocator_traits< allocator< _Tp >
           >::select_on_container_copy_construction ( const allocator_type & __rhs )  [inline],[static]
```

Obtain an allocator to use when copying a container.

Parameters

<code>__rhs</code>	An allocator.
--------------------	---------------

Returns

`__rhs`

Definition at line 556 of file `bits/alloc_traits.h`.

4.495.1 Detailed Description

```
template<typename _Tp>  
class std::auto_ptr<_Tp>
```

A simple smart pointer providing strict ownership semantics.

The Standard says:

An `auto_ptr` owns the object it holds a pointer to. Copying an `auto_ptr` copies the pointer and transfers ownership to the destination. If more than one `auto_ptr` owns the same object at the same time the behavior of the program is undefined.

The uses of `auto_ptr` include providing temporary exception-safety for dynamically allocated memory, passing ownership of dynamically allocated memory to a function, and returning dynamically allocated memory from a function. `auto_ptr` does not meet the CopyConstructible requirements for Standard Library `container` elements and thus instantiating a Standard Library container with an `auto_ptr` results in undefined behavior.

Quoted from [20.4.5]/3.

Good examples of what can and cannot be done with `auto_ptr` can be found in the `libstdc++` testsuite.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` 127. `auto_ptr<>` conversion issues These resolutions have all been incorporated.

Definition at line 87 of file `auto_ptr.h`.

4.495.2 Member Typedef Documentation

4.495.2.1 `template<typename _Tp> typedef _Tp std::auto_ptr<_Tp>::element_type`

The pointed-to type.

Definition at line 94 of file `auto_ptr.h`.

4.495.3 Constructor & Destructor Documentation

4.495.3.1 `template<typename _Tp> std::auto_ptr<_Tp>::auto_ptr (element_type *__p = 0) throw () [inline], [explicit]`

An `auto_ptr` is usually constructed from a raw pointer.

Parameters

\leftrightarrow __p	A pointer (defaults to NULL).
--------------------------	-------------------------------

This object now *owns* the object pointed to by __p.

Definition at line 103 of file auto_ptr.h.

4.495.3.2 `template<typename _Tp> std::auto_ptr<_Tp>::auto_ptr (auto_ptr<_Tp> &__a) throw () [inline]`

An auto_ptr can be constructed from another auto_ptr.

Parameters

\leftrightarrow __a	Another auto_ptr of the same type.
--------------------------	------------------------------------

This object now *owns* the object previously owned by __a, which has given up ownership.

Definition at line 112 of file auto_ptr.h.

4.495.3.3 `template<typename _Tp> template<typename _Tp1> std::auto_ptr<_Tp>::auto_ptr (auto_ptr<_Tp1> &__a) throw () [inline]`

An auto_ptr can be constructed from another auto_ptr.

Parameters

\leftrightarrow __a	Another auto_ptr of a different but related type.
--------------------------	---

A pointer-to-Tp1 must be convertible to a pointer-to-Tp/element_type.

This object now *owns* the object previously owned by __a, which has given up ownership.

Definition at line 125 of file auto_ptr.h.

4.495.3.4 `template<typename _Tp> std::auto_ptr<_Tp>::~~auto_ptr () [inline]`

When the auto_ptr goes out of scope, the object it owns is deleted. If it no longer owns anything (i.e., get () is NULL), then this has no effect.

The C++ standard says there is supposed to be an empty throw specification here, but omitting it is standard conforming. Its presence can be detected only if _Tp::~~_Tp() throws, but this is prohibited. [17.4.3.6]/2

Definition at line 170 of file auto_ptr.h.

4.495.3.5 `template<typename _Tp> std::auto_ptr<_Tp>::auto_ptr (auto_ptr_ref< element_type > __ref) throw)`
`[inline]`

Automatic conversions.

These operations convert an `auto_ptr` into and from an `auto_ptr_ref` automatically as needed. This allows constructs such as

```
auto_ptr<Derived> func_returning_auto_ptr(....);
...
auto_ptr<Base> ptr = func_returning_auto_ptr(....);
```

Definition at line 260 of file `auto_ptr.h`.

References `std::move()`, `std::shared_ptr<_Tp>::shared_ptr()`, and `std::unique_ptr<_Tp, _Dp>::unique_ptr()`.

4.495.4 Member Function Documentation

4.495.4.1 `template<typename _Tp> element_type* std::auto_ptr<_Tp>::get () const throw)` `[inline]`

Bypassing the smart pointer.

Returns

The raw pointer being managed.

You can get a copy of the pointer that this object owns, for situations such as passing to a function which only accepts a raw pointer.

Note

This `auto_ptr` still owns the memory.

Definition at line 211 of file `auto_ptr.h`.

4.495.4.2 `template<typename _Tp> element_type& std::auto_ptr<_Tp>::operator* () const throw)` `[inline]`

Smart pointer dereferencing.

If this `auto_ptr` no longer owns anything, then this operation will crash. (For a smart pointer, *no longer owns anything* is the same as being a null pointer, and you know what happens when you dereference one of those...)

Definition at line 181 of file `auto_ptr.h`.

4.495.4.3 `template<typename _Tp> element_type* std::auto_ptr<_Tp>::operator-> () const throw)` `[inline]`

Smart pointer dereferencing.

This returns the pointer itself, which the language then will automatically cause to be dereferenced.

Definition at line 194 of file `auto_ptr.h`.

4.495.4.4 `template<typename _Tp> auto_ptr& std::auto_ptr<_Tp>::operator= (auto_ptr<_Tp> & __a) throw)`
`[inline]`

`auto_ptr` assignment operator.

Parameters

	Another auto_ptr of the same type.
<code>__a</code>	

This object now *owns* the object previously owned by `__a`, which has given up ownership. The object that this one *used* to own and track has been deleted.

Definition at line 136 of file auto_ptr.h.

4.495.4.5 `template<typename _Tp> template<typename _Tp1 > auto_ptr& std::auto_ptr<_Tp>::operator=(auto_ptr<_Tp1 > &__a) throw) [inline]`

auto_ptr assignment operator.

Parameters

	Another auto_ptr of a different but related type.
<code>__a</code>	

A pointer-to-Tp1 must be convertible to a pointer-to-Tp/element_type.

This object now *owns* the object previously owned by `__a`, which has given up ownership. The object that this one *used* to own and track has been deleted.

Definition at line 154 of file auto_ptr.h.

4.495.4.6 `template<typename _Tp> element_type* std::auto_ptr<_Tp>::release () throw) [inline]`

Bypassing the smart pointer.

Returns

The raw pointer being managed.

You can get a copy of the pointer that this object owns, for situations such as passing to a function which only accepts a raw pointer.

Note

This auto_ptr no longer owns the memory. When this object goes out of scope, nothing will happen.

Definition at line 225 of file auto_ptr.h.

4.495.4.7 `template<typename _Tp> void std::auto_ptr<_Tp>::reset (element_type * __p = 0) throw) [inline]`

Forcibly deletes the managed object.

Parameters

<code>__p</code>	A pointer (defaults to NULL).
------------------	-------------------------------

This object now *owns* the object pointed to by `__p`. The previous object has been deleted.

Definition at line 240 of file `auto_ptr.h`.

- [auto_ptr.h](#)

4.496 `std::auto_ptr_ref<_Tp1>` Struct Template Reference

Public Member Functions

- `auto_ptr_ref` (`_Tp1 *__p`)

Public Attributes

- `_Tp1 * _M_ptr`

4.496.1 Detailed Description

```
template<typename _Tp1>
struct std::auto_ptr_ref<_Tp1>
```

A wrapper class to provide `auto_ptr` with reference semantics. For example, an `auto_ptr` can be assigned (or constructed from) the result of a function which returns an `auto_ptr` by value.

All the `auto_ptr_ref` stuff should happen behind the scenes.

Definition at line 48 of file `auto_ptr.h`.

The documentation for this struct was generated from the following file:

- [auto_ptr.h](#)

4.497 `std::back_insert_iterator<_Container>` Class Template Reference

Inheritance diagram for `std::back_insert_iterator<_Container>`:

Public Types

- typedef `_Container` `container_type`
- typedef void `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

Public Member Functions

- `back_insert_iterator` (`_Container &__x`)
- `back_insert_iterator` & `operator*` ()
- `back_insert_iterator` & `operator++` ()
- `back_insert_iterator` `operator++` (int)
- `back_insert_iterator` & `operator=` (const typename `_Container::value_type` &__value)
- `back_insert_iterator` & **`operator=`** (typename `_Container::value_type` &&__value)

Protected Attributes

- `_Container *` **`container`**

4.497.1 Detailed Description

```
template<typename _Container>
class std::back_insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator appends it to the container using `push_back`.

Tip: Using the `back_inserter` function to create these iterators can save typing.

Definition at line 403 of file `stl_iterator.h`.

4.497.2 Member Typedef Documentation

4.497.2.1 `template<typename _Container > typedef _Container std::back_insert_iterator< _Container >::container_type`

A nested typedef for the type of whatever container you used.

Definition at line 411 of file `stl_iterator.h`.

4.497.2.2 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type` `[inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.497.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category` `[inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.497.2.4 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer` `[inherited]`

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.497.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference` `[inherited]`

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.497.2.6 typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file stl_iterator_base_types.h.

4.497.3 Constructor & Destructor Documentation

4.497.3.1 template<typename _Container> std::back_insert_iterator<_Container>::back_insert_iterator(_Container &__x) [inline], [explicit]

The only way to create this iterator is with a container.

Definition at line 415 of file stl_iterator.h.

4.497.4 Member Function Documentation

4.497.4.1 template<typename _Container> back_insert_iterator& std::back_insert_iterator<_Container>::operator*() [inline]

Simply returns *this.

Definition at line 453 of file stl_iterator.h.

4.497.4.2 template<typename _Container> back_insert_iterator& std::back_insert_iterator<_Container>::operator++() [inline]

Simply returns *this. (This iterator does not *move*.)

Definition at line 458 of file stl_iterator.h.

4.497.4.3 template<typename _Container> back_insert_iterator std::back_insert_iterator<_Container>::operator++(int) [inline]

Simply returns *this. (This iterator does not *move*.)

Definition at line 463 of file stl_iterator.h.

4.497.4.4 template<typename _Container> back_insert_iterator& std::back_insert_iterator<_Container>::operator=(const typename _Container::value_type &__value) [inline]

Parameters

__value	An instance of whatever type container_type::const_reference is; presumably a reference-to-const T for container<T>.
---------	--

Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the end, if you like). Assigning a value to the iterator will always append the value to the end of the container.

Definition at line 437 of file `stl_iterator.h`.

References `std::move()`.

The documentation for this class was generated from the following file:

- [stl_iterator.h](#)

4.498 `std::bad_weak_ptr` Class Reference

Inherits exception.

Public Member Functions

4.499.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_ios< _CharT, _Traits >
```

Template class basic_ios, virtual base class for all stream classes.

Template Parameters

<code>_CharT</code>	Type of character stream.
<code>_Traits</code>	Traits for character type, defaults to <code>char_traits<_CharT></code> .

Most of the member functions called dispatched on stream objects (e.g., `std::cout.foo(bar);`) are consolidated in this class.

Definition at line 66 of file `basic_ios.h`.

4.499.2 Member Typedef Documentation

4.499.2.1 `template<typename _CharT, typename _Traits> typedef ctype<_CharT> std::basic_ios<_CharT, _Traits>::__ctype_type`

These are non-standard types.

Definition at line 86 of file `basic_ios.h`.

4.499.2.2 `template<typename _CharT, typename _Traits> typedef num_get<_CharT, istreambuf_iterator<_CharT, _Traits>> std::basic_ios<_CharT, _Traits>::__num_get_type`

These are non-standard types.

Definition at line 90 of file `basic_ios.h`.

4.499.2.3 `template<typename _CharT, typename _Traits> typedef num_put<_CharT, ostreambuf_iterator<_CharT, _Traits>> std::basic_ios<_CharT, _Traits>::__num_put_type`

These are non-standard types.

Definition at line 88 of file `basic_ios.h`.

4.499.2.4 `template<typename _CharT, typename _Traits> typedef _CharT std::basic_ios<_CharT, _Traits>::__char_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 75 of file `basic_ios.h`.

4.499.2.5 `typedef void(* std::ios_base::event_callback)(event __e, ios_base &__b, int __i) [inherited]`

The type of an event callback function.

Parameters

 _e	One of the members of the event enum.
 _b	Reference to the ios_base object.
 _i	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several ios_base and basic_ios functions, specifically imbue(), copyfmt(), and ~ios().

Definition at line 436 of file ios_base.h.

4.499.2.6 typedef _Ios_Fmtflags std::ios_base::fmtflags [inherited]

This is a bitmask type.

_Ios_Fmtflags is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type fmtflags are:

- boolalpha
- dec
- fixed
- hex
- internal
- left
- oct
- right
- scientific
- showbase
- showpoint
- showpos
- skipws
- unitbuf
- uppercase
- adjustfield
- basefield
- floatfield

Definition at line 255 of file ios_base.h.

4.499.2.7 `template<typename _CharT, typename _Traits > typedef _Traits::int_type std::basic_ios< _CharT, _Traits >::int_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 76 of file `basic_ios.h`.

4.499.2.8 `typedef _ios_istate std::ios_base::istate [inherited]`

This is a bitmask type.

`_Ios_Iostate` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `istate` are:

- `badbit`
- `eofbit`
- `failbit`
- `goodbit`

Definition at line 330 of file `ios_base.h`.

4.499.2.9 `template<typename _CharT, typename _Traits > typedef _Traits::off_type std::basic_ios< _CharT, _Traits >::off_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 78 of file `basic_ios.h`.

4.499.2.10 `typedef _ios_Openmode std::ios_base::openmode [inherited]`

This is a bitmask type.

`_Ios_Openmode` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `openmode` are:

- `app`
- `ate`
- `binary`
- `in`
- `out`
- `trunc`

Definition at line 361 of file `ios_base.h`.

4.499.2.11 `template<typename _CharT, typename _Traits > typedef _Traits::pos_type std::basic_ios< _CharT, _Traits >::pos_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 77 of file `basic_ios.h`.

4.499.2.12 `typedef _Ios_Seekdir std::ios_base::seekdir` `[inherited]`

This is an enumerated type.

`_Ios_Seekdir` is implementation-defined. Defined values of type `seekdir` are:

- `beg`
- `cur`, equivalent to `SEEK_CUR` in the C standard library.
- `end`, equivalent to `SEEK_END` in the C standard library.

Definition at line 393 of file `ios_base.h`.

4.499.2.13 `template<typename _CharT, typename _Traits > typedef _Traits std::basic_ios< _CharT, _Traits >::traits_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 79 of file `basic_ios.h`.

4.499.3 Member Enumeration Documentation

4.499.3.1 `enum std::ios_base::event` `[inherited]`

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

Definition at line 419 of file `ios_base.h`.

4.499.4 Constructor & Destructor Documentation

4.499.4.1 `template<typename _CharT, typename _Traits > std::basic_ios< _CharT, _Traits >::basic_ios (basic_streambuf< _CharT, _Traits > * __sb)` `[inline], [explicit]`

Constructor performs initialization.

The parameter is passed by derived streams.

Definition at line 264 of file `basic_ios.h`.

References `std::basic_ios< _CharT, _Traits >::init()`.

4.499.4.2 `template<typename _CharT, typename _Traits > virtual std::basic_ios< _CharT, _Traits >::~basic_ios ()`
`[inline], [virtual]`

Empty.

The destructor does nothing. More specifically, it does not destroy the streambuf held by rdbuf().

Definition at line 276 of file basic_ios.h.

4.499.4.3 `template<typename _CharT, typename _Traits > std::basic_ios< _CharT, _Traits >::~basic_ios ()` `[inline],`
`[protected]`

Empty.

The default constructor does nothing and is not normally accessible to users.

Definition at line 454 of file basic_ios.h.

References `std::basic_ios< _CharT, _Traits >::init()`.

4.499.5 Member Function Documentation

4.499.5.1 `const locale& std::ios_base::_M_getloc () const` `[inline], [inherited]`

Locale access.

Returns

A reference to the current locale.

Like `getloc` above, but returns a reference instead of generating a copy.

Definition at line 706 of file ios_base.h.

References `std::ios_base::xalloc()`.

4.499.5.2 `template<typename _CharT, typename _Traits > bool std::basic_ios< _CharT, _Traits >::bad () const`
`[inline]`

Fast error checking.

Returns

True if the badbit is set.

Note that other iostate flags may also be set.

Definition at line 205 of file basic_ios.h.

References `std::ios_base::badbit`, and `std::basic_ios< _CharT, _Traits >::rdstate()`.

4.499.5.3 `template<typename _CharT, typename _Traits > void std::basic_ios< _CharT, _Traits >::clear (iostate __state =`
`goodbit)`

[Re]sets the error state.

Parameters

<code>__state</code>	The new state flag(s) to set.
----------------------	-------------------------------

See `std::ios_base::iostate` for the possible bit values. Most users will not need to pass an argument.

Referenced by `std::basic_ios< _CharT, _Traits >::exceptions()`, `std::basic_ios< _CharT, _Traits >::rdstate()`, and `std::basic_ios< _CharT, _Traits >::setstate()`.

4.499.5.4 `template<typename _CharT, typename _Traits> basic_ios& std::basic_ios< _CharT, _Traits >::copyfmt (const basic_ios< _CharT, _Traits > &__rhs)`

Copies fields of `__rhs` into this.

Parameters

<code>__rhs</code>	The source values for the copies.
--------------------	-----------------------------------

Returns

Reference to this object.

All fields of `__rhs` are copied into this object except that `rdbuf()` and `rdstate()` remain unchanged. All values in the `pword` and `iword` arrays are copied. Before copying, each callback is invoked with `erase_event`. After copying, each (new) callback is invoked with `copyfmt_event`. The final step is to copy `exceptions()`.

Referenced by `std::basic_ios< _CharT, _Traits >::rdbuf()`.

4.499.5.5 `template<typename _CharT, typename _Traits> bool std::basic_ios< _CharT, _Traits >::eof () const [inline]`

Fast error checking.

Returns

True if the eofbit is set.

Note that other `iostate` flags may also be set.

Definition at line 184 of file `basic_ios.h`.

References `std::ios_base::eofbit`, and `std::basic_ios< _CharT, _Traits >::rdstate()`.

4.499.5.6 `template<typename _CharT, typename _Traits > ios_base::basic_ios< _CharT, _Traits >::exceptions () const`
`[inline]`

Throwing exceptions on errors.

Returns

The current exceptions mask.

This changes nothing in the stream. See the one-argument version of `exceptions(ios_base)` for the meaning of the return value.

Definition at line 216 of file `basic_ios.h`.

Referenced by `std::basic_ios< _CharT, _Traits >::setstate()`.

4.499.5.7 `template<typename _CharT, typename _Traits > void std::basic_ios< _CharT, _Traits >::exceptions (ios_base::__except)`
`[inline]`

Throwing exceptions on errors.

Parameters

<code>__except</code>	The new exceptions mask.
-----------------------	--------------------------

By default, error flags are set silently. You can set an exceptions mask for each stream; if a bit in the mask becomes set in the error flags, then an exception of type `std::ios_base::failure` is thrown.

If the error flag is already set when the exceptions mask is added, the exception is immediately thrown. Try running the following under GCC 3.1 or later:

```
#include <iostream>
#include <fstream>
#include <exception>

int main()
{
    std::set_terminate (__gnu_cxx::__verbose_terminate_handler);

    std::ifstream f ("/etc/motd");

    std::cerr << "Setting badbit\n";
    f.setstate (std::ios_base::badbit);

    std::cerr << "Setting exception mask\n";
    f.exceptions (std::ios_base::badbit);
}
```

Definition at line 251 of file `basic_ios.h`.

References `std::basic_ios< _CharT, _Traits >::clear()`.

4.499.5.8 `template<typename _CharT, typename _Traits > bool std::basic_ios< _CharT, _Traits >::fail () const`
`[inline]`

Fast error checking.

Returns

True if either the badbit or the failbit is set.

Checking the badbit in fail() is historical practice. Note that other iostate flags may also be set.

Definition at line 195 of file basic_ios.h.

References std::ios_base::badbit, std::ios_base::failbit, and std::basic_ios< _CharT, _Traits >::rdstate().

Referenced by std::basic_ios< _CharT, _Traits >::operator void *(), and std::basic_ios< _CharT, _Traits >::operator!().

4.499.5.9 `template<typename _CharT, typename _Traits > char_type std::basic_ios< _CharT, _Traits >::fill () const`
`[inline]`

Retrieves the *empty* character.

Returns

The current fill character.

It defaults to a space (' ') in the current locale.

Definition at line 364 of file basic_ios.h.

References std::basic_ios< _CharT, _Traits >::widen().

Referenced by std::basic_ios< _CharT, _Traits >::fill().

4.499.5.10 `template<typename _CharT, typename _Traits > char_type std::basic_ios< _CharT, _Traits >::fill (char_type`
`__ch) [inline]`

Sets a new *empty* character.

Parameters

<code>__ch</code>	The new character.
-------------------	--------------------

Returns

The previous fill character.

The fill character is used to fill out space when P+ characters have been requested (e.g., via setw), Q characters are actually used, and Q<P. It defaults to a space (' ') in the current locale.

Definition at line 384 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::fill()`, and `std::basic_ios<_CharT, _Traits>::imbue()`.

4.499.5.11 `fmtflags std::ios_base::flags () const` `[inline]`, `[inherited]`

Access to format flags.

Returns

The format control flags for both input and output.

Definition at line 551 of file `ios_base.h`.

4.499.5.12 `fmtflags std::ios_base::flags (fmtflags __fmtfl)` `[inline]`, `[inherited]`

Setting new format flags all at once.

Parameters

<code>__fmtfl</code>	The new flags to set.
----------------------	-----------------------

Returns

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

Definition at line 562 of file `ios_base.h`.

4.499.5.13 `locale std::ios_base::getloc () const` `[inline]`, `[inherited]`

Locale access.

Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Definition at line 695 of file `ios_base.h`.

4.499.5.14 `template<typename _CharT, typename _Traits> bool std::basic_ios< _CharT, _Traits >::good () const`
`[inline]`

Fast error checking.

Returns

True if no error flags are set.

A wrapper around `rdstate`.

Definition at line 174 of file `basic_ios.h`.

References `std::basic_ios< _CharT, _Traits >::rdstate()`.

4.499.5.15 `template<typename _CharT, typename _Traits> locale std::basic_ios< _CharT, _Traits >::imbue (const locale & __loc)`

Moves to a new locale.

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Calls `ios_base::imbue(loc)`, and if a stream buffer is associated with this stream, calls that buffer's `pubimbue(loc)`.

Additional I10n notes are at <http://gcc.gnu.org/onlinedocs/libstdc++/manual/localization.html>.

Referenced by `std::basic_ios< _CharT, _Traits >::fill()`.

4.499.5.16 `template<typename _CharT, typename _Traits> void std::basic_ios< _CharT, _Traits >::init (basic_streambuf< _CharT, _Traits > * __sb)` `[protected]`

All setup is performed here.

This is called from the public constructor. It is not virtual and cannot be redefined.

Referenced by `std::basic_ios< _CharT, _Traits >::basic_ios()`.

4.499.5.17 `long& std::ios_base::iword (int __ix)` `[inline]`, `[inherited]`

Access to integer array.

Parameters

<code>_↵</code> <code>_ix</code>	Index into the array.
-------------------------------------	-----------------------

Returns

A reference to an integer associated with the index.

The `iword` function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 741 of file `ios_base.h`.

4.499.5.18 `template<typename _CharT, typename _Traits> char std::basic_ios<_CharT, _Traits>::narrow (char_type __c, char __default) const [inline]`

Squeezes characters.

Parameters

<code>__c</code>	The character to narrow.
<code>__default</code>	The character to narrow.

Returns

The narrowed character.

Maps a character of `char_type` to a character of `char`, if possible.

Returns the result of

```
std::use_facet<ctype<char_type>> >(getloc()).narrow(c, default)
```

Additional I10n notes are at <http://gcc.gnu.org/onlinedocs/libstdc++/manual/localization.↵html>

Definition at line 424 of file `basic_ios.h`.

4.499.5.19 `template<typename _CharT, typename _Traits> std::basic_ios<_CharT, _Traits>::operator void * () const [inline]`

The quick-and-easy status check.

This allows you to write constructs such as `if (!a_stream) ...` and `while (a_stream) ...`

Definition at line 115 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::fail()`.

4.499.5.20 `template<typename _CharT, typename _Traits> bool std::basic_ios< _CharT, _Traits >::operator! () const`
`[inline]`

The quick-and-easy status check.

This allows you to write constructs such as `if (!a_stream) ...` and `while (a_stream) ...`.

Definition at line 119 of file `basic_ios.h`.

References `std::basic_ios< _CharT, _Traits >::fail()`.

4.499.5.21 `streamsize std::ios_base::precision () const` `[inline],[inherited]`

Flags access.

Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Definition at line 621 of file `ios_base.h`.

4.499.5.22 `streamsize std::ios_base::precision (streamsize __prec)` `[inline],[inherited]`

Changing flags.

Parameters

<code>__prec</code>	The new precision value.
---------------------	--------------------------

Returns

The previous value of `precision()`.

Definition at line 630 of file `ios_base.h`.

4.499.5.23 `void*& std::ios_base::pword (int __ix)` `[inline],[inherited]`

Access to void pointer array.

Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

Returns

A reference to a `void*` associated with the index.

The `pwd` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 762 of file `ios_base.h`.

References `std::ios_base::~~ios_base()`.

4.499.5.24 `template<typename _CharT, typename _Traits> basic_streambuf<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::rdbuf () const [inline]`

Accessing the underlying buffer.

Returns

The current stream buffer.

This does not change the state of the stream.

Definition at line 315 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::copyfmt()`.

4.499.5.25 `template<typename _CharT, typename _Traits> basic_streambuf<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::rdbuf (basic_streambuf<_CharT, _Traits> * __sb)`

Changing the underlying buffer.

Parameters

<code>__sb</code>	The new stream buffer.
-------------------	------------------------

Returns

The previous stream buffer.

Associates a new buffer with the current stream, and clears the error state.

Due to historical accidents which the LWG refuses to correct, the I/O library suffers from a design error: this function is hidden in derived classes by overrides of the zero-argument `rdbuf()`, which is non-virtual for hysterical raisins. As a result, you must use explicit qualifications to access this function via any derived class. For example:

```
std::fstream    foo;           // or some other derived type
std::streambuf* p = .....;

foo.ios::rdbuf(p);             // ios == basic_ios<char>
```

4.499.5.26 `template<typename _CharT, typename _Traits> iostate std::basic_ios< _CharT, _Traits >::rdstate () const`
`[inline]`

Returns the error state of the stream buffer.

Returns

A bit pattern (well, isn't everything?)

See `std::ios_base::iostate` for the possible bit values. Most users will call one of the interpreting wrappers, e.g., `good()`.

Definition at line 131 of file `basic_ios.h`.

References `std::basic_ios< _CharT, _Traits >::clear()`, and `std::ios_base::goodbit`.

Referenced by `std::basic_ios< _CharT, _Traits >::bad()`, `std::basic_ios< _CharT, _Traits >::eof()`, `std::basic_ios< _CharT, _Traits >::fail()`, `std::basic_ios< _CharT, _Traits >::good()`, and `std::basic_ios< _CharT, _Traits >::setstate()`.

4.499.5.27 `void std::ios_base::register_callback (event_callback __fn, int __index)` `[inherited]`

Add the callback `__fn` with parameter `__index`.

Parameters

<code>__fn</code>	The function to add.
<code>__index</code>	The integer to pass to the function when invoked.

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

4.499.5.28 `fmtflags std::ios_base::setf (fmtflags __fmtfl)` `[inline],[inherited]`

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
----------------------	--------------------------

Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

Definition at line 578 of file `ios_base.h`.

Referenced by `std::boolalpha()`, `std::dec()`, `std::fixed()`, `std::hex()`, `std::left()`, `std::oct()`, `std::right()`, `std::scientific()`, `std::showbase()`, `std::showpoint()`, `std::showpos()`, `std::skipws()`, `std::unitbuf()`, and `std::uppercase()`.

4.499.5.29 `fmtflags std::ios_base::set(fmtflags __fmtfl, fmtflags __mask)` `[inline],[inherited]`

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
<code>__mask</code>	The flags mask for <code>fmtfl</code> .

Returns

The previous format control flags.

This function clears `mask` in the format flags, then sets `fmtfl` & `mask`. An example mask is `ios_base::adjustfield`.

Definition at line 595 of file `ios_base.h`.

4.499.5.30 `template<typename _CharT, typename _Traits> void std::basic_ios<_CharT, _Traits>::setstate(iostate __state)` `[inline]`

Sets additional flags in the error state.

Parameters

<code>__state</code>	The additional state flag(s) to set.
----------------------	--------------------------------------

See `std::ios_base::iostate` for the possible bit values.

Definition at line 151 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::clear()`, `std::basic_ios<_CharT, _Traits>::exceptions()`, and `std::basic_ios<_CharT, _Traits>::rdstate()`.

4.499.5.31 `static bool std::ios_base::sync_with_stdio(bool __sync = true)` `[static],[inherited]`

Interaction with the standard C I/O objects.

Parameters

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., stdout) and the standard C++ objects (e.g., cout). User-declared streams are unaffected. See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt1.html>

Referenced by std::ios_base::width().

4.499.5.32 `template<typename _CharT, typename _Traits> basic_ostream<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::tie() const [inline]`

Fetches the current *tied* stream.

Returns

A pointer to the tied stream, or NULL if the stream is not tied.

A stream may be *tied* (or synchronized) to a second output stream. When this stream performs any I/O, the tied stream is first flushed. For example, `std::cin` is tied to `std::cout`.

Definition at line 289 of file basic_ios.h.

4.499.5.33 `template<typename _CharT, typename _Traits> basic_ostream<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::tie(basic_ostream<_CharT, _Traits> * __tiestr) [inline]`

Ties this stream to an output stream.

Parameters

<code>__tiestr</code>	The output stream.
-----------------------	--------------------

Returns

The previously tied output stream, or NULL if the stream was not tied.

This sets up a new tie; see tie() for more.

Definition at line 301 of file basic_ios.h.

4.499.5.34 `void std::ios_base::unsetf(fmtflags __mask) [inline], [inherited]`

Clearing format flags.

Parameters

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

Definition at line 610 of file `ios_base.h`.

Referenced by `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nunitbuf()`, and `std::nouppercase()`.

4.499.5.35 `template<typename _CharT, typename _Traits> char_type std::basic_ios<_CharT, _Traits>::widen (char __c)`
`const [inline]`

Widens characters.

Parameters

<code>__c</code>	The character to widen.
------------------	-------------------------

Returns

The widened character.

Maps a character of `char` to a character of `char_type`.

Returns the result of

```
std::use_facet<ctype<char_type>> >(getloc()).widen(c)
```

Additional I10n notes are at <http://gcc.gnu.org/onlinedocs/libstdc++/manual/localization.html>

Definition at line 443 of file `basic_ios.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::fill()`.

4.499.5.36 `streamsize std::ios_base::width () const [inline], [inherited]`

Flags access.

Returns

The minimum field width to generate on output operations.

Minimum field width refers to the number of characters.

Definition at line 644 of file `ios_base.h`.

4.499.5.37 `streamsize std::ios_base::width (streamsize __wide) [inline], [inherited]`

Changing flags.

Parameters

<code>__wide</code>	The new width value.
---------------------	----------------------

Returns

The previous value of `width()`.

Definition at line 653 of file `ios_base.h`.

References `std::ios_base::imbue()`, and `std::ios_base::sync_with_stdio()`.

4.499.5.38 `static int std::ios_base::xalloc () throw` `[static], [inherited]`

Access to unique indices.

Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

Referenced by `std::ios_base::_M_getloc()`.

4.499.6 Member Data Documentation

4.499.6.1 `const fmtflags std::ios_base::adjustfield` `[static], [inherited]`

A mask of `left|right|internal`. Useful for the 2-arg form of `setf`.

Definition at line 310 of file `ios_base.h`.

Referenced by `std::internal()`, `std::left()`, and `std::right()`.

4.499.6.2 `const openmode std::ios_base::app` `[static], [inherited]`

Seek to end before each write.

Definition at line 364 of file `ios_base.h`.

4.499.6.3 `const openmode std::ios_base::ate` `[static], [inherited]`

Open and seek to end immediately after opening.

Definition at line 367 of file `ios_base.h`.

4.499.6.4 `const iostate std::ios_base::badbit` `[static], [inherited]`

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 334 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::bad()`, and `std::basic_ios<_CharT, _Traits>::fail()`.

4.499.6.5 `const fmtflags std::ios_base::basefield` `[static], [inherited]`

A mask of `dec|oct|hex`. Useful for the 2-arg form of `setf`.

Definition at line 313 of file `ios_base.h`.

Referenced by `std::dec()`, `std::hex()`, and `std::oct()`.

4.499.6.6 `const seekdir std::ios_base::beg` `[static], [inherited]`

Request a seek relative to the beginning of the stream.

Definition at line 396 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.499.6.7 `const openmode std::ios_base::binary` `[static], [inherited]`

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch27s02.html>.

Definition at line 372 of file `ios_base.h`.

4.499.6.8 `const fmtflags std::ios_base::boolalpha` `[static], [inherited]`

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 258 of file `ios_base.h`.

Referenced by `std::boolalpha()`, and `std::noboolalpha()`.

4.499.6.9 `const seekdir std::ios_base::cur` `[static], [inherited]`

Request a seek relative to the current position within the sequence.

Definition at line 399 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.499.6.10 `const fmtflags std::ios_base::dec` `[static], [inherited]`

Converts integer input or generates integer output in decimal base.

Definition at line 261 of file `ios_base.h`.

Referenced by `std::dec()`.

4.499.6.11 `const seekdir std::ios_base::end` `[static], [inherited]`

Request a seek relative to the current end of the sequence.

Definition at line 402 of file `ios_base.h`.

4.499.6.12 `const iostate std::ios_base::eofbit` `[static], [inherited]`

Indicates that an input operation reached the end of an input sequence.

Definition at line 337 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::eof()`.

4.499.6.13 `const iostate std::ios_base::failbit` `[static], [inherited]`

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 342 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::fail()`.

4.499.6.14 `const fmtflags std::ios_base::fixed` `[static], [inherited]`

Generate floating-point output in fixed-point notation.

Definition at line 264 of file `ios_base.h`.

Referenced by `std::fixed()`.

4.499.6.15 `const fmtflags std::ios_base::floatfield` `[static], [inherited]`

A mask of `scientific|fixed`. Useful for the 2-arg form of `setf`.

Definition at line 316 of file `ios_base.h`.

Referenced by `std::fixed()`, and `std::scientific()`.

4.499.6.16 `const ios_base::goodbit` `[static], [inherited]`

Indicates all is well.

Definition at line 345 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::rdstate()`.

4.499.6.17 `const fmtflags std::ios_base::hex` `[static], [inherited]`

Converts integer input or generates integer output in hexadecimal base.

Definition at line 267 of file `ios_base.h`.

Referenced by `std::hex()`.

4.499.6.18 `const openmode std::ios_base::in` `[static], [inherited]`

Open for input. Default for `ifstream` and `fstream`.

Definition at line 375 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.499.6.19 `const fmtflags std::ios_base::internal` `[static], [inherited]`

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Definition at line 272 of file `ios_base.h`.

Referenced by `std::internal()`.

4.499.6.20 `const fmtflags std::ios_base::left` `[static], [inherited]`

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 276 of file `ios_base.h`.

Referenced by `std::left()`.

4.499.6.21 `const fmtflags std::ios_base::oct` `[static], [inherited]`

Converts integer input or generates integer output in octal base.

Definition at line 279 of file `ios_base.h`.

Referenced by `std::oct()`.

4.499.6.22 `const openmode std::ios_base::out` `[static], [inherited]`

Open for output. Default for `ofstream` and `fstream`.

Definition at line 378 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.499.6.23 `const fmtflags std::ios_base::right` `[static], [inherited]`

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 283 of file `ios_base.h`.

Referenced by `std::right()`.

4.499.6.24 `const fmtflags std::ios_base::scientific` `[static], [inherited]`

Generates floating-point output in scientific notation.

Definition at line 286 of file `ios_base.h`.

Referenced by `std::scientific()`.

4.499.6.25 `const fmtflags std::ios_base::showbase` `[static], [inherited]`

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 290 of file `ios_base.h`.

Referenced by `std::noshowbase()`, and `std::showbase()`.

4.499.6.26 `const fmtflags std::ios_base::showpoint` `[static], [inherited]`

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 294 of file `ios_base.h`.

Referenced by `std::noshowpoint()`, and `std::showpoint()`.

4.499.6.27 `const fmtflags std::ios_base::showpos` `[static], [inherited]`

Generates a + sign in non-negative generated numeric output.

Definition at line 297 of file `ios_base.h`.

Referenced by `std::noshowpos()`, and `std::showpos()`.

4.499.6.28 `const fmtflags std::ios_base::skipws` `[static], [inherited]`

Skips leading white space before certain input operations.

Definition at line 300 of file `ios_base.h`.

Referenced by `std::noskipws()`, and `std::skipws()`.

4.499.6.29 `const openmode std::ios_base::trunc` `[static], [inherited]`

Open for input. Default for `ofstream`.

Definition at line 381 of file `ios_base.h`.

4.499.6.30 `const fmtflags std::ios_base::unitbuf` `[static], [inherited]`

Flushes output after each output operation.

Definition at line 303 of file `ios_base.h`.

Referenced by `std::nounitbuf()`, and `std::unitbuf()`.

4.499.6.31 `const fmtflags std::ios_base::uppercase` `[static], [inherited]`

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 307 of file `ios_base.h`.

Referenced by `std::nouppercase()`, and `std::uppercase()`.

4.500.1 Detailed Description

```
template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::basic_regex<_Ch_type, _Rx_traits >
```

Objects of specializations of this class represent regular expressions constructed from sequences of character type `_Ch_type`.

Storage for the regular expression is allocated and deallocated as necessary by the member functions of this class.

Definition at line 35 of file `regex.h`.

4.500.2 Constructor & Destructor Documentation

4.500.2.1 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,`
`_Rx_traits >::basic_regex () [inline]`

Constructs a basic regular expression that does not match any character sequence.

Definition at line 435 of file `regex.h`.

4.500.2.2 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,`
`_Rx_traits >::basic_regex (const _Ch_type * __p, flag_type __f = ECMAScript) [inline],`
`[explicit]`

Constructs a basic regular expression from the sequence `[__p, __p + char_traits<_Ch_type>::length(__p))` interpreted according to the flags in `__f`.

Parameters

<code>__p</code>	A pointer to the start of a C-style null-terminated string containing a regular expression.
<code>__f</code>	Flags indicating the syntax rules and options.

Exceptions

<code>regex_error</code>	if <code>__p</code> is not a valid regular expression.
--------------------------	--

Definition at line 451 of file regex.h.

```
4.500.2.3 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
    _Rx_traits>::basic_regex ( const _Ch_type * __p, std::size_t __len, flag_type __f = ECMAScript )
    [inline]
```

Constructs a basic regular expression from the sequence [p, p + len) interpreted according to the flags in f.

Parameters

<code>__p</code>	A pointer to the start of a string containing a regular expression.
<code>__len</code>	The length of the string containing the regular expression.
<code>__f</code>	Flags indicating the syntax rules and options.

Exceptions

<code>regex_error</code>	if <code>__p</code> is not a valid regular expression.
--------------------------	--

Definition at line 467 of file regex.h.

```
4.500.2.4 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
    _Rx_traits>::basic_regex ( const basic_regex<_Ch_type, _Rx_traits> & __rhs ) [inline]
```

Copy-constructs a basic regular expression.

Parameters

<code>__rhs</code>	A regex object.
--------------------	-----------------

Definition at line 477 of file regex.h.

References `std::basic_regex< _Ch_type, _Rx_traits >::getloc()`.

```
4.500.2.5 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
    _Rx_traits>::basic_regex ( basic_regex<_Ch_type, _Rx_traits> && __rhs ) [inline]
```

Move-constructs a basic regular expression.

Parameters

<code>__rhs</code>	A regex object.
--------------------	-----------------

The implementation is a workaround concerning ABI compatibility. See: <https://gcc.gnu.org/ml/libstdc++/2014-09/msg00001.html>

Definition at line 492 of file regex.h.

```
4.500.2.6  template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>>> template<typename _Ch_traits ,
            typename _Ch_alloc > std::basic_regex<_Ch_type, _Rx_traits >::basic_regex ( const std::basic_string<
            _Ch_type, _Ch_traits, _Ch_alloc > &__s, flag_type __f=ECMAScript ) [inline],[explicit]
```

Constructs a basic regular expression from the string `s` interpreted according to the flags in `f`.

Parameters

<code>__s</code>	A string containing a regular expression.
<code>__f</code>	Flags indicating the syntax rules and options.

Exceptions

<code>regex_error</code>	if <code>__s</code> is not a valid regular expression.
--------------------------	--

Definition at line 512 of file `regex.h`.

```
4.500.2.7  template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>>> template<typename _Fwdlter >
            std::basic_regex<_Ch_type, _Rx_traits >::basic_regex ( _Fwdlter __first, _Fwdlter __last, flag_type __f =
            ECMAScript ) [inline]
```

Constructs a basic regular expression from the range `[first, last)` interpreted according to the flags in `f`.

Parameters

<code>__first</code>	The start of a range containing a valid regular expression.
<code>__last</code>	The end of a range containing a valid regular expression.
<code>__f</code>	The format flags of the regular expression.

Exceptions

<code>regex_error</code>	if <code>[__first, __last)</code> is not a valid regular expression.
--------------------------	--

Definition at line 532 of file `regex.h`.

```
4.500.2.8  template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>>> std::basic_regex<_Ch_type,
            _Rx_traits >::basic_regex ( initializer_list<_Ch_type > __l, flag_type __f=ECMAScript ) [inline]
```

Constructs a basic regular expression from an initializer list.

Parameters

	The initializer list.
	
	
	
	
	The format flags of the regular expression.
	
	
	
	

Exceptions

<i>regex_error</i>	if <code>__l</code> is not a valid regular expression.
--------------------	--

Definition at line 551 of file regex.h.

4.500.2.9 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type, _Rx_traits>::~basic_regex () [inline]`

Destroys a basic regular expression.

Definition at line 558 of file regex.h.

4.500.3 Member Function Documentation

4.500.3.1 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign (const basic_regex<_Ch_type, _Rx_traits> &__rhs) [inline]`

the real assignment operator.

Parameters

<code>__rhs</code>	Another regular expression object.
--------------------	------------------------------------

Definition at line 619 of file regex.h.

References `std::basic_regex<_Ch_type, _Rx_traits>::getloc()`.

Referenced by `std::basic_regex<_Ch_type, _Rx_traits>::swap()`.

4.500.3.2 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign (basic_regex<_Ch_type, _Rx_traits> &&__rhs) [inline]`

The move-assignment operator.

Parameters

<code>__rhs</code>	Another regular expression object.
--------------------	------------------------------------

The implementation is a workaround concerning ABI compatibility. See: <https://gcc.gnu.org/ml/libstdc++/2014-09/msg00001.html>

Definition at line 637 of file `regex.h`.

References `std::move()`.

4.500.3.3 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign (const _Ch_type * __p, flag_type __flags = ECMAScript) [inline]`

Assigns a new regular expression to a regex object from a C-style null-terminated string containing a regular expression pattern.

Parameters

<code>__p</code>	A pointer to a C-style null-terminated string containing a regular expression pattern.
<code>__flags</code>	Syntax option flags.

Exceptions

<code>regex_error</code>	if <code>__p</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, <code>*this</code> remains unchanged.
--------------------------	--

Definition at line 661 of file `regex.h`.

4.500.3.4 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign (const _Ch_type * __p, std::size_t __len, flag_type __flags) [inline]`

Assigns a new regular expression to a regex object from a C-style string containing a regular expression pattern.

Parameters

<code>__p</code>	A pointer to a C-style string containing a regular expression pattern.
<code>__len</code>	The length of the regular expression pattern string.
<code>__flags</code>	Syntax option flags.

Exceptions

<code>regex_error</code>	if <code>p</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, <code>*this</code> remains unchanged.
--------------------------	--

Definition at line 678 of file regex.h.

4.500.3.5 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _Ch_type, typename _Alloc > basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign (const basic_string<_Ch_type, _Ch_type_traits, _Alloc> &__s, flag_type __flags = ECMAScript) [inline]`

Assigns a new regular expression to a regex object from a string containing a regular expression pattern.

Parameters

<code>__s</code>	A string containing a regular expression pattern.
<code>__flags</code>	Syntax option flags.

Exceptions

<code>regex_error</code>	if <code>__s</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, <code>*this</code> remains unchanged.
--------------------------	--

Definition at line 694 of file regex.h.

References `std::basic_string<_CharT, _Traits, _Alloc>::data()`, and `std::basic_string<_CharT, _Traits, _Alloc>::size()`.

4.500.3.6 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _InputIterator > basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign (_InputIterator __first, _InputIterator __last, flag_type __flags = ECMAScript) [inline]`

Assigns a new regular expression to a regex object.

Parameters

<code>__first</code>	The start of a range containing a valid regular expression.
<code>__last</code>	The end of a range containing a valid regular expression.
<code>__flags</code>	Syntax option flags.

Exceptions

<code>regex_error</code>	if <code>p</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, the object remains unchanged.
--------------------------	--

Definition at line 719 of file regex.h.

4.500.3.7 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign (initializer_list<_Ch_type> __l, flag_type __flags = ECMAScript) [inline]`

Assigns a new regular expression to a regex object.

Parameters

<code>__l</code>	An initializer list representing a regular expression.
<code>__flags</code>	Syntax option flags.

Exceptions

<code>regex_error</code>	if <code>__l</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, the object remains unchanged.
--------------------------	--

Definition at line 735 of file `regex.h`.

4.500.3.8 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> flag_type std::basic_regex<_Ch_type, _Rx_traits>::flags() const [inline]`

Gets the flags used to construct the regular expression or in the last call to `assign()`.

Definition at line 756 of file `regex.h`.

4.500.3.9 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> locale_type std::basic_regex<_Ch_type, _Rx_traits>::getloc() const [inline]`

Gets the locale currently imbued in the regular expression object.

Definition at line 777 of file `regex.h`.

Referenced by `std::basic_regex<_Ch_type, _Rx_traits>::assign()`, and `std::basic_regex<_Ch_type, _Rx_traits>::basic_regex()`.

4.500.3.10 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> locale_type std::basic_regex<_Ch_type, _Rx_traits>::imbue(locale_type __loc) [inline]`

Imbues the regular expression object with the given locale.

Parameters

<code>__loc</code>	A locale.
--------------------	-----------

Definition at line 766 of file `regex.h`.

4.500.3.11 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> unsigned int std::basic_regex<_Ch_type, _Rx_traits>::mark_count() const [inline]`

Gets the number of marked subexpressions within the regular expression.

Definition at line 744 of file `regex.h`.

```
4.500.3.12 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex&
std::basic_regex< _Ch_type, _Rx_traits >::operator= ( const basic_regex< _Ch_type, _Rx_traits > & __rhs )
[inline]
```

Assigns one regular expression to another.

Definition at line 565 of file regex.h.

```
4.500.3.13 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex&
std::basic_regex< _Ch_type, _Rx_traits >::operator= ( basic_regex< _Ch_type, _Rx_traits > && __rhs )
[inline]
```

Move-assigns one regular expression to another.

The implementation is a workaround concerning ABI compatibility. See: <https://gcc.gnu.org/ml/libstdc++/2014-09/msg00001.html>

Definition at line 575 of file regex.h.

References std::move().

```
4.500.3.14 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex&
std::basic_regex< _Ch_type, _Rx_traits >::operator= ( const _Ch_type * __p ) [inline]
```

Replaces a regular expression with a new one constructed from a C-style null-terminated string.

Parameters

<code>__p</code>	A pointer to the start of a null-terminated C-style string containing a regular expression.
------------------	---

Definition at line 586 of file regex.h.

```
4.500.3.15 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex&
std::basic_regex< _Ch_type, _Rx_traits >::operator= ( initializer_list<_Ch_type> __l ) [inline]
```

Replaces a regular expression with a new one constructed from an initializer list.

Parameters

<code>__l</code>	The initializer list.
------------------	-----------------------

Exceptions

<code>regex_error</code>	if <code>__l</code> is not a valid regular expression.
--------------------------	--

Definition at line 598 of file regex.h.

```
4.500.3.16  template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _Ch_typeraits ,
            typename _Alloc > basic_regex& std::basic_regex< _Ch_type, _Rx_traits >::operator= ( const basic_string<
            _Ch_type, _Ch_typeraits, _Alloc > & __s )  [inline]
```

Replaces a regular expression with a new one constructed from a string.

Parameters

<code>__s</code>	A pointer to a string containing a regular expression.
------------------	--

Definition at line 609 of file regex.h.

```
4.500.3.17  template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> void std::basic_regex< _Ch_type,
            _Rx_traits >::swap ( basic_regex< _Ch_type, _Rx_traits > & __rhs )  [inline]
```

Swaps the contents of two regular expression objects.

Parameters

<code>__rhs</code>	Another regular expression object.
--------------------	------------------------------------

Definition at line 787 of file regex.h.

References `std::basic_regex< _Ch_type, _Rx_traits >::assign()`, `std::move()`, and `std::swap()`.

Referenced by `std::swap()`.

4.501.1 Detailed Description

```
template<typename _CharT, typename _Traits, typename _Alloc>
class std::basic_string< _CharT, _Traits, _Alloc >
```

Managing sequences of characters and character-like objects.

Template Parameters

<code>_CharT</code>	Type of character
<code>_Traits</code>	Traits for character type, defaults to <code>char_traits<_CharT></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_CharT></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#). Of the [optional sequence requirements](#), only `push_back`, `at`, and `array` access are supported.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Documentation? What's that? Nathan Myers ncm@cantrip.org.

A string looks like this:

```

[basic_string<char_type>]
_M_dataplus
_M_p ----->
                                     [_Rep]
                                     _M_length
                                     _M_capacity
                                     _M_refcount
                                     unnamed array of char_type
```

Where the `_M_p` points to the first character in the string, and you cast it to a pointer-to-`_Rep` and subtract 1 to get a pointer to the header.

This approach has the enormous advantage that a string object requires only one allocation. All the ugliness is confined within a single pair of inline functions, which each compile to a single *add* instruction: `_Rep::_M_data()`, and `string::_M_rep()`; and the allocation function which gets a block of raw bytes and with room enough and constructs a `_Rep` object at the front.

The reason you want `_M_data` pointing to the character array and not the `_Rep` is so that the debugger can see the string contents. (Probably we should add a non-inline member to get the `_Rep` for the debugger to use, so users can check the actual string length.)

Note that the `_Rep` object is a POD so that you can have a static *empty string* `_Rep` object already *constructed* before static constructors have run. The reference-count encoding is chosen so that a 0 indicates one reference, so you never try to destroy the empty-string `_Rep` object.

All but the last paragraph is considered pretty conventional for a C++ string implementation.

Definition at line 112 of file `basic_string.h`.

4.501.2 Constructor & Destructor Documentation

4.501.2.1 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc>::basic_string() [inline]`

Default constructor creates an empty string.

Definition at line 441 of file `basic_string.h`.

Referenced by `std::basic_string<_Ch_type>::basic_string()`, and `std::basic_string<_Ch_type>::substr()`.

4.501.2.2 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc>::basic_string (const _Alloc &__a) [explicit]`

Construct an empty string using allocator *a*.

4.501.2.3 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc>::basic_string (const basic_string<_CharT, _Traits, _Alloc> &__str)`

Construct string with copy of value of *str*.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

4.501.2.4 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string (const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos, size_type __n = npos)`

Construct string as copy of a substring.

Parameters

<code>__str</code>	Source string.
<code>__pos</code>	Index of first character to copy from.
<code>__n</code>	Number of characters to copy (default remainder).

4.501.2.5 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string (const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos, size_type __n, const _Alloc & __a)`

Construct string as copy of a substring.

Parameters

<code>__str</code>	Source string.
<code>__pos</code>	Index of first character to copy from.
<code>__n</code>	Number of characters to copy.
<code>__a</code>	Allocator to use.

4.501.2.6 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string (const _CharT * __s, size_type __n, const _Alloc & __a = _Alloc())`

Construct string initialized by a character array.

Parameters

<code>__s</code>	Source character array.
<code>__n</code>	Number of characters to copy.
<code>__a</code>	Allocator to use (default is default allocator).

NB: `__s` must have at least `__n` characters, `'\0'` has no special meaning.

4.501.2.7 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc>::basic_string (const _CharT * __s, const _Alloc & __a = _Alloc())`

Construct string as copy of a C string.

Parameters

<code>__s</code>	Source C string.
<code>__a</code>	Allocator to use (default is default allocator).

4.501.2.8 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc>::basic_string (size_type __n, _CharT __c, const _Alloc & __a = _Alloc())`

Construct string as multiple characters.

Parameters

<code>__n</code>	Number of characters.
<code>__c</code>	Character to use.
<code>__a</code>	Allocator to use (default is default allocator).

4.501.2.9 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc>::basic_string (basic_string<_CharT, _Traits, _Alloc> && __str) [inline], [noexcept]`

Move construct string.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

The newly-created string contains the exact contents of `__str`. `__str` is a valid, but unspecified string.

Definition at line 511 of file `basic_string.h`.

4.501.2.10 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc>::basic_string (initializer_list<_CharT> __l, const _Alloc & __a = _Alloc())`

Construct string from an initializer list.

Parameters

<code>_l</code>	<code>std::initializer_list</code> of characters.
<code>_a</code>	Allocator to use (default is default allocator).

4.501.2.11 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator >
std::basic_string<_CharT, _Traits, _Alloc>::basic_string (_InputIterator __beg, _InputIterator __end, const
_Alloc & __a = _Alloc())`

Construct string as copy of a range.

Parameters

<code>__beg</code>	Start of range.
<code>__end</code>	End of range.
<code>__a</code>	Allocator to use (default is default allocator).

4.501.2.12 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string<_CharT, _Traits, _Alloc
>::~~basic_string () [inline], [noexcept]`

Destroy the string instance.

Definition at line 545 of file `basic_string.h`.

4.501.3 Member Function Documentation

4.501.3.1 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT,
_Traits, _Alloc>::append (const basic_string<_CharT, _Traits, _Alloc> & __str)`

Append a string to this string.

Parameters

<code>__str</code>	The string to append.
--------------------	-----------------------

Returns

Reference to this string.

Referenced by `std::basic_string<_Ch_type>::append()`, `std::operator+()`, and `std::basic_string<_Ch_type>::operator+=()`.

4.501.3.2 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append (const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos, size_type __n)`

Append a substring.

Parameters

<code>__str</code>	The string to append.
<code>__pos</code>	Index of the first character of <code>str</code> to append.
<code>__n</code>	The number of characters to append.

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	if <code>__pos</code> is not a valid index.
--------------------------------	---

This function appends `__n` characters from `__str` starting at `__pos` to this string. If `__n` is larger than the number of available characters in `__str`, the remainder of `__str` is appended.

4.501.3.3 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append (const _CharT * __s, size_type __n)`

Append a C substring.

Parameters

<code>__s</code>	The C string to append.
<code>__n</code>	The number of characters to append.

Returns

Reference to this string.

4.501.3.4 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append (const _CharT * __s) [inline]`

Append a C string.

Parameters

<code>__s</code>	The C string to append.
------------------	-------------------------

Returns

Reference to this string.

Definition at line 1022 of file `basic_string.h`.

4.501.3.5 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append (size_type __n, _CharT __c)`

Append multiple characters.

Parameters

<code>__n</code>	The number of characters to append.
<code>__c</code>	The character to use.

Returns

Reference to this string.

Appends `__n` copies of `__c` to this string.

4.501.3.6 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append (initializer_list< _CharT > __l) [inline]`

Append an `initializer_list` of characters.

Parameters

<code>__l</code>	The <code>initializer_list</code> of characters to append.
------------------	--

Returns

Reference to this string.

Definition at line 1046 of file `basic_string.h`.

4.501.3.7 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append (_InputIterator __first, _InputIterator __last) [inline]`

Append a range of characters.

Parameters

<code>__first</code>	Iterator referencing the first character to append.
<code>__last</code>	Iterator marking the end of the range.

Returns

Reference to this string.

Appends characters in the range [`__first`,`__last`) to this string.

Definition at line 1060 of file `basic_string.h`.

4.501.3.8 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign (const basic_string< _CharT, _Traits, _Alloc > & __str)`

Set value to contents of another string.

Parameters

<code>__str</code>	Source string to use.
--------------------	-----------------------

Returns

Reference to this string.

Referenced by `std::basic_string< _Ch_type >::assign()`, `std::basic_string< _Ch_type >::operator=()`, and `std::basic_string< _Ch_type >::push_back()`.

4.501.3.9 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign (basic_string< _CharT, _Traits, _Alloc > && __str) [inline]`

Set value to contents of another string.

Parameters

<code>__str</code>	Source string to use.
--------------------	-----------------------

Returns

Reference to this string.

This function sets this string to the exact contents of `__str`. `__str` is a valid, but unspecified string.

Definition at line 1096 of file `basic_string.h`.

```
4.501.3.10 template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::assign ( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos, size_type __n )
    [inline]
```

Set value to a substring of a string.

Parameters

<code>__str</code>	The string to use.
<code>__pos</code>	Index of the first character of str.
<code>__n</code>	Number of characters to use.

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	if <code>pos</code> is not a valid index.
--------------------------------	---

This function sets this string to the substring of `__str` consisting of `__n` characters at `__pos`. If `__n` is larger than the number of available characters in `__str`, the remainder of `__str` is used.

Definition at line 1117 of file `basic_string.h`.

```
4.501.3.11 template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::assign ( const _CharT * __s, size_type __n )
```

Set value to a C substring.

Parameters

<code>__s</code>	The C string to use.
<code>__n</code>	Number of characters to use.

Returns

Reference to this string.

This function sets the value of this string to the first `__n` characters of `__s`. If `__n` is larger than the number of available characters in `__s`, the remainder of `__s` is used.

4.501.3.12 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign (const _CharT * __s) [inline]`

Set value to contents of a C string.

Parameters

<code>__s</code>	The C string to use.
------------------	----------------------

Returns

Reference to this string.

This function sets the value of this string to the value of `__s`. The data is copied, so there is no dependence on `__s` once the function returns.

Definition at line 1145 of file `basic_string.h`.

4.501.3.13 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign (size_type __n, _CharT __c) [inline]`

Set value to multiple characters.

Parameters

<code>__n</code>	Length of the resulting string.
<code>__c</code>	The character to use.

Returns

Reference to this string.

This function sets the value of this string to `__n` copies of character `__c`.

Definition at line 1161 of file `basic_string.h`.

4.501.3.14 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign (_InputIterator __first, _InputIterator __last) [inline]`

Set value to a range of characters.

Parameters

<code>__first</code>	Iterator referencing the first character to append.
<code>__last</code>	Iterator marking the end of the range.

Returns

Reference to this string.

Sets value of string to characters in the range [`__first`,`__last`).

Definition at line 1174 of file `basic_string.h`.

4.501.3.15 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign (initializer_list< _CharT > __l) [inline]`

Set value to an `initializer_list` of characters.

Parameters

<code>__l</code>	The <code>initializer_list</code> of characters to assign.
<code>__l</code>	
<code>__l</code>	
<code>__l</code>	
<code>__l</code>	

Returns

Reference to this string.

Definition at line 1184 of file `basic_string.h`.

4.501.3.16 `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string< _CharT, _Traits, _Alloc >::at (size_type __n) const [inline]`

Provides access to the data contained in the string.

Parameters

<code>__n</code>	The index of the character to access.
<code>__n</code>	

Returns

Read-only (`const`) reference to the character.

Exceptions

<code>std::out_of_range</code>	If <code>n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws `out_of_range` if the check fails.

Definition at line 874 of file basic_string.h.

4.501.3.17 `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string<_CharT, _Traits, _Alloc>::at(size_type __n) [inline]`

Provides access to the data contained in the string.

Parameters

<code>__n</code>	The index of the character to access.
------------------	---------------------------------------

Returns

Read/write reference to the character.

Exceptions

<code>std::out_of_range</code>	If <i>n</i> is an invalid index.
--------------------------------	----------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws `out_of_range` if the check fails. Success results in unsharing the string.

Definition at line 896 of file basic_string.h.

4.501.3.18 `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string<_CharT, _Traits, _Alloc>::back() [inline]`

Returns a read/write reference to the data at the last element of the string.

Definition at line 929 of file basic_string.h.

4.501.3.19 `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string<_CharT, _Traits, _Alloc>::back() const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the string.

Definition at line 937 of file basic_string.h.

4.501.3.20 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string<_CharT, _Traits, _Alloc>::begin() [inline]`

Returns a read/write iterator that points to the first character in the string. Unshares the string.

Definition at line 613 of file basic_string.h.

Referenced by `__gnu_profile::__report()`, `std::basic_string<_Ch_type>::crend()`, `std::regex_match()`, `std::regex_replace()`, `std::regex_search()`, and `std::basic_string<_Ch_type>::rend()`.

4.501.3.21 `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string< _CharT, _Traits, _Alloc >::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first character in the string.

Definition at line 624 of file `basic_string.h`.

4.501.3.22 `template<typename _CharT, typename _Traits, typename _Alloc> const _CharT* std::basic_string< _CharT, _Traits, _Alloc >::c_str () const [inline], [noexcept]`

Return const pointer to null-terminated contents.

This is a handle to internal data. Do not modify or dire things may happen.

Definition at line 1818 of file `basic_string.h`.

Referenced by `__gnu_profile::__report()`, `std::getline()`, `std::messages< _CharT >::messages()`, `std::operator==()`, `std::regex_replace()`, and `std::messages< _CharT >::~~messages()`.

4.501.3.23 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::capacity () const [inline], [noexcept]`

Returns the total number of characters that the string can hold before needing to allocate more memory.

Definition at line 784 of file `basic_string.h`.

Referenced by `std::operator+()`, `std::basic_string< _Ch_type >::push_back()`, and `std::basic_string< _Ch_type >::shrink_to_fit()`.

4.501.3.24 `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string< _CharT, _Traits, _Alloc >::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first character in the string.

Definition at line 688 of file `basic_string.h`.

4.501.3.25 `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string< _CharT, _Traits, _Alloc >::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last character in the string.

Definition at line 696 of file `basic_string.h`.

4.501.3.26 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::clear () [inline]`

Erases the string, making it empty.

Definition at line 812 of file `basic_string.h`.

4.501.3.27 `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string< _CharT, _Traits, _Alloc >::compare (const basic_string< _CharT, _Traits, _Alloc > & __str) const [inline]`

Compare to a string.

Parameters

<code>__str</code>	String to compare against.
--------------------	----------------------------

Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before `__str`, 0 if their values are equivalent, or > 0 if this string is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and `str.size()`. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Definition at line 2243 of file `basic_string.h`.

Referenced by `std::basic_string<_Ch_type>::compare()`, `std::operator<()`, `std::operator<=()`, `std::operator==()`, `std::operator>()`, and `std::operator>=()`.

4.501.3.28 `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string<_CharT, _Traits, _Alloc>::compare (size_type __pos, size_type __n, const basic_string<_CharT, _Traits, _Alloc> & __str) const`

Compare substring to a string.

Parameters

<code>__pos</code>	Index of first character of substring.
<code>__n</code>	Number of characters in substring.
<code>__str</code>	String to compare against.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n` characters starting at `__pos`. Returns an integer < 0 if the substring is ordered before `__str`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__str.size()`. The function then compares the two strings by calling `traits::compare(substring.data(), str.data(), rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

4.501.3.29 `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string<_CharT, _Traits, _Alloc>::compare (size_type __pos1, size_type __n1, const basic_string<_CharT, _Traits, _Alloc> & __str, size_type __pos2, size_type __n2) const`

Compare substring to a substring.

Parameters

<code>__pos1</code>	Index of first character of substring.
---------------------	--

Parameters

<code>__n1</code>	Number of characters in substring.
<code>__str</code>	String to compare against.
<code>__pos2</code>	Index of first character of substring of <code>str</code> .
<code>__n2</code>	Number of characters in substring of <code>str</code> .

Returns

Integer < 0 , 0 , or > 0 .

Form the substring of this string from the `__n1` characters starting at `__pos1`. Form the substring of `__str` from the `__n2` characters starting at `__pos2`. Returns an integer < 0 if this substring is ordered before the substring of `__str`, 0 if their values are equivalent, or > 0 if this substring is ordered after the substring of `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the lengths of the substrings. The function then compares the two strings by calling `traits::compare(substring.data(),str.substr(pos2,n2).data(),rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

4.501.3.30 `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string< _CharT, _Traits, _Alloc >::compare (const _CharT * __s) const`

Compare to a C string.

Parameters

<code>__s</code>	C string to compare against.
------------------	------------------------------

Returns

Integer < 0 , 0 , or > 0 .

Returns an integer < 0 if this string is ordered before `__s`, 0 if their values are equivalent, or > 0 if this string is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and the length of a string constructed from `__s`. The function then compares the two strings by calling `traits::compare(data(),s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

4.501.3.31 `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string< _CharT, _Traits, _Alloc >::compare (size_type __pos, size_type __n1, const _CharT * __s) const`

Compare substring to a C string.

Parameters

<code>__pos</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__s</code>	C string to compare against.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `pos`. Returns an integer < 0 if the substring is ordered before `__s`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and the length of a string constructed from `__s`. The function then compares the two string by calling `traits::compare(substring.data(),__s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

4.501.3.32 `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string< _CharT, _Traits, _Alloc >::compare (size_type __pos, size_type __n1, const _CharT * __s, size_type __n2) const`

Compare substring against a character array.

Parameters

<code>__pos</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__s</code>	character array to compare against.
<code>__n2</code>	Number of characters of <code>s</code> .

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos`. Form a string from the first `__n2` characters of `__s`. Returns an integer < 0 if this substring is ordered before the string from `__s`, 0 if their values are equivalent, or > 0 if this substring is ordered after the string from `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__n2`. The function then compares the two strings by calling `traits::compare(substring.data(),s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

NB: `s` must have at least `n2` characters, `'\0'` has no special meaning.

4.501.3.33 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::copy (_CharT * __s, size_type __n, size_type __pos = 0) const`

Copy substring into C string.

Parameters

<code>__s</code>	C string to copy value into.
<code>__n</code>	Number of characters to copy.
<code>__pos</code>	Index of first character to copy.

Returns

Number of characters actually copied

Exceptions

<code>std::out_of_range</code>	If <code>__pos > size()</code> .
--------------------------------	-------------------------------------

Copies up to `__n` characters starting at `__pos` into the C string `__s`. If `__pos` is greater than `size()`, `out_of_range` is thrown.

Referenced by `std::basic_string<_Ch_type>::replace()`.

4.501.3.34 `template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string<_CharT, _Traits, _Alloc>::crbegin() const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last character in the string. Iteration is done in reverse element order.

Definition at line 705 of file `basic_string.h`.

4.501.3.35 `template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string<_CharT, _Traits, _Alloc>::crend() const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order.

Definition at line 714 of file `basic_string.h`.

4.501.3.36 `template<typename _CharT, typename _Traits, typename _Alloc> const _CharT* std::basic_string<_CharT, _Traits, _Alloc>::data() const [inline], [noexcept]`

Return const pointer to contents.

This is a handle to internal data. Do not modify or dire things may happen.

Definition at line 1828 of file `basic_string.h`.

Referenced by `std::basic_regex<_Ch_type, _Rx_traits>::assign()`, `std::basic_string<_Ch_type>::compare()`, `std::basic_string<_Ch_type>::find()`, `std::basic_string<_Ch_type>::find_first_not_of()`, `std::basic_string<_Ch_type>::find_first_of()`, `std::basic_string<_Ch_type>::find_last_not_of()`, `std::basic_string<_Ch_type>::find_last_of()`, `std::match_results<_Bi_iter>::format()`, `std::operator<<()`, `std::operator==()`, `std::basic_string<_Ch_type>::rfind()`, and `std::regex_traits<_Ch_type>::transform()`.

4.501.3.37 `template<typename _CharT, typename _Traits, typename _Alloc> bool std::basic_string<_CharT, _Traits, _Alloc>::empty() const [inline], [noexcept]`

Returns true if the string is empty. Equivalent to `*this == ""`.

Definition at line 820 of file `basic_string.h`.

4.501.338 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string< _CharT, _Traits, _Alloc >::end() [inline]`

Returns a read/write iterator that points one past the last character in the string. Unshares the string.

Definition at line 632 of file `basic_string.h`.

Referenced by `__gnu_profile::__report()`, `std::basic_string< _Ch_type >::crbegin()`, `std::basic_string< _Ch_type >::begin()`, `std::regex_match()`, `std::regex_replace()`, and `std::regex_search()`.

4.501.339 `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string< _CharT, _Traits, _Alloc >::end() const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last character in the string.

Definition at line 643 of file `basic_string.h`.

4.501.340 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::erase (size_type __pos = 0, size_type __n = npos) [inline]`

Remove characters.

Parameters

<code>__pos</code>	Index of first character to remove (default 0).
<code>__n</code>	Number of characters to remove (default remainder).

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	If <code>pos</code> is beyond the end of this string.
--------------------------------	---

Removes `__n` characters from this string starting at `__pos`. The length of the string is reduced by `__n`. If there are `< __n` characters to remove, the remainder of the string is truncated. If `__p` is beyond end of string, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1379 of file `basic_string.h`.

Referenced by `__gnu_profile::__report()`, `std::basic_string< _Ch_type >::erase()`, and `std::basic_string< _Ch_type >::pop_back()`.

4.501.341 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string< _CharT, _Traits, _Alloc >::erase (iterator __position) [inline]`

Remove one character.

Parameters

<code>__position</code>	Iterator referencing the character to remove.
-------------------------	---

Returns

iterator referencing same location after removal.

Removes the character at `__position` from this string. The value of the string doesn't change if an error is thrown.

Definition at line 1395 of file `basic_string.h`.

4.501.3.42 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string< _CharT, _Traits, _Alloc >::erase (iterator __first, iterator __last)`

Remove a range of characters.

Parameters

<code>__first</code>	Iterator referencing the first character to remove.
<code>__last</code>	Iterator referencing the end of the range.

Returns

Iterator referencing location of first after removal.

Removes the characters in the range `[first,last)` from this string. The value of the string doesn't change if an error is thrown.

4.501.3.43 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find (const _CharT * __s, size_type __pos, size_type __n) const`

Find position of a C substring.

Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to search from.
<code>__n</code>	Number of characters from <code>s</code> to search for.

Returns

Index of start of first occurrence.

Starting from `__pos`, searches forward for the first `__n` characters in `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Referenced by `__gnu_profile::__report()`, `std::basic_string< _Ch_type >::find()`, `std::basic_string< _Ch_type >::find←_first_of()`, and `std::basic_string< _Ch_type >::get_allocator()`.

4.501.3.44 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find (const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = 0) const [inline], [noexcept]`

Find position of a string.

Parameters

<code>__str</code>	String to locate.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of start of first occurrence.

Starting from `__pos`, searches forward for value of `__str` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1864 of file `basic_string.h`.

4.501.3.45 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find (const _CharT * __s, size_type __pos = 0) const [inline]`

Find position of a C string.

Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of start of first occurrence.

Starting from `__pos`, searches forward for the value of `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1879 of file `basic_string.h`.

4.501.3.46 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find (_CharT __c, size_type __pos = 0) const [noexcept]`

Find position of a character.

Parameters

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.47 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of (const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = 0) const`
`[inline], [noexcept]`

Find position of a character not in string.

Parameters

<code>__str</code>	String containing characters to avoid.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2097 of file `basic_string.h`.

Referenced by `__gnu_profile::__report()`, and `std::basic_string< _Ch_type >::find_first_not_of()`.

4.501.3.48 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of (const _CharT * __s, size_type __pos, size_type __n) const`

Find position of a character not in C substring.

Parameters

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search from.
<code>__n</code>	Number of characters from <code>__s</code> to consider.

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.49 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of (const _CharT* __s, size_type __pos = 0) const [inline]`

Find position of a character not in C string.

Parameters

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2128 of file `basic_string.h`.

4.501.3.50 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of (_CharT __c, size_type __pos = 0) const [noexcept]`

Find position of a different character.

Parameters

<code>__c</code>	Character to avoid.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character other than `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.51 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_of (const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = 0) const [inline], [noexcept]`

Find position of a character of string.

Parameters

<code>__str</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for one of the characters of `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1970 of file `basic_string.h`.

Referenced by `__gnu_profile::__report()`, and `std::basic_string<_Ch_type>::find_first_of()`.

4.501.3.52 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::find_first_of(const _CharT * __s, size_type __pos, size_type __n) const`

Find position of a character of C substring.

Parameters

<code>__s</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search from.
<code>__n</code>	Number of characters from <code>s</code> to search for.

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for one of the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.53 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::find_first_of(const _CharT * __s, size_type __pos = 0) const [inline]`

Find position of a character of C string.

Parameters

<code>__s</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for one of the characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2000 of file `basic_string.h`.

```
4.501.3.54 template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits,
    _Alloc >::find_first_of( _CharT __c, size_type __pos = 0 ) const [inline], [noexcept]
```

Find position of a character.

Parameters

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for the character `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Note: equivalent to `find(__c, __pos)`.

Definition at line 2019 of file `basic_string.h`.

```
4.501.3.55 template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits,
    _Alloc >::find_last_not_of( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = npos ) const
    [inline], [noexcept]
```

Find last position of a character not in string.

Parameters

<code>__str</code>	String containing characters to avoid.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2160 of file `basic_string.h`.

Referenced by `std::basic_string< _Ch_type >::find_last_not_of()`.

4.501.3.56 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_not_of (const _CharT * __s, size_type __pos, size_type __n) const`

Find last position of a character not in C substring.

Parameters

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search back from.
<code>__n</code>	Number of characters from s to consider.

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.57 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_not_of (const _CharT * __s, size_type __pos = npos) const [inline]`

Find last position of a character not in C string.

Parameters

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2191 of file `basic_string.h`.

4.501.3.58 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_not_of (_CharT __c, size_type __pos = npos) const [noexcept]`

Find last position of a different character.

Parameters

<code>__c</code>	Character to avoid.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character other than `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.59 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::find_last_of(const basic_string<_CharT, _Traits, _Alloc> & __str, size_type __pos = npos) const`
`[inline], [noexcept]`

Find last position of a character of string.

Parameters

<code>__str</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for one of the characters of `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2034 of file `basic_string.h`.

Referenced by `std::basic_string<_Ch_type>::find_last_of()`.

4.501.3.60 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::find_last_of(const _CharT* __s, size_type __pos, size_type __n) const`

Find last position of a character of C substring.

Parameters

<code>__s</code>	C string containing characters to locate.
<code>__pos</code>	Index of character to search back from.
<code>__n</code>	Number of characters from <code>s</code> to search for.

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for one of the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.61 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_of(const _CharT* __s, size_type __pos = npos) const [inline]`

Find last position of a character of C string.

Parameters

<code>__s</code>	C string containing characters to locate.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for one of the characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2064 of file `basic_string.h`.

4.501.3.62 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_of(_CharT __c, size_type __pos = npos) const [inline], [noexcept]`

Find last position of a character.

Parameters

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Note: equivalent to `rfind(__c, __pos)`.

Definition at line 2083 of file `basic_string.h`.

4.501.3.63 `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string< _CharT, _Traits, _Alloc >::front() [inline]`

Returns a read/write reference to the data at the first element of the string.

Definition at line 913 of file `basic_string.h`.

4.501.3.64 `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string< _CharT, _Traits, _Alloc >::front () const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the first element of the string.

Definition at line 921 of file basic_string.h.

4.501.3.65 `template<typename _CharT, typename _Traits, typename _Alloc> allocator_type std::basic_string< _CharT, _Traits, _Alloc >::get_allocator () const [inline], [noexcept]`

Return copy of allocator used to construct this string.

Definition at line 1835 of file basic_string.h.

Referenced by `std::basic_string< _Ch_type >::basic_string()`, and `std::basic_string< _Ch_type >::~~basic_string()`.

4.501.3.66 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::insert (iterator __p, size_type __n, _CharT __c) [inline]`

Insert multiple characters.

Parameters

<code>__p</code>	Iterator referencing location in string to insert at.
<code>__n</code>	Number of characters to insert
<code>__c</code>	The character to insert.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts `__n` copies of character `__c` starting at the position referenced by iterator `__p`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1202 of file basic_string.h.

Referenced by `std::basic_string< _Ch_type >::insert()`, and `std::operator+()`.

4.501.3.67 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > void std::basic_string< _CharT, _Traits, _Alloc >::insert (iterator __p, _InputIterator __beg, _InputIterator __end) [inline]`

Insert a range of characters.

Parameters

<code>__p</code>	Iterator referencing location in string to insert at.
<code>__beg</code>	Start of range.
<code>__end</code>	End of range.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts characters in range `[__beg, __end)`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1219 of file `basic_string.h`.

```
4.501.3.68  template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string<_CharT, _Traits, _Alloc>::insert( iterator __p, initializer_list<_CharT> __l ) [inline]
```

Insert an `initializer_list` of characters.

Parameters

<code>__p</code>	Iterator referencing location in string to insert at.
<code>__l</code>	The <code>initializer_list</code> of characters to insert.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Definition at line 1230 of file `basic_string.h`.

```
4.501.3.69  template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::insert( size_type __pos1, const basic_string<_CharT, _Traits, _Alloc> & __str ) [inline]
```

Insert value of a string.

Parameters

<code>__pos1</code>	Iterator referencing location in string to insert at.
<code>__str</code>	The string to insert.

Returns

Reference to this string.

Exceptions

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
--------------------------	---

Inserts value of `__str` starting at `__pos1`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1250 of file `basic_string.h`.

4.501.3.70 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::insert(size_type __pos1, const basic_string<_CharT, _Traits, _Alloc> & __str, size_type __pos2, size_type __n) [inline]`

Insert a substring.

Parameters

<code>__pos1</code>	Iterator referencing location in string to insert at.
<code>__str</code>	The string to insert.
<code>__pos2</code>	Start of characters in <code>str</code> to insert.
<code>__n</code>	Number of characters to insert.

Returns

Reference to this string.

Exceptions

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
<i>std::out_of_range</i>	If <code>pos1 > size()</code> or <code>__pos2 > str.size()</code> .

Starting at `pos1`, insert `__n` character of `__str` beginning with `__pos2`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos1` is beyond the end of this string or `__pos2` is beyond the end of `__str`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1272 of file `basic_string.h`.

4.501.3.71 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::insert(size_type __pos, const _CharT* __s, size_type __n)`

Insert a C substring.

Parameters

<code>__pos</code>	Iterator referencing location in string to insert at.
<code>__s</code>	The C string to insert.
<code>__n</code>	The number of characters to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
<code>std::out_of_range</code>	If <code>__pos</code> is beyond the end of this string.

Inserts the first `__n` characters of `__s` starting at `__pos`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos` is beyond `end()`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

4.501.3.72 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::insert (size_type __pos, const _CharT* __s) [inline]`

Insert a C string.

Parameters

<code>__pos</code>	Iterator referencing location in string to insert at.
<code>__s</code>	The C string to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
<code>std::out_of_range</code>	If <code>pos</code> is beyond the end of this string.

Inserts the first `n` characters of `__s` starting at `__pos`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos` is beyond `end()`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1313 of file `basic_string.h`.

4.501.3.73 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::insert (size_type __pos, size_type __n, _CharT __c) [inline]`

Insert multiple characters.

Parameters

<code>__pos</code>	Index in string to insert at.
<code>__n</code>	Number of characters to insert
<code>__c</code>	The character to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
<code>std::out_of_range</code>	If <code>__pos</code> is beyond the end of this string.

Inserts `__n` copies of character `__c` starting at index `__pos`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos > length()`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1336 of file `basic_string.h`.

4.501.3.74 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string<_CharT, _Traits, _Alloc>::insert (iterator __p, _CharT __c) [inline]`

Insert one character.

Parameters

<code>__p</code>	Iterator referencing position in string to insert at.
<code>__c</code>	The character to insert.

Returns

Iterator referencing newly inserted char.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts character `__c` at position referenced by `__p`. If adding character causes the length to exceed `max_size()`, `length_error` is thrown. If `__p` is beyond end of string, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1354 of file `basic_string.h`.

```
4.501.3.75  template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits,
            _Alloc >::length ( ) const    [inline], [noexcept]
```

Returns the number of characters in the string, not including any null-termination.

Definition at line 729 of file `basic_string.h`.

Referenced by `__gnu_profile::__report()`.

```
4.501.3.76  template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits,
            _Alloc >::max_size ( ) const    [inline], [noexcept]
```

Returns the `size()` of the largest possible string.

Definition at line 734 of file `basic_string.h`.

```
4.501.3.77  template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
            _Traits, _Alloc >::operator+=( const basic_string< _CharT, _Traits, _Alloc > & __str )    [inline]
```

Append a string to this string.

Parameters

<code>__str</code>	The string to append.
--------------------	-----------------------

Returns

Reference to this string.

Definition at line 948 of file `basic_string.h`.

```
4.501.3.78  template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
            _Traits, _Alloc >::operator+=( const _CharT * __s )    [inline]
```

Append a C string.

Parameters

<code>__s</code>	The C string to append.
------------------	-------------------------

Returns

Reference to this string.

Definition at line 957 of file basic_string.h.

```
4.501.3.79 template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::operator+=( _CharT __c ) [inline]
```

Append a character.

Parameters

<code>__c</code>	The character to append.
-------------------------	--------------------------

Returns

Reference to this string.

Definition at line 966 of file basic_string.h.

```
4.501.3.80 template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::operator+=( initializer_list< _CharT > __l ) [inline]
```

Append an initializer_list of characters.

Parameters

<code>__l</code>	The initializer_list of characters to be appended.
-------------------------	--

Returns

Reference to this string.

Definition at line 979 of file basic_string.h.

```
4.501.3.81 template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::operator=( const basic_string< _CharT, _Traits, _Alloc > & __str ) [inline]
```

Assign the value of *str* to this string.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

Definition at line 553 of file `basic_string.h`.

4.501.3.82 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator= (const _CharT * __s) [inline]`

Copy contents of `s` into this string.

Parameters

<code>__s</code>	Source null-terminated string.
------------------	--------------------------------

Definition at line 561 of file `basic_string.h`.

4.501.3.83 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator= (_CharT __c) [inline]`

Set value to string of length 1.

Parameters

<code>__c</code>	Source character.
------------------	-------------------

Assigning to a character makes this string length 1 and `(*this)[0] == c`.

Definition at line 572 of file `basic_string.h`.

4.501.3.84 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator= (basic_string< _CharT, _Traits, _Alloc > && __str) [inline]`

Move assign the value of `str` to this string.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

The contents of `str` are moved into this string (without copying). `str` is a valid, but unspecified string.

Definition at line 588 of file `basic_string.h`.

4.501.3.85 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator=(initializer_list< _CharT > __l) [inline]`

Set value to string constructed from initializer list.

Parameters

↩	std::initializer_list.
↩	
↩	
↩	
/	

Definition at line 600 of file basic_string.h.

4.501.3.86 `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string< _CharT, _Traits, _Alloc >::operator[](size_type __pos) const [inline], [noexcept]`

Subscript access to the data contained in the string.

Parameters

__pos	The index of the character to access.
-------	---------------------------------------

Returns

Read-only (constant) reference to the character.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

Definition at line 835 of file basic_string.h.

Referenced by std::basic_string< _Ch_type >::back(), and std::basic_string< _Ch_type >::front().

4.501.3.87 `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string< _CharT, _Traits, _Alloc >::operator[](size_type __pos) [inline]`

Subscript access to the data contained in the string.

Parameters

__pos	The index of the character to access.
-------	---------------------------------------

Returns

Read/write reference to the character.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.) Unshares the string.

Definition at line 852 of file `basic_string.h`.

```
4.501.3.88  template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc
>::pop_back( ) [inline]
```

Remove the last character.

The string must be non-empty.

Definition at line 1424 of file `basic_string.h`.

```
4.501.3.89  template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc
>::push_back( _CharT __c ) [inline]
```

Append a single character.

Parameters

<code>__c</code>	Character to append.
------------------	----------------------

Definition at line 1068 of file `basic_string.h`.

Referenced by `std::basic_string< _Ch_type >::operator+=()`.

```
4.501.3.90  template<typename _CharT, typename _Traits, typename _Alloc> reverse_iterator std::basic_string< _CharT,
_Traits, _Alloc >::rbegin( ) [inline]
```

Returns a read/write reverse iterator that points to the last character in the string. Iteration is done in reverse element order. Unshares the string.

Definition at line 652 of file `basic_string.h`.

```
4.501.3.91  template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string<
_CharT, _Traits, _Alloc >::rbegin( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last character in the string. Iteration is done in reverse element order.

Definition at line 661 of file `basic_string.h`.

```
4.501.3.92  template<typename _CharT, typename _Traits, typename _Alloc> reverse_iterator std::basic_string< _CharT,
_Traits, _Alloc >::rend( ) [inline]
```

Returns a read/write reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order. Unshares the string.

Definition at line 670 of file `basic_string.h`.

4.501.3.93 `template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string< _CharT, _Traits, _Alloc >::rend() const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order.

Definition at line 679 of file basic_string.h.

4.501.3.94 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::replace(size_type __pos, size_type __n, const basic_string< _CharT, _Traits, _Alloc > & __str) [inline]`

Replace characters with value from another string.

Parameters

<code>__pos</code>	Index of first character to replace.
<code>__n</code>	Number of characters to be replaced.
<code>__str</code>	String to insert.

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	If <code>pos</code> is beyond the end of this string.
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos, __pos+__n)` from this string. In place, the value of `__str` is inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of the result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1446 of file basic_string.h.

Referenced by `std::basic_string< _Ch_type >::append()`, `std::basic_string< _Ch_type >::assign()`, `std::basic_string< _Ch_type >::insert()`, and `std::basic_string< _Ch_type >::replace()`.

4.501.3.95 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::replace(size_type __pos1, size_type __n1, const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos2, size_type __n2) [inline]`

Replace characters with value from another string.

Parameters

<code>__pos1</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__str</code>	String to insert.
<code>__pos2</code>	Index of first character of <code>str</code> to use.
<code>__n2</code>	Number of characters from <code>str</code> to use.

Returns

Reference to this string.

Exceptions

<i>std::out_of_range</i>	If <code>__pos1 > size()</code> or <code>__pos2 > __str.size()</code> .
<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos1, __pos1 + n)` from this string. In place, the value of `__str` is inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of the result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1468 of file `basic_string.h`.

4.501.3.96 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace (size_type __pos, size_type __n1, const _CharT * __s, size_type __n2)`

Replace characters with value of a C substring.

Parameters

<code>__pos</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__s</code>	C string to insert.
<code>__n2</code>	Number of characters from <code>s</code> to use.

Returns

Reference to this string.

Exceptions

<i>std::out_of_range</i>	If <code>pos1 > size()</code> .
<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos, __pos + __n1)` from this string. In place, the first `__n2` characters of `__s` are inserted, or all of `__s` if `__n2` is too large. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

4.501.3.97 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace (size_type __pos, size_type __n1, const _CharT * __s) [inline]`

Replace characters with value of a C string.

Parameters

<code>__pos</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__s</code>	C string to insert.

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	If <code>pos > size()</code> .
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos, __pos + __n1)` from this string. In place, the characters of `__s` are inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1513 of file `basic_string.h`.

4.501.3.98 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace (size_type __pos, size_type __n1, size_type __n2, _CharT __c) [inline]`

Replace characters with multiple characters.

Parameters

<code>__pos</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__n2</code>	Number of characters to insert.
<code>__c</code>	Character to insert.

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	If <code>__pos > size()</code> .
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[pos, pos + n1)` from this string. In place, `__n2` copies of `__c` are inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1537 of file basic_string.h.

```
4.501.3.99  template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::replace ( iterator __i1, iterator __i2, const basic_string< _CharT, _Traits, _Alloc > & __str )
    [inline]
```

Replace range of characters with string.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__str</code>	String value to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Removes the characters in the range `[__i1, __i2)`. In place, the value of `__str` is inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1555 of file basic_string.h.

```
4.501.3.100  template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::replace ( iterator __i1, iterator __i2, const _CharT* __s, size_type __n ) [inline]
```

Replace range of characters with C substring.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__s</code>	C string value to insert.
<code>__n</code>	Number of characters from <code>s</code> to insert.

Returns

Reference to this string.

Exceptions

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
--------------------------	---

Removes the characters in the range `[__i1, __i2)`. In place, the first `__n` characters of `__s` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1574 of file `basic_string.h`.

4.501.3.101 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace (iterator __i1, iterator __i2, const _CharT *__s) [inline]`

Replace range of characters with C string.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__s</code>	C string value to insert.

Returns

Reference to this string.

Exceptions

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
--------------------------	---

Removes the characters in the range `[__i1, __i2)`. In place, the characters of `__s` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1595 of file `basic_string.h`.

4.501.3.102 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace (iterator __i1, iterator __i2, size_type __n, _CharT __c) [inline]`

Replace range of characters with multiple characters.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.

Parameters

<code>__n</code>	Number of characters to insert.
<code>__c</code>	Character to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Removes the characters in the range `[__i1,__i2)`. In place, `__n` copies of `__c` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1616 of file `basic_string.h`.

4.501.3.103 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace (iterator __i1, iterator __i2, _InputIterator __k1, _InputIterator __k2) [inline]`

Replace range of characters with range.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__k1</code>	Iterator referencing start of range to insert.
<code>__k2</code>	Iterator referencing end of range to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Removes the characters in the range `[__i1,__i2)`. In place, characters in the range `[__k1,__k2)` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1640 of file `basic_string.h`.

4.501.3.104 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace (iterator __i1, iterator __i2, initializer_list<_CharT> __l) [inline]`

Replace range of characters with initializer_list.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__l</code>	The initializer_list of characters to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Removes the characters in the range `[__i1, __i2)`. In place, characters in the range `[__k1, __k2)` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1709 of file `basic_string.h`.

4.501.3.105 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string<_CharT, _Traits, _Alloc>::reserve (size_type __res_arg = 0)`

Attempt to preallocate enough memory for specified number of characters.

Parameters

<code>__res_arg</code>	Number of characters required.
------------------------	--------------------------------

Exceptions

<code>std::length_error</code>	If <code>__res_arg</code> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the string to hold the specified number of characters. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the string length that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of string data.

Referenced by `std::basic_string< _Ch_type >::capacity()`, `std::basic_string< _Ch_type >::push_back()`, and `std::basic_string< _Ch_type >::shrink_to_fit()`.

4.501.3.106 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::resize (size_type __n, _CharT __c)`

Resizes the string to the specified number of characters.

Parameters

<code>__n</code>	Number of characters the string should contain.
<code>__c</code>	Character to fill any new elements.

This function will resize the string to the specified number of characters. If the number is smaller than the string's current size the string is truncated, otherwise the string is extended and new elements are set to `__c`.

Referenced by `std::basic_string< _Ch_type >::max_size()`, and `std::basic_string< _Ch_type >::resize()`.

4.501.3.107 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::resize (size_type __n) [inline]`

Resizes the string to the specified number of characters.

Parameters

<code>__n</code>	Number of characters the string should contain.
------------------	---

This function will resize the string to the specified length. If the new size is smaller than the string's current size the string is truncated, otherwise the string is extended and new characters are default-constructed. For basic types such as `char`, this means setting them to 0.

Definition at line 761 of file `basic_string.h`.

4.501.3.108 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::rfind (const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = npos) const [inline], [noexcept]`

Find last position of a string.

Parameters

<code>__str</code>	String to locate.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of start of last occurrence.

Starting from `__pos`, searches backward for value of `__str` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1909 of file `basic_string.h`.

Referenced by `std::basic_string<_Ch_type>::find_last_of()`, and `std::basic_string<_Ch_type>::rfind()`.

4.501.3.109 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::rfind (const _CharT * __s, size_type __pos, size_type __n) const`

Find last position of a C substring.

Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to search back from.
<code>__n</code>	Number of characters from <code>s</code> to search for.

Returns

Index of start of last occurrence.

Starting from `__pos`, searches backward for the first `__n` characters in `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

4.501.3.110 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::rfind (const _CharT * __s, size_type __pos = npos) const [inline]`

Find last position of a C string.

Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to start search at (default end).

Returns

Index of start of last occurrence.

Starting from `__pos`, searches backward for the value of `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1939 of file `basic_string.h`.

4.501.3.111 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::rfind (_CharT __c, size_type __pos = npos) const [noexcept]`

Find last position of a character.

Parameters

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from `__pos`, searches backward for `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.501.3.112 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::shrink_to_fit () [inline], [noexcept]`

A non-binding request to reduce `capacity()` to `size()`.

Definition at line 767 of file `basic_string.h`.

4.501.3.113 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::size () const [inline], [noexcept]`

Returns the number of characters in the string, not including any null-termination.

Definition at line 723 of file `basic_string.h`.

Referenced by `std::basic_regex< _Ch_type, _Rx_traits >::assign()`, `std::basic_string< _Ch_type >::assign()`, `std::basic_string< _Ch_type >::at()`, `std::basic_string< _Ch_type >::back()`, `std::basic_string< _Ch_type >::cend()`, `std::basic_string< _Ch_type >::clear()`, `std::basic_string< _Ch_type >::compare()`, `std::basic_string< _Ch_type >::empty()`, `std::basic_string< _Ch_type >::end()`, `std::basic_string< _Ch_type >::find()`, `std::basic_string< _Ch_type >::find_first_not_of()`, `std::basic_string< _Ch_type >::find_first_of()`, `std::basic_string< _Ch_type >::find_last_not_of()`, `std::basic_string< _Ch_type >::find_last_of()`, `std::match_results< _Bi_iter >::format()`, `std::basic_string< _Ch_type >::insert()`, `std::operator+`, `std::operator<<`, `std::operator==()`, `std::basic_string< _Ch_type >::operator[]()`, `std::basic_string< _Ch_type >::pop_back()`, `std::basic_string< _Ch_type >::push_back()`, `std::basic_string< _Ch_type >::replace()`, `std::basic_string< _Ch_type >::rfind()`, `std::basic_string< _Ch_type >::shrink_to_fit()`, and `std::basic_regex_traits< _Ch_type >::transform()`.

4.501.3.114 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string std::basic_string< _CharT, _Traits, _Alloc >::substr (size_type __pos = 0, size_type __n = npos) const [inline]`

Get a substring.

Parameters

<code>__pos</code>	Index of first character (default 0).
<code>__n</code>	Number of characters in substring (default remainder).

Returns

The new string.

Exceptions

<code>std::out_of_range</code>	If <code>__pos > size()</code> .
--------------------------------	-------------------------------------

Construct and return a new string using the `__n` characters starting at `__pos`. If the string is too short, use the remainder of the characters. If `__pos` is beyond the end of the string, `out_of_range` is thrown.

Definition at line 2224 of file `basic_string.h`.

Referenced by `__gnu_profile::__report()`.

4.501.3.115 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::swap (basic_string< _CharT, _Traits, _Alloc > & __s)`

Swap contents with another string.

Parameters

<code>__s</code>	String to swap with.
------------------	----------------------

Exchanges the contents of this string with that of `__s` in constant time.

Referenced by `std::basic_string< _Ch_type >::assign()`, `std::basic_string< _Ch_type >::operator=()`, `std::basic_string< _Ch_type >::replace()`, and `std::swap()`.

4.501.4 Member Data Documentation

4.501.4.1 `template<typename _CharT, typename _Traits, typename _Alloc> const size_type std::basic_string< _CharT, _Traits, _Alloc >::npos [static]`

Value returned by various member functions when they fail.

Definition at line 285 of file `basic_string.h`.

4.502.1 Detailed Description

A Bernoulli random number distribution.

Generates a sequence of true and false values with likelihood p that true will come up and $(1 - p)$ that false will appear.

Definition at line 3574 of file random.h.

4.502.2 Member Typedef Documentation

4.502.2.1 typedef bool std::bernoulli_distribution::result_type

The type of the range of the distribution.

Definition at line 3578 of file random.h.

4.502.3 Constructor & Destructor Documentation

4.502.3.1 std::bernoulli_distribution::bernoulli_distribution (double __p = 0.5) [inline],[explicit]

Constructs a Bernoulli distribution with likelihood p .

Parameters

\leftarrow __p	[IN] The likelihood of a true result being returned. Must be in the interval $[0, 1]$.
---------------------	---

Definition at line 3611 of file random.h.

4.502.4 Member Function Documentation

4.502.4.1 result_type std::bernoulli_distribution::max () const [inline]

Returns the least upper bound value of the distribution.

Definition at line 3661 of file random.h.

References std::max().

4.502.4.2 result_type std::bernoulli_distribution::min () const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 3654 of file random.h.

References std::min().

4.502.4.3 template<typename _UniformRandomNumberGenerator > result_type std::bernoulli_distribution::operator() (_UniformRandomNumberGenerator & __urng) [inline]

Generating functions.

Definition at line 3669 of file random.h.

4.502.4.4 `double std::bernoulli_distribution::p () const [inline]`

Returns the `p` parameter of the distribution.

Definition at line 3632 of file `random.h`.

4.502.4.5 `param_type std::bernoulli_distribution::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 3639 of file `random.h`.

Referenced by `std::operator>>()`.

4.502.4.6 `void std::bernoulli_distribution::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3647 of file `random.h`.

4.502.4.7 `void std::bernoulli_distribution::reset () [inline]`

Resets the distribution state.

Does nothing for a Bernoulli distribution.

Definition at line 3626 of file `random.h`.

4.502.5 Friends And Related Function Documentation

4.502.5.1 `bool operator== (const bernoulli_distribution & __d1, const bernoulli_distribution & __d2) [friend]`

Return true if two Bernoulli distributions have the same parameters.

Definition at line 3711 of file `random.h`.

The documentation for this class was generated from the following file:

4.509.1 Detailed Description

```
template<typename _IntType = int>
class std::binomial_distribution< _IntType >
```

A discrete binomial random number distribution.

The formula for the binomial probability density function is $p(i|t, p) = \binom{t}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.

Definition at line 3779 of file random.h.

4.509.2 Member Typedef Documentation

4.509.2.1 template<typename _IntType = int> typedef _IntType std::binomial_distribution< _IntType >::result_type

The type of the range of the distribution.

Definition at line 3782 of file random.h.

4.509.3 Member Function Documentation

4.509.3.1 template<typename _IntType = int> result_type std::binomial_distribution< _IntType >::max () const
[inline]

Returns the least upper bound value of the distribution.

Definition at line 3889 of file random.h.

4.509.3.2 template<typename _IntType = int> result_type std::binomial_distribution< _IntType >::min () const
[inline]

Returns the greatest lower bound value of the distribution.

Definition at line 3882 of file random.h.

4.509.3.3 template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type
std::binomial_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]

Generating functions.

Definition at line 3897 of file random.h.

4.509.3.4 template<typename _IntType = int> double std::binomial_distribution< _IntType >::p () const [inline]

Returns the distribution p parameter.

Definition at line 3860 of file random.h.

4.509.3.5 template<typename _IntType = int> param_type std::binomial_distribution< _IntType >::param () const
[inline]

Returns the parameter set of the distribution.

Definition at line 3867 of file random.h.

4.509.3.6 template<typename _IntType = int> void std::binomial_distribution< _IntType >::param (const param_type &
__param) [inline]

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3875 of file random.h.

4.509.3.7 `template<typename _IntType = int> void std::binomial_distribution<_IntType>::reset () [inline]`

Resets the distribution state.

Definition at line 3846 of file random.h.

4.509.3.8 `template<typename _IntType = int> _IntType std::binomial_distribution<_IntType>::t () const [inline]`

Returns the distribution `t` parameter.

Definition at line 3853 of file random.h.

4.509.4 Friends And Related Function Documentation

4.509.4.1 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::binomial_distribution<_IntType1> & __x) [friend]`

Inserts a `binomial_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>binomial_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.509.4.2 `template<typename _IntType = int> bool operator== (const binomial_distribution<_IntType> & __d1, const binomial_distribution<_IntType> & __d2) [friend]`

Return true if two binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3933 of file random.h.

4.509.4.3 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is, std::binomial_distribution<_IntType1> & __x) [friend]`

Extracts a `binomial_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>binomial_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.513.1 Detailed Description

```
template<class _CharT>
struct std::char_traits< _CharT >
```

Basis for explicit traits specializations.

Note

For any given actual character type, this definition is probably wrong. Since this is just a thin wrapper around `__gnu_cxx::char_traits`, it is possible to achieve a more appropriate definition by specializing `__gnu_cxx::char_traits`.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt05ch13s03.html> for advice on how to make use of this class for *unusual* character types. Also, check out `include/ext/pod_char_traits.h`.

4.517.1 Detailed Description

```
template<typename _RealType = double>
class std::chi_squared_distribution< _RealType >
```

A [chi_squared_distribution](#) random number distribution.

The formula for the normal probability mass function is $p(x|n) = \frac{x^{(n/2)-1} e^{-x/2}}{\Gamma(n/2) 2^{n/2}}$

Definition at line 2721 of file random.h.

4.517.2 Member Typedef Documentation

4.517.2.1 `template<typename _RealType = double> typedef _RealType std::chi_squared_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 2724 of file random.h.

4.517.3 Member Function Documentation

4.517.3.1 `template<typename _RealType = double> result_type std::chi_squared_distribution<_RealType>::max ()
const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 2801 of file random.h.

References `std::max()`.

4.517.3.2 `template<typename _RealType = double> result_type std::chi_squared_distribution<_RealType>::min ()
const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2794 of file random.h.

4.517.3.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type
std::chi_squared_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng)
[inline]`

Generating functions.

Definition at line 2809 of file random.h.

4.517.3.4 `template<typename _RealType = double> param_type std::chi_squared_distribution<_RealType>::param ()
const [inline]`

Returns the parameter set of the distribution.

Definition at line 2779 of file random.h.

4.517.3.5 `template<typename _RealType = double> void std::chi_squared_distribution<_RealType>::param (const
param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2787 of file random.h.

4.517.3.6 `template<typename _RealType = double> void std::chi_squared_distribution<_RealType>::reset ()`
`[inline]`

Resets the distribution state.

Definition at line 2765 of file random.h.

4.517.4 Friends And Related Function Documentation

4.517.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits`
`> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::chi_squared_distribution<_RealType1> & __x) [friend]`

Inserts a `chi_squared_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>chi_squared_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.517.4.2 `template<typename _RealType = double> bool operator==(const chi_squared_distribution<_RealType> & __d1,`
`const chi_squared_distribution<_RealType> & __d2) [friend]`

Return true if two Chi-squared distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2860 of file random.h.

4.517.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename`
`_Traits> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is,`
`std::chi_squared_distribution<_RealType1> & __x) [friend]`

Extracts a `chi_squared_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>_is</code>	An input stream.
<code>_x</code>	A chi_squared_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.519.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>
class std::codecvt<_InternT, _ExternT, _StateT >
```

Primary class template codecvt.

NB: Generic, mostly useless implementation.

Definition at line 276 of file codecvt.h.

4.519.2 Member Function Documentation

4.519.2.1 `template<typename _InternT, typename _ExternT, typename _StateT> virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next) const [protected], [virtual]`

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements [std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >](#).

4.519.2.2 `template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::in (state_type & __state, const extern_type * __from, const extern_type * __from_end, const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next) const [inline], [inherited]`

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 196 of file codecvt.h.

4.519.2.3 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT>::out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next) const [inline], [inherited]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This is analogous to wcsrtombs. It does this by calling codecvt::do_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 116 of file codecvt.h.

4.519.2.4 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT>::unshift (state_type & __state, extern_type * __to, extern_type * __to_end, extern_type * & __to_next) const [inline], [inherited]

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecv_t::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecv_t_base::result`. If the state could be reset and data written, returns `codecv_t_base::ok`. If no conversion is necessary, returns `codecv_t_base::noconv`. If the output has insufficient space, returns `codecv_t_base::partial`. Otherwise the reset failed and `codecv_t_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecv_t_base::result`.

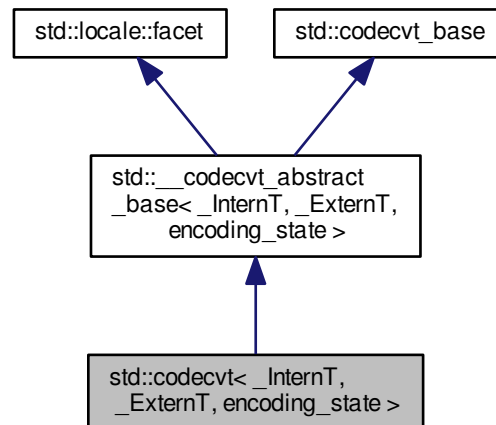

Definition at line 155 of file `codecv_t.h`.

4.520.1 Detailed Description

```
template<typename _InternT, typename _ExternT>
class std::codecvt< _InternT, _ExternT, encoding_state >
```

codecvt<InternT, _ExternT, encoding_state> specialization.

Definition at line 230 of file codecvt_specializations.h.

4.520.2 Member Function Documentation

4.520.2.1 `template<typename _InternT, typename _ExternT > codecvt_base::result std::codecvt< _InternT, _ExternT, encoding_state >::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type *& __from_next, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const` [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements `std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >`.

Definition at line 306 of file codecvt_specializations.h.

References `std::min()`.

4.520.2.2 **result** std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::in (state_type & __state, const extern_type * __from, const extern_type * __from_end, const extern_type *& __from_next, intern_type * __to, intern_type * __to_end, intern_type *& __to_next) const [inline],[inherited]

Convert from external to internal character set.

Converts input string of extern_type to output string of intern_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 196 of file codecvt.h.

4.520.2.3 **result** std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type *& __from_next, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const [inline],[inherited]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This is analogous to wcsrtombs. It does this by calling codecvt::do_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

4.520.2.4 `result std::__codecvt_abstract_base<_InternT,_ExternT,encoding_state>::unshift (state_type & __state, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const` `[inline],[inherited]`

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

codecvt_base::result.

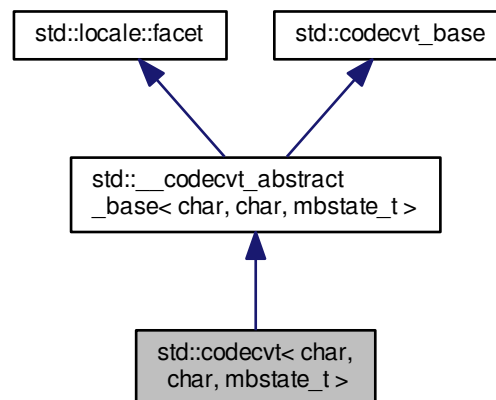

Definition at line 155 of file codecvt.h.

4.522.1 Detailed Description

template<>

class std::codecvt< wchar_t, char, mbstate_t >

class codecvt<wchar_t, char, mbstate_t> specialization.

Definition at line 398 of file codecvt.h.

4.522.2 Member Function Documentation

4.522.2.1 virtual result std::codecvt< wchar_t, char, mbstate_t >::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type *& __from_next, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements [std::__codecvt_abstract_base< wchar_t, char, mbstate_t >](#).

4.522.2.2 **result** **std::__codecvt_abstract_base**< **wchar_t**, **char**, **mbstate_t** >::**in** (**state_type** & **__state**, **const extern_type** * **__from**, **const extern_type** * **__from_end**, **const extern_type** * & **__from_next**, **intern_type** * **__to**, **intern_type** * **__to_end**, **intern_type** * & **__to_next**) **const** [inline],[inherited]

Convert from external to internal character set.

Converts input string of **extern_type** to output string of **intern_type**. This is analogous to **mbsrtowcs**. It does this by calling **codecvt::do_in**.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [**from**,**from_end**) are converted and written to [**to**,**to_end**). **from_next** and **to_next** are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, **from_next** and **to_next** are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of **codecvt_base::result**. If all the input is converted, returns **codecvt_base::ok**. If no conversion is necessary, returns **codecvt_base::noconv**. If the input ends early or there is insufficient space in the output, returns **codecvt_base::partial**. Otherwise the conversion failed and **codecvt_base::error** is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 196 of file **codecvt.h**.

4.522.2.3 **result** **std::__codecvt_abstract_base**< **wchar_t**, **char**, **mbstate_t** >::**out** (**state_type** & **__state**, **const intern_type** * **__from**, **const intern_type** * **__from_end**, **const intern_type** * & **__from_next**, **extern_type** * **__to**, **extern_type** * **__to_end**, **extern_type** * & **__to_next**) **const** [inline],[inherited]

Convert from internal to external character set.

Converts input string of **intern_type** to output string of **extern_type**. This is analogous to **wcsrtombs**. It does this by calling **codecvt::do_out**.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

4.522.2.4 `result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::unshift (state_type & __state, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const` `[inline],[inherited]`

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

4.524.2 Member Function Documentation

4.524.2.1 `template<typename _InternT, typename _ExternT, typename _StateT> virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next) const` [protected], [virtual], [inherited]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements [std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >](#).

4.524.2.2 `template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::in (state_type & __state, const extern_type * __from, const extern_type * __from_end, const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next) const` [inline], [inherited]

Convert from external to internal character set.

Converts input string of extern_type to output string of intern_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The state argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how state is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 196 of file codecvt.h.

```
4.524.2.3 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT>::out ( state_type & __state, const intern_type * __from, const intern_type * __from_end,
    const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next ) const
    [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This is analogous to wcsrtombs. It does this by calling codecvt::do_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 116 of file codecvt.h.

```
4.524.2.4 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT>::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type
    * & __to_next ) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 155 of file `codecvt.h`.

4.525.1 Detailed Description

```
template<typename _CharT>
class std::collate<_CharT>
```

Facet for localized string comparison.

This facet encapsulates the code to compare strings in a localized manner.

The collate template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the collate facet.

Definition at line 584 of file locale_classes.h.

4.525.2 Member Typedef Documentation

4.525.2.1 `template<typename _CharT> typedef _CharT std::collate<_CharT>::char_type`

Public typedefs.

Definition at line 590 of file locale_classes.h.

4.525.2.2 `template<typename _CharT> typedef basic_string<_CharT> std::collate<_CharT>::string_type`

Public typedefs.

Definition at line 591 of file locale_classes.h.

4.525.3 Constructor & Destructor Documentation

4.525.3.1 `template<typename _CharT> std::collate<_CharT>::collate (size_t __refs = 0) [inline],[explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 611 of file locale_classes.h.

4.525.3.2 `template<typename _CharT> std::collate<_CharT>::collate (__c_locale __cloc, size_t __refs = 0) [inline],[explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	Passed to the base facet class.

Definition at line 625 of file `locale_classes.h`.

4.525.3.3 `template<typename _CharT> virtual std::collate<_CharT>::~~collate () [inline], [protected], [virtual]`

Destructor.

Definition at line 688 of file `locale_classes.h`.

4.525.4 Member Function Documentation

4.525.4.1 `template<typename _CharT> int std::collate<_CharT>::compare (const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2) const [inline]`

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 642 of file `locale_classes.h`.

4.525.4.2 `template<typename _CharT> virtual int std::collate<_CharT>::do_compare (const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2) const [protected], [virtual]`

Compare two strings.

This function is a hook for derived classes to change the value returned.

See also

`compare()`.

Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

Returns

1 if string1 > string2, -1 if string1 < string2, else 0.

4.525.4.3 `template<typename _CharT> virtual long std::collate<_CharT>::do_hash (const _CharT * __lo, const _CharT * __hi) const` [protected],[virtual]

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

Parameters

<code>__↔ __lo</code>	Start of string.
<code>__↔ __hi</code>	End of string.

Returns

Hash value.

4.525.4.4 `template<typename _CharT> virtual string_type std::collate<_CharT>::do_transform (const _CharT * __lo, const _CharT * __hi) const` [protected],[virtual]

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

Parameters

<code>__↔ __lo</code>	Start.
<code>__↔ __hi</code>	End.

Returns

transformed string.

4.525.4.5 `template<typename _CharT> long std::collate<_CharT>::hash (const _CharT * __lo, const _CharT * __hi) const [inline]`

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning `collate::do_hash()`.

Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

Returns

Hash value.

Definition at line 675 of file `locale_classes.h`.

4.525.4.6 `template<typename _CharT> string_type std::collate<_CharT>::transform (const _CharT * __lo, const _CharT * __hi) const [inline]`

Transform string to comparable form.

This function is a wrapper for `strxfrm` functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

Returns

Transformed `string_type`.

Definition at line 661 of file `locale_classes.h`.

4.526.3 Member Function Documentation

4.526.3.1 `template<typename _CharT> int std::collate<_CharT>::compare(const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2) const` [inline], [inherited]

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 642 of file locale_classes.h.

4.526.3.2 `template<typename _CharT> virtual int std::collate<_CharT>::do_compare(const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2) const` [protected], [virtual], [inherited]

Compare two strings.

This function is a hook for derived classes to change the value returned.

See also

`compare()`.

Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

4.526.3.3 `template<typename _CharT> virtual long std::collate<_CharT>::do_hash (const _CharT * __lo, const _CharT * __hi) const` [protected],[virtual],[inherited]

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

Parameters

<code>__↔ __lo</code>	Start of string.
<code>__↔ __hi</code>	End of string.

Returns

Hash value.

4.526.3.4 `template<typename _CharT> virtual string_type std::collate<_CharT>::do_transform (const _CharT * __lo, const _CharT * __hi) const` [protected],[virtual],[inherited]

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

Parameters

<code>__↔ __lo</code>	Start.
<code>__↔ __hi</code>	End.

Returns

transformed string.

4.526.3.5 `template<typename _CharT> long std::collate<_CharT>::hash (const _CharT * __lo, const _CharT * __hi) const`
`[inline],[inherited]`

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning `collate::do_hash()`.

Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

Returns

Hash value.

Definition at line 675 of file `locale_classes.h`.

4.526.3.6 `template<typename _CharT> string_type std::collate<_CharT>::transform (const _CharT * __lo, const _CharT * __hi) const`
`[inline],[inherited]`

Transform string to comparable form.

This function is a wrapper for `strxfrm` functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

Returns

Transformed `string_type`.

4.531.1 Detailed Description

```
template<typename _CharT>
class std::ctype<_CharT>
```

Primary class template ctype facet.

This template class defines classification and conversion functions for character sets. It wraps ctype functionality. Ctype gets used by streams for many I/O operations.

This template provides the protected virtual functions the developer will have to replace in a derived class or specialization to make a working facet. The public functions that access them are defined in __ctype_abstract_base, to allow for implementation flexibility. See ctype<wchar_t> for an example. The functions are documented in __ctype_abstract_↵base.

Note: implementations are provided for all the protected virtual functions, but will likely not be useful.

Definition at line 605 of file locale_facets.h.

4.531.2 Member Function Documentation

4.531.2.1 `template<typename _CharT> virtual bool std::ctype<_CharT>::do_is (mask __m, char_type __c) const`
`[protected], [virtual]`

Test char_type classification.

This function finds a mask M for c and compares it to mask m.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

<code>↵ __c</code>	The char_type to find the mask of.
<code>↵ __m</code>	The mask to compare against.

Returns

(M & __m) != 0.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.2 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_is (const char_type * __lo, const char_type * __hi, mask * __vec) const` `[protected], [virtual]`

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.3 `template<typename _CharT> virtual char std::ctype<_CharT>::do_narrow (char_type __c, char __dfault) const` `[protected], [virtual]`

Narrow char_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char_type to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted char.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.4 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_narrow (const char_type *
__lo, const char_type * __hi, char __default, char * __to) const [protected], [virtual]`

Narrow char_type array to char.

This virtual function converts each char_type in the range [`__lo`,`__hi`) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.5 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_is (mask __m, const
char_type * __lo, const char_type * __hi) const [protected], [virtual]`

Find char_type matching mask.

This function searches for and returns the first char_type `c` in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else __hi.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.6 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` [protected], [virtual]

Find char_type not matching mask.

This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __hi.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.7 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_tolower (char_type __c) const` [protected], [virtual]

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__c</code>	The char_type to convert.
----------------------------------	---------------------------

Returns

The lowercase char_type if convertible, else __c.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.8 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_tolower (char_type * __lo, const char_type * __hi) const` [protected], [virtual]

Convert array to lowercase.

This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

 __lo	Pointer to start of range.
 __hi	Pointer to end of range.

Returns

[!\[\]\(c444627dab9fee9a1550c053ffaaaae2_img.jpg\) __hi](#).

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.9 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_toupper (char_type __c) const` [protected], [virtual]

Convert to uppercase.

This virtual function converts the char_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

 __c	The char_type to convert.
---	---------------------------

Returns

The uppercase `char_type` if convertible, else `__c`.

Implements [std::__ctype_abstract_base<_CharT>](#).

```
4.531.2.10 template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_toupper ( char_type * __lo,
const char_type * __hi ) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

```
4.531.2.11 template<typename _CharT> virtual char_type std::ctype<_CharT>::do_widen ( char __c ) const
[protected], [virtual]
```

Widen char.

This virtual function converts the `char` to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.12 `template<typename _CharT> virtual const char* std::ctype<_CharT>::do_widen (const char * __lo, const char * __hi, char_type * __to) const` `[protected],[virtual]`

Widen char array.

This function converts each char in the input to char_type using the simplest reasonable transformation.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

[`__hi`](#).

Implements [std::__ctype_abstract_base<_CharT>](#).

4.531.2.13 `template<typename _CharT> bool std::__ctype_abstract_base<_CharT>::is (mask __m, char_type __c) const` `[inline],[inherited]`

Test char_type classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

(M & __m) != 0.

Definition at line 162 of file locale_facets.h.

Referenced by `std::ctype<char>::is()`, `std::isalnum()`, `std::isalpha()`, `std::iscntrl()`, `std::isdigit()`, `std::isgraph()`, `std::islower()`, `std::isprint()`, `std::ispunct()`, `std::isspace()`, `std::isupper()`, and `std::isxdigit()`.

4.531.2.14 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is(const char_type * __lo, const char_type * __hi, mask * __vec) const` `[inline]`, `[inherited]`

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 179 of file locale_facets.h.

4.531.2.15 `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow(char_type __c, char __default) const` `[inline]`, `[inherited]`

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, `default` is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

Returns

The converted `char`.

Definition at line 324 of file locale_facets.h.

4.531.2.16 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const` `[inline],[inherited]`

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 346 of file `locale_facets.h`.

4.531.2.17 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_is (mask __m, const char_type * __lo, const char_type * __hi) const` `[inline],[inherited]`

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to matching `char_type` if found, else `__hi`.

Definition at line 195 of file `locale_facets.h`.

Referenced by `std::ctype< char >::is()`.

4.531.2.18 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` `[inline],[inherited]`

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file locale_facets.h.

Referenced by std::ctype<char>::scan_is().

4.531.2.19 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower (char_type __c) const` `[inline],[inherited]`

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The lowercase char_type if convertible, else `__c`.

Definition at line 254 of file locale_facets.h.

Referenced by std::tolower().

4.531.2.20 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower (char_type
* __lo, const char_type * __hi) const [inline],[inherited]`

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo,__hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 269 of file `locale_facets.h`.

4.531.2.21 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper (char_type __c)
const [inline],[inherited]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

Referenced by `std::toupper()`.

4.531.2.22 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper (char_type
* __lo, const char_type * __hi) const [inline],[inherited]`

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

Parameters

 <code>__lo</code>	Pointer to start of range.
 <code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 240 of file locale_facets.h.

```
4.531.2.23  template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen ( char __c ) const
            [inline],[inherited]
```

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

 <code>__c</code>	The char to convert.
---	----------------------

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

```
4.531.2.24  template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen ( const char * __lo,
            const char * __hi, char_type * __to ) const  [inline],[inherited]
```

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

 <code>__lo</code>	Pointer to start of range.
 <code>__hi</code>	Pointer to end of range.
 <code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 305 of file `locale_facets.h`.

4.531.3 Member Data Documentation

4.531.3.1 `template<typename _CharT> locale::id std::ctype<_CharT>::id` `[static]`

The facet id for `ctype<char_type>`

Definition at line 613 of file `locale_facets.h`.

The documentation for this class was generated from the following file:

4.532.1 Detailed Description

```
template<>
class std::ctype< char >
```

The ctype<char> specialization.

This class defines classification and conversion functions for the char type. It gets used by char streams for many I/O operations. The char specialization provides a number of optimizations as well.

Definition at line 674 of file locale_facets.h.

4.532.2 Member Typedef Documentation

4.532.2.1 typedef char std::ctype< char >::char_type

Typedef for the template parameter char.

Definition at line 679 of file locale_facets.h.

4.532.3 Constructor & Destructor Documentation

4.532.3.1 std::ctype< char >::ctype (const mask * __table = 0, bool __del = false, size_t __refs = 0) [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__table</code>	If non-zero, table is used as the per-char mask. Else <code>classic_table()</code> is used.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

4.532.3.2 `std::ctype< char >::ctype (__c_locale __cloc, const mask * __table = 0, bool __del = false, size_t __refs = 0)`
`[explicit]`

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__table</code>	If non-zero, table is used as the per-char mask.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

4.532.3.3 `virtual std::ctype< char >::~~ctype ()` `[protected], [virtual]`

Destructor.

This function deletes `table()` if `del` was true in the constructor.

4.532.4 Member Function Documentation

4.532.4.1 `static const mask* std::ctype< char >::classic_table () throw` `[static]`

Returns a pointer to the C locale mask table.

4.532.4.2 `virtual char std::ctype< char >::do_narrow (char_type __c, char __dfault) const` `[inline], [protected], [virtual]`

Narrow char.

This virtual function converts the `char` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an undervied `ctype<char>` facet, `c` will be returned unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
<code>__default</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 1124 of file locale_facets.h.

4.532.4.3 `virtual const char_type* std::ctype< char >::do_narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const` `[inline], [protected], [virtual]`

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 1150 of file locale_facets.h.

4.532.4.4 `virtual char_type std::ctype< char >::do_tolower (char_type __c) const` `[protected], [virtual]`

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

\leftrightarrow _c	The char to convert.
-------------------------	----------------------

Returns

The lowercase char if convertible, else __c.

4.532.4.5 `virtual const char_type* std::ctype< char >::do_tolower (char_type * __lo, const char_type * __hi) const` `[protected], [virtual]`

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

\leftrightarrow _lo	Pointer to first char in range.
\leftrightarrow _hi	Pointer to end of range.

Returns

__hi.

4.532.4.6 `virtual char_type std::ctype< char >::do_toupper (char_type __c) const` `[protected], [virtual]`

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

\leftrightarrow _c	The char to convert.
-------------------------	----------------------

Returns

The uppercase char if convertible, else `__c`.

4.532.4.7 `virtual const char_type* std::ctype< char >::do_toupper (char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`

Convert array to uppercase.

This virtual function converts each char in the range `[lo,hi)` to uppercase if possible. Other chars remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

4.532.4.8 `virtual char_type std::ctype< char >::do_widen (char __c) const` `[inline]`, `[protected]`, `[virtual]`

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 1075 of file `locale_facets.h`.

4.532.4.9 `virtual const char* std::ctype< char >::do_widen (const char * __lo, const char * __hi, char_type * __to) const`
`[inline], [protected], [virtual]`

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an undervied ctype<char> facet, the argument will be copied unchanged.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 1098 of file locale_facets.h.

4.532.4.10 `bool std::ctype< char >::is (mask __m, char __c) const` `[inline]`

Test char classification.

This function compares the mask table[c] to `__m`.

Parameters

<code>__c</code>	The char to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file ctype_inline.h.

References `std::__ctype_abstract_base< _CharT >::is()`.

4.532.4.11 `const char * std::ctype< char >::is (const char * __lo, const char * __hi, mask * __vec) const` `[inline]`

Return a mask array.

This function finds the mask for each char in the range [lo, hi) and successively writes it to vec. vec must have as many elements as the char array.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 48 of file `ctype_inline.h`.

References `std::__ctype_abstract_base< _CharT >::scan_is()`.

4.532.4.12 `char std::ctype< char >::narrow (char_type __c, char __dfault) const` `[inline]`

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, c will be returned unchanged.

This function works as if it returns `ctype<char>::do_narrow(c)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted character.

Definition at line 923 of file `locale_facets.h`.

References `std::__ctype_abstract_base< _CharT >::do_narrow()`.

4.532.4.13 `const char_type* std::ctype< char >::narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const` `[inline]`

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_narrow(lo, hi, default, to)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 956 of file `locale_facets.h`.

References `std::__ctype_abstract_base< _CharT >::do_narrow()`.

4.532.4.14 `const char * std::ctype< char >::scan_is (mask __m, const char * __lo, const char * __hi) const` `[inline]`

Find char matching a mask.

This function searches for and returns the first char in `[lo,hi)` for which `is(m,char)` is true.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching char if found, else `__hi`.

Definition at line 57 of file `ctype_inline.h`.

References std::__ctype_abstract_base< _CharT >::scan_not().

4.532.4.15 `const char * std::ctype< char >::scan_not (mask __m, const char * __lo, const char * __hi) const` [inline]

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [`__lo`,`__hi`) for which `is(m,char)` is false.

Parameters

<code>↔</code> <code>__m</code>	The mask to compare against.
<code>↔</code> <code>__lo</code>	Pointer to start of range.
<code>↔</code> <code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char if found, else `__hi`.

Definition at line 67 of file `ctype_inline.h`.

4.532.4.16 `const mask* std::ctype< char >::table () const throw` [inline]

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

Definition at line 974 of file `locale_facets.h`.

References std::__ctype_abstract_base< _CharT >::do_tolower(), and std::__ctype_abstract_base< _CharT >::do_↔
_toupper().

4.532.4.17 `char_type std::ctype< char >::tolower (char_type __c) const` [inline]

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__c)`. `do_tolower()` must always return the same result for the same input.

Parameters

<code>↔</code> <code>__c</code>	The char to convert.
------------------------------------	----------------------

Returns

The lowercase char if convertible, else `__c`.

Definition at line 828 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_tolower()`.

4.532.4.18 `const char_type* std::ctype<char>::tolower (char_type * __lo, const char_type * __hi) const`
`[inline]`

Convert array to lowercase.

This function converts each char in the range `[lo,hi)` to lowercase if possible. Other chars remain untouched.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__lo, __hi)`. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 845 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_tolower()`.

4.532.4.19 `char_type std::ctype<char>::toupper (char_type __c) const` `[inline]`

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`toupper()` acts as if it returns `ctype<char>::do_toupper(c)`. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The uppercase char if convertible, else `__c`.

Definition at line 795 of file locale_facets.h.

References `std::__ctype_abstract_base<_CharT>::do_toupper()`.

4.532.4.20 `const char_type* std::ctype< char >::toupper (char_type * __lo, const char_type * __hi) const`
`[inline]`

Convert array to uppercase.

This function converts each char in the range `[__lo,__hi)` to uppercase if possible. Other chars remain untouched.

`toupper()` acts as if it returns `ctype<char>::do_toupper(__lo, __hi)`. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 812 of file locale_facets.h.

References `std::__ctype_abstract_base<_CharT>::do_toupper()`.

4.532.4.21 `char_type std::ctype< char >::widen (char __c) const` `[inline]`

Widen char.

This function converts the `char` to `char_type` using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 865 of file locale_facets.h.

References `std::__ctype_abstract_base<_CharT>::do_widen()`.

4.532.4.22 `const char* std::ctype<char>::widen (const char * __lo, const char * __hi, char_type * __to) const`
`[inline]`

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 892 of file locale_facets.h.

References `std::__ctype_abstract_base<_CharT>::do_widen()`.

4.532.5 Member Data Documentation

4.532.5.1 `locale::id std::ctype<char>::id` `[static]`

The facet id for `ctype<char>`

Definition at line 696 of file locale_facets.h.

4.532.5.2 const size_t std::ctype< char >::table_size [static]

The size of the mask table. It is SCHAR_MAX + 1.

Definition at line 698 of file locale_facets.h.

4.533.1 Detailed Description

```
template<>
class std::ctype< wchar_t >
```

The ctype<wchar_t> specialization.

This class defines classification and conversion functions for the wchar_t type. It gets used by wchar_t streams for many I/O operations. The wchar_t specialization provides a number of optimizations as well.

ctype<wchar_t> inherits its public methods from __ctype_abstract_base<wchar_t>.

Definition at line 1175 of file locale_facets.h.

4.533.2 Member Typedef Documentation

4.533.2.1 typedef wchar_t std::ctype< wchar_t >::char_type

Typedef for the template parameter wchar_t.

Definition at line 1180 of file locale_facets.h.

4.533.3 Constructor & Destructor Documentation

4.533.3.1 std::ctype< wchar_t >::ctype (size_t __refs = 0) [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

4.533.3.2 `std::ctype<wchar_t>::ctype (__c_locale __cloc, size_t __refs = 0)` `[explicit]`

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__refs</code>	Passed to the base facet class.

4.533.3.3 `virtual std::ctype<wchar_t>::~~ctype ()` `[protected]`, `[virtual]`

Destructor.

4.533.4 Member Function Documentation

4.533.4.1 `virtual bool std::ctype<wchar_t>::do_is (mask __m, char_type __c) const` `[protected]`, `[virtual]`

Test `wchar_t` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>wchar_t</code> to find the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0.`

Implements [std::__ctype_abstract_base<wchar_t>](#).

4.533.4.2 `virtual const char_type* std::ctype< wchar_t >::do_is (const char_type * __lo, const char_type * __hi, mask * __vec) const` [protected], [virtual]

Return a mask array.

This function finds the mask for each `wchar_t` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.3 `virtual char std::ctype< wchar_t >::do_narrow (char_type __c, char __dfault) const` [protected], [virtual]

Narrow `wchar_t` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<wchar_t>` facet, `c` will be cast to `char` and returned.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted `char`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.4 `virtual const char_type* std::ctype<wchar_t>::do_narrow(const char_type * __lo, const char_type * __hi, char __dfault, char * __to) const` [protected], [virtual]

Narrow `wchar_t` array to `char` array.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `wchar_t` in the input that cannot be converted, *dfault* is used instead. For an underived `ctype<wchar_t>` facet, the argument will be copied, casting each element to `char`.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<wchar_t>](#).

4.533.4.5 `virtual const char_type* std::ctype<wchar_t>::do_scan_is(mask __m, const char_type * __lo, const char_type * __hi) const` [protected], [virtual]

Find `wchar_t` matching mask.

This function searches for and returns the first `wchar_t` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching wchar_t if found, else __hi.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.6 virtual const char_type* std::ctype< wchar_t >::do_scan_not (mask __m, const char_type * __lo, const char_type * __hi) const [protected], [virtual]

Find wchar_t not matching mask.

This function searches for and returns a pointer to the first wchar_t c of [__lo,__hi) for which is(__m,c) is false.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

 __m	The mask to compare against.
 __lo	Pointer to start of range.
 __hi	Pointer to end of range.

Returns

Pointer to a non-matching wchar_t if found, else __hi.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.7 virtual char_type std::ctype< wchar_t >::do_tolower (char_type __c) const [protected], [virtual]

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

 __c	The wchar_t to convert.
---	-------------------------

Returns

The lowercase `wchar_t` if convertible, else `__c`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.8 `virtual const char_type* std::ctype< wchar_t >::do_tolower (char_type * __lo, const char_type * __hi) const` `[protected], [virtual]`

Convert array to lowercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.9 `virtual char_type std::ctype< wchar_t >::do_toupper (char_type __c) const` `[protected], [virtual]`

Convert to uppercase.

This virtual function converts the `wchar_t` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
------------------	--------------------------------------

Returns

The uppercase `wchar_t` if convertible, else `__c`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.10 **virtual const char_type* std::ctype< wchar_t >::do_toupper (char_type * __lo, const char_type * __hi) const** [protected], [virtual]

Convert array to uppercase.

This virtual function converts each wchar_t in the range [lo,hi) to uppercase if possible. Other elements remain untouched.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

 __lo	Pointer to start of range.
 __hi	Pointer to end of range.

Returns

__hi.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.11 **virtual char_type std::ctype< wchar_t >::do_widen (char __c) const** [protected], [virtual]

Widen char to wchar_t.

This virtual function converts the char to wchar_t using the simplest reasonable transformation. For an underived ctype<wchar_t> facet, the argument will be cast to wchar_t.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

 __c	The char to convert.
--	----------------------

Returns

The converted wchar_t.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.533.4.12 `virtual const char* std::ctype< wchar_t >::do_widen (const char * __lo, const char * __hi, char_type * __to) const` `[protected]`, `[virtual]`

Widen char array to wchar_t array.

This function converts each char in the input to wchar_t using the simplest reasonable transformation. For an underived ctype<wchar_t> facet, the argument will be copied, casting each element to wchar_t.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements `std::__ctype_abstract_base< wchar_t >`.

4.533.4.13 `bool std::__ctype_abstract_base< wchar_t >::is (mask __m, char_type __c) const` `[inline]`, `[inherited]`

Test char_type classification.

This function finds a mask M for __c and compares it to mask __m. It does so by returning the value of ctype<char_type>::do_is().

Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0`.

Definition at line 162 of file locale_facets.h.

References `std::__ctype_abstract_base< _CharT >::do_is()`.

4.533.4.14 `const char_type* std::__ctype_abstract_base< wchar_t >::is (const char_type * __lo, const char_type * __hi, mask * __vec) const` [inline],[inherited]

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 179 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_is().

4.533.4.15 `char std::__ctype_abstract_base< wchar_t >::narrow (char_type __c, char __dfault) const` [inline],[inherited]

Narrow char_type to char.

This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char_type to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_narrow().

4.533.4.16 **const char_type* std::__ctype_abstract_base<wchar_t>::narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const** [inline],[inherited]

Narrow array to char array.

This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *default* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __default, __to).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 346 of file locale_facets.h.

References std::__ctype_abstract_base<_CharT>::do_is(), std::__ctype_abstract_base<_CharT>::do_narrow(), std::__ctype_abstract_base<_CharT>::do_scan_is(), std::__ctype_abstract_base<_CharT>::do_scan_not(), std::__ctype_abstract_base<_CharT>::do_tolower(), std::__ctype_abstract_base<_CharT>::do_toupper(), std::__ctype_abstract_base<_CharT>::do_widen(), and std::locale::facet::facet().

4.533.4.17 **const char_type* std::__ctype_abstract_base<wchar_t>::scan_is (mask __m, const char_type * __lo, const char_type * __hi) const** [inline],[inherited]

Find char_type matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to matching char_type if found, else __hi.

Definition at line 195 of file locale_facets.h.

References std::__ctype_abstract_base<_CharT>::do_scan_is().

4.533.4.18 `const char_type* std::__ctype_abstract_base<wchar_t>::scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` [inline],[inherited]

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to non-matching char if found, else __hi.

Definition at line 211 of file locale_facets.h.

References std::__ctype_abstract_base<_CharT>::do_scan_not().

4.533.4.19 `char_type std::__ctype_abstract_base<wchar_t>::tolower (char_type __c) const` [inline],[inherited]

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The lowercase `char_type` if convertible, else `__c`.

Definition at line 254 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_tolower()`.

4.533.4.20 `const char_type* std::__ctype_abstract_base<wchar_t>::tolower (char_type * __lo, const char_type * __hi) const` `[inline]`, `[inherited]`

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 269 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_tolower()`.

4.533.4.21 `char_type std::__ctype_abstract_base<wchar_t>::toupper (char_type __c) const` `[inline]`, `[inherited]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

References std::__ctype_abstract_base< _CharT >::do_toupper().

4.533.4.22 `const char_type* std::__ctype_abstract_base< wchar_t >::toupper (char_type * __lo, const char_type * __hi) const` `[inline], [inherited]`

Convert array to uppercase.

This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>::do_toupper(lo, hi).

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 240 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_toupper().

4.533.4.23 `char_type std::__ctype_abstract_base< wchar_t >::widen (char __c) const` `[inline], [inherited]`

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_widen().

4.533.4.24 `const char* std::__ctype_abstract_base<wchar_t>::widen (const char * __lo, const char * __hi, char_type * __to) const` `[inline],[inherited]`

Widen array to `char_type`.

This function converts each char in the input to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 305 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_widen()`.

4.533.5 Member Data Documentation

4.533.5.1 `locale::id std::ctype<wchar_t>::id` `[static]`

4.535.1 Detailed Description

```
template<typename _CharT>
class std::ctype_byname<_CharT>
```

class [ctype_byname](#) [22.2.1.2].

Definition at line 1467 of file [locale_facets.h](#).

4.535.2 Member Function Documentation

4.535.2.1 `template<typename _CharT> virtual bool std::ctype<_CharT>::do_is (mask __m, char_type __c) const`
`[protected], [virtual], [inherited]`

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>char_type</code> to find the mask of.
<code>__m</code>	The mask to compare against.

Returns

$(M \& \text{__m}) \neq 0$.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.2 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_is (const char_type * __lo, const char_type * __hi, mask * __vec) const`
`[protected], [virtual], [inherited]`

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.3 `template<typename _CharT> virtual char std::ctype<_CharT>::do_narrow (char_type __c, char __dfault) const` `[protected]`, `[virtual]`, `[inherited]`

Narrow `char_type` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted `char`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.4 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_narrow (const char_type* __lo, const char_type* __hi, char __dfault, char* __to) const` `[protected]`, `[virtual]`, `[inherited]`

Narrow `char_type` array to `char`.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__dfault` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.5 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_is (mask __m, const char_type * __lo, const char_type * __hi) const` [protected],[virtual],[inherited]

Find char_type matching mask.

This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else __hi.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.6 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` [protected],[virtual],[inherited]

Find char_type not matching mask.

This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __hi.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.7 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_tolower (char_type __c) const`
`[protected], [virtual], [inherited]`

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The lowercase char_type if convertible, else __c.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.8 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_tolower (char_type * __lo, const char_type * __hi) const`
`[protected], [virtual], [inherited]`

Convert array to lowercase.

This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.9 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_toupper (char_type __c) const`
`[protected], [virtual], [inherited]`

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.10 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_toupper (char_type * __lo,`
`const char_type * __hi) const` `[protected], [virtual], [inherited]`

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[__lo, __hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns`__hi`.Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.11 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_widen (char __c) const`
`[protected], [virtual], [inherited]`

Widen char.

This virtual function converts the char to char_type using the simplest reasonable transformation.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type

Implements [std::__ctype_abstract_base<_CharT>](#).

4.535.2.12 `template<typename _CharT> virtual const char* std::ctype<_CharT>::do_widen (const char * __lo, const char * __hi, char_type * __to) const`
`[protected], [virtual], [inherited]`

Widen char array.

This function converts each char in the input to char_type using the simplest reasonable transformation.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

4.535.2.13 `template<typename _CharT> bool std::__ctype_abstract_base<_CharT>::is (mask __m, char_type __c)
const [inline],[inherited]`

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__c</code>	The <code>char_type</code> to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0`.

Definition at line 162 of file `locale_facets.h`.

Referenced by `std::ctype<char>::is()`, `std::isalnum()`, `std::isalpha()`, `std::iscntrl()`, `std::isdigit()`, `std::isgraph()`, `std::islower()`, `std::isprint()`, `std::ispunct()`, `std::isspace()`, `std::isupper()`, and `std::isxdigit()`.

4.535.2.14 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is (const char_type
* __lo, const char_type * __hi, mask * __vec) const [inline],[inherited]`

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 179 of file `locale_facets.h`.

4.535.2.15 `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow (char_type __c, char __dfault) const [inline],[inherited]`

Narrow char_type to char.

This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char_type to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file locale_facets.h.

4.535.2.16 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::narrow (const char_type * __lo, const char_type * __hi, char __dfault, char * __to) const [inline],[inherited]`

Narrow array to char array.

This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, dfault is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 346 of file locale_facets.h.

4.535.2.17 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_is (mask __m, const char_type * __lo, const char_type * __hi) const [inline],[inherited]`

Find char_type matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to matching `char_type` if found, else `__hi`.

Definition at line 195 of file `locale_facets.h`.

Referenced by `std::ctype<char>::is()`.

```
4.535.2.18 template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not( mask __m,
const char_type * __lo, const char_type * __hi ) const [inline],[inherited]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file `locale_facets.h`.

Referenced by `std::ctype<char>::scan_is()`.

```
4.535.2.19 template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower( char_type __c )
const [inline],[inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The lowercase char_type if convertible, else `__c`.

Definition at line 254 of file locale_facets.h.

Referenced by `std::tolower()`.

4.535.2.20 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower (char_type * __lo, const char_type * __hi) const [inline],[inherited]`

Convert array to lowercase.

This function converts each char_type in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo,__hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 269 of file locale_facets.h.

4.535.2.21 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper (char_type __c) const [inline],[inherited]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The uppercase char_type if convertible, else __c.

Definition at line 225 of file locale_facets.h.

Referenced by std::toupper().

4.535.2.22 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper (char_type *__lo, const char_type *__hi) const [inline],[inherited]`

Convert array to uppercase.

This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>::do_toupper(lo, hi).

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 240 of file locale_facets.h.

4.535.2.23 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen (char __c) const [inline],[inherited]`

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

4.535.2.24 `template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen (const char * __lo, const char * __hi, char_type * __to) const` `[inline], [inherited]`

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 305 of file `locale_facets.h`.

4.535.3 Member Data Documentation

4.535.3.1 `template<typename _CharT> locale::id std::ctype<_CharT>::id` `[static], [inherited]`

4.536.1 Detailed Description

```
template<>
class std::ctype_byname< char >
```

22.2.1.4 Class ctype_byname specializations.

Definition at line 1482 of file locale_facets.h.

4.536.2 Member Typedef Documentation

4.536.2.1 `typedef char std::ctype< char >::char_type` [inherited]

Typedef for the template parameter char.

Definition at line 679 of file locale_facets.h.

4.536.3 Member Function Documentation

4.536.3.1 `static const mask* std::ctype< char >::classic_table () throw` [static],[inherited]

Returns a pointer to the C locale mask table.

4.536.3.2 `virtual char std::ctype< char >::do_narrow (char_type __c, char __dfault) const` [inline],
[protected],[virtual],[inherited]

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, c will be returned unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 1124 of file locale_facets.h.

4.536.3.3 `virtual const char_type* std::ctype< char >::do_narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const` `[inline], [protected], [virtual], [inherited]`

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an undervied `ctype<char>` facet, the argument will be copied unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 1150 of file `locale_facets.h`.

4.536.3.4 `virtual char_type std::ctype< char >::do_tolower (char_type __c) const` `[protected], [virtual], [inherited]`

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The lowercase char if convertible, else `__c`.

4.536.3.5 **virtual const char_type* std::ctype< char >::do_toupper (char_type * __lo, const char_type * __hi) const** [protected], [virtual], [inherited]

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do_toupper() is a hook for a derived facet to change the behavior of lowercasing. do_toupper() must always return the same result for the same input.

Parameters

\leftrightarrow __lo	Pointer to first char in range.
\leftrightarrow __hi	Pointer to end of range.

Returns

__hi.

4.536.3.6 **virtual char_type std::ctype< char >::do_toupper (char_type __c) const** [protected], [virtual], [inherited]

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

\leftrightarrow __c	The char to convert.
--------------------------	----------------------

Returns

The uppercase char if convertible, else __c.

4.536.3.7 **virtual const char_type* std::ctype< char >::do_toupper (char_type * __lo, const char_type * __hi) const** [protected], [virtual], [inherited]

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

4.536.3.8 `virtual char_type std::ctype< char >::do_widen (char __c) const` `[inline], [protected], [virtual], [inherited]`

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 1075 of file `locale_facets.h`.

4.536.3.9 `virtual const char* std::ctype< char >::do_widen (const char * __lo, const char * __hi, char_type * __to) const` `[inline], [protected], [virtual], [inherited]`

Widen char array.

This function converts each char in the range `[lo,hi)` to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be copied unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 1098 of file locale_facets.h.

4.536.3.10 `bool std::ctype< char >::is (mask __m, char __c) const` `[inline]`, `[inherited]`

Test char classification.

This function compares the mask table[c] to `__m`.

Parameters

<code>__c</code>	The char to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file ctype_inline.h.

References `std::__ctype_abstract_base< _CharT >::is()`.

4.536.3.11 `const char * std::ctype< char >::is (const char * __lo, const char * __hi, mask * __vec) const` `[inline]`, `[inherited]`

Return a mask array.

This function finds the mask for each char in the range [lo, hi) and successively writes it to vec. vec must have as many elements as the char array.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 48 of file `ctype_inline.h`.

References `std::__ctype_abstract_base<_CharT>::scan_is()`.

4.536.3.12 `char std::ctype<char>::narrow (char_type __c, char __dfault) const` `[inline]`, `[inherited]`

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived `ctype<char>` facet, *c* will be returned unchanged.

This function works as if it returns `ctype<char>::do_narrow(c)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted character.

Definition at line 923 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_narrow()`.

4.536.3.13 `const char_type* std::ctype<char>::narrow (const char_type * __lo, const char_type * __hi, char __dfault, char * __to) const` `[inline]`, `[inherited]`

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_narrow(lo, hi, dfault, to)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns`__hi`.

Definition at line 956 of file locale_facets.h.

References `std::__ctype_abstract_base<_CharT>::do_narrow()`.

4.536.3.14 `const char * std::ctype< char >::scan_is (mask __m, const char * __lo, const char * __hi) const` `[inline]`,
`[inherited]`

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

ReturnsPointer to a matching char if found, else `__hi`.

Definition at line 57 of file ctype_inline.h.

References `std::__ctype_abstract_base<_CharT>::scan_not()`.

4.536.3.15 `const char * std::ctype< char >::scan_not (mask __m, const char * __lo, const char * __hi) const` `[inline]`,
`[inherited]`

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [__lo,__hi) for which is(m,char) is false.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char if found, else `__hi`.

Definition at line 67 of file `ctype_inline.h`.

4.536.3.16 `const mask* std::ctype< char >::table () const throw` `[inline], [inherited]`

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

Definition at line 974 of file `locale_facets.h`.

References `std::__ctype_abstract_base< _CharT >::do_tolower()`, and `std::__ctype_abstract_base< _CharT >::do_↵_toupper()`.

4.536.3.17 `char_type std::ctype< char >::tolower (char_type __c) const` `[inline], [inherited]`

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__c)`. `do_tolower()` must always return the same result for the same input.

Parameters

<code>↵ __c</code>	The char to convert.
------------------------	----------------------

Returns

The lowercase char if convertible, else `__c`.

Definition at line 828 of file `locale_facets.h`.

References `std::__ctype_abstract_base< _CharT >::do_tolower()`.

4.536.3.18 `const char_type* std::ctype< char >::tolower (char_type * __lo, const char_type * __hi) const`
`[inline], [inherited]`

Convert array to lowercase.

This function converts each char in the range `[lo,hi)` to lowercase if possible. Other chars remain untouched.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__lo, __hi)`. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 845 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_tolower().

4.536.3.19 `char_type std::ctype< char >::toupper (char_type __c) const` [inline],[inherited]

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

toupper() acts as if it returns ctype<char>::do_toupper(c). do_toupper() must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The uppercase char if convertible, else `__c`.

Definition at line 795 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_toupper().

4.536.3.20 `const char_type* std::ctype< char >::toupper (char_type * __lo, const char_type * __hi) const` [inline],[inherited]

Convert array to uppercase.

This function converts each char in the range [`__lo`,`__hi`) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>:: do_toupper(`__lo`, `__hi`). do_toupper() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 812 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_toupper()`.

4.536.3.21 `char_type std::ctype<char>::widen (char __c) const` `[inline],[inherited]`

Widen char.

This function converts the `char` to `char_type` using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 865 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_widen()`.

4.536.3.22 `const char* std::ctype<char>::widen (const char * __lo, const char * __hi, char_type * __to) const` `[inline],[inherited]`

Widen char array.

This function converts each `char` in the input to `char` using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 892 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_widen()`.

4.536.4 Member Data Documentation

4.536.4.1 `locale::id std::ctype<char>::id` `[static]`, `[inherited]`

The facet id for `ctype<char>`

Definition at line 696 of file `locale_facets.h`.

4.536.4.2 `const size_t std::ctype<char>::table_size` `[static]`, `[inherited]`

The size of the mask table. It is `SCHAR_MAX + 1`.

Definition at line 698 of file `locale_facets.h`.

4.538.1 Detailed Description

```
template<typename _Tp>
struct std::default_delete<_Tp[]>
```

Specialization for arrays, default_delete.

Definition at line 84 of file unique_ptr.h.

4.538.2 Constructor & Destructor Documentation

4.538.2.1 `template<typename _Tp> constexpr std::default_delete<_Tp[]>::default_delete () [default],
[noexcept]`

Default constructor.

4.538.2.2 `template<typename _Tp> template<typename _Up, typename = typename enable_if<!
_is_derived<_Tp, _Up>::value>::type> std::default_delete<_Tp[]>::default_delete (const default_delete<_Up[]> &)
[inline], [noexcept]`

Converting constructor.

Allows conversion from a deleter for arrays of another type, such as a const-qualified version of _Tp.

Conversions from types derived from _Tp are not allowed because it is unsafe to delete[] an array of derived types through a pointer to the base type.

Definition at line 111 of file unique_ptr.h.

4.538.3 Member Function Documentation

4.538.3.1 `template<typename _Tp> void std::default_delete<_Tp[]>::operator() (_Tp * __ptr) const [inline]`

Calls delete[] __ptr.

Definition at line 115 of file unique_ptr.h.

References std::default_delete<_Tp>::operator()().

4.539.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::deque<_Tp, _Alloc>
```

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#).

In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.

Here's how a `deque<Tp>` manages memory. Each deque has 4 members:

- `Tp** _M_map`
- `size_t _M_map_size`
- `iterator _M_start, _M_finish`

`map_size` is at least 8. `map` is an array of `map_size` pointers-to-*nodes*. (The name `map` has nothing to do with the `std::map` class, and **nodes** should not be confused with `std::list`'s usage of *node*.)

A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-`Tp`. If `Tp` is very large, there will be one `Tp` element per node (i.e., an *array* of one). For non-huge `Tp`'s, node size is inversely related to `Tp` size: the larger the `Tp`, the fewer `Tp`'s will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different `Tp`'s, to improve allocator efficiency.

Not every pointer in the `map` array will point to a node. If the initial number of elements in the deque is small, the `/middle/` `map` pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the `map` grows: available `map` pointers, if any, will be on the ends. As new nodes are created, only a subset of the `map`'s pointers need to be copied *outward*.

Class invariants:

- For any nonsingular iterator `i`:
 - `i.node` points to a member of the `map` array. (Yes, you read that correctly: `i.node` does not actually point to a node.) The member of the `map` array is what actually points to the node.
 - `i.first == *(i.node)` (This points to the node (first `Tp` element).)
 - `i.last == i.first + node_size`
 - `i.cur` is a pointer in the range `[i.first, i.last)`. NOTE: the implication of this is that `i.cur` is always a dereferenceable pointer, even if `i` is a past-the-end iterator.
- `Start` and `Finish` are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with `<N` elements (where `N` is the node buffer size) must have one node, a deque with `N` through `(2N-1)` elements must have two nodes, etc.
- For every node other than `start.node` and `finish.node`, every element in the node is an initialized object. If `start.cur == finish.cur`, then `[start.cur, finish.cur)` are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, `[start.cur, start.last)` and `[finish.first, finish.cur)` are initialized objects, and `[start.first, start.cur)` and `[finish.cur, finish.last)` are uninitialized storage.

- [map, map + map_size) is a valid, non-empty range.
- [start.node, finish.node] is a valid range contained within [map, map + map_size).
- A pointer in the range [map, map + map_size) points to an allocated node if and only if the pointer is in the range [start.node, finish.node].

Here's the magic: nothing in deque is **aware** of the discontinuous storage!

The memory setup and layout occurs in the parent, _Base, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the start and finish iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

Definition at line 735 of file stl_deque.h.

4.539.2 Constructor & Destructor Documentation

4.539.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque ()`
`[inline]`

Creates a deque with no elements.

Definition at line 788 of file stl_deque.h.

4.539.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (const allocator_type &__a)` `[inline], [explicit]`

Creates a deque with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 795 of file stl_deque.h.

4.539.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (size_type __n)` `[inline], [explicit]`

Creates a deque with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor fills the deque with *n* default constructed elements.

Definition at line 807 of file stl_deque.h.

4.539.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (size_type __n, const value_type & __value, const allocator_type & __a = allocator_type()) [inline]`

Creates a deque with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the deque with `__n` copies of `__value`.

Definition at line 819 of file `stl_deque.h`.

4.539.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (const deque<_Tp, _Alloc> & __x) [inline]`

Deque copy constructor.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The newly-created deque uses a copy of the allocation object used by `__x`.

Definition at line 846 of file `stl_deque.h`.

4.539.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (deque<_Tp, _Alloc> && __x) [inline]`

Deque move constructor.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The newly-created deque contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified deque.

Definition at line 860 of file `stl_deque.h`.

4.539.2.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (initializer_list<value_type> __l, const allocator_type & __a = allocator_type()) [inline]`

Builds a deque from an initializer list.

Parameters

<code>__l</code>	An initializer_list.
<code>__a</code>	An allocator object.

Create a deque consisting of copies of the elements in the initializer_list `__l`.

This will call the element type's copy constructor N times (where N is `__l.size()`) and do no memory reallocation.

Definition at line 874 of file `stl_deque.h`.

4.539.2.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> std::deque<_Tp, _Alloc>::deque (_InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type()) [inline]`

Builds a deque from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a deque consisting of copies of the elements from `[__first, __last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is `distance(__first, __last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

Definition at line 901 of file `stl_deque.h`.

4.539.2.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::~~deque () [inline], [noexcept]`

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 922 of file `stl_deque.h`.

4.539.3 Member Function Documentation

4.539.3.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::_M_fill_initialize (const value_type & __value) [protected]`

Fills the deque with copies of `value`.

Parameters

<code>__value</code>	Initial value.
----------------------	----------------

Returns

Nothing.

Precondition

`_M_start` and `_M_finish` have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).

4.539.3.2 `template<typename _Tp, typename _Alloc> void std::_Deque_base<_Tp, _Alloc>::_M_initialize_map(size_t __num_elements) [protected], [inherited]`

Layout storage.

Parameters

<code>__num_elements</code>	The count of T's for which to allocate space at first.
-----------------------------	--

Returns

Nothing.

The initial underlying memory layout is a bit complicated...

Definition at line 587 of file `stl_deque.h`.

References `std::max()`.

4.539.3.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::_M_new_elements_at_back(size_type __new_elements) [protected]`

Memory-handling helpers for the previous internal insert functions.

4.539.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::_M_new_elements_at_front(size_type __new_elements) [protected]`

Memory-handling helpers for the previous internal insert functions.

4.539.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::_M_pop_back_aux() [protected]`

Helper functions for `push_*` and `pop_*`.

4.539.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_pop_front_aux() [protected]`

Helper functions for push_* and pop_*.

4.539.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> void std::deque< _Tp, _Alloc >::_M_push_back_aux(_Args &&... __args) [protected]`

Helper functions for push_* and pop_*.

4.539.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> void std::deque< _Tp, _Alloc >::_M_push_front_aux(_Args &&... __args) [protected]`

Helper functions for push_* and pop_*.

4.539.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_range_check(size_type __n) const [inline], [protected]`

Safety check used only from at().

Definition at line 1270 of file stl_deque.h.

4.539.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator > void std::deque< _Tp, _Alloc >::_M_range_initialize(_InputIterator __first, _InputIterator __last, std::input_iterator_tag) [protected]`

Fills the deque with whatever is in [first,last).

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using push_back on each value from the iterator.

4.539.3.11 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _ForwardIterator > void std::deque< _Tp, _Alloc >::_M_range_initialize(_ForwardIterator __first, _ForwardIterator __last, std::forward_iterator_tag) [protected]`

Fills the deque with whatever is in [first,last).

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

```
4.539.3.12 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>
           >::_M_reallocate_map ( size_type __nodes_to_add, bool __add_at_front ) [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

```
4.539.3.13 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>
           >::_M_reserve_elements_at_back ( size_type __n ) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

Definition at line 1970 of file `stl_deque.h`.

```
4.539.3.14 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>
           >::_M_reserve_elements_at_front ( size_type __n ) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

Definition at line 1960 of file `stl_deque.h`.

```
4.539.3.15 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>
           >::_M_reserve_map_at_back ( size_type __nodes_to_add = 1 ) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

Definition at line 1996 of file `stl_deque.h`.

```
4.539.3.16 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>
           >::_M_reserve_map_at_front ( size_type __nodes_to_add = 1 ) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

Definition at line 2004 of file `stl_deque.h`.

```
4.539.3.17 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::assign (
           size_type __n, const value_type & __val ) [inline]
```

Assigns a given value to a deque.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a deque with n copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 983 of file `stl_deque.h`.

4.539.3.18 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> void std::deque<_Tp, _Alloc>::assign (_InputIterator __first, _InputIterator __last) [inline]`

Assigns a range to a deque.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a deque with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 1002 of file `stl_deque.h`.

4.539.3.19 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::assign (initializer_list<value_type> __l) [inline]`

Assigns an initializer list to a deque.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a deque with copies of the elements in the initializer_list `__l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 1027 of file `stl_deque.h`.

4.539.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::at (`
`size_type __n) [inline]`

Provides access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read/write reference to data.

Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

Definition at line 1292 of file `stl_deque.h`.

4.539.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::at (`
`size_type __n) const [inline]`

Provides access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read-only (constant) reference to data.

Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

Definition at line 1310 of file `stl_deque.h`.

4.539.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::back ()`
`[inline], [noexcept]`

Returns a read/write reference to the data at the last element of the deque.

Definition at line 1337 of file `stl_deque.h`.

4.539.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::back () const` `[inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the deque.

Definition at line 1349 of file `stl_deque.h`.

4.539.3.24 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::begin ()`
`[inline], [noexcept]`

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1042 of file `stl_deque.h`.

Referenced by `std::deque<_StateSeqT>::deque()`, and `std::operator==()`.

4.539.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::begin () const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1050 of file `stl_deque.h`.

4.539.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::cbegin () const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1113 of file `stl_deque.h`.

4.539.3.27 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::cend () const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1122 of file `stl_deque.h`.

4.539.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::clear ()`
`[inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1682 of file `stl_deque.h`.

4.539.3.29 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque<_Tp,`
`_Alloc>::crbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1131 of file `stl_deque.h`.

4.539.3.30 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque<_Tp,`
`_Alloc>::crend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1140 of file `stl_deque.h`.

4.539.3.31 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator`
`std::deque<_Tp, _Alloc>::emplace (const_iterator __position, _Args &&... __args)`

Inserts an object in deque before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the deque.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location.`

4.539.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::deque<_Tp, _Alloc>::empty ()`
`const [inline], [noexcept]`

Returns true if the deque is empty. (Thus `begin()` would equal `end()`.)

Definition at line 1233 of file `stl_deque.h`.

4.539.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1059 of file `stl_deque.h`.

Referenced by `std::deque<_StateSeqT>::deque()`, and `std::operator==()`.

4.539.3.34 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::end () const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1068 of file `stl_deque.h`.

4.539.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::erase (const_iterator __position)` `[inline]`

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1622 of file `stl_deque.h`.

4.539.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::erase (const_iterator __first, const_iterator __last)` `[inline]`

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [*__first*,*__last*) and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1646 of file `stl_deque.h`.

```
4.539.3.37  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::front ( )
           [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the deque.

Definition at line 1321 of file `stl_deque.h`.

```
4.539.3.38  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::front ( ) const
           [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the deque.

Definition at line 1329 of file `stl_deque.h`.

```
4.539.3.39  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::deque<_Tp, _Alloc>::get_allocator ( ) const
           [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 1033 of file `stl_deque.h`.

```
4.539.3.40  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::insert (
           const_iterator __position, const value_type & __x )
```

Inserts given value into deque before specified iterator.

Parameters

<i>__position</i>	A <code>const_iterator</code> into the deque.
<i>__x</i>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

4.539.3.41 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::insert (const_iterator __position, value_type && __x) [inline]`

Inserts given rvalue into deque before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

Definition at line 1512 of file `stl_deque.h`.

4.539.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::insert (const_iterator __p, initializer_list<value_type> __l) [inline]`

Inserts an initializer list into the deque.

Parameters

<code>__p</code>	An iterator into the deque.
<code>__l</code>	An initializer_list.

This function will insert copies of the data in the initializer_list `__l` into the deque before the location specified by `__p`. This is known as *list insert*.

Definition at line 1525 of file `stl_deque.h`.

4.539.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::insert (const_iterator __position, size_type __n, const value_type & __x) [inline]`

Inserts a number of copies of given data into the deque.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

Definition at line 1541 of file `stl_deque.h`.

```
4.539.3.44  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
std:: _RequireInputIter<_InputIterator>> iterator std::deque<_Tp, _Alloc >::insert ( const_iterator __position,
_InputIterator __first, _InputIterator __last )  [inline]
```

Inserts a range into the deque.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the deque.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the deque before the location specified by `__position`. This is known as *range insert*.

Definition at line 1577 of file `stl_deque.h`.

```
4.539.3.45  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::deque<_Tp, _Alloc >::max_size (
) const  [inline], [noexcept]
```

Returns the `size()` of the largest possible deque.

Definition at line 1152 of file `stl_deque.h`.

```
4.539.3.46  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque<_Tp, _Alloc >::operator= (
const deque<_Tp, _Alloc > &__x )
```

Deque assignment operator.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

All the elements of `x` are copied, but unlike the copy constructor, the allocator object is not copied.

4.539.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque<_Tp, _Alloc>::operator= (deque<_Tp, _Alloc> && __x) [inline], [noexcept]`

Deque move assignment operator.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this deque (without copying). `__x` is a valid, but unspecified deque.

Definition at line 944 of file `stl_deque.h`.

4.539.3.48 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque<_Tp, _Alloc>::operator= (initializer_list<value_type> __l) [inline]`

Assigns an initializer list to a deque.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a deque with copies of the elements in the `initializer_list __l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 965 of file `stl_deque.h`.

4.539.3.49 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::operator[] (size_type __n) [inline], [noexcept]`

Subscript access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1249 of file `stl_deque.h`.

```
4.539.3.50  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque< _Tp, _Alloc
              >::operator[]( size_type __n ) const    [inline], [noexcept]
```

Subscript access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1264 of file `stl_deque.h`.

```
4.539.3.51  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::pop_back ( )
              [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1450 of file `stl_deque.h`.

```
4.539.3.52  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::pop_front ( )
              [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 1429 of file `stl_deque.h`.

```
4.539.3.53  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::push_back (
              const value_type &__x )    [inline]
```

Add data to the end of the deque.

Parameters

$_x$	Data to be added.
-------	-------------------

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1398 of file stl_deque.h.

```
4.539.3.54 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::push_front (
    const value_type &_x ) [inline]
```

Add data to the front of the deque.

Parameters

$_x$	Data to be added.
-------	-------------------

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1367 of file stl_deque.h.

```
4.539.3.55 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque< _Tp, _Alloc
    >::rbegin ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1077 of file stl_deque.h.

```
4.539.3.56 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp,
    _Alloc >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1086 of file stl_deque.h.

```
4.539.3.57 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque< _Tp, _Alloc
    >::rend ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1095 of file stl_deque.h.

4.539.3.58 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque<_Tp, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1104 of file `stl_deque.h`.

4.539.3.59 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::resize (size_type __new_size) [inline]`

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
-------------------------	--

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

Definition at line 1166 of file `stl_deque.h`.

4.539.3.60 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::resize (size_type __new_size, const value_type &__x) [inline]`

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

Definition at line 1188 of file `stl_deque.h`.

4.539.3.61 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::shrink_to_fit () [inline], [noexcept]`

A non-binding request to reduce memory use.

Definition at line 1224 of file `stl_deque.h`.

4.539.3.62 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::deque<_Tp, _Alloc>::size () const [inline], [noexcept]`

Returns the number of elements in the deque.

Definition at line 1147 of file `stl_deque.h`.

Referenced by `std::operator==()`.

```
4.539.3.63 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::swap (
    deque<_Tp, _Alloc> &__x ) [inline], [noexcept]
```

Swaps data with another deque.

Parameters

<code>__x</code>	A deque of the same element and allocator types.
------------------	--

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(d1,d2)` will feed to this function.

Definition at line 1662 of file `stl_deque.h`.

Referenced by `std::swap()`.

4.540.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
class std::discard_block_engine< _RandomNumberEngine, __p, __r >
```

Produces random numbers from some base engine by discarding blocks of data.

0 <= __r <= __p

Definition at line 856 of file random.h.

4.540.2 Member Typedef Documentation

4.540.2.1 template<typename _RandomNumberEngine, size_t __p, size_t __r> typedef _RandomNumberEngine::result_type
std::discard_block_engine< _RandomNumberEngine, __p, __r >::result_type

The type of the generated random value.

Definition at line 859 of file random.h.

4.540.3 Constructor & Destructor Documentation

4.540.3.1 template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<
_RandomNumberEngine, __p, __r >::discard_block_engine () [inline]

Constructs a default discard_block_engine engine.

The underlying engine is default constructed as well.

Definition at line 874 of file random.h.

4.540.3.2 template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<
_RandomNumberEngine, __p, __r >::discard_block_engine (const _RandomNumberEngine & __rng)
[inline], [explicit]

Copy constructs a discard_block_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 884 of file random.h.

```
4.540.3.3 template<typename _RandomNumberEngine , size_t __p, size_t __r> std::discard_block_engine<
    _RandomNumberEngine, __p, __r>::discard_block_engine ( _RandomNumberEngine && __rng ) [inline],
    [explicit]
```

Move constructs a discard_block_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 894 of file random.h.

```
4.540.3.4 template<typename _RandomNumberEngine , size_t __p, size_t __r> std::discard_block_engine<
    _RandomNumberEngine, __p, __r>::discard_block_engine ( result_type __s ) [inline],[explicit]
```

Seed constructs a discard_block_engine engine.

Constructs the underlying generator engine seeded with __s.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 904 of file random.h.

```
4.540.3.5 template<typename _RandomNumberEngine , size_t __p, size_t __r> template<typename _Sseq , typename
    = typename std::enable_if<!std::is_same<_Sseq, discard_block_engine>::value && !std::is_same<_Sseq,
    _RandomNumberEngine>::value> ::type> std::discard_block_engine< _RandomNumberEngine, __p, __r
    >::discard_block_engine ( _Sseq & __q ) [inline],[explicit]
```

Generator construct a discard_block_engine engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 917 of file random.h.

4.540.4 Member Function Documentation

4.540.4.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> const _RandomNumberEngine& std::discard_block_engine<_RandomNumberEngine, __p, __r>::base() const [inline], [noexcept]`

Gets a const reference to the underlying generator engine object.

Definition at line 961 of file random.h.

4.540.4.2 `template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard(unsigned long long __z) [inline]`

Discard a sequence of random numbers.

Definition at line 982 of file random.h.

4.540.4.3 `template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::max() [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 975 of file random.h.

References `std::max()`.

4.540.4.4 `template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::min() [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 968 of file random.h.

References `std::min()`.

4.540.4.5 `template<typename _RandomNumberEngine, size_t __p, size_t __r> result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::operator()()`

Gets the next value in the generated random number sequence.

4.540.4.6 `template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed() [inline]`

Reseeds the `discard_block_engine` object with the default seed for the underlying base class generator engine.

Definition at line 926 of file random.h.

4.540.4.7 `template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed(result_type __s) [inline]`

Reseeds the `discard_block_engine` object with the default seed for the underlying base class generator engine.

Definition at line 937 of file random.h.

4.540.4.8 `template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _Sseq> void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed(_Sseq & __q) [inline]`

Reseeds the `discard_block_engine` object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 950 of file random.h.

4.540.5 Friends And Related Function Documentation

4.540.5.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::discard_block_engine<_RandomNumberEngine1, __p1, __r1> & __x) [friend]`

Inserts the current state of a discard_block_engine random number generator engine __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A discard_block_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

4.540.5.2 `template<typename _RandomNumberEngine, size_t __p, size_t __r> bool operator==(const discard_block_engine<_RandomNumberEngine, __p, __r> & __lhs, const discard_block_engine<_RandomNumberEngine, __p, __r> & __rhs) [friend]`

Compares two discard_block_engine random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A discard_block_engine random number generator object.
<code>__rhs</code>	Another discard_block_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1006 of file random.h.

```
4.540.5.3 template<typename _RandomNumberEngine , size_t __p, size_t __r> template<typename _RandomNumberEngine1 ,
size_t __p1, size_t __r1, typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (
std::basic_istream<_CharT, _Traits> & __is, std::discard_block_engine<_RandomNumberEngine1, __p1, __r1 >
& __x ) [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A discard_block_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

`std::discrete_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 5384 of file random.h.

4.541.3.4 `template<typename _IntType = int> param_type std::discrete_distribution< _IntType >::param () const`
`[inline]`

Returns the parameter set of the distribution.

Definition at line 5351 of file random.h.

4.541.3.5 `template<typename _IntType = int> void std::discrete_distribution< _IntType >::param (const param_type &`
`__param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5359 of file random.h.

4.541.3.6 `template<typename _IntType = int> std::vector<double> std::discrete_distribution< _IntType >::probabilities (`
`) const [inline]`

Returns the probabilities of the distribution.

Definition at line 5341 of file random.h.

4.541.3.7 `template<typename _IntType = int> void std::discrete_distribution<_IntType>::reset () [inline]`

Resets the distribution state.

Definition at line 5334 of file random.h.

4.541.4 Friends And Related Function Documentation

4.541.4.1 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> &__os, const std::discrete_distribution<_IntType1> &__x) [friend]`

Inserts a discrete_distribution random number distribution __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A discrete_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.541.4.2 `template<typename _IntType = int> bool operator== (const discrete_distribution<_IntType> &__d1, const discrete_distribution<_IntType> &__d2) [friend]`

Return true if two discrete distributions have the same parameters.

Definition at line 5419 of file random.h.

4.541.4.3 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> &__is, std::discrete_distribution<_IntType1> &__x) [friend]`

Extracts a discrete_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A discrete_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

4.550.1 Detailed Description

```
template<typename _RealType = double>
class std::fisher_f_distribution<_RealType>
```

A fisher_f_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \left(\frac{m}{n}\right)^{m/2} x^{(m/2)-1} \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}$$

Definition at line 3132 of file random.h.

4.550.2 Member Typedef Documentation

4.550.2.1 `template<typename _RealType = double> typedef _RealType std::fisher_f_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 3135 of file random.h.

4.550.3 Member Function Documentation

4.550.3.1 `template<typename _RealType = double> result_type std::fisher_f_distribution<_RealType>::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 3226 of file random.h.

References std::max().

4.550.3.2 `template<typename _RealType = double> result_type std::fisher_f_distribution<_RealType>::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 3219 of file random.h.

4.550.3.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type std::fisher_f_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 3234 of file random.h.

4.550.3.4 `template<typename _RealType = double> param_type std::fisher_f_distribution<_RealType>::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 3204 of file random.h.

4.550.3.5 `template<typename _RealType = double> void std::fisher_f_distribution<_RealType>::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3212 of file random.h.

4.550.3.6 `template<typename _RealType = double> void std::fisher_f_distribution<_RealType>::reset() [inline]`

Resets the distribution state.

Definition at line 3183 of file random.h.

4.550.4 Friends And Related Function Documentation

4.550.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits
> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const
std::fisher_f_distribution<_RealType1> & __x) [friend]`

Inserts a `fisher_f_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>fisher_f_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.550.4.2 `template<typename _RealType = double> bool operator==(const fisher_f_distribution<_RealType> & __d1,
const fisher_f_distribution<_RealType> & __d2) [friend]`

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3282 of file random.h.

4.550.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename
_Traits> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is,
std::fisher_f_distribution<_RealType1> & __x) [friend]`

Extracts a `fisher_f_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>fisher_f_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.553.1 Detailed Description

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
class std::forward_list<_Tp, _Alloc>
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::forward_list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

Definition at line 414 of file `forward_list.h`.

4.553.2 Constructor & Destructor Documentation

4.553.2.1 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (const _Alloc & __al = _Alloc()) [inline], [explicit]`

Creates a `forward_list` with no elements.

Parameters

<code>__al</code>	An allocator object.
-------------------	----------------------

Definition at line 446 of file `forward_list.h`.

4.553.2.2 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (const forward_list<_Tp, _Alloc> & __list, const _Alloc & __al) [inline]`

Copy constructor with allocator argument.

Parameters

<code>__list</code>	Input list to copy.
<code>__al</code>	An allocator object.

Definition at line 455 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::begin()`, and `std::forward_list<_Tp, _Alloc>::end()`.

4.553.2.3 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (forward_list<_Tp, _Alloc> && __list, const _Alloc & __al) [inline], [noexcept]`

Move constructor with allocator argument.

Parameters

<code>__list</code>	Input list to move.
<code>__al</code>	An allocator object.

Definition at line 464 of file `forward_list.h`.

4.553.2.4 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (size_type __n, const _Alloc & __al = _Alloc()) [inline],[explicit]`

Creates a forward_list with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor creates the forward_list with `__n` default constructed elements.

Definition at line 477 of file forward_list.h.

4.553.2.5 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (size_type __n, const _Tp & __value, const _Alloc & __al = _Alloc()) [inline]`

Creates a forward_list with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__al</code>	An allocator object.

This constructor fills the forward_list with `__n` copies of `__value`.

Definition at line 490 of file forward_list.h.

4.553.2.6 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>>> std::forward_list<_Tp, _Alloc>::forward_list (_InputIterator __first, _InputIterator __last, const _Alloc & __al = _Alloc()) [inline]`

Builds a forward_list from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__al</code>	An allocator object.

Create a forward_list consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

Definition at line 507 of file forward_list.h.

4.553.2.7 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (const forward_list<_Tp, _Alloc> & __list) [inline]`

The forward_list copy constructor.

Parameters

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	--

Definition at line 517 of file forward_list.h.

References `std::forward_list<_Tp, _Alloc>::begin()`, and `std::forward_list<_Tp, _Alloc>::end()`.

4.553.2.8 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (forward_list<_Tp, _Alloc> && __list) [inline],[noexcept]`

The forward_list move constructor.

Parameters

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	--

The newly-created forward_list contains the exact contents of `__list`. The contents of `__list` are a valid, but unspecified forward_list.

Definition at line 531 of file forward_list.h.

4.553.2.9 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (std::initializer_list<_Tp> __il, const _Alloc & __al = _Alloc()) [inline]`

Builds a forward_list from an initializer_list.

Parameters

<code>__il</code>	An initializer_list of value_type.
<code>__al</code>	An allocator object.

Create a forward_list consisting of copies of the elements in the initializer_list `__il`. This is linear in `__il.size()`.

Definition at line 542 of file forward_list.h.

4.553.2.10 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::~forward_list () [inline],[noexcept]`

The forward_list dtor.

Definition at line 550 of file forward_list.h.

4.553.3 Member Function Documentation

4.553.3.1 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> void std::forward_list<_Tp, _Alloc>::assign (_InputIterator __first, _InputIterator __last) [inline]`

Assigns a range to a forward_list.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a forward_list with copies of the elements in the range [`__first`,`__last`).

Note that the assignment completely changes the forward_list and that the number of elements of the resulting forward_list is the same as the number of elements assigned. Old data is lost.

Definition at line 615 of file forward_list.h.

4.553.3.2 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::assign (size_type __n, const _Tp & __val) [inline]`

Assigns a given value to a forward_list.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a forward_list with `__n` copies of the given value. Note that the assignment completely changes the forward_list, and that the resulting forward_list has `__n` elements. Old data is lost.

Definition at line 632 of file forward_list.h.

4.553.3.3 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::assign (std::initializer_list<_Tp> __il) [inline]`

Assigns an initializer_list to a forward_list.

Parameters

<code>__il</code>	An initializer_list of value_type.
-------------------	------------------------------------

Replace the contents of the forward_list with copies of the elements in the initializer_list `__il`. This is linear in `il.size()`.

Definition at line 644 of file forward_list.h.

4.553.3.4 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::before_begin () [inline], [noexcept]`

Returns a read/write iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 659 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::splice_after()`.

4.553.3.5 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::before_begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 668 of file `forward_list.h`.

4.553.3.6 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::begin () [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 676 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::forward_list()`, and `std::forward_list<_Tp, _Alloc>::reverse()`.

4.553.3.7 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 685 of file `forward_list.h`.

4.553.3.8 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::cbefore_begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 721 of file `forward_list.h`.

4.553.3.9 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 712 of file `forward_list.h`.

Referenced by `std::operator<()`.

4.553.3.10 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::cend() const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

Definition at line 730 of file forward_list.h.

Referenced by std::operator<().

4.553.3.11 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::clear()` `[inline], [noexcept]`

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1033 of file forward_list.h.

4.553.3.12 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> iterator std::forward_list<_Tp, _Alloc>::emplace_after(const_iterator __pos, _Args &&... __args)` `[inline]`

Constructs object in forward_list after the specified iterator.

Parameters

<code>__pos</code>	A const_iterator into the forward_list.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) after the specified location. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 843 of file forward_list.h.

4.553.3.13 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> void std::forward_list<_Tp, _Alloc>::emplace_front(_Args &&... __args)` `[inline]`

Constructs object in forward_list at the front of the list.

Parameters

<code>__args</code>	Arguments.
---------------------	------------

This function will insert an object of type `Tp` constructed with `Tp(std::forward<Args>(args)...) at the front of the list. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.`

Definition at line 787 of file `forward_list.h`.

4.553.3.14 `template<typename _Tp, typename _Alloc = allocator<_Tp>> bool std::forward_list<_Tp, _Alloc>::empty ()`
`const [inline], [noexcept]`

Returns true if the `forward_list` is empty. (Thus `begin()` would equal `end()`.)

Definition at line 738 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::splice_after()`.

4.553.3.15 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 694 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::forward_list()`, `std::forward_list<_Tp, _Alloc>::reverse()`, and `std::forward_list<_Tp, _Alloc>::splice_after()`.

4.553.3.16 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>`
`>::end () const [inline], [noexcept]`

Returns a read-only iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 703 of file `forward_list.h`.

4.553.3.17 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>`
`>::erase_after (const_iterator __pos) [inline]`

Removes the element pointed to by the iterator following `pos`.

Parameters

<code>__pos</code>	Iterator pointing before element to be erased.
--------------------	--

Returns

An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

This function will erase the element at the given position and thus shorten the `forward_list` by one.

Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 946 of file forward_list.h.

```
4.553.3.18 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc
>::erase_after ( const_iterator __pos, const_iterator __last ) [inline]
```

Remove a range of elements.

Parameters

<code>__pos</code>	Iterator pointing before the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

@ `__last`.

This function will erase the elements in the range (`__pos`,`__last`) and shorten the forward_list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 969 of file forward_list.h.

```
4.553.3.19 template<typename _Tp, typename _Alloc = allocator<_Tp>> reference std::forward_list< _Tp, _Alloc >::front ( )
[inline]
```

Returns a read/write reference to the data at the first element of the forward_list.

Definition at line 755 of file forward_list.h.

```
4.553.3.20 template<typename _Tp, typename _Alloc = allocator<_Tp>> const_reference std::forward_list< _Tp, _Alloc
>::front ( ) const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the forward_list.

Definition at line 766 of file forward_list.h.

```
4.553.3.21 template<typename _Tp, typename _Alloc = allocator<_Tp>> allocator_type std::forward_list< _Tp, _Alloc
>::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 649 of file forward_list.h.

```
4.553.3.22 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc
>::insert_after ( const_iterator __pos, const _Tp & __val ) [inline]
```

Inserts given value into forward_list after specified iterator.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__val</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 860 of file `forward_list.h`.

References `std::move()`.

```
4.553.3.23  template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc
>::insert_after( const_iterator __pos, size_type __n, const _Tp & __val )
```

Inserts a number of copies of given data into the `forward_list`.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__n</code>	Number of elements to be inserted.
<code>__val</code>	Data to be inserted.

Returns

An iterator pointing to the last inserted copy of `val` or `pos` if `n == 0`.

This function will insert a specified number of copies of the given data after the location specified by `pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

```
4.553.3.24  template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename =
std::_RequireInputIter<_InputIterator>> iterator std::forward_list< _Tp, _Alloc >::insert_after( const_iterator
__pos, _InputIterator __first, _InputIterator __last )
```

Inserts a range into the `forward_list`.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator pointing to the last inserted element or `__pos` if `__first == __last`.

This function will insert copies of the data in the range `[__first, __last)` into the `forward_list` after the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

4.553.3.25 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::insert_after (const_iterator __pos, std::initializer_list<_Tp> __il) [inline]`

Inserts the contents of an `initializer_list` into `forward_list` after the specified iterator.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__il</code>	An <code>initializer_list</code> of value_type.

Returns

An iterator pointing to the last inserted element or `__pos` if `__il` is empty.

This function will insert copies of the data in the `initializer_list` `__il` into the `forward_list` before the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 925 of file `forward_list.h`.

4.553.3.26 `template<typename _Tp, typename _Alloc = allocator<_Tp>> size_type std::forward_list< _Tp, _Alloc >::max_size () const [inline], [noexcept]`

Returns the largest possible number of elements of `forward_list`.

Definition at line 745 of file `forward_list.h`.

4.553.3.27 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::merge (forward_list< _Tp, _Alloc > && __list) [inline]`

Merge sorted lists.

Parameters

<code>__list</code>	Sorted list to merge.
---------------------	-----------------------

Assumes that both `list` and this list are sorted according to operator<(). Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equal.

Definition at line 1171 of file forward_list.h.

References `std::move()`.

4.553.3.28 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _Comp > void
std::forward_list<_Tp, _Alloc>::merge (forward_list<_Tp, _Alloc> && __list, _Comp __comp)`

Merge sorted lists according to comparison function.

Parameters

<code>__list</code>	Sorted list to merge.
<code>__comp</code>	Comparison function defining sort order.

Assumes that both `__list` and this list are sorted according to `comp`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equivalent according to `comp()`.

4.553.3.29 `template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list<_Tp, _Alloc>
>::operator= (const forward_list<_Tp, _Alloc> & __list)`

The `forward_list` assignment operator.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	---

All the elements of `__list` are copied, but unlike the copy constructor, the allocator object is not copied.

4.553.3.30 `template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list<_Tp, _Alloc>
>::operator= (forward_list<_Tp, _Alloc> && __list) [inline], [noexcept]`

The `forward_list` move assignment operator.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	---

The contents of `__list` are moved into this `forward_list` (without copying, if the allocators permit it). `__list` is a valid, but unspecified `forward_list`

Definition at line 574 of file forward_list.h.

References `std::move()`.

4.553.3.31 `template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list<_Tp, _Alloc>
>::operator= (std::initializer_list<_Tp> __il) [inline]`

The `forward_list` initializer list assignment operator.

Parameters

<code>__il</code>	An initializer_list of value_type.
-------------------	------------------------------------

Replace the contents of the forward_list with copies of the elements in the initializer_list `__il`. This is linear in `__il.size()`.

Definition at line 594 of file forward_list.h.

4.553.3.32 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::pop_front ()`
`[inline]`

Removes first element.

This is a typical stack operation. It shrinks the forward_list by one. Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 825 of file forward_list.h.

4.553.3.33 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::push_front (`
`const _Tp &__val) [inline]`

Add data to the front of the forward_list.

Parameters

<code>__val</code>	Data to be added.
--------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the forward_list and assigns the given data to it. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 802 of file forward_list.h.

References `std::move()`.

4.553.3.34 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::remove (`
`const _Tp &__val)`

Remove all elements equal to value.

Parameters

<code>__val</code>	The value to remove.
--------------------	----------------------

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only

erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.553.3.35 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _Pred > void std::forward_list<_Tp, _Alloc>::remove_if (_Pred __pred)`

Remove all elements satisfying a predicate.

Parameters

<code>__pred</code>	Unary predicate function or object.
---------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.553.3.36 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::resize (size_type __sz)`

Resizes the `forward_list` to the specified number of elements.

Parameters

<code>__sz</code>	Number of elements the <code>forward_list</code> should contain.
-------------------	--

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and the new elements are default constructed.

4.553.3.37 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::resize (size_type __sz, const value_type & __val)`

Resizes the `forward_list` to the specified number of elements.

Parameters

<code>__sz</code>	Number of elements the <code>forward_list</code> should contain.
<code>__val</code>	Data with which new elements should be populated.

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and new elements are populated with given data.

4.553.3.38 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::reverse () [inline], [noexcept]`

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1224 of file forward_list.h.

References std::begin(), std::forward_list< _Tp, _Alloc >::begin(), std::end(), std::forward_list< _Tp, _Alloc >::end(), std::move(), and std::swap().

4.553.3.39 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::sort ()`
`[inline]`

Sort the elements of the list.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 1205 of file forward_list.h.

4.553.3.40 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _Comp > void`
`std::forward_list< _Tp, _Alloc >::sort (_Comp __comp)`

Sort the forward_list using a comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

4.553.3.41 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::splice_after (`
`const_iterator __pos, forward_list< _Tp, _Alloc > && __list) [inline]`

Insert contents of another forward_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.

The elements of *list* are inserted in constant time after the element referenced by *pos*. *list* becomes an empty list.

Requires this != x.

Definition at line 1050 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::before_begin(), std::forward_list< _Tp, _Alloc >::empty(), std::forward_list< _Tp, _Alloc >::end(), and std::move().

4.553.3.42 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::splice_after (`
`const_iterator __pos, forward_list< _Tp, _Alloc > && __list, const_iterator __i)`

Insert element from another forward_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__i</code>	Iterator referencing the element before the element to move.

Removes the element in list *list* referenced by *i* and inserts it into the current list after *pos*.

4.553.3.43 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::splice_after (const_iterator __pos, forward_list<_Tp, _Alloc> &&, const_iterator __before, const_iterator __last) [inline]`

Insert range from another forward_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__before</code>	Iterator referencing before the start of range in list.
<code>__last</code>	Iterator referencing the end of range in list.

Removes elements in the range (`__before`,`__last`) and inserts them after `__pos` in constant time.

Undefined if `__pos` is in (`__before`,`__last`).

Definition at line 1093 of file forward_list.h.

4.553.3.44 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::swap (forward_list<_Tp, _Alloc> & __list) [inline], [noexcept]`

Swaps data with another forward_list.

Parameters

<code>__list</code>	A forward_list of the same element and allocator types.
---------------------	---

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Definition at line 986 of file forward_list.h.

References `std::swap()`.

Referenced by `std::swap()`.

4.553.3.45 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::unique ()`
`[inline]`

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1142 of file `forward_list.h`.

4.553.3.46 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _BinPred > void`
`std::forward_list<_Tp, _Alloc>::unique (_BinPred __binary_pred)`

Remove consecutive elements satisfying a predicate.

Parameters

<code>__binary_pred</code>	Binary predicate function or object.
----------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

- [_StateT state](#) () const

4.554.1 Detailed Description

```
template<typename _StateT>  
class std::fpos<_StateT >
```

Class representing stream positions.

The standard places no requirements upon the template parameter `StateT`. In this implementation `StateT` must be `DefaultConstructible`, `CopyConstructible` and `Assignable`. The standard only requires that `fpos` should contain a member of type `StateT`. In this implementation it also contains an offset stored as a signed integer.

Parameters

<i>StateT</i>	Type passed to and returned from state().
---------------	---

Definition at line 112 of file postypes.h.

4.554.2 Constructor & Destructor Documentation

4.554.2.1 `template<typename _StateT> std::fpos<_StateT>::fpos (streamoff __off) [inline]`

Construct position from offset.

Definition at line 133 of file postypes.h.

4.554.3 Member Function Documentation

4.554.3.1 `template<typename _StateT> std::fpos<_StateT>::operator streamoff () const [inline]`

Convert to streamoff.

Definition at line 137 of file postypes.h.

4.554.3.2 `template<typename _StateT> fpos std::fpos<_StateT>::operator+ (streamoff __off) const [inline]`

Add position and offset.

Definition at line 178 of file postypes.h.

4.554.3.3 `template<typename _StateT> fpos& std::fpos<_StateT>::operator+= (streamoff __off) [inline]`

Add offset to this position.

Definition at line 154 of file postypes.h.

4.554.3.4 `template<typename _StateT> fpos std::fpos<_StateT>::operator- (streamoff __off) const [inline]`

Subtract offset from position.

Definition at line 192 of file postypes.h.

4.554.3.5 `template<typename _StateT> streamoff std::fpos<_StateT>::operator- (const fpos<_StateT> & __other) const [inline]`

Subtract position to return offset.

Definition at line 205 of file postypes.h.

4.554.3.6 `template<typename _StateT> fpos& std::fpos<_StateT>::operator=(streamoff __off) [inline]`

Subtract offset from this position.

Definition at line 165 of file postypes.h.

4.554.3.7 `template<typename _StateT> void std::fpos<_StateT>::state (_StateT __st) [inline]`

Remember the value of *st*.

Definition at line 141 of file postypes.h.

4.554.3.8 `template<typename _StateT> _StateT std::fpos<_StateT>::state () const [inline]`

Return the last set value of *st*.

Definition at line 146 of file postypes.h.

- [front_insert_iterator](#) & [operator=](#) (typename _Container::value_type &&__value)

Protected Attributes

- _Container * **container**

4.555.1 Detailed Description

```
template<typename _Container>
class std::front_insert_iterator<_Container>
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using `push_front`.

Tip: Using the `front_inserter` function to create these iterators can save typing.

Definition at line 494 of file `stl_iterator.h`.

4.555.2 Member Typedef Documentation

4.555.2.1 `template<typename _Container> typedef _Container std::front_insert_iterator<_Container>::container_type`

A nested typedef for the type of whatever container you used.

Definition at line 502 of file `stl_iterator.h`.

4.555.2.2 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::difference_type` `[inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.555.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void>::iterator_category` `[inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.555.2.4 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer` [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.555.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference` [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.555.2.6 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type` [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.555.3 Constructor & Destructor Documentation

4.555.3.1 `template<typename _Container > std::front_insert_iterator< _Container >::front_insert_iterator (_Container &__x)` [inline],[explicit]

The only way to create this iterator is with a container.

Definition at line 505 of file `stl_iterator.h`.

4.555.4 Member Function Documentation

4.555.4.1 `template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator* ()` [inline]

Simply returns `*this`.

Definition at line 543 of file `stl_iterator.h`.

4.555.4.2 `template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator++ ()` [inline]

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 548 of file `stl_iterator.h`.

4.555.4.3 `template<typename _Container > front_insert_iterator std::front_insert_iterator< _Container >::operator++ (int)` [inline]

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 553 of file `stl_iterator.h`.

4.555.4.4 `template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator= (const typename _Container::value_type &__value)` [inline]

Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container<T></code> .
----------------------	---

Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

Definition at line 527 of file `stl_iterator.h`.

References `std::move()`.

4.556.1 Detailed Description

```
template<typename _RealType = double>
class std::gamma_distribution< _RealType >
```

A gamma continuous distribution for random numbers.

The formula for the gamma probability density function is:

$$p(x|\alpha, \beta) = \frac{1}{\beta\Gamma(\alpha)} (x/\beta)^{\alpha-1} e^{-x/\beta}$$

Definition at line 2504 of file random.h.

4.556.2 Member Typedef Documentation

4.556.2.1 `template<typename _RealType = double> typedef _RealType std::gamma_distribution< _RealType
>::result_type`

The type of the range of the distribution.

Definition at line 2507 of file random.h.

4.556.3 Constructor & Destructor Documentation

4.556.3.1 `template<typename _RealType = double> std::gamma_distribution< _RealType >::gamma_distribution
(_RealType __alpha_val = _RealType(1), _RealType __beta_val = _RealType(1)) [inline],
[explicit]`

Constructs a gamma distribution with parameters α and β .

Definition at line 2556 of file random.h.

4.556.4 Member Function Documentation

4.556.4.1 `template<typename _RealType = double> _RealType std::gamma_distribution<_RealType>::alpha () const`
[inline]

Returns the α of the distribution.

Definition at line 2577 of file random.h.

4.556.4.2 `template<typename _RealType = double> _RealType std::gamma_distribution<_RealType>::beta () const`
[inline]

Returns the β of the distribution.

Definition at line 2584 of file random.h.

4.556.4.3 `template<typename _RealType = double> result_type std::gamma_distribution<_RealType>::max () const`
[inline]

Returns the least upper bound value of the distribution.

Definition at line 2613 of file random.h.

4.556.4.4 `template<typename _RealType = double> result_type std::gamma_distribution<_RealType>::min () const`
[inline]

Returns the greatest lower bound value of the distribution.

Definition at line 2606 of file random.h.

4.556.4.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type
std::gamma_distribution<_RealType>::operator() (_UniformRandomNumberGenerator &__urng)` [inline]

Generating functions.

Definition at line 2621 of file random.h.

4.556.4.6 `template<typename _RealType = double> param_type std::gamma_distribution<_RealType>::param () const`
[inline]

Returns the parameter set of the distribution.

Definition at line 2591 of file random.h.

4.556.4.7 `template<typename _RealType = double> void std::gamma_distribution<_RealType>::param (const
param_type &__param)` [inline]

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2599 of file random.h.

4.556.4.8 `template<typename _RealType = double> void std::gamma_distribution<_RealType>::reset() [inline]`

Resets the distribution state.

Definition at line 2570 of file random.h.

4.556.5 Friends And Related Function Documentation

4.556.5.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits
> std::basic_ostream<_CharT, _Traits>& operator<<(std::basic_ostream<_CharT, _Traits> & __os, const
std::gamma_distribution<_RealType1> & __x) [friend]`

Inserts a gamma_distribution random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A gamma_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.556.5.2 `template<typename _RealType = double> bool operator==(const gamma_distribution<_RealType> & __d1,
const gamma_distribution<_RealType> & __d2) [friend]`

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2657 of file random.h.

4.556.5.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename
_Traits> std::basic_istream<_CharT, _Traits>& operator>>(std::basic_istream<_CharT, _Traits> & __is,
std::gamma_distribution<_RealType1> & __x) [friend]`

Extracts a gamma_distribution random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>gamma_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

Friends

- `template<typename _Tp >`
class **valarray**

4.562.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size.

For example, if you have `offset==3`, `stride[0]==11`, `size[1]==3`, `stride[1]==3`, then `slice[0,0]==array[3]`, `slice[0,1]==array[6]`, `slice[0,2]==array[9]`, `slice[1,0]==array[14]`, `slice[1,1]==array[17]`, `slice[1,2]==array[20]`.

4.563.1 Detailed Description

```
template<typename _Tp>
class std::gslice_array< _Tp >
```

Reference to multi-dimensional subset of an array.

A `gslice_array` is a reference to the actual elements of an array specified by a `gslice`. The way to get a `gslice_array` is to call `operator[](gslice)` on a `valarray`. The returned `gslice_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying `valarray` this `gslice_array` refers to.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

4.598.1 Detailed Description

```
template<typename \_RandomNumberEngine, size_t __w, typename UIntType>
class std::independent\_bits\_engine< \_RandomNumberEngine, __w, UIntType >
```

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits `__w`.

Definition at line 1076 of file random.h.

4.598.2 Member Typedef Documentation

4.598.2.1 `template<typename _RandomNumberEngine , size_t __w, typename UIntType > typedef UIntType std::independent_bits_engine< _RandomNumberEngine, __w, UIntType >::result_type`

The type of the generated random value.

Definition at line 1079 of file random.h.

4.598.3 Constructor & Destructor Documentation

4.598.3.1 `template<typename _RandomNumberEngine , size_t __w, typename UIntType > std::independent_bits_engine< _RandomNumberEngine, __w, UIntType >::independent_bits_engine () [inline]`

Constructs a default `independent_bits_engine` engine.

The underlying engine is default constructed as well.

Definition at line 1092 of file random.h.

4.598.3.2 `template<typename _RandomNumberEngine , size_t __w, typename UIntType > std::independent_bits_engine< _RandomNumberEngine, __w, UIntType >::independent_bits_engine (const _RandomNumberEngine & __rng) [inline], [explicit]`

Copy constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1102 of file random.h.

```
4.598.3.3 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine<
    _RandomNumberEngine, __w, _UIntType>::independent_bits_engine ( _RandomNumberEngine && __rng )
    [inline], [explicit]
```

Move constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1112 of file random.h.

```
4.598.3.4 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine<
    _RandomNumberEngine, __w, _UIntType>::independent_bits_engine ( result_type __s ) [inline],
    [explicit]
```

Seed constructs a `independent_bits_engine` engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 1122 of file random.h.

```
4.598.3.5 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _Sseq, typename
    = typename std::enable_if<!std::is_same<_Sseq, independent_bits_engine>::value && !std::is_same<_Sseq,
    _RandomNumberEngine>::value> ::type> std::independent_bits_engine< _RandomNumberEngine, __w,
    _UIntType>::independent_bits_engine ( _Sseq & __q ) [inline], [explicit]
```

Generator construct a `independent_bits_engine` engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 1135 of file random.h.

4.598.4 Member Function Documentation

4.598.4.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> const _RandomNumberEngine& std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::base () const [inline], [noexcept]`

Gets a const reference to the underlying generator engine object.

Definition at line 1170 of file random.h.

Referenced by `std::operator<<()`.

4.598.4.2 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::discard (unsigned long long __z) [inline]`

Discard a sequence of random numbers.

Definition at line 1191 of file random.h.

4.598.4.3 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::max () [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 1184 of file random.h.

4.598.4.4 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::min () [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 1177 of file random.h.

4.598.4.5 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> result_type std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::operator() ()`

Gets the next value in the generated random number sequence.

4.598.4.6 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::seed () [inline]`

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1144 of file random.h.

4.598.4.7 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::seed (result_type __s) [inline]`

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1152 of file random.h.

4.598.4.8 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _Sseq> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::seed (_Sseq & __q) [inline]`

Reseeds the `independent_bits_engine` object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 1162 of file random.h.

4.598.5 Friends And Related Function Documentation

4.598.5.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> bool operator==(const independent_bits_engine<_RandomNumberEngine, __w, _UIntType> & __lhs, const independent_bits_engine<_RandomNumberEngine, __w, _UIntType> & __rhs) [friend]`

Compares two `independent_bits_engine` random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A <code>independent_bits_engine</code> random number generator object.
<code>__rhs</code>	Another <code>independent_bits_engine</code> random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1216 of file random.h.

4.598.5.2 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>>(std::basic_istream<_CharT, _Traits> & __is, std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType> & __x) [friend]`

Extracts the current state of a `% subtract_with_carry_engine` random number generator engine `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>independent_bits_engine</code> random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

Definition at line 1234 of file random.h.

Friends

- class `gslice_array<_Tp>`
- class `valarray<_Tp>`

4.599.1 Detailed Description

```
template<class _Tp>
class std::indirect_array<_Tp>
```

Reference to arbitrary subset of an array.

An `indirect_array` is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an `indirect_array` is to call `operator[]`(`valarray<size_t>`) on a `valarray`. The returned `indirect_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if an `indirect_array` is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have `array[0]==3`, `array[2]==2`, and `array[4]==1`.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 62 of file `indirect_array.h`.

- [indirect_array.h](#)

4.600 std::input_iterator_tag Struct Reference

Inheritance diagram for std::input_iterator_tag:

4.600.1 Detailed Description

Marking input iterators.

Definition at line 89 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl_iterator_base_types.h](#)

4.601 `std::insert_iterator<_Container>` Class Template Reference

Inheritance diagram for `std::insert_iterator<_Container>`:

Public Types

- typedef `_Container` `container_type`
- typedef void `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

Public Member Functions

- `insert_iterator` (`_Container &__x`, `typename _Container::iterator __i`)
- `insert_iterator & operator*` ()
- `insert_iterator & operator++` ()
- `insert_iterator & operator++` (int)
- `insert_iterator & operator=` (const `typename _Container::value_type &__value`)
- `insert_iterator & operator=` (`typename _Container::value_type &&__value`)

Protected Attributes

- `_Container *` **`container`**
- `_Container::iterator` **`iter`**

4.601.1 Detailed Description

```
template<typename _Container>
class std::insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the inserter function to create these iterators can save typing.

Definition at line 588 of file stl_iterator.h.

4.601.2 Member Typedef Documentation

4.601.2.1 `template<typename _Container> typedef _Container std::insert_iterator< _Container >::container_type`

A nested typedef for the type of whatever container you used.

Definition at line 597 of file stl_iterator.h.

4.601.2.2 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type` [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.601.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category` [inherited]

One of the [tag types](#).

Definition at line 121 of file stl_iterator_base_types.h.

4.601.2.4 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer` [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file stl_iterator_base_types.h.

4.601.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference` [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file stl_iterator_base_types.h.

4.601.2.6 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type` `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.601.3 Constructor & Destructor Documentation

4.601.3.1 `template<typename _Container> std::insert_iterator< _Container >::insert_iterator (_Container & __x, typename _Container::iterator __i)` `[inline]`

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

Definition at line 603 of file `stl_iterator.h`.

4.601.4 Member Function Documentation

4.601.4.1 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator* ()` `[inline]`

Simply returns `*this`.

Definition at line 657 of file `stl_iterator.h`.

4.601.4.2 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator++ ()` `[inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 662 of file `stl_iterator.h`.

4.601.4.3 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator++ (int)` `[inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 667 of file `stl_iterator.h`.

4.601.4.4 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator= (const typename _Container::value_type & __value)` `[inline]`

Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container<T></code> .
----------------------	---

Returns

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z
insert_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;

// vector v contains A, 1, 2, 3, and Z
```

Definition at line 639 of file `stl_iterator.h`.

References `std::move()`.

4.602.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

Definition at line 199 of file `ios_base.h`.

4.602.2 Member Typedef Documentation

4.602.2.1 `typedef void(* std::ios_base::event_callback)(event __e, ios_base &__b, int __i)`

The type of an event callback function.

Parameters

<code>__e</code>	One of the members of the event enum.
<code>__b</code>	Reference to the <code>ios_base</code> object.
<code>__i</code>	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several `ios_base` and `basic_ios` functions, specifically `imbue()`, `copyfmt()`, and `~ios()`.

Definition at line 436 of file `ios_base.h`.

4.602.2.2 `typedef _ios_Fmtflags std::ios_base::fmtflags`

This is a bitmask type.

`_Ios_Fmtflags` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `fmtflags` are:

- `boolalpha`
- `dec`
- `fixed`
- `hex`
- `internal`
- `left`
- `oct`

- right
- scientific
- showbase
- showpoint
- showpos
- skipws
- unitbuf
- uppercase
- adjustfield
- basefield
- floatfield

Definition at line 255 of file ios_base.h.

4.602.2.3 typedef _Ios_Iostate std::ios_base::iostate

This is a bitmask type.

_Ios_Iostate is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type iostate are:

- badbit
- eofbit
- failbit
- goodbit

Definition at line 330 of file ios_base.h.

4.602.2.4 typedef _Ios_Openmode std::ios_base::openmode

This is a bitmask type.

_Ios_Openmode is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type openmode are:

- app
- ate
- binary
- in
- out
- trunc

Definition at line 361 of file ios_base.h.

4.602.2.5 typedef _Ios_Seekdir std::ios_base::seekdir

This is an enumerated type.

`_Ios_Seekdir` is implementation-defined. Defined values of type `seekdir` are:

- `beg`
- `cur`, equivalent to `SEEK_CUR` in the C standard library.
- `end`, equivalent to `SEEK_END` in the C standard library.

Definition at line 393 of file `ios_base.h`.

4.602.3 Member Enumeration Documentation

4.602.3.1 enum std::ios_base::event

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

Definition at line 419 of file `ios_base.h`.

4.602.4 Constructor & Destructor Documentation

4.602.4.1 virtual std::ios_base::~ios_base () [virtual]

Invokes each callback with `erase_event`. Destroys local storage.

Note that the `ios_base` object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with `erase_event` (unless `copyfmt` is used).

Referenced by `pword()`.

4.602.5 Member Function Documentation

4.602.5.1 const locale& std::ios_base::_M_getloc () const [inline]

Locale access.

Returns

A reference to the current locale.

Like `getloc` above, but returns a reference instead of generating a copy.

Definition at line 706 of file `ios_base.h`.

References `xalloc()`.

4.602.5.2 `fmtflags std::ios_base::flags () const` `[inline]`

Access to format flags.

Returns

The format control flags for both input and output.

Definition at line 551 of file `ios_base.h`.

4.602.5.3 `fmtflags std::ios_base::flags (fmtflags __fmtfl)` `[inline]`

Setting new format flags all at once.

Parameters

<code>__fmtfl</code>	The new flags to set.
----------------------	-----------------------

Returns

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

Definition at line 562 of file `ios_base.h`.

4.602.5.4 `locale std::ios_base::getloc () const` `[inline]`

Locale access.

Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Definition at line 695 of file `ios_base.h`.

4.602.5.5 `locale std::ios_base::imbue (const locale & __loc) throw ()`

Setting a new locale.

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Sets the new locale for this stream, and then invokes each callback with imbue_event.

Referenced by width().

4.602.5.6 long& std::ios_base::iword (int __ix) [inline]

Access to integer array.

Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

Returns

A reference to an integer associated with the index.

The iword function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use xalloc to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 741 of file ios_base.h.

4.602.5.7 streamsize std::ios_base::precision () const [inline]

Flags access.

Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Definition at line 621 of file ios_base.h.

4.602.5.8 streamsize std::ios_base::precision (streamsize __prec) [inline]

Changing flags.

Parameters

<code>__prec</code>	The new precision value.
---------------------	--------------------------

Returns

The previous value of `precision()`.

Definition at line 630 of file `ios_base.h`.

4.602.5.9 `void*& std::ios_base::pword (int __ix) [inline]`

Access to void pointer array.

Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

Returns

A reference to a `void*` associated with the index.

The `pword` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 762 of file `ios_base.h`.

References `~ios_base()`.

4.602.5.10 `void std::ios_base::register_callback (event_callback __fn, int __index)`

Add the callback `__fn` with parameter `__index`.

Parameters

<code>__fn</code>	The function to add.
<code>__index</code>	The integer to pass to the function when invoked.

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

4.602.5.11 `fmtflags std::ios_base::setf (fmtflags __fmtfl) [inline]`

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
----------------------	--------------------------

Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

Definition at line 578 of file ios_base.h.

Referenced by `std::boolalpha()`, `std::dec()`, `std::fixed()`, `std::hex()`, `std::left()`, `std::oct()`, `std::right()`, `std::scientific()`, `std::showbase()`, `std::showpoint()`, `std::showpos()`, `std::skipws()`, `std::unitbuf()`, and `std::uppercase()`.

4.602.5.12 `fmtflags std::ios_base::setf (fmtflags __fmtfl, fmtflags __mask)` `[inline]`

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
<code>__mask</code>	The flags mask for <code>fmtfl</code> .

Returns

The previous format control flags.

This function clears `mask` in the format flags, then sets `fmtfl & mask`. An example mask is `ios_base::adjustfield`.

Definition at line 595 of file ios_base.h.

4.602.5.13 `static bool std::ios_base::sync_with_stdio (bool __sync = true)` `[static]`

Interaction with the standard C I/O objects.

Parameters

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., `stdout`) and the standard C++ objects (e.g., `cout`). User-declared streams are unaffected. See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt1.html>

Referenced by `width()`.

4.602.5.14 `void std::ios_base::unsetf (fmtflags __mask)` `[inline]`

Clearing format flags.

Parameters

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

Definition at line 610 of file `ios_base.h`.

Referenced by `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nounitbuf()`, and `std::nouppercase()`.

4.602.5.15 `streamsize std::ios_base::width () const` `[inline]`

Flags access.

Returns

The minimum field width to generate on output operations.

Minimum field width refers to the number of characters.

Definition at line 644 of file `ios_base.h`.

4.602.5.16 `streamsize std::ios_base::width (streamsize __wide)` `[inline]`

Changing flags.

Parameters

<code>__wide</code>	The new width value.
---------------------	----------------------

Returns

The previous value of `width()`.

Definition at line 653 of file `ios_base.h`.

References `imbue()`, and `sync_with_stdio()`.

4.602.5.17 `static int std::ios_base::xalloc () throw` `[static]`

Access to unique indices.

Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

Referenced by `_M_getloc()`.

4.602.6 Member Data Documentation

4.602.6.1 const fmtflags std::ios_base::adjustfield [static]

A mask of `left|right|internal`. Useful for the 2-arg form of `setf`.

Definition at line 310 of file `ios_base.h`.

Referenced by `std::internal()`, `std::left()`, and `std::right()`.

4.602.6.2 const openmode std::ios_base::app [static]

Seek to end before each write.

Definition at line 364 of file `ios_base.h`.

4.602.6.3 const openmode std::ios_base::ate [static]

Open and seek to end immediately after opening.

Definition at line 367 of file `ios_base.h`.

4.602.6.4 const iostate std::ios_base::badbit [static]

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 334 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::bad()`, and `std::basic_ios<_CharT, _Traits>::fail()`.

4.602.6.5 const fmtflags std::ios_base::basefield [static]

A mask of `dec|oct|hex`. Useful for the 2-arg form of `setf`.

Definition at line 313 of file `ios_base.h`.

Referenced by `std::dec()`, `std::hex()`, and `std::oct()`.

4.602.6.6 `const seekdir std::ios_base::beg` [static]

Request a seek relative to the beginning of the stream.

Definition at line 396 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.602.6.7 `const openmode std::ios_base::binary` [static]

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch27s02.html>.

Definition at line 372 of file `ios_base.h`.

4.602.6.8 `const fmtflags std::ios_base::boolalpha` [static]

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 258 of file `ios_base.h`.

Referenced by `std::boolalpha()`, and `std::noboolalpha()`.

4.602.6.9 `const seekdir std::ios_base::cur` [static]

Request a seek relative to the current position within the sequence.

Definition at line 399 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.602.6.10 `const fmtflags std::ios_base::dec` [static]

Converts integer input or generates integer output in decimal base.

Definition at line 261 of file `ios_base.h`.

Referenced by `std::dec()`.

4.602.6.11 `const seekdir std::ios_base::end` [static]

Request a seek relative to the current end of the sequence.

Definition at line 402 of file `ios_base.h`.

4.602.6.12 `const iostate std::ios_base::eofbit` [static]

Indicates that an input operation reached the end of an input sequence.

Definition at line 337 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::eof()`.

4.602.6.13 `const iostate std::ios_base::failbit` `[static]`

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 342 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::fail()`.

4.602.6.14 `const fmtflags std::ios_base::fixed` `[static]`

Generate floating-point output in fixed-point notation.

Definition at line 264 of file `ios_base.h`.

Referenced by `std::fixed()`.

4.602.6.15 `const fmtflags std::ios_base::floatfield` `[static]`

A mask of `scientific|fixed`. Useful for the 2-arg form of `setf`.

Definition at line 316 of file `ios_base.h`.

Referenced by `std::fixed()`, and `std::scientific()`.

4.602.6.16 `const iostate std::ios_base::goodbit` `[static]`

Indicates all is well.

Definition at line 345 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::rdstate()`.

4.602.6.17 `const fmtflags std::ios_base::hex` `[static]`

Converts integer input or generates integer output in hexadecimal base.

Definition at line 267 of file `ios_base.h`.

Referenced by `std::hex()`.

4.602.6.18 `const openmode std::ios_base::in` `[static]`

Open for input. Default for `ifstream` and `fstream`.

Definition at line 375 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.602.6.19 `const fmtflags std::ios_base::internal` `[static]`

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Definition at line 272 of file `ios_base.h`.

Referenced by `std::internal()`.

4.602.6.20 `const fmtflags std::ios_base::left` `[static]`

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 276 of file `ios_base.h`.

Referenced by `std::left()`.

4.602.6.21 `const fmtflags std::ios_base::oct` `[static]`

Converts integer input or generates integer output in octal base.

Definition at line 279 of file `ios_base.h`.

Referenced by `std::oct()`.

4.602.6.22 `const openmode std::ios_base::out` `[static]`

Open for output. Default for `ofstream` and `fstream`.

Definition at line 378 of file `ios_base.h`.

Referenced by `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file()`.

4.602.6.23 `const fmtflags std::ios_base::right` `[static]`

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 283 of file `ios_base.h`.

Referenced by `std::right()`.

4.602.6.24 `const fmtflags std::ios_base::scientific` `[static]`

Generates floating-point output in scientific notation.

Definition at line 286 of file `ios_base.h`.

Referenced by `std::scientific()`.

4.602.6.25 const fmtflags std::ios_base::showbase [static]

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 290 of file ios_base.h.

Referenced by std::noshowbase(), and std::showbase().

4.602.6.26 const fmtflags std::ios_base::showpoint [static]

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 294 of file ios_base.h.

Referenced by std::noshowpoint(), and std::showpoint().

4.602.6.27 const fmtflags std::ios_base::showpos [static]

Generates a + sign in non-negative generated numeric output.

Definition at line 297 of file ios_base.h.

Referenced by std::noshowpos(), and std::showpos().

4.602.6.28 const fmtflags std::ios_base::skipws [static]

Skips leading white space before certain input operations.

Definition at line 300 of file ios_base.h.

Referenced by std::noskipws(), and std::skipws().

4.602.6.29 const openmode std::ios_base::trunc [static]

Open for input. Default for ofstream.

Definition at line 381 of file ios_base.h.

4.602.6.30 const fmtflags std::ios_base::unitbuf [static]

Flushes output after each output operation.

Definition at line 303 of file ios_base.h.

Referenced by std::nounitbuf(), and std::unitbuf().

4.602.6.31 `const fmtflags std::ios_base::uppercase` [static]

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 307 of file `ios_base.h`.

Referenced by `std::nouppercase()`, and `std::uppercase()`.

The documentation for this class was generated from the following file:

- [ios_base.h](#)

4.603 `std::ios_base::failure` Class Reference

Inherits exception.

Public Member Functions

- **failure** (const [string](#) &__str) throw ()
- virtual const char * **what** () const throw ()

4.603.1 Detailed Description

These are thrown to indicate problems with io.

27.4.2.1.1 Class `ios_base::failure`.

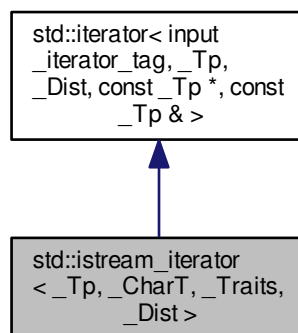

Definition at line 209 of file `ios_base.h`.

The documentation for this class was generated from the following file:

- [ios_base.h](#)

4.604 `std::istream_iterator< _Tp, _CharT, _Traits, _Dist >` Class Template Reference

4.606 `std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >` Struct Template Reference

Public Types

- typedef `_Distance` [difference_type](#)
- typedef `_Category` [iterator_category](#)
- typedef `_Pointer` [pointer](#)
- typedef `_Reference` [reference](#)
- typedef `_Tp` [value_type](#)

4.606.1 Detailed Description

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference =  
_Tp&>  
struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >
```

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

Definition at line 118 of file `stl_iterator_base_types.h`.

4.606.2 Member Typedef Documentation

4.606.2.1 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&> typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference
>::difference_type`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.606.2.2 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,

4.611.1 Detailed Description

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
class std::linear_congruential_engine< _UIntType, __a, __c, __m >
```

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to `(__m-1)`. If the template parameter `__m` is 0, the modulus `__m` used is `std::numeric_limits<_UIntType>::max()` plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

Definition at line 243 of file random.h.

4.611.2 Member Typedef Documentation

4.611.2.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> typedef _UIntType
std::linear_congruential_engine<_UIntType, __a, __c, __m>::result_type`

The type of the generated random value.

Definition at line 246 of file random.h.

4.611.3 Constructor & Destructor Documentation

4.611.3.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> std::linear_congruential_engine<
_UIntType, __a, __c, __m>::linear_congruential_engine (result_type __s = default_seed)
[inline], [explicit]`

Constructs a linear_congruential_engine random number generator engine with seed __s. The default seed value is 1.

Parameters

<code>__s</code>	The initial seed value.
------------------	-------------------------

Definition at line 270 of file random.h.

4.611.3.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq
, typename = typename std::enable_if<!std::is_same<_Sseq, linear_congruential_engine>::value>::type>
std::linear_congruential_engine<_UIntType, __a, __c, __m>::linear_congruential_engine (_Sseq & __q)
[inline], [explicit]`

Constructs a linear_congruential_engine random number generator engine seeded from the seed sequence __q.

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

Definition at line 283 of file random.h.

4.611.4 Member Function Documentation

4.611.4.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> void std::linear_↵
_congruential_engine<_UIntType, __a, __c, __m>::discard (unsigned long long __z)
[inline]`

Discard a sequence of random numbers.

Definition at line 327 of file random.h.

4.611.4.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type
std::linear_congruential_engine<_UIntType, __a, __c, __m>::max () [inline], [static]`

Gets the largest possible value in the output range.

Definition at line 320 of file random.h.

4.611.4.3 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type
std::linear_congruential_engine<_UIntType, __a, __c, __m>::min () [inline], [static]`

Gets the smallest possible value in the output range.

The minimum depends on the `__c` parameter: if it is zero, the minimum generated must be > 0 , otherwise 0 is allowed.

Definition at line 313 of file random.h.

4.611.4.4 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> result_type
std::linear_congruential_engine<_UIntType, __a, __c, __m>::operator() () [inline]`

Gets the next random number in the sequence.

Definition at line 337 of file random.h.

4.611.4.5 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> void std::linear_↵
congruential_engine<_UIntType, __a, __c, __m>::seed (result_type __s = default_seed
)`

Reseeds the `linear_congruential_engine` random number generator engine sequence to the seed `__s`.

Parameters

<code>↵ __s</code>	The new seed.
------------------------	---------------

4.611.4.6 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq >
std::enable_if<std::is_class<_Sseq>::value>::type std::linear_congruential_engine<_UIntType, __a, __c, __m
>::seed (_Sseq & __q)`

Reseeds the `linear_congruential_engine` random number generator engine sequence using values from the seed sequence `__q`.

Parameters

<code>↵ __q</code>	the seed sequence.
------------------------	--------------------

4.611.5 Friends And Related Function Documentation

4.611.5.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::linear_congruential_engine<_UIntType1, __a1, __c1, __m1> & __lcr) [friend]`

Writes the textual representation of the state x(i) of x to __os.

Parameters

<code>__os</code>	The output stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

Returns

`__os`.

4.611.5.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> bool operator== (const linear_congruential_engine<_UIntType, __a, __c, __m> & __lhs, const linear_congruential_engine<_UIntType, __a, __c, __m> & __rhs) [friend]`

Compares two linear congruential random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A linear congruential random number generator object.
<code>__rhs</code>	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 355 of file random.h.

4.611.5.3 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is, std::linear_congruential_engine<_UIntType1, __a1, __c1, __m1> & __lcr) [friend]`

Sets the state of the engine by reading its textual representation from __is.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments `_CharT` and `_Traits` were the same as those of `__is`.

Parameters

<code>__is</code>	The input stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

Returns

`__is`.

4.611.6 Member Data Documentation

4.611.6.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::increment [static]`

An increment.

Definition at line 257 of file random.h.

4.611.6.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::modulus [static]`

The modulus.

Definition at line 259 of file random.h.

4.611.6.3 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::multiplier [static]`

The multiplier.

Definition at line 255 of file random.h.

4.612.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::list<_Tp, _Alloc>
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for `list<Tp>`:

First, we never actually allocate a `Tp`, we allocate `List_node<Tp>`'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from `list<X,Alloc1>` are spliced into `list<X,Alloc2>`, destroying the memory of the second list is a valid operation, i.e., `Alloc1` giveth and `Alloc2` taketh away.

Second, a list conceptually represented as

```
A <----> B <----> C <----> D
```

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private `list::iterator` pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's `next/previous` pointers refer to itself, the list is empty.

Definition at line 447 of file `stl_list.h`.

4.612.2 Constructor & Destructor Documentation

4.612.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list () [inline], [noexcept]`

Creates a list with no elements.

Definition at line 533 of file `stl_list.h`.

4.612.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (const allocator_type &__a) [inline], [explicit], [noexcept]`

Creates a list with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 544 of file `stl_list.h`.

4.612.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (size_type __n)`
`[inline], [explicit]`

Creates a list with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor fills the list with `__n` default constructed elements.

Definition at line 556 of file `stl_list.h`.

4.612.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (size_type __n,`
`const value_type & __value, const allocator_type & __a = allocator_type()) [inline]`

Creates a list with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator object.

This constructor fills the list with `__n` copies of `__value`.

Definition at line 568 of file `stl_list.h`.

4.612.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (const list<_Tp,`
`_Alloc> & __x) [inline]`

List copy constructor.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The newly-created list uses a copy of the allocation object used by `__x`.

Definition at line 595 of file `stl_list.h`.

4.612.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (list<_Tp, _Alloc`
`> && __x) [inline], [noexcept]`

List move constructor.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The newly-created list contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified list.

Definition at line 607 of file `stl_list.h`.

```
4.612.2.7  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( initializer_list<
value_type > __l, const allocator_type & __a = allocator_type() ) [inline]
```

Builds a list from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements in the `initializer_list` `__l`. This is linear in `__l.size()`.

Definition at line 618 of file `stl_list.h`.

```
4.612.2.8  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
std::_RequireInputIter<_InputIterator>>> std::list<_Tp, _Alloc>::list ( _InputIterator __first, _InputIterator __last,
const allocator_type & __a = allocator_type() ) [inline]
```

Builds a list from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

Definition at line 637 of file `stl_list.h`.

4.612.3 Member Function Documentation

```
4.612.3.1  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> _Node* std::list<
_Tp, _Alloc>::_M_create_node ( _Args &&... __args ) [inline], [protected]
```

Parameters

<code>__args</code>	An instance of user data.
---------------------	---------------------------

Allocates space for a new node and constructs a copy of `__args` in it.

Definition at line 509 of file `stl_list.h`.

4.612.3.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::assign (size_type __n, const value_type & __val) [inline]`

Assigns a given value to a list.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a list with `__n` copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 715 of file `stl_list.h`.

4.612.3.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> void std::list<_Tp, _Alloc>::assign (_InputIterator __first, _InputIterator __last) [inline]`

Assigns a range to a list.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a list with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 734 of file `stl_list.h`.

4.612.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::assign (initializer_list<value_type> & __l) [inline]`

Assigns an `initializer_list` to a list.

Parameters

↩	An initializer_list of value_type.
↩	
↩	
↩	
/	

Replace the contents of the list with copies of the elements in the initializer_list `__l`. This is linear in `__l.size()`.

Definition at line 756 of file `stl_list.h`.

4.612.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::list<_Tp, _Alloc>::back ()`
`[inline], [noexcept]`

Returns a read/write reference to the data at the last element of the list.

Definition at line 956 of file `stl_list.h`.

4.612.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list<_Tp, _Alloc>::back ()`
`const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the list.

Definition at line 968 of file `stl_list.h`.

4.612.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::begin ()`
`[inline], [noexcept]`

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 771 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::list()`, `std::operator==()`, and `std::list< __inp, __rebind_inp >::splice()`.

4.612.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::begin ()`
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 780 of file `stl_list.h`.

4.612.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::cbegin ()`
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 844 of file `stl_list.h`.

4.612.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 853 of file `stl_list.h`.

4.612.3.11 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::clear () [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1302 of file `stl_list.h`.

4.612.3.12 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::crbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 862 of file `stl_list.h`.

4.612.3.13 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::crend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 871 of file `stl_list.h`.

4.612.3.14 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator std::list<_Tp, _Alloc>::emplace (const_iterator __position, _Args &&... __args)`

Constructs object in list before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location`. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

4.612.3.15 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::list<_Tp, _Alloc>::empty () const`
`[inline], [noexcept]`

Returns true if the list is empty. (Thus `begin()` would equal `end()`.)

Definition at line 881 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::splice()`.

4.612.3.16 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 789 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::list()`, `std::operator==()`, and `std::list< __inp, __rebind_inp >::splice()`.

4.612.3.17 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::end () const`
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 798 of file `stl_list.h`.

4.612.3.18 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::erase (`
`const_iterator __position) [noexcept]`

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.612.3.19 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::erase (`
`const_iterator __first, const_iterator __last) [inline], [noexcept]`

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [first,last) and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1264 of file stl_list.h.

4.612.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::list<_Tp, _Alloc>::front ()`
`[inline], [noexcept]`

Returns a read/write reference to the data at the first element of the list.

Definition at line 940 of file stl_list.h.

4.612.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list<_Tp, _Alloc>::front () const`
`[inline], [noexcept]`

Returns a read-only (constant) reference to the data at the first element of the list.

Definition at line 948 of file stl_list.h.

4.612.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::list<_Tp, _Alloc>::get_allocator () const`
`[inline], [noexcept]`

Get a copy of the memory allocation object.

Definition at line 762 of file stl_list.h.

4.612.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert (const_iterator __position, const value_type & __x)`

Inserts given value into list before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the list.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

4.612.3.24 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert (const_iterator __position, value_type && __x) [inline]`

Inserts given rvalue into list before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the list.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1116 of file `stl_list.h`.

4.612.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert (const_iterator __p, initializer_list<value_type> __l) [inline]`

Inserts the contents of an initializer_list into list before specified const_iterator.

Parameters

<code>__p</code>	A const_iterator into the list.
<code>__l</code>	An initializer_list of value_type.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the initializer_list `l` into the list before the location specified by `p`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1135 of file `stl_list.h`.

4.612.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::insert (const_iterator __position, size_type __n, const value_type & __x)`

Inserts a number of copies of given data into the list.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert a specified number of copies of the given data before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

4.612.3.27 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> iterator std::list< _Tp, _Alloc >::insert (const_iterator __position, _InputIterator __first, _InputIterator __last)`

Inserts a range into the list.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the range *[first,last)* into the list before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

4.612.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list< _Tp, _Alloc >::max_size () const [inline],[noexcept]`

Returns the `size()` of the largest possible list.

Definition at line 891 of file `stl_list.h`.

4.612.3.29 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::merge (list< _Tp, _Alloc > && __x)`

Merge sorted lists.

Parameters

<code>__x</code>	Sorted list to merge.
------------------	-----------------------

Assumes that both `__x` and this list are sorted according to `operator<()`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equal.

4.612.3.30 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _StrictWeakOrdering > void std::list<_Tp, _Alloc>::merge (list<_Tp, _Alloc> && __x, _StrictWeakOrdering __comp)`

Merge sorted lists according to comparison function.

Template Parameters

<code>__StrictWeakOrdering</code>	Comparison function defining sort order.
-----------------------------------	--

Parameters

<code>__x</code>	Sorted list to merge.
<code>__comp</code>	Comparison functor.

Assumes that both `__x` and this list are sorted according to `StrictWeakOrdering`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equivalent according to `StrictWeakOrdering()`.

4.612.3.31 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list<_Tp, _Alloc>::operator= (const list<_Tp, _Alloc> & __x)`

List assignment operator.

No explicit dtor needed as the `_Base` dtor takes care of things. The `_Base` dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

4.612.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list<_Tp, _Alloc>::operator= (list<_Tp, _Alloc> && __x) [inline]`

List move assignment operator.

Parameters

<code>__x</code>	A list of identical element and allocator types.
<code>__x</code>	

The contents of `__x` are moved into this list (without copying). `__x` is a valid, but unspecified list

Definition at line 680 of file `stl_list.h`.

4.612.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list<_Tp, _Alloc>::operator= (initializer_list<value_type> __l) [inline]`

List initializer list assignment operator.

Parameters

<code>__l</code>	An initializer_list of value_type.
<code>__l</code>	
<code>__l</code>	
<code>__l</code>	
<code>l</code>	

Replace the contents of the list with copies of the elements in the initializer_list `__l`. This is linear in `l.size()`.

Definition at line 697 of file `stl_list.h`.

4.612.3.34 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::pop_back () [inline], [noexcept]`

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1054 of file `stl_list.h`.

4.612.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::pop_front () [inline], [noexcept]`

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 1014 of file `stl_list.h`.

4.612.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::push_back (const value_type & __x) [inline]`

Add data to the end of the list.

Parameters

$_ \leftrightarrow$	Data to be added.
$_x$	

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1028 of file `stl_list.h`.

```
4.612.3.37  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::push_front ( const
value_type & __x )  [inline]
```

Add data to the front of the list.

Parameters

$_ \leftrightarrow$	Data to be added.
$_x$	

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 987 of file `stl_list.h`.

```
4.612.3.38  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list<_Tp, _Alloc
>::rbegin ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 807 of file `stl_list.h`.

```
4.612.3.39  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc
>::rbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 816 of file `stl_list.h`.

```
4.612.3.40  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::remove ( const _Tp
& __value )
```

Remove all elements equal to value.

Parameters

$__value$	The value to remove.
-------------	----------------------

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.612.3.41 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _Predicate > void std::list<_Tp, _Alloc>::remove_if (_Predicate)`

Remove all elements satisfying a predicate.

Template Parameters

<code>_Predicate</code>	Unary predicate function or object.
-------------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.612.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list<_Tp, _Alloc>::rend () [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 825 of file `stl_list.h`.

4.612.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 834 of file `stl_list.h`.

4.612.3.44 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::resize (size_type __new_size)`

Resizes the list to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the list should contain.
-------------------------	---

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

4.612.3.45 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::resize (size_type __new_size, const value_type & __x)`

Resizes the list to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the list should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

4.612.3.46 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::reverse ()`
`[inline], [noexcept]`

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1576 of file `stl_list.h`.

4.612.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list<_Tp, _Alloc>::size () const`
`[inline], [noexcept]`

Returns the number of elements in the list.

Definition at line 886 of file `stl_list.h`.

4.612.3.48 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::sort ()`

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

4.612.3.49 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _StrictWeakOrdering > void`
`std::list<_Tp, _Alloc>::sort (_StrictWeakOrdering)`

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

4.612.3.50 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (`
`const_iterator __position, list<_Tp, _Alloc> && __x) [inline], [noexcept]`

Insert contents of another list.

Parameters

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.

The elements of `__x` are inserted in constant time in front of the element referenced by `__position`. `__x` becomes an empty list.

Requires this != `__x`.

Definition at line 1322 of file `stl_list.h`.

```
4.612.3.51 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (
    const_iterator __position, list<_Tp, _Alloc> && __x, const_iterator __i ) [inline], [noexcept]
```

Insert element from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__i</code>	Const_iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

Definition at line 1354 of file `stl_list.h`.

```
4.612.3.52 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (
    const_iterator __position, list<_Tp, _Alloc> & __x, const_iterator __i ) [inline], [noexcept]
```

Insert element from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__i</code>	Const_iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

Definition at line 1393 of file `stl_list.h`.

```
4.612.3.53 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (
    const_iterator __position, list<_Tp, _Alloc> && __x, const_iterator __first, const_iterator __last )
    [inline], [noexcept]
```

Insert range from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Const_iterator referencing the start of range in x.
<code>__last</code>	Const_iterator referencing the end of range in x.

Removes elements in the range [`__first`,`__last`) and inserts them before `__position` in constant time.

Undefined if `__position` is in [`__first`,`__last`).

Definition at line 1412 of file `stl_list.h`.

4.612.3.54 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (`
`const_iterator __position, list<_Tp, _Alloc> &__x, const_iterator __first, const_iterator __last)`
`[inline], [noexcept]`

Insert range from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Const_iterator referencing the start of range in x.
<code>__last</code>	Const_iterator referencing the end of range in x.

Removes elements in the range [`__first`,`__last`) and inserts them before `__position` in constant time.

Undefined if `__position` is in [`__first`,`__last`).

Definition at line 1458 of file `stl_list.h`.

4.612.3.55 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::swap (list<_Tp,`
`_Alloc> &__x) [inline]`

Swaps data with another list.

Parameters

<code>__x</code>	A list of the same element and allocator types.
------------------	---

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Definition at line 1284 of file `stl_list.h`.

Referenced by `std::swap()`.

4.612.3.56 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::unique ()`

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.612.3.57 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _BinaryPredicate > void
std::list<_Tp, _Alloc >::unique (_BinaryPredicate)`

Remove consecutive elements satisfying a predicate.

Template Parameters

<code>_BinaryPredicate</code>	Binary predicate function or object.
-------------------------------	--------------------------------------

For each consecutive set of elements [first,last) that satisfy predicate(first,i) where i is an iterator in [first,last), remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.613.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.

Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

Definition at line 62 of file `locale_classes.h`.

4.613.2 Member Typedef Documentation

4.613.2.1 typedef int std::locale::category

Definition of `locale::category`.

Definition at line 67 of file `locale_classes.h`.

4.613.3 Constructor & Destructor Documentation

4.613.3.1 std::locale::locale () throw)

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

Referenced by operator!=().

4.613.3.2 std::locale::locale (const locale & __other) throw)

Copy constructor.

Constructs a copy of *other*.

Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

4.613.3.3 std::locale::locale (const char * __s) [explicit]

Named locale constructor.

Constructs a copy of the named C library locale.

Parameters

<code>__s</code>	Name of the locale to construct.
------------------	----------------------------------

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

4.613.3.4 std::locale::locale (const locale & __base, const char * __s, category __cat)

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__s</code>	Name of the locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <code>__s</code> .

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

4.613.3.5 `std::locale::locale (const locale & __base, const locale & __add, category __cat)`

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__add</code>	The locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from add.

4.613.3.6 `template<typename _Facet > std::locale::locale (const locale & __other, _Facet * __f)`

Construct locale with another facet.

Constructs a copy of the locale *__other*. The facet *__f* is added to *__other*, replacing an existing facet of type *Facet* if there is one. If *__f* is null, this locale is a copy of *__other*.

Parameters

<code>__other</code>	The locale to copy.
<code>__f</code>	The facet to add in.

4.613.3.7 `std::locale::~~locale () throw`

Locale destructor.

4.613.4 Member Function Documentation

4.613.4.1 `static const locale& std::locale::classic () [static]`

Return reference to the C locale.

Referenced by operator!=().

4.613.4.2 `template<typename _Facet > locale std::locale::combine (const locale & __other) const`

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type *Facet* from the locale *other* into the new locale.

Template Parameters

<code>_Facet</code>	The facet type to copy from other
---------------------	-----------------------------------

Parameters

<code>__other</code>	The locale to copy from.
----------------------	--------------------------

Returns

Newly constructed locale.

Exceptions

<code>std::runtime_error</code>	if <code>__other</code> has no facet of type <code>_Facet</code> .
---------------------------------	--

4.613.4.3 static locale std::locale::global (const locale & __loc) [static]

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call `std::setlocale(LC_ALL, loc.name())`.

Parameters

<code>__loc</code>	The new locale to make global.
--------------------	--------------------------------

Returns

Copy of the old global locale.

Referenced by operator!=().

4.613.4.4 string std::locale::name () const

Return locale name.

Returns

Locale name or "*" if unnamed.

4.613.4.5 bool std::locale::operator!=(const locale & __other) const throw) [inline]

Locale inequality.

Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

Returns

`! (*this == __other)`

Definition at line 235 of file `locale_classes.h`.

References `__gnu_debug::__base()`, `classic()`, `global()`, `locale()`, `operator()()`, and `operator==()`.

4.613.4.6 `template<typename _Char, typename _Traits, typename _Alloc> bool std::locale::operator() (const basic_string<_Char, _Traits, _Alloc> & __s1, const basic_string<_Char, _Traits, _Alloc> & __s2) const`

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector `v` of strings could be sorted according to locale `loc` by doing:

```
std::sort(v.begin(), v.end(), loc);
```

Parameters

<code>__s1</code>	First string to compare.
<code>__s2</code>	Second string to compare.

Returns

True if `collate<_Char>` facet compares `__s1 < __s2`, else false.

Referenced by `operator!=()`.

4.613.4.7 `const locale& std::locale::operator= (const locale & __other) throw`

Assignment operator.

Set this locale to be a copy of *other*.

Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

Returns

A reference to this locale.

Referenced by `std::locale::facet::facet()`, and `std::locale::id::id()`.

4.613.4.8 bool std::locale::operator==(const locale & __other) const throw)

Locale equality.

Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

Returns

True if `other` and this refer to the same locale instance, are copies, or have the same name. False otherwise.

Referenced by `operator!=()`.

4.613.5 Member Data Documentation**4.613.5.1 const category std::locale::all [static]**

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 105 of file `locale_classes.h`.

4.613.5.2 const category std::locale::collate [static]

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 101 of file `locale_classes.h`.

4.613.5.3 `const category std::locale::ctype` `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 99 of file `locale_classes.h`.

4.613.5.4 `const category std::locale::messages` `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 104 of file `locale_classes.h`.

4.613.5.5 `const category std::locale::monetary` `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 103 of file `locale_classes.h`.

4.613.5.6 `const category std::locale::none` `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 98 of file `locale_classes.h`.

4.613.5.7 `const category std::locale::numeric` `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 100 of file `locale_classes.h`.

4.613.5.8 const category std::locale::time [static]

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 102 of file `locale_classes.h`.

4.614.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

Definition at line 338 of file `locale_classes.h`.

4.614.2 Constructor & Destructor Documentation

4.614.2.1 `std::locale::facet::facet (size_t __refs = 0) throw ()` `[inline]`, `[explicit]`, `[protected]`

Facet constructor.

This is the constructor provided by the standard. If `refs` is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

Parameters

<code>__refs</code>	The initial value for reference count.
---------------------	--

Definition at line 370 of file `locale_classes.h`.

References `std::locale::operator=()`.

Referenced by `std::__ctype_abstract_base< wchar_t >::narrow()`.

4.614.2.2 `virtual std::locale::facet::~~facet () [protected],[virtual]`

Facet destructor.

The documentation for this class was generated from the following file:

4.615.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member `locale::id`, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The `locale::id` ensures that each class type gets a unique identifier.

Definition at line 436 of file `locale_classes.h`.

4.615.2 Constructor & Destructor Documentation

4.615.2.1 `std::locale::id::id () [inline]`

Constructor.

Definition at line 467 of file `locale_classes.h`.

References `std::locale::operator=()`.

The documentation for this class was generated from the following file:

4.619.1 Detailed Description

```
template<typename _RealType = double>
class std::lognormal_distribution< _RealType >
```

A lognormal_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

Definition at line 2300 of file random.h.

4.619.2 Member Typedef Documentation

4.619.2.1 `template<typename _RealType = double> typedef _RealType std::lognormal_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 2303 of file random.h.

4.619.3 Member Function Documentation

4.619.3.1 `template<typename _RealType = double> result_type std::lognormal_distribution< _RealType >::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 2391 of file random.h.

References std::max().

4.619.3.2 `template<typename _RealType = double> result_type std::lognormal_distribution< _RealType >::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2384 of file random.h.

4.619.3.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::lognormal_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 2399 of file random.h.

4.619.3.4 `template<typename _RealType = double> param_type std::lognormal_distribution< _RealType >::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 2369 of file random.h.

4.619.3.5 `template<typename _RealType = double> void std::lognormal_distribution< _RealType >::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2377 of file random.h.

4.619.3.6 `template<typename _RealType = double> void std::lognormal_distribution<_RealType>::reset ()`
`[inline]`

Resets the distribution state.

Definition at line 2351 of file random.h.

4.619.4 Friends And Related Function Documentation

4.619.4.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits`
`> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::lognormal_distribution<_RealType1> & __x) [friend]`

Inserts a lognormal_distribution random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A lognormal_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.619.4.2 `template<typename _RealType = double> bool operator==(const lognormal_distribution<_RealType> & __d1,`
`const lognormal_distribution<_RealType> & __d2) [friend]`

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2436 of file random.h.

4.619.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename`
`_Traits> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is,`
`std::lognormal_distribution<_RealType1> & __x) [friend]`

Extracts a lognormal_distribution random number distribution `__x` from the input stream `__is`.

Parameters

<code>_↔ _is</code>	An input stream.
<code>_↔ _x</code>	A lognormal_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

`bool operator== (const map< _K1, _T1, _C1, _A1 > &, const map< _K1, _T1, _C1, _A1 > &)`

4.621.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >>
class std::map< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<pair<const _Key, _Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 96 of file `stl_map.h`.

4.621.2 Constructor & Destructor Documentation

```
4.621.2.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map ( ) [inline]
```

Default constructor creates no elements.

Definition at line 162 of file `stl_map.h`.

```
4.621.2.2 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map ( const _Compare &
__comp, const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Creates a map with no elements.

Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Definition at line 171 of file stl_map.h.

```
4.621.2.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( const map<
_Key, _Tp, _Compare, _Alloc> &__x ) [inline]
```

Map copy constructor.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The newly-created map uses a copy of the allocation object used by `__x`.

Definition at line 182 of file stl_map.h.

```
4.621.2.4 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( map<_Key, _Tp,
_Compare, _Alloc> &&__x ) [inline], [noexcept]
```

Map move constructor.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The newly-created map contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified map.

Definition at line 193 of file stl_map.h.

```
4.621.2.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map (
initializer_list<value_type> __l, const _Compare &__comp = _Compare(), const allocator_type &__a =
allocator_type() ) [inline]
```

Builds a map from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements in the `initializer_list` `__l`. This is linear in `N` if the range is already sorted, and `NlogN` otherwise (where `N` is `__l.size()`).

Definition at line 208 of file stl_map.h.

```
4.621.2.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( const
allocator_type & __a ) [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 216 of file stl_map.h.

```
4.621.2.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( const map<
_Key, _Tp, _Compare, _Alloc> & __m, const allocator_type & __a ) [inline]
```

Allocator-extended copy constructor.

Definition at line 220 of file stl_map.h.

```
4.621.2.8 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( map<_Key, _Tp,
_Compare, _Alloc> && __m, const allocator_type & __a ) [inline], [noexcept]
```

Allocator-extended move constructor.

Definition at line 224 of file stl_map.h.

```
4.621.2.9 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( initializer_list<
value_type> & __l, const allocator_type & __a ) [inline]
```

Allocator-extended initializer-list constructor.

Definition at line 230 of file stl_map.h.

```
4.621.2.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::map<_Key, _Tp,
_Compare, _Alloc>::map ( _InputIterator __first, _InputIterator __last, const allocator_type & __a ) [inline]
```

Allocator-extended range constructor.

Definition at line 236 of file stl_map.h.

```
4.621.2.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::map<_Key, _Tp,
_Compare, _Alloc>::map ( _InputIterator __first, _InputIterator __last ) [inline]
```

Builds a map from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

Definition at line 253 of file `stl_map.h`.

```
4.621.2.12  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::map< _Key, _Tp,
_Compare, _Alloc >::map ( _InputIterator __first, _InputIterator __last, const _Compare & __comp, const
allocator_type & __a = allocator_type() ) [inline]
```

Builds a map from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

Definition at line 270 of file `stl_map.h`.

4.621.3 Member Function Documentation

```
4.621.3.1  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::map< _Key, _Tp, _Compare, _Alloc >::at ( const
key_type & __k ) [inline]
```

Access to map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data whose key is equivalent to `__k`, if such a data is present in the map.

Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

Definition at line 536 of file stl_map.h.

References `std::map< _Key, _Tp, _Compare, _Alloc >::end()`, `std::map< _Key, _Tp, _Compare, _Alloc >::key_comp()`, and `std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound()`.

4.621.3.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin ()`
`[inline], [noexcept]`

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 355 of file stl_map.h.

4.621.3.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin ()`
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 364 of file stl_map.h.

4.621.3.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cbegin ()`
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 428 of file stl_map.h.

4.621.3.5 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cend ()`
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 437 of file stl_map.h.

4.621.3.6 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> void std::map<_Key, _Tp, _Compare, _Alloc >::clear ()
[inline], [noexcept]`

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 826 of file `stl_map.h`.

Referenced by `std::map<_Key, _Tp, _Compare, _Alloc >::operator=()`.

4.621.3.7 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> size_type std::map<_Key, _Tp, _Compare, _Alloc >::count (const
key_type & __x) const [inline]`

Finds the number of elements with given key.

Parameters

<code>_↔</code>	Key of (key, value) pairs to be located.
<code>_X</code>	

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 886 of file stl_map.h.

```
4.621.3.8 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc
>::crbegin( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 446 of file stl_map.h.

```
4.621.3.9 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc
>::crend( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 455 of file stl_map.h.

```
4.621.3.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> std::pair<iterator, bool>
std::map<_Key, _Tp, _Compare, _Alloc>::emplace( _Args &&... _args ) [inline]
```

Attempts to build and insert a std::pair into the map.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 575 of file `stl_map.h`.

```
4.621.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator std::map<_Key, _Tp,
_Compare, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the map.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 605 of file `stl_map.h`.

```
4.621.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> bool std::map<_Key, _Tp, _Compare, _Alloc >::empty ( ) const
[inline], [noexcept]
```

Returns true if the map is empty. (Thus `begin()` would equal `end()`.)

Definition at line 464 of file `stl_map.h`.

```
4.621.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc >::end ( )
[inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 373 of file `stl_map.h`.

Referenced by `std::map<_Key, _Tp, _Compare, _Alloc >::at()`, and `std::map<_Key, _Tp, _Compare, _Alloc >::operator[]()`.

```
4.621.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::end ( )
const [inline],[noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 382 of file stl_map.h.

```
4.621.3.15 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::map<_Key, _Tp, _Compare,
_Alloc>::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 955 of file stl_map.h.

```
4.621.3.16 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<const_iterator, const_iterator> std::map<_Key, _Tp,
_Compare, _Alloc>::equal_range ( const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 974 of file stl_map.h.

References std::operator==().

```
4.621.3.17 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc>::erase (
const_iterator __position ) [inline]
```

Erases an element from a map.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 725 of file stl_map.h.

Referenced by std::map<_Key, _Tp, _Compare, _Alloc>::erase().

```
4.621.3.18 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map<_Key, _Tp, _Compare, _Alloc>::erase ( const
key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>_↔</code>	Key of element to be erased.
<code>_X</code>	

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 761 of file `stl_map.h`.

```
4.621.3.19 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
const_iterator __first, const_iterator __last ) [inline]
```

Erases a `[first,last)` range of elements from a map.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 781 of file `stl_map.h`.

References `std::map< _Key, _Tp, _Compare, _Alloc >::erase()`.

```
4.621.3.20 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::find ( const
key_type & __x ) [inline]
```

Tries to locate an element in a map.

Parameters

<code>_↔</code>	Key of (key, value) pair to be located.
<code>_X</code>	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 859 of file stl_map.h.

```
4.621.3.21 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::find (
const key_type & __x ) const [inline]
```

Tries to locate an element in a map.

Parameters

	Key of (key, value) pair to be located.
	

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 874 of file stl_map.h.

```
4.621.3.22 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::map<_Key, _Tp, _Compare, _Alloc>
>::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 345 of file stl_map.h.

```
4.621.3.23 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, bool> std::map<_Key, _Tp, _Compare, _Alloc>
>::insert ( const value_type & __x ) [inline]
```

Attempts to insert a std::pair into the map.

Parameters

	Pair to be inserted (see std::make_pair for easy creation of pairs).
	

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 629 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::insert(), std::map< _Key, _Tp, _Compare, _Alloc >::operator=(), and std::map< _Key, _Tp, _Compare, _Alloc >::operator[]().

```
4.621.3.24 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
std::initializer_list< value_type > __list ) [inline]
```

Attempts to insert a list of std::pairs into the map.

Parameters

<code>__list</code>	A std::initializer_list<value_type> of pairs to be inserted.
---------------------	--

Complexity similar to that of the range constructor.

Definition at line 650 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::insert().

```
4.621.3.25 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
const_iterator __position, const value_type & __x ) [inline]
```

Attempts to insert a std::pair into the map.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of __x (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 679 of file `stl_map.h`.

References `std::map<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.621.3.26  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> void std::map<_Key, _Tp,
            _Compare, _Alloc>::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

Template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 705 of file `stl_map.h`.

```
4.621.3.27  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> key_compare std::map<_Key, _Tp, _Compare, _Alloc>::key_comp (
            ) const [inline]
```

Returns the key comparison object out of which the map was constructed.

Definition at line 835 of file `stl_map.h`.

Referenced by `std::map<_Key, _Tp, _Compare, _Alloc>::at()`, and `std::map<_Key, _Tp, _Compare, _Alloc>::operator[]()`.

```
4.621.3.28  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc>::lower_bound (
            const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 901 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::at(), and std::map< _Key, _Tp, _Compare, _Alloc >::operator[]().

```
4.621.3.29 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare, _Alloc
>::lower_bound ( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 916 of file stl_map.h.

```
4.621.3.30 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size ( )
const [inline], [noexcept]
```

Returns the maximum size of the map.

Definition at line 474 of file stl_map.h.

```
4.621.3.31 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= ( const
map< _Key, _Tp, _Compare, _Alloc > & __x ) [inline]
```

Map assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 293 of file `stl_map.h`.

```
4.621.3.32 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
map<_Key, _Tp, _Compare, _Alloc> && __x ) [inline], [noexcept]
```

Map move assignment operator.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this map (without copying if the allocators compare equal or get moved on assignment). Afterwards `__x` is in a valid, but unspecified state.

Definition at line 309 of file `stl_map.h`.

References `std::map<_Key, _Tp, _Compare, _Alloc>::clear()`, and `std::map<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.621.3.33 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
initializer_list< value_type > __l ) [inline]
```

Map list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 335 of file `stl_map.h`.

References `std::map<_Key, _Tp, _Compare, _Alloc>::clear()`, and `std::map<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.621.3.34 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::map< _Key, _Tp, _Compare, _Alloc
>::operator[] ( const key_type & __k ) [inline]
```

Subscript ([]) access to map data.

Parameters

\longleftrightarrow _k	The key for which data should be retrieved.
-----------------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

Definition at line 491 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::end(), std::map< _Key, _Tp, _Compare, _Alloc >::insert(), std::map< _Key, _Tp, _Compare, _Alloc >::key_comp(), std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound(), and std::piecewise_construct.

```
4.621.3.35 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc
>::rbegin ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 391 of file stl_map.h.

```
4.621.3.36 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc
>::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 400 of file stl_map.h.

```
4.621.3.37 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend (
) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 409 of file stl_map.h.

```
4.621.3.38  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc
            >::rend ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 418 of file stl_map.h.

```
4.621.3.39  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =

            [inline], [noexcept]
```

Returns the size of the map.

Definition at line 469 of file stl_map.h.

```
4.621.3.40  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> void std::map<_Key, _Tp, _Compare, _Alloc >::swap ( map<
            _Key, _Tp, _Compare, _Alloc > &__x )    [inline], [noexcept]
```

Swaps data with another map.

Parameters

\leftarrow	A map of the same element and allocator types.
$_x$	

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 813 of file stl_map.h.

Referenced by `std::swap()`.

```
4.621.3.41  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> iterator std::map<_Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type &__x )    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

\leftarrow	Key of (key, value) pair to be located.
$_x$	

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 926 of file `stl_map.h`.

```
4.621.3.42 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::upper_bound ( const key_type & __x ) const    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 936 of file `stl_map.h`.

```
4.621.3.43 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> value_compare std::map<_Key, _Tp, _Compare, _Alloc>::value_comp ( ) const    [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

Definition at line 843 of file `stl_map.h`.

Friends

- class `valarray<_Tp>`

4.622.1 Detailed Description

```
template<class _Tp>
class std::mask_array<_Tp>
```

Reference to selected subset of an array.

A mask_array is a reference to the actual elements of an array specified by a bitmask in the form of an array of bool. The way to get a mask_array is to call operator[](valarray<bool>) on a valarray. The returned mask_array then permits carrying operations out on the referenced subset of elements in the original valarray.

For example, if a mask_array is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to array[1] and array[3] in the underlying array.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

10.4 Formatting

These functions perform formatted substitution of the matched character sequences into their target. The format specifiers and escape sequences accepted by these functions are determined by their `flags` parameter as documented above.

- `template<typename _Out_iter>`
`_Out_iter format (_Out_iter __out, const char_type * __fmt_first, const char_type * __fmt_last, match_flag_type`
`__flags=regex_constants::format_default) const`
- `template<typename _Out_iter, typename _St, typename _Sa>`
`_Out_iter format (_Out_iter __out, const basic_string< char_type, _St, _Sa > & __fmt, match_flag_type __`
`flags=regex_constants::format_default) const`
- `template<typename _St, typename _Sa>`
`basic_string< char_type, _St, _Sa > format (const basic_string< char_type, _St, _Sa > & __fmt, match_flag_`
`type __flags=regex_constants::format_default) const`
- `string_type format (const char_type * __fmt, match_flag_type __flags=regex_constants::format_default) const`

10.5 Allocator

- `allocator_type get_allocator () const`

10.6 Swap

- `void swap (match_results & __that)`

4.623.1 Detailed Description

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>
class std::match_results< _Bi_iter, _Alloc >
```

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the `sub_`↵
`match` member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked
sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match
then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters
[`first`, `second`) which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of
the sequence that was searched.

Definition at line 38 of file `regex.h`.

4.623.2 Constructor & Destructor Documentation

4.623.2.1 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::match_results (const _Alloc & __a = _Alloc()) [inline], [explicit]`

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

Definition at line 1592 of file regex.h.

4.623.2.2 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::match_results (const match_results<_Bi_iter, _Alloc> & __rhs) [default]`

Copy constructs a match_results.

4.623.2.3 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::match_results (match_results<_Bi_iter, _Alloc> && __rhs) [default], [noexcept]`

Move constructs a match_results.

4.623.2.4 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::~~match_results () [inline]`

Destroys a match_results object.

Definition at line 1621 of file regex.h.

4.623.3 Member Function Documentation

4.623.3.1 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_iterator std::match_results<_Bi_iter, _Alloc>::begin () const [inline]`

Gets an iterator to the start of the sub_match collection.

Definition at line 1778 of file regex.h.

Referenced by std::operator==().

4.623.3.2 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_iterator std::match_results<_Bi_iter, _Alloc>::cbegin () const [inline]`

Gets an iterator to the start of the sub_match collection.

Definition at line 1785 of file regex.h.

4.623.3.3 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_iterator std::match_results<_Bi_iter, _Alloc>::cend () const [inline]`

Gets an iterator to one-past-the-end of the collection.

Definition at line 1799 of file regex.h.

4.623.3.4 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> bool std::match_results<_Bi_iter, _Alloc>::empty () const [inline]`

Indicates if the match_results contains no results.

Return values

<i>true</i>	The match_results object is empty.
<i>false</i>	The match_results object is not empty.

Definition at line 1665 of file regex.h.

Referenced by std::operator==().

4.623.3.5 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_iterator
std::match_results<_Bi_iter, _Alloc>::end() const [inline]`

Gets an iterator to one-past-the-end of the collection.

Definition at line 1792 of file regex.h.

Referenced by std::operator==().

4.623.3.6 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> template<typename _Out_iter >
_Out_iter std::match_results<_Bi_iter, _Alloc>::format(_Out_iter __out, const char_type * __fmt_first, const
char_type * __fmt_last, match_flag_type __flags = regex_constants::format_default) const`

Precondition

ready() == true

4.623.3.7 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> template<typename _Out_iter ,
typename _St , typename _Sa > _Out_iter std::match_results<_Bi_iter, _Alloc>::format(_Out_iter __out, const
basic_string<char_type, _St, _Sa> & __fmt, match_flag_type __flags = regex_constants::format_default)
const [inline]`

Precondition

ready() == true

Definition at line 1828 of file regex.h.

4.623.3.8 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> template<typename _St ,
typename _Sa > basic_string<char_type, _St, _Sa> std::match_results<_Bi_iter, _Alloc>::format(const
basic_string<char_type, _St, _Sa> & __fmt, match_flag_type __flags = regex_constants::format_default)
const [inline]`

Precondition

ready() == true

Definition at line 1840 of file regex.h.

```
4.623.3.9  template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> string_type
            std::match_results<_Bi_iter, _Alloc>::format ( const char_type * __fmt, match_flag_type __flags =
            regex_constants::format_default ) const    [inline]
```

Precondition

ready() == true

Definition at line 1852 of file regex.h.

```
4.623.3.10 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> allocator_type
            std::match_results<_Bi_iter, _Alloc>::get_allocator ( ) const    [inline]
```

Gets a copy of the allocator.

Definition at line 1874 of file regex.h.

```
4.623.3.11 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> difference_type
            std::match_results<_Bi_iter, _Alloc>::length ( size_type __sub = 0 ) const    [inline]
```

Gets the length of the indicated submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

ready() == true

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

Definition at line 1684 of file regex.h.

```
4.623.3.12 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> size_type
            std::match_results<_Bi_iter, _Alloc>::max_size ( ) const    [inline]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1656 of file regex.h.

```
4.623.3.13 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results&
std::match_results<_Bi_iter, _Alloc >::operator= ( const match_results<_Bi_iter, _Alloc > & __rhs )
[default]
```

Assigns rhs to *this.

```
4.623.3.14 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results&
std::match_results<_Bi_iter, _Alloc >::operator= ( match_results<_Bi_iter, _Alloc > && __rhs )
[default]
```

Move-assigns rhs to *this.

```
4.623.3.15 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference
std::match_results<_Bi_iter, _Alloc >::operator[] ( size_type __sub ) const [inline]
```

Gets a sub_match reference for the match or submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function gets a reference to the indicated submatch, or the entire match if `__sub` is zero.

If `__sub >= size()` then this function returns a sub_match with a special value indicating no submatch.

Definition at line 1732 of file regex.h.

```
4.623.3.16 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> difference_type
std::match_results<_Bi_iter, _Alloc >::position ( size_type __sub = 0 ) const [inline]
```

Gets the offset of the beginning of the indicated submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of `__sub` is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

Returns -1 if `__sub` is out of range.

Definition at line 1701 of file `regex.h`.

4.623.3.17 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_reference
std::match_results<_Bi_iter, _Alloc>::prefix () const [inline]`

Gets a `sub_match` representing the match prefix.

Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the start of the target range and the start of the match.

Definition at line 1749 of file `regex.h`.

Referenced by `std::operator==()`.

4.623.3.18 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> bool std::match_results<
_Bi_iter, _Alloc>::ready () const [inline]`

Indicates if the `match_results` is ready.

Return values

<i>true</i>	The object has a fully-established result state.
<i>false</i>	The object is not ready.

Definition at line 1632 of file `regex.h`.

Referenced by `std::operator==()`.

4.623.3.19 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> size_type
std::match_results<_Bi_iter, _Alloc>::size () const [inline]`

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1649 of file `regex.h`.

Referenced by `std::operator==()`.

```
4.623.3.20  template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> string_type  
            std::match_results<_Bi_iter, _Alloc>::str ( size_type __sub = 0 ) const  [inline]
```

Gets the match or submatch converted to a string type.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

Definition at line 1717 of file `regex.h`.

```
4.623.3.21  template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference
            std::match_results<_Bi_iter, _Alloc>::suffix ( ) const    [inline]
```

Gets a `sub_match` representing the match suffix.

Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the end of the match and the end of the target range.

Definition at line 1766 of file `regex.h`.

Referenced by `std::operator==()`.

```
4.623.3.22  template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> void std::match_results<
            _Bi_iter, _Alloc>::swap ( match_results<_Bi_iter, _Alloc> &__that )    [inline]
```

Swaps the contents of two `match_results`.

Definition at line 1888 of file `regex.h`.

Referenced by `std::swap()`.

4.628.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s,
        _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >
```

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined `mt19937` class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

Template Parameters

<code>__w</code>	Word size, the number of bits in each element of the state vector.
<code>__n</code>	The degree of recursion.
<code>__m</code>	The period parameter.
<code>__r</code>	The separation point bit index.
<code>__a</code>	The last row of the twist matrix.
<code>__u</code>	The first right-shift tempering matrix parameter.
<code>__d</code>	The first right-shift tempering matrix mask.
<code>__s</code>	The first left-shift tempering matrix parameter.
<code>__b</code>	The first left-shift tempering matrix mask.

Template Parameters

\leftarrow _t	The second left-shift tempering matrix parameter.
\leftarrow _c	The second left-shift tempering matrix mask.
\leftarrow _l	The second right-shift tempering matrix parameter.
\leftarrow _f	Initialization multiplier.

Definition at line 451 of file random.h.

4.628.2 Member Typedef Documentation

4.628.2.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::result_type`

The type of the generated random value.

Definition at line 454 of file random.h.

4.628.3 Constructor & Destructor Documentation

4.628.3.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _Sseq, typename = typename std::enable_if<!std::is_same< _Sseq, mersenne_twister_engine>::value> ::type> std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::mersenne_twister_engine (_Sseq & __q) [inline], [explicit]`

Constructs a mersenne_twister_engine random number generator engine seeded from the seed sequence __q.

Parameters

\leftarrow _q	the seed sequence.
--------------------	--------------------

Definition at line 515 of file random.h.

4.628.4 Member Function Documentation

4.628.4.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> void std::mersenne_twister_engine<_UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f>::discard (unsigned long long __z)`

Discard a sequence of random numbers.

4.628.4.2 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine<_UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f>::max () [inline], [static]`

Gets the largest possible value in the output range.

Definition at line 536 of file random.h.

4.628.4.3 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine<_UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f>::min () [inline], [static]`

Gets the smallest possible value in the output range.

Definition at line 529 of file random.h.

4.628.5 Friends And Related Function Documentation

4.628.5.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::mersenne_twister_engine<_UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1> & __x) [friend]`

Inserts the current state of a % mersenne_twister_engine random number generator engine __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

```

4.628.5.2 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType
    __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> bool operator== ( const
    mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs, const
    mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs )
    [friend]

```

Compares two % mersenne_twister_engine random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A % mersenne_twister_engine random number generator object.
<code>__rhs</code>	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 561 of file random.h.

```

4.628.5.3 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d,
    size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1 ,
    size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1,
    _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename
    _Traits > std::basic_istream< _CharT, _Traits>& operator>> ( std::basic_istream< _CharT, _Traits > & __is,
    std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1,
    __f1 > & __x ) [friend]

```

Extracts the current state of a % mersenne_twister_engine random number generator engine `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

Returns

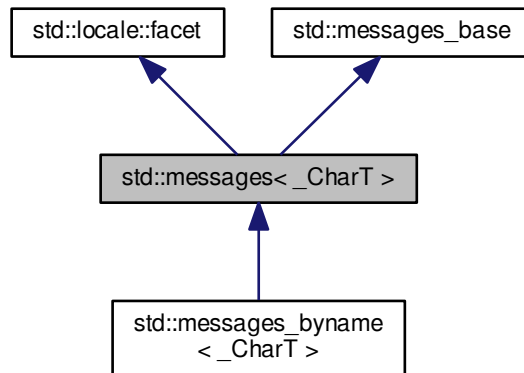

The input stream with the state of `__x` extracted or in an error state.

4.629.1 Detailed Description

```
template<typename _CharT>
class std::messages<_CharT>
```

Primary class template `messages`.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around `gettext`, provided by `libintl`. The second version (ieee) is a wrapper around `catgets`. The final version (default) does no actual translation. These implementations are only provided for `char` and `wchar_t` instantiations.

The `messages` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `messages` facet.

Definition at line 1695 of file `locale_facets_nonio.h`.

4.629.2 Member Typedef Documentation

4.629.2.1 template<typename _CharT> typedef _CharT std::messages<_CharT>::char_type

Public typedefs.

4.629.3 Constructor & Destructor Documentation

4.629.3.1 template<typename _CharT> std::messages<_CharT>::messages (size_t __refs = 0) [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 44 of file messages_members.h.

4.629.3.2 template<typename _CharT> std::messages<_CharT>::messages (__c_locale __cloc, const char * __s, size_t __refs = 0) [explicit]

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	Refcount to pass to the base class.

Definition at line 50 of file messages_members.h.

References std::basic_string<_CharT, _Traits, _Alloc>::c_str().

4.635.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::money_get<_CharT, _InIter>
```

Primary class template `money_get`.

This facet encapsulates the code to parse and return a monetary amount from a string.

The `money_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_get` facet.

Definition at line 1370 of file `locale_facets_nonio.h`.

4.635.2 Member Typedef Documentation

4.635.2.1 `template<typename _CharT, typename _InIter> typedef _CharT std::money_get< _CharT, _InIter >::char_type`

Public typedefs.

Definition at line 1376 of file locale_facets_nonio.h.

4.635.2.2 `template<typename _CharT, typename _InIter> typedef _InIter std::money_get< _CharT, _InIter >::iter_type`

Public typedefs.

Definition at line 1377 of file locale_facets_nonio.h.

4.635.2.3 `template<typename _CharT, typename _InIter> typedef basic_string<_CharT> std::money_get< _CharT, _InIter >::string_type`

Public typedefs.

Definition at line 1378 of file locale_facets_nonio.h.

4.635.3 Constructor & Destructor Documentation

4.635.3.1 `template<typename _CharT, typename _InIter> std::money_get< _CharT, _InIter >::money_get (size_t __refs = 0) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1392 of file locale_facets_nonio.h.

4.635.3.2 `template<typename _CharT, typename _InIter> virtual std::money_get< _CharT, _InIter >::~~money_get () [inline], [protected], [virtual]`

Destructor.

Definition at line 1460 of file locale_facets_nonio.h.

4.635.4 Member Function Documentation

4.635.4.1 `template<typename _CharT, typename _InIter> virtual iter_type std::money_get< _CharT, _InIter >::do_get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, long double & __units) const [protected], [virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

`get()` for details.

4.635.4.2 `template<typename _CharT, typename _InIter> virtual iter_type std::money_get< _CharT, _InIter >::do_get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, string_type & __digits) const [protected], [virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

`get()` for details.

4.635.4.3 `template<typename _CharT, typename _InIter> iter_type std::money_get< _CharT, _InIter >::get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, long double & __units) const [inline]`

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `units` as an integral value `moneypunct::frac_digits() * the actual amount`. For example, the string \$10.01 in a US locale would store 1001 in `units`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. `units` is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1422 of file locale_facets_nonio.h.

```
4.635.4.4 template<typename _CharT, typename _InIter> iter_type std::money_get< _CharT, _InIter >::get ( iter_type
    __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, string_type & __digits ) const
    [inline]
```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `money_punct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `digits`. For example, the string `$10.01` in a US locale would store `1001` in `digits`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of `do_get()`.

Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet<money_punct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1453 of file locale_facets_nonio.h.

4.635.5 Member Data Documentation

```
4.635.5.1 template<typename _CharT, typename _InIter> locale::id std::money_get< _CharT, _InIter >::id [static]
```

Numpunct facet id.

Definition at line 1382 of file locale_facets_nonio.h.

4.636.1 Detailed Description

```
template<typename _CharT, typename _Outlter>
class std::money_put<_CharT, _Outlter>
```

Primary class template money_put.

This facet encapsulates the code to format and output a monetary amount.

The money_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the money_put facet.

Definition at line 1521 of file locale_facets_nonio.h.

4.636.2 Member Typedef Documentation

Public typedefs.

Definition at line 1526 of file locale_facets_nonio.h.

4.636.2.2 `template<typename _CharT, typename _Outlter> typedef _Outlter std::money_put<_CharT, _Outlter>::iter_type`

Public typedefs.

Definition at line 1527 of file locale_facets_nonio.h.

4.636.2.3 `template<typename _CharT, typename _Outlter> typedef basic_string<_CharT> std::money_put<_CharT, _Outlter>::string_type`

Public typedefs.

Definition at line 1528 of file locale_facets_nonio.h.

4.636.3 Constructor & Destructor Documentation

4.636.3.1 `template<typename _CharT, typename _Outlter> std::money_put<_CharT, _Outlter>::money_put (size_t __refs = 0) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1542 of file `locale_facets_nonio.h`.

4.636.3.2 `template<typename _CharT, typename _OutIter> virtual std::money_put<_CharT, _OutIter>::~~money_put ()`
`[inline], [protected], [virtual]`

Destructor.

Definition at line 1592 of file `locale_facets_nonio.h`.

4.636.4 Member Function Documentation

4.636.4.1 `template<typename _CharT, typename _OutIter> virtual iter_type std::money_put<_CharT, _OutIter>::do_put (`
`iter_type __s, bool __intl, ios_base & __io, char_type __fill, long double __units) const` `[protected],`
`[virtual]`

Format and output a monetary value.

This function formats *units* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the value 1001 in a US locale would write \$10.01 to `__s`.

This function is a hook for derived classes to change the value returned.

See also

`put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator after writing.

4.636.4.2 `template<typename _CharT, typename _OutIter> virtual iter_type std::money_put<_CharT, _OutIter>::do_put`
`(iter_type __s, bool __intl, ios_base & __io, char_type __fill, const string_type & __digits) const`
`[protected], [virtual]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function is a hook for derived classes to change the value returned.

See also

`put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator after writing.

4.636.4.3 `template<typename _CharT, typename _OutIter> iter_type std::money_put<_CharT, _OutIter>::put (iter_type __s, bool __intl, ios_base & __io, char_type __fill, long double __units) const [inline]`

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to `__s`. For example, the value `1001` in a US locale would write `$10.01` to `__s`.

This function works by returning the result of `do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1562 of file `locale_facets_nonio.h`.

4.636.4.4 `template<typename _CharT, typename _Outiter> iter_type std::money_put<_CharT, _Outiter>::put (iter_type __s, bool __intl, ios_base & __io, char_type __fill, const string_type & __digits) const [inline]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function works by returning the result of `do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1585 of file `locale_facets_nonio.h`.

4.637.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct< _CharT, _Intl >
```

Primary class template moneypunct.

This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

Definition at line 934 of file `locale_facets_nonio.h`.

4.637.2 Member Typedef Documentation

4.637.2.1 template<typename _CharT, bool _Intl> typedef _CharT std::moneypunct<_CharT, _Intl>::char_type

Public typedefs.

Definition at line 940 of file locale_facets_nonio.h.

4.637.2.2 template<typename _CharT, bool _Intl> typedef basic_string<_CharT> std::moneypunct<_CharT, _Intl>::string_type

Public typedefs.

Definition at line 941 of file locale_facets_nonio.h.

4.637.3 Constructor & Destructor Documentation

4.637.3.1 template<typename _CharT, bool _Intl> std::moneypunct<_CharT, _Intl>::moneypunct (size_t __refs = 0)
[inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 963 of file locale_facets_nonio.h.

4.637.3.2 template<typename _CharT, bool _Intl> std::moneypunct<_CharT, _Intl>::moneypunct (__cache_type * __cache, size_t __refs = 0) [inline], [explicit]

Constructor performs initialization.

This is an internal constructor.

Parameters

<code>__cache</code>	Cache for optimization.
<code>__refs</code>	Passed to the base facet class.

Definition at line 976 of file locale_facets_nonio.h.

4.637.3.3 `template<typename _CharT, bool _Intl> std::moneypunct< _CharT, _Intl >::moneypunct (__c_locale __cloc, const char * __s, size_t __refs = 0) [inline], [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	Passed to the base facet class.

Definition at line 991 of file `locale_facets_nonio.h`.

4.637.3.4 `template<typename _CharT, bool _Intl> virtual std::moneypunct< _CharT, _Intl >::~~moneypunct () [protected], [virtual]`

Destructor.

Referenced by `std::moneypunct< _CharT, _Intl >::do_neg_format()`.

4.637.4 Member Function Documentation

4.637.4.1 `template<typename _CharT, bool _Intl> string_type std::moneypunct< _CharT, _Intl >::curr_symbol () const [inline]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. It does so by returning `moneypunct<char_↵_type>::do_curr_symbol()`.

Returns

string_type representing a currency symbol.

Definition at line 1061 of file `locale_facets_nonio.h`.

4.637.4.2 `template<typename _CharT, bool _Intl> char_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `moneypunct<char_↵type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

Definition at line 1005 of file `locale_facets_nonio.h`.

4.637.4.3 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_curr_symbol () const` `[inline], [protected], [virtual]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

`curr_symbol()` for details.

Returns

string_type representing a currency symbol.

Definition at line 1207 of file `locale_facets_nonio.h`.

4.637.4.4 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_decimal_point () const` `[inline], [protected], [virtual]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1169 of file `locale_facets_nonio.h`.

4.637.4.5 `template<typename _CharT, bool _Intl> virtual int std::moneypunct<_CharT, _Intl>::do_frac_digits () const` `[inline], [protected], [virtual]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

`frac_digits()` for details.

Returns

Number of digits in amount fraction.

Definition at line 1247 of file `locale_facets_nonio.h`.

4.637.4.6 `template<typename _CharT, bool _Intl> virtual string std::moneypunct<_CharT, _Intl>::do_grouping () const`
`[inline], [protected], [virtual]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

`grouping()` for details.

Returns

String representing grouping specification.

Definition at line 1194 of file `locale_facets_nonio.h`.

4.637.4.7 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_neg_format () const`
`[inline], [protected], [virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

`neg_format()` for details.

Returns

Pattern for money values.

Definition at line 1275 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::~~moneypunct()`.

4.637.4.8 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_negative_sign () const`
`[inline], [protected], [virtual]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

`negative_sign()` for details.

Returns

string_type representing a negative sign.

Definition at line 1233 of file `locale_facets_nonio.h`.

4.637.4.9 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_pos_format () const`
`[inline], [protected], [virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

`pos_format()` for details.

Returns

Pattern for money values.

Definition at line 1261 of file `locale_facets_nonio.h`.

4.637.4.10 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_positive_sign`
`() const [inline], [protected], [virtual]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

`positive_sign()` for details.

Returns

string_type representing a positive sign.

Definition at line 1220 of file `locale_facets_nonio.h`.

4.637.4.11 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_thousands_sep`
`() const [inline], [protected], [virtual]`

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1181 of file `locale_facets_nonio.h`.

4.637.4.12 `template<typename _CharT, bool _Intl> int std::moneypunct<_CharT, _Intl>::frac_digits () const`
`[inline]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `returning moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

Returns

Number of digits in amount fraction.

Definition at line 1111 of file `locale_facets_nonio.h`.

4.637.4.13 `template<typename _CharT, bool _Intl> string std::moneypunct<_CharT, _Intl>::grouping () const`
`[inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

Definition at line 1048 of file `locale_facets_nonio.h`.

4.637.4.14 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::neg_format () const`
`[inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `std::moneypunct<char_type>::do_pos_format()` or `std::moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1151 of file `locale_facets_nonio.h`.

4.637.4.15 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::negative_sign () const`
`[inline]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `std::moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1095 of file `locale_facets_nonio.h`.

4.637.4.16 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::pos_format () const`
`[inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

Returns

Pattern for money values.

Definition at line 1147 of file `locale_facets_nonio.h`.

4.637.4.17 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::positive_sign () const`
`[inline]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1078 of file `locale_facets_nonio.h`.

4.637.4.18 `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::thousands_sep () const`
`[inline]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1018 of file `locale_facets_nonio.h`.

```

class moneypunct_byname [22.2.6.4].

Definition at line 1324 of file locale_facets_nonio.h.

4.638.2 Member Function Documentation

4.638.2.1 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::curr_symbol () const`
`[inline], [inherited]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. It does so by returning `moneypunct<char↵_type>::do_curr_symbol()`.

Returns

string_type representing a currency symbol.

Definition at line 1061 of file locale_facets_nonio.h.

4.638.2.2 `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::decimal_point () const`
`[inline], [inherited]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `moneypunct<char↵_type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

Definition at line 1005 of file locale_facets_nonio.h.

```
4.638.2.3  template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_curr_symbol (
    ) const    [inline], [protected], [virtual], [inherited]
```

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

`curr_symbol()` for details.

Returns

string_type representing a currency symbol.

Definition at line 1207 of file `locale_facets_nonio.h`.

```
4.638.2.4  template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_decimal_point (
    ) const    [inline], [protected], [virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1169 of file `locale_facets_nonio.h`.

```
4.638.2.5  template<typename _CharT, bool _Intl> virtual int std::moneypunct<_CharT, _Intl>::do_frac_digits ( ) const
    [inline], [protected], [virtual], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

`frac_digits()` for details.

Returns

Number of digits in amount fraction.

Definition at line 1247 of file `locale_facets_nonio.h`.

4.638.2.6 `template<typename _CharT, bool _Intl> virtual string std::moneypunct<_CharT, _Intl>::do_grouping () const`
`[inline], [protected], [virtual], [inherited]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1194 of file locale_facets_nonio.h.

4.638.2.7 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_neg_format () const`
`[inline], [protected], [virtual], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

neg_format() for details.

Returns

Pattern for money values.

Definition at line 1275 of file locale_facets_nonio.h.

References std::moneypunct<_CharT, _Intl>::~~moneypunct().

4.638.2.8 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_negative_sign () const`
`[inline], [protected], [virtual], [inherited]`

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

negative_sign() for details.

Returns

string_type representing a negative sign.

Definition at line 1233 of file locale_facets_nonio.h.

4.638.2.9 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_pos_format () const`
`[inline], [protected], [virtual], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

`pos_format()` for details.

Returns

Pattern for money values.

Definition at line 1261 of file `locale_facets_nonio.h`.

4.638.2.10 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_positive_sign`
`() const [inline], [protected], [virtual], [inherited]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

`positive_sign()` for details.

Returns

string_type representing a positive sign.

Definition at line 1220 of file `locale_facets_nonio.h`.

4.638.2.11 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_thousands_sep`
`() const [inline], [protected], [virtual], [inherited]`

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1181 of file `locale_facets_nonio.h`.

```
4.638.2.12 template<typename _CharT, bool _Intl> int std::moneypunct<_CharT, _Intl >::frac_digits ( ) const  
[inline], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char_type>::do_frac_digits().

The fractional part of a money amount is optional. But if it is present, there must be frac_digits() digits.

Returns

Number of digits in amount fraction.

Definition at line 1111 of file locale_facets_nonio.h.

```
4.638.2.13 template<typename _CharT, bool _Intl> string std::moneypunct<_CharT, _Intl >::grouping ( ) const  
[inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns \003\002 and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling moneypunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1048 of file locale_facets_nonio.h.

4.638.2.14 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::neg_format () const`
`[inline], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1151 of file `locale_facets_nonio.h`.

4.638.2.15 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::negative_sign () const`
`[inline], [inherited]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1095 of file `locale_facets_nonio.h`.

4.638.2.16 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::pos_format () const`
`[inline], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

Returns

Pattern for money values.

Definition at line 1147 of file `locale_facets_nonio.h`.

4.638.2.17 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::positive_sign () const`
`[inline], [inherited]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1078 of file `locale_facets_nonio.h`.

4.638.2.18 `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::thousands_sep () const`
`[inline], [inherited]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1018 of file `locale_facets_nonio.h`.

4.639.1 Detailed Description

```
template<typename _Iterator>
class std::move_iterator<_Iterator>
```

Class template `move_iterator` is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

Definition at line 403 of file `cpp_type_traits.h`.

4.640.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>>
class std::multimap<_Key, _Tp, _Compare, _Alloc>
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>>.

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 95 of file stl_multimap.h.

4.640.2 Constructor & Destructor Documentation

4.640.2.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ()`
`[inline]`

Default constructor creates no elements.

Definition at line 160 of file stl_multimap.h.

4.640.2.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (const _Compare & __comp, const allocator_type & __a = allocator_type())` `[inline], [explicit]`

Creates a multimap with no elements.

Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Definition at line 169 of file stl_multimap.h.

4.640.2.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (const multimap<_Key, _Tp, _Compare, _Alloc> & __x)` `[inline]`

Multimap copy constructor.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The newly-created multimap uses a copy of the allocation object used by `__x`.

Definition at line 180 of file stl_multimap.h.

4.640.2.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (multimap<_Key, _Tp, _Compare, _Alloc> && __x)` `[inline], [noexcept]`

Multimap move constructor.

Parameters

<code>__l</code>	A multimap of identical element and allocator types.
<code>__x</code>	

The newly-created multimap contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified multimap.

Definition at line 191 of file `stl_multimap.h`.

```
4.640.2.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap
( initializer_list<value_type> &__l, const _Compare &__comp = _Compare(), const allocator_type &__a =
allocator_type() ) [inline]
```

Builds a multimap from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from the `initializer_list`. This is linear in N if the list is already sorted, and $N\log N$ otherwise (where N is `__l.size()`).

Definition at line 205 of file `stl_multimap.h`.

```
4.640.2.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ( const
allocator_type &__a ) [inline],[explicit]
```

Allocator-extended default constructor.

Definition at line 213 of file `stl_multimap.h`.

```
4.640.2.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ( const
multimap<_Key, _Tp, _Compare, _Alloc> &__m, const allocator_type &__a ) [inline]
```

Allocator-extended copy constructor.

Definition at line 217 of file `stl_multimap.h`.

```
4.640.2.8 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
multimap<_Key, _Tp, _Compare, _Alloc> &&__m, const allocator_type &__a ) [inline],[noexcept]
```

Allocator-extended move constructor.

Definition at line 221 of file `stl_multimap.h`.

```
4.640.2.9  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
initializer_list< value_type > __l, const allocator_type & __a ) [inline]
```

Allocator-extended initialier-list constructor.

Definition at line 227 of file stl_multimap.h.

```
4.640.2.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::multimap<_Key,
_Tp, _Compare, _Alloc >::multimap ( _InputIterator __first, _InputIterator __last, const allocator_type & __a )
[inline]
```

Allocator-extended range constructor.

Definition at line 233 of file stl_multimap.h.

```
4.640.2.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::multimap<_Key, _Tp,
_Compare, _Alloc >::multimap ( _InputIterator __first, _InputIterator __last ) [inline]
```

Builds a multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

Definition at line 249 of file stl_multimap.h.

```
4.640.2.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::multimap<_Key, _Tp,
_Compare, _Alloc >::multimap ( _InputIterator __first, _InputIterator __last, const _Compare & __comp, const
allocator_type & __a = allocator_type() ) [inline]
```

Builds a multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already

sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 265 of file stl_multimap.h.

4.640.3 Member Function Documentation

4.640.3.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::begin () [inline], [noexcept]`

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 350 of file stl_multimap.h.

4.640.3.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 359 of file stl_multimap.h.

4.640.3.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 423 of file stl_multimap.h.

4.640.3.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 432 of file stl_multimap.h.

4.640.3.5 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::multimap<_Key, _Tp, _Compare, _Alloc>::clear () [inline], [noexcept]`

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 736 of file stl_multimap.h.

Referenced by `std::multimap<_Key, _Tp, _Compare, _Alloc>::operator=()`.

4.640.3.6 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::count (const key_type & __x) const [inline]`

Finds the number of elements with given key.

Parameters

<code>_↔</code>	Key of (key, value) pairs to be located.
<code>_X</code>	

Returns

Number of elements with specified key.

Definition at line 793 of file `stl_multimap.h`.

```
4.640.3.7  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap< _Key, _Tp, _Compare,
            _Alloc >::crbegin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 441 of file `stl_multimap.h`.

```
4.640.3.8  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap< _Key, _Tp, _Compare,
            _Alloc >::crend ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 450 of file `stl_multimap.h`.

```
4.640.3.9  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::multimap< _Key, _Tp,
            _Compare, _Alloc >::emplace ( _Args &&... __args )    [inline]
```

Build and insert a `std::pair` into the multimap.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--

Returns

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 490 of file `stl_multimap.h`.

```
4.640.3.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator std::multimap<_Key, _Tp,
_Compare, _Alloc>::emplace_hint( const_iterator __pos, _Args&&... __args ) [inline]
```

Builds and inserts a std::pair into the multimap.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 517 of file stl_multimap.h.

```
4.640.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> bool std::multimap<_Key, _Tp, _Compare, _Alloc>::empty( )
const [inline], [noexcept]
```

Returns true if the multimap is empty.

Definition at line 457 of file stl_multimap.h.

```
4.640.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end( )
[inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 368 of file stl_multimap.h.

```
4.640.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end(
) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 377 of file stl_multimap.h.

```
4.640.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::multimap<_Key, _Tp, _Compare,
_Alloc>::equal_range( const key_type &__x ) [inline]
```

Finds a subsequence matching given key.

Parameters

$_↔$	Key of (key, value) pairs to be located.
$_X$	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 860 of file stl_multimap.h.

```
4.640.3.15 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator> std::multimap<_Key,
_Tp, _Compare, _Alloc>::equal_range ( const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

$_↔$	Key of (key, value) pairs to be located.
$_X$	

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 877 of file stl_multimap.h.

References std::operator==().

```
4.640.3.16 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::erase (
const_iterator __position ) [inline]
```

Erases an element from a multimap.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 631 of file `stl_multimap.h`.

Referenced by `std::multimap< _Key, _Tp, _Compare, _Alloc >::erase()`.

```
4.640.3.17  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

<code>__key</code>	Key of element to be erased.
--------------------	------------------------------

Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 667 of file `stl_multimap.h`.

```
4.640.3.18  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __first, const_iterator __last )  [inline]
```

Erases a `[first,last)` range of elements from a multimap.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased .

Returns

The iterator `__last`.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 688 of file `stl_multimap.h`.

References `std::multimap<_Key, _Tp, _Compare, _Alloc>::erase()`.

```
4.640.3.19 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::find ( const
key_type & __x ) [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 769 of file `stl_multimap.h`.

```
4.640.3.20 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::find (
const key_type & __x ) const [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 784 of file `stl_multimap.h`.

```
4.640.3.21 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::multimap<_Key, _Tp, _Compare, _Alloc
>::get_allocator( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 340 of file stl_multimap.h.

```
4.640.3.22 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::insert (
const value_type & __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	--

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 537 of file stl_multimap.h.

Referenced by std::multimap< _Key, _Tp, _Compare, _Alloc >::insert(), and std::multimap< _Key, _Tp, _Compare, _Alloc >::operator=().

```
4.640.3.23 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::insert (
const_iterator __position, const value_type & __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17>.↩
html

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 571 of file `stl_multimap.h`.

References `std::multimap<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.640.3.24  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =

            _Tp, _Compare, _Alloc>::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 598 of file `stl_multimap.h`.

```
4.640.3.25  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> void std::multimap<_Key, _Tp, _Compare, _Alloc>::insert (
            initializer_list<value_type> __l ) [inline]
```

Attempts to insert a list of `std::pairs` into the multimap.

Parameters

↩ _↩ ↩ _↩ /	A <code>std::initializer_list<value_type></code> of pairs to be inserted.
-------------------------	---

Complexity similar to that of the range constructor.

Definition at line 610 of file `stl_multimap.h`.

References `std::multimap<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.640.3.26 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> key_compare std::multimap< _Key, _Tp, _Compare, _Alloc
>::key_comp ( ) const [inline]
```

Returns the key comparison object out of which the multimap was constructed.

Definition at line 745 of file stl_multimap.h.

```
4.640.3.27 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::lower_bound ( const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
-------------------------	---

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 808 of file stl_multimap.h.

```
4.640.3.28 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::lower_bound ( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
-------------------------	---

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

Definition at line 823 of file stl_multimap.h.

```
4.640.3.29  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::max_size
            ( ) const    [inline], [noexcept]
```

Returns the maximum size of the multimap.

Definition at line 467 of file `stl_multimap.h`.

```
4.640.3.30  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc>
            >::operator= ( const multimap<_Key, _Tp, _Compare, _Alloc> &__x )    [inline]
```

Multimap assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 288 of file `stl_multimap.h`.

```
4.640.3.31  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc>
            >::operator= ( multimap<_Key, _Tp, _Compare, _Alloc> &&__x )    [inline], [noexcept]
```

Multimap move assignment operator.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this multimap (without copying if the allocators compare equal or get moved on assignment). Afterwards `__x` is in a valid, but unspecified state.

Definition at line 304 of file `stl_multimap.h`.

References `std::multimap<_Key, _Tp, _Compare, _Alloc>::clear()`, and `std::multimap<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.640.3.32  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc>
            >::operator= ( initializer_list<value_type> __l )    [inline]
```

Multimap list assignment operator.

Parameters

↩	An initializer_list.
_↩	
↩	
_↩	
/	

This function fills a multimap with copies of the elements in the initializer list __l.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 330 of file stl_multimap.h.

References std::multimap< _Key, _Tp, _Compare, _Alloc >::clear(), and std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

4.640.3.33 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 386 of file stl_multimap.h.

4.640.3.34 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 395 of file stl_multimap.h.

4.640.3.35 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 404 of file stl_multimap.h.

4.640.3.36 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 413 of file stl_multimap.h.

```
4.640.3.37  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare, _Alloc >::size ( )
            const [inline],[noexcept]
```

Returns the size of the multimap.

Definition at line 462 of file stl_multimap.h.

```
4.640.3.38  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> void std::multimap<_Key, _Tp, _Compare, _Alloc >::swap (
            multimap<_Key, _Tp, _Compare, _Alloc > &__x ) [inline],[noexcept]
```

Swaps data with another multimap.

Parameters

\leftrightarrow	A multimap of the same element and allocator types.
x	

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 723 of file stl_multimap.h.

Referenced by `std::swap()`.

```
4.640.3.39  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc
            >::upper_bound ( const key_type &__x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

\leftrightarrow	Key of (key, value) pair to be located.
x	

Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 833 of file stl_multimap.h.

```
4.640.3.40  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc
            >::upper_bound ( const key_type &__x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_↔</code>	Key of (key, value) pair to be located.
<code>_X</code>	

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 843 of file `stl_multimap.h`.

```
4.640.3.41 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> value_compare std::multimap<_Key, _Tp, _Compare, _Alloc
>::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

Definition at line 753 of file `stl_multimap.h`.

4.642.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::multiset< _Key, _Compare, _Alloc >
```

A standard container made up of elements, which can be retrieved in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multiset<Key>` the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 92 of file `stl_multiset.h`.

4.642.2 Constructor & Destructor Documentation

4.642.2.1 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
std::multiset< _Key, _Compare, _Alloc >::multiset () [inline]`

Default constructor creates no elements.

Definition at line 140 of file `stl_multiset.h`.

4.642.2.2 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
std::multiset< _Key, _Compare, _Alloc >::multiset (const _Compare & __comp, const allocator_type & __a =
allocator_type()) [inline], [explicit]`

Creates a multiset with no elements.

Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

Definition at line 149 of file `stl_multiset.h`.

4.642.2.3 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset (_InputIterator __first,
_InputIterator __last) [inline]`

Builds a multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 163 of file stl_multiset.h.

```
4.642.2.4  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > std::multiset<_Key, _Compare, _Alloc>::multiset ( _InputIterator __first,
            _InputIterator __last, const _Compare & __comp, const allocator_type & __a = allocator_type() )
            [inline]
```

Builds a multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 179 of file stl_multiset.h.

```
4.642.2.5  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::multiset<_Key, _Compare, _Alloc>::multiset ( const multiset<_Key, _Compare, _Alloc> & __x )
            [inline]
```

Multiset copy constructor.

Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The newly-created multiset uses a copy of the allocation object used by __x.

Definition at line 192 of file stl_multiset.h.

```
4.642.2.6  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::multiset<_Key, _Compare, _Alloc>::multiset ( multiset<_Key, _Compare, _Alloc> && __x ) [inline],
            [noexcept]
```

Multiset move constructor.

Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The newly-created multiset contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified multiset.

Definition at line 203 of file `stl_multiset.h`.

```
4.642.2.7 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    std::multiset< _Key, _Compare, _Alloc >::multiset ( initializer_list< value_type > __l, const _Compare & __comp =
        _Compare(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds a multiset from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in `N` if the list is already sorted, and `NlogN` otherwise (where `N` is `__l.size()`).

Definition at line 217 of file `stl_multiset.h`.

```
4.642.2.8 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    std::multiset< _Key, _Compare, _Alloc >::multiset ( const allocator_type & __a ) [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 225 of file `stl_multiset.h`.

```
4.642.2.9 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    std::multiset< _Key, _Compare, _Alloc >::multiset ( const multiset< _Key, _Compare, _Alloc > & __m, const
    allocator_type & __a ) [inline]
```

Allocator-extended copy constructor.

Definition at line 229 of file `stl_multiset.h`.

4.642.2.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    std::multiset< _Key, _Compare, _Alloc >::multiset ( multiset< _Key, _Compare, _Alloc > && __m, const
    allocator_type & __a ) [inline], [noexcept]
```

Allocator-extended move constructor.

Definition at line 233 of file `stl_multiset.h`.

```
4.642.2.11 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    std::multiset< _Key, _Compare, _Alloc >::multiset ( initializer_list< value_type > __l, const allocator_type & __a )
    [inline]
```

Allocator-extended initialier-list constructor.

Definition at line 239 of file `stl_multiset.h`.

4.642.2.12 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
 template<typename _InputIterator > std::multiset<_Key, _Compare, _Alloc>::multiset (_InputIterator __first,
 _InputIterator __last, const allocator_type & __a) [inline]`

Allocator-extended range constructor.

Definition at line 245 of file `stl_multiset.h`.

4.642.3 Member Function Documentation

4.642.3.1 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
 std::multiset<_Key, _Compare, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 330 of file `stl_multiset.h`.

4.642.3.2 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
 std::multiset<_Key, _Compare, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 367 of file `stl_multiset.h`.

4.642.3.3 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
 std::multiset<_Key, _Compare, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 376 of file `stl_multiset.h`.

4.642.3.4 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
 std::multiset<_Key, _Compare, _Alloc>::clear () [inline], [noexcept]`

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 654 of file `stl_multiset.h`.

Referenced by `std::multiset<_Key, _Compare, _Alloc>::operator=()`.

4.642.3.5 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
 size_type std::multiset<_Key, _Compare, _Alloc>::count (const key_type & __x) const [inline]`

Finds the number of elements with given key.

Parameters

<code>_↔</code>	Key of elements to be located.
<code>_X</code>	

Returns

Number of elements with specified key.

Definition at line 665 of file stl_multiset.h.

```
4.642.3.6 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::crbegin ( ) const [inline],[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 385 of file stl_multiset.h.

```
4.642.3.7 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::crend ( ) const [inline],[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 394 of file stl_multiset.h.

```
4.642.3.8 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args> iterator std::multiset<_Key, _Compare, _Alloc>::emplace ( _Args &&... _args )
[inline]
```

Builds and inserts an element into the multiset.

Parameters

<code>__args</code>	Arguments used to generate the element instance to be inserted.
---------------------	---

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 447 of file stl_multiset.h.

```
4.642.3.9  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
            template<typename... _Args> iterator std::multiset<_Key, _Compare, _Alloc>::emplace_hint( const_iterator __pos,
            _Args &&... __args ) [inline]
```

Builds and inserts an element into the multiset.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 473 of file `stl_multiset.h`.

```
4.642.3.10  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>> bool
            std::multiset<_Key, _Compare, _Alloc>::empty( ) const [inline], [noexcept]
```

Returns true if the set is empty.

Definition at line 400 of file `stl_multiset.h`.

```
4.642.3.11  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>> iterator
            std::multiset<_Key, _Compare, _Alloc>::end( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 339 of file `stl_multiset.h`.

```
4.642.3.12  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
            std::pair<iterator, iterator> std::multiset<_Key, _Compare, _Alloc>::equal_range( const key_type & __x )
            [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 745 of file stl_multiset.h.

```
4.642.3.13 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::pair<const_iterator, const_iterator> std::multiset<_Key, _Compare, _Alloc >::equal_range ( const key_type
            & __x ) const    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 749 of file stl_multiset.h.

```
4.642.3.14 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            _GLIBCXX_ABI_TAG_CXX11 iterator std::multiset<_Key, _Compare, _Alloc >::erase ( const_iterator __position )
            [inline]
```

Erases an element from a multiset.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 575 of file `stl_multiset.h`.

Referenced by `std::multiset<_Key, _Compare, _Alloc>::erase()`.

```
4.642.3.15  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            size_type std::multiset<_Key, _Compare, _Alloc>::erase ( const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 605 of file `stl_multiset.h`.

```
4.642.3.16  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            _GLIBCXX_ABI_TAG_CXX11 iterator std::multiset<_Key, _Compare, _Alloc>::erase ( const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a `[first,last)` range of elements from a multiset.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 627 of file stl_multiset.h.

References std::multiset< _Key, _Compare, _Alloc >::erase().

4.642.3.17 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset< _Key, _Compare, _Alloc >::find (const key_type & __x) [inline]`

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 683 of file stl_multiset.h.

4.642.3.18 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (const key_type & __x) const [inline]`

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 687 of file stl_multiset.h.

4.642.3.19 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]`

Returns the memory allocation object.

Definition at line 321 of file `stl_multiset.h`.

4.642.3.20 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset< _Key, _Compare, _Alloc >::insert (const value_type & __x) [inline]`

Inserts an element into the multiset.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 492 of file `stl_multiset.h`.

References `std::move()`.

Referenced by `std::multiset< _Key, _Compare, _Alloc >::insert()`, and `std::multiset< _Key, _Compare, _Alloc >::operator=()`.

4.642.3.21 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset< _Key, _Compare, _Alloc >::insert (const_iterator __position, const value_type & __x) [inline]`

Inserts an element into the multiset.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 522 of file stl_multiset.h.

References std::multiset< _Key, _Compare, _Alloc >::insert(), and std::move().

            template<typename _InputIterator > void std::multiset< _Key, _Compare, _Alloc >::insert ( _InputIterator __first,
            _InputIterator __last ) [inline]
```

A template function that tries to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 541 of file stl_multiset.h.

```
4.642.3.23 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
            std::multiset< _Key, _Compare, _Alloc >::insert ( initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the multiset.

Parameters

<code>←</code> <code>__l</code> <code>←</code> <code>←</code> <code>__l</code> <code>l</code>	A std::initializer_list<value_type> of elements to be inserted.
--	---

Complexity similar to that of the range constructor.

Definition at line 553 of file stl_multiset.h.

References std::multiset< _Key, _Compare, _Alloc >::insert().

```
4.642.3.24 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp ( ) const [inline]
```

Returns the comparison object.

Definition at line 313 of file stl_multiset.h.

4.642.3.25 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset<_Key, _Compare, _Alloc>::lower_bound (const key_type & __x) [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 704 of file `stl_multiset.h`.

4.642.3.26 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset<_Key, _Compare, _Alloc>::lower_bound (const key_type & __x) const [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 708 of file `stl_multiset.h`.

4.642.3.27 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset<_Key, _Compare, _Alloc>::max_size () const [inline], [noexcept]`

Returns the maximum size of the set.

Definition at line 410 of file `stl_multiset.h`.

4.642.3.28 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset& std::multiset<_Key, _Compare, _Alloc>::operator= (const multiset<_Key, _Compare, _Alloc> & __x
) [inline]`

Multiset assignment operator.

Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 259 of file `stl_multiset.h`.

```
4.642.3.29 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= ( multiset< _Key, _Compare, _Alloc > && __x )
[inline], [noexcept]
```

Multiset move assignment operator.

Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this multiset (without copying if the allocators compare equal or get moved on assignment). Afterwards `__x` is in a valid, but unspecified state.

Definition at line 275 of file `stl_multiset.h`.

References `std::multiset< _Key, _Compare, _Alloc >::clear()`, and `std::multiset< _Key, _Compare, _Alloc >::insert()`.

```
4.642.3.30 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= ( initializer_list< value_type > __l ) [inline]
```

Multiset list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 301 of file `stl_multiset.h`.

References `std::multiset< _Key, _Compare, _Alloc >::clear()`, and `std::multiset< _Key, _Compare, _Alloc >::insert()`.

```
4.642.3.31  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            reverse_iterator std::multiset<_Key, _Compare, _Alloc>::rbegin( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 348 of file stl_multiset.h.

```
4.642.3.32  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            reverse_iterator std::multiset<_Key, _Compare, _Alloc>::rend( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 357 of file stl_multiset.h.

```
4.642.3.33  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            size_type std::multiset<_Key, _Compare, _Alloc>::size( ) const  [inline], [noexcept]
```

Returns the size of the set.

Definition at line 405 of file stl_multiset.h.

```
4.642.3.34  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
            std::multiset<_Key, _Compare, _Alloc>::swap( multiset<_Key, _Compare, _Alloc> & __x ) [inline],
            [noexcept]
```

Swaps data with another multiset.

Parameters

<code>__x</code>	A multiset of the same element and allocator types.
------------------	---

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 425 of file stl_multiset.h.

Referenced by `std::swap()`.

```
4.642.3.35  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::multiset<_Key, _Compare, _Alloc>::upper_bound( const key_type & __x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

$_x$	Key to be located.
-------	--------------------

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 720 of file stl_multiset.h.

```
4.642.3.36 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset<_Key, _Compare, _Alloc>::upper_bound ( const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

$_x$	Key to be located.
-------	--------------------

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 724 of file stl_multiset.h.

```
4.642.3.37 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::multiset<_Key, _Compare, _Alloc>::value_comp ( ) const [inline]
```

Returns the comparison object.

Definition at line 317 of file stl_multiset.h.

4.644.1 Detailed Description

```
template<typename _IntType = int>
class std::negative_binomial_distribution< _IntType >
```

A negative_binomial_distribution random number distribution.

The formula for the negative binomial probability mass function is $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.

Definition at line 4210 of file random.h.

4.644.2 Member Typedef Documentation

4.644.2.1 `template<typename _IntType = int> typedef _IntType std::negative_binomial_distribution< _IntType >::result_type`

The type of the range of the distribution.

Definition at line 4213 of file random.h.

4.644.3 Member Function Documentation

4.644.3.1 `template<typename _IntType = int> _IntType std::negative_binomial_distribution< _IntType >::k () const`
`[inline]`

Return the k parameter of the distribution.

Definition at line 4268 of file random.h.

4.644.3.2 `template<typename _IntType = int> result_type std::negative_binomial_distribution< _IntType >::max ()`
`const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4304 of file random.h.

References `std::max()`.

4.644.3.3 `template<typename _IntType = int> result_type std::negative_binomial_distribution<_IntType>::min ()
const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4297 of file random.h.

4.644.3.4 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator> result_type
std::negative_binomial_distribution<_IntType>::operator() (_UniformRandomNumberGenerator & __urng)`

Generating functions.

4.644.3.5 `template<typename _IntType = int> double std::negative_binomial_distribution<_IntType>::p () const
[inline]`

Return the p parameter of the distribution.

Definition at line 4275 of file random.h.

4.644.3.6 `template<typename _IntType = int> param_type std::negative_binomial_distribution<_IntType>::param ()
const [inline]`

Returns the parameter set of the distribution.

Definition at line 4282 of file random.h.

4.644.3.7 `template<typename _IntType = int> void std::negative_binomial_distribution<_IntType>::param (const
param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4290 of file random.h.

4.644.3.8 `template<typename _IntType = int> void std::negative_binomial_distribution<_IntType>::reset ()
[inline]`

Resets the distribution state.

Definition at line 4261 of file random.h.

4.644.4 Friends And Related Function Documentation

```
4.644.4.1  template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits >
            std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits > &__os, const
            std::negative_binomial_distribution<_IntType1 > &__x ) [friend]
```

Inserts a `negative_binomial_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

```
4.644.4.2  template<typename _IntType = int> bool operator==( const negative_binomial_distribution<_IntType > &__d1,
                  const negative_binomial_distribution<_IntType > &__d2 ) [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4353 of file `random.h`.

```
4.644.4.3  template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits
            > std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits > &__is,
            std::negative_binomial_distribution<_IntType1 > &__x ) [friend]
```

Extracts a `negative_binomial_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.647.1 Detailed Description

```
template<typename _RealType = double>
class std::normal_distribution<_RealType>
```

A normal continuous distribution for random numbers.

The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

Definition at line 2087 of file random.h.

4.647.2 Member Typedef Documentation

`[inline]`

Returns the parameter set of the distribution.

Definition at line 2167 of file random.h.

4.647.4.6 `template<typename _RealType = double> void std::normal_distribution<_RealType>::param (const`
`param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2175 of file random.h.

4.647.4.7 `template<typename _RealType = double> void std::normal_distribution<_RealType>::reset () [inline]`

Resets the distribution state.

Definition at line 2146 of file random.h.

4.647.4.8 `template<typename _RealType = double> _RealType std::normal_distribution<_RealType>::stddev () const`
`[inline]`

Returns the standard deviation of the distribution.

Definition at line 2160 of file random.h.

4.647.5 Friends And Related Function Documentation

4.647.5.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits>
> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const
std::normal_distribution<_RealType1> & __x) [friend]`

Inserts a `normal_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>normal_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.647.5.2 `template<typename _RealType = double> template<typename _RealType1 > bool operator==(const
std::normal_distribution< _RealType1 > & __d1, const std::normal_distribution< _RealType1 > & __d2)
[friend]`

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

4.647.5.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename
_Traits > std::basic_istream< _CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & __is,
std::normal_distribution< _RealType1 > & __x) [friend]`

Extracts a `normal_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>normal_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.650.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::num_get< _CharT, _InIter >
```

Primary class template `num_get`.

This facet encapsulates the code to parse and return a number from a string. It is used by the `istream` numeric extraction operators.

The `num_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `num_get` facet.

Definition at line 1915 of file `locale_facets.h`.

4.650.2 Member Typedef Documentation

4.650.2.1 `template<typename _CharT, typename _InIter> typedef _CharT std::num_get< _CharT, _InIter >::char_type`

Public typedefs.

Definition at line 1921 of file `locale_facets.h`.

4.650.2.2 `template<typename _CharT, typename _InIter > typedef _InIter std::num_get<_CharT, _InIter >::iter_type`

Public typedefs.

4.650.3 Constructor & Destructor Documentation

4.650.3.1 `template<typename _CharT, typename _InIter > std::num_get<_CharT, _InIter >::num_get (size_t __refs = 0)`
`[inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1936 of file locale_facets.h.

4.650.3.2 `template<typename _CharT, typename _InIter > virtual std::num_get<_CharT, _InIter >::~~num_get ()`
`[inline], [protected], [virtual]`

Destructor.

Definition at line 2108 of file locale_facets.h.

4.650.4 Member Function Documentation

4.650.4.1 `template<typename _CharT, typename _InIter > virtual iter_type std::num_get<_CharT, _InIter >::do_get (`
`iter_type, iter_type, ios_base &, ios_base::iostate &, bool &) const` `[protected], [virtual]`

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

```
4.650.4.2  template<typename _CharT, typename _InIter > virtual iter_type std::num_get<_CharT, _InIter >::do_get (
            iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, long & __v ) const    [inline],
            [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2176 of file `locale_facets.h`.

```
4.650.4.3  template<typename _CharT, typename _InIter > virtual iter_type std::num_get<_CharT, _InIter >::do_get (
            iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned short & __v ) const
            [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2181 of file locale_facets.h.

```
4.650.4.4 template<typename _CharT, typename _InIter > virtual iter_type std::num_get<_CharT, _InIter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned int & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2186 of file locale_facets.h.

```
4.650.4.5 template<typename _CharT, typename _InIter > virtual iter_type std::num_get<_CharT, _InIter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2191 of file locale_facets.h.

```
4.650.4.6  template<typename _CharT, typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (

<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

```
4.650.4.11  template<typename _CharT, typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type, iter_type, ios_base &, ios_base::iostate &, void *& ) const  [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

4.650.4.12 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, bool & __v) const [inline]`

Numeric parsing.

Parses the input stream into the bool *v*. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Sets *v* to true or false if successful. Sets *err* to `ios_base::failbit` if reading the string fails. Sets *err* to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets *v* to true, if the value is 0, sets *v* to false, and otherwise set *err* to `ios_base::failbit`.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 1962 of file `locale_facets.h`.

4.650.4.13 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, long & __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 1999 of file `locale_facets.h`.

```
4.650.4.14  template<typename _CharT, typename _InIter > iter_type std::num_get< _CharT, _InIter >::get ( iter_type __in,
            iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned short & __v ) const  [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2004 of file `locale_facets.h`.

4.650.4.15 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned int & __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2025 of file `locale_facets.h`.

4.650.4.19 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get (iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, float & __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf` `g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2059 of file `locale_facets.h`.

```
4.650.4.20 template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in,
iter_type __end, ios_base & __io, ios_base::iostate & __err, double & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2064 of file `locale_facets.h`.

```
4.650.4.21 template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in,
iter_type __end, ios_base & __io, ios_base::iostate & __err, long double & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2069 of file locale_facets.h.

```
4.650.4.22 template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in,
iter_type __end, ios_base & __io, ios_base::iostate & __err, void *& __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf p specifier.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

4.651.1 Detailed Description

```
template<typename _CharT, typename _Outiter>
class std::num_put< _CharT, _Outiter >
```

Primary class template num_put.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.

The num_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_put facet.

4.651.4 Member Function Documentation

4.651.4.1 `template<typename _CharT, typename _Outiter> virtual iter_type std::num_put<_CharT, _Outiter>::do_put (`
`iter_type __s, ios_base & __io, char_type __fill, bool __v) const` `[protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

4.651.4.2 `template<typename _CharT, typename _Outiter> virtual iter_type std::num_put<_CharT, _Outiter>::do_put`
`(iter_type __s, ios_base & __io, char_type __fill, long __v) const` `[inline], [protected],`
`[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2474 of file locale_facets.h.

```
4.651.4.3  template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put (
            iter_type __s, ios_base & __io, char_type __fill, unsigned long __v ) const    [inline], [protected],
            [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2478 of file locale_facets.h.

```
4.651.4.4  template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put
            ( iter_type __s, ios_base & __io, char_type __fill, long long __v ) const    [inline], [protected],
            [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2484 of file locale_facets.h.

```
4.651.4.5 template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put (
    iter_type __s, ios_base & __io, char_type __fill, unsigned long long __v ) const    [inline], [protected],
    [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2489 of file locale_facets.h.

```
4.651.4.6 template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put (
    iter_type, ios_base &, char_type, double ) const    [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

4.651.4.7 `template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put (iter_type, ios_base &, char_type, long double) const` `[protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>_↔ _s</code>	Stream to write to.
<code>_↔ _io</code>	Source of locale and flags.
<code>_↔ _fill</code>	Char_type to use for filling.
<code>_↔ _v</code>	Value to format and insert.

Returns

Iterator after writing.

4.651.4.8 `template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put (iter_type, ios_base &, char_type, const void *) const` `[protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>_↔ _s</code>	Stream to write to.
<code>_↔ _io</code>	Source of locale and flags.
<code>_↔ _fill</code>	Char_type to use for filling.
<code>_↔ _v</code>	Value to format and insert.

Returns

Iterator after writing.

4.651.4.9 `template<typename _CharT, typename _Outlter > iter_type std::num_put<_CharT, _Outlter >::put (iter_type __s, ios_base & __io, char_type __fill, bool __v) const [inline]`

Numeric formatting.

Formats the boolean *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

If `ios_base::boolalpha` is set, writes `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Otherwise formats *v* as an int.

Parameters

<code>↔ __s</code>	Stream to write to.
<code>↔ __io</code>	Source of locale and flags.
<code>↔ __fill</code>	Char_type to use for filling.
<code>↔ __v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2293 of file `locale_facets.h`.

4.651.4.10 `template<typename _CharT, typename _Outlter > iter_type std::num_put<_CharT, _Outlter >::put (iter_type __s, ios_base & __io, char_type __fill, long __v) const [inline]`

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2335 of file locale_facets.h.

```
4.651.4.11 template<typename _CharT, typename _Outiter > iter_type std::num_put<_CharT, _Outiter >::put ( iter_type
__s, ios_base & __io, char_type __fill, unsigned long __v ) const [inline]
```

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `+` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `+` or `-` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2339 of file locale_facets.h.

```
4.651.4.12 template<typename _CharT, typename _Outiter > iter_type std::num_put<_CharT, _Outiter >::put ( iter_type
    __s, ios_base & __io, char_type __fill, long long __v ) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2345 of file locale_facets.h.

```
4.651.4.13 template<typename _CharT, typename _Outiter > iter_type std::num_put<_CharT, _Outiter >::put ( iter_type
    __s, ios_base & __io, char_type __fill, unsigned long long __v ) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2349 of file `locale_facets.h`.

```
4.651.4.14 template<typename _CharT, typename _OutIter> iter_type std::num_put<_CharT, _OutIter>::put ( iter_type
    __s, ios_base & __io, char_type __fill, double __v ) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both `fixed` and `scientific` are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `numpunct::decimal_point()`. Thousands separators are inserted according to `numpunct::grouping()` and `numpunct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2398 of file `locale_facets.h`.

4.651.4.15 `template<typename _CharT, typename _OutIter> iter_type std::num_put<_CharT, _OutIter>::put (iter_type __s, ios_base & __io, char_type __fill, long double __v) const [inline]`

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags() & ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the printf *f* specifier. Else if equal to `ios_base::scientific`, formats like *e* or *E* with `ios_base::uppercase` unset or set respectively. Otherwise, formats like *g* or *G* depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like *g* or *G*.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `numpunct::decimal_point()`. Thousands separators are inserted according to `numpunct::grouping()` and `numpunct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2402 of file locale_facets.h.

```
4.651.4.16 template<typename _CharT, typename _Outiter > iter_type std::num_put<_CharT, _Outiter >::put ( iter_type
__s, ios_base & __io, char_type __fill, const void *__v ) const [inline]
```

Numeric formatting.

Formats the pointer value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

This function formats *v* as an unsigned long with `ios_base::hex` and `ios_base::showbase` set.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

4.652.1 Detailed Description

```
template<typename _CharT>
class std::numpunct<_CharT>
```

Primary class template `numpunct`.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The `numpunct` facet is used by streams for many I/O operations involving numbers.

The `numpunct` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a `numpunct` facet.

Definition at line 1641 of file `locale_facets.h`.

4.652.3 Constructor & Destructor Documentation

4.652.3.1 template<typename _CharT> std::numpunct<_CharT>::numpunct (size_t __refs = 0) [inline],
[explicit]

Numpunct constructor.

Parameters

<code>__refs</code>	Refcount to pass to the base class.
---------------------	-------------------------------------

Definition at line 1665 of file locale_facets.h.

4.652.3.2 template<typename _CharT> std::numpunct<_CharT>::numpunct (__cache_type * __cache, size_t __refs = 0) [inline], [explicit]

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

Parameters

<code>__cache</code>	<code>__numpunct_cache</code> object.
<code>__refs</code>	Refcount to pass to the base class.

Definition at line 1679 of file locale_facets.h.

4.652.3.3 template<typename _CharT> std::numpunct<_CharT>::numpunct (__c_locale __cloc, size_t __refs = 0) [inline], [explicit]

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	Refcount to pass to the base class.

Definition at line 1693 of file `locale_facets.h`.

4.652.3.4 `template<typename _CharT> virtual std::numpunct<_CharT>::~~numpunct ()` `[protected]`,
`[virtual]`

Destructor.

Referenced by `std::numpunct<_CharT>::do_falsename()`.

4.652.4 Member Function Documentation

4.652.4.1 `template<typename _CharT> char_type std::numpunct<_CharT>::decimal_point () const` `[inline]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

Definition at line 1707 of file `locale_facets.h`.

4.652.4.2 `template<typename _CharT> virtual char_type std::numpunct<_CharT>::do_decimal_point () const`
`[inline]`, `[protected]`, `[virtual]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1794 of file `locale_facets.h`.

4.652.4.3 `template<typename _CharT> virtual string_type std::num_punct<_CharT>::do_falsename () const`
[inline], [protected], [virtual]

Return string representation of bool false.

Returns a `string_type` containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

`string_type` representing printed form of false.

Definition at line 1845 of file `locale_facets.h`.

References `std::num_punct<_CharT>::~~num_punct()`.

4.652.4.4 `template<typename _CharT> virtual string std::num_punct<_CharT>::do_grouping () const` [inline],
[protected], [virtual]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

`grouping()` for details.

Returns

String representing grouping specification.

Definition at line 1819 of file `locale_facets.h`.

4.652.4.5 `template<typename _CharT> virtual char_type std::num_punct<_CharT>::do_thousands_sep () const`
[inline], [protected], [virtual]

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

`char_type` representing a thousands separator.

Definition at line 1806 of file `locale_facets.h`.

4.652.4.6 `template<typename _CharT > virtual string_type std::num_punct<_CharT>::do_truename () const`
`[inline], [protected], [virtual]`

Return string representation of bool true.

Returns a `string_type` containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

`string_type` representing printed form of true.

Definition at line 1832 of file `locale_facets.h`.

4.652.4.7 `template<typename _CharT > string_type std::num_punct<_CharT>::falsename () const` `[inline]`

Return string representation of bool false.

This function returns a `string_type` containing the text representation for false bool variables. It does so by calling `num_punct<char_type>::do_falsename()`.

Returns

`string_type` representing printed form of false.

Definition at line 1777 of file `locale_facets.h`.

4.652.4.8 `template<typename _CharT > string std::num_punct<_CharT>::grouping () const` `[inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `"\003\002"` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `"32"`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `num_punct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

Definition at line 1751 of file `locale_facets.h`.

4.652.4.9 `template<typename _CharT> char_type std::numpunct<_CharT>::thousands_sep() const [inline]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `numpunct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1720 of file `locale_facets.h`.

4.652.4.10 `template<typename _CharT> string_type std::numpunct<_CharT>::truename() const [inline]`

Return string representation of bool true.

This function returns a `string_type` containing the text representation for true bool variables. It does so by calling `numpunct<char_type>::do_truename()`.

Returns

`string_type` representing printed form of true.

Definition at line 1764 of file `locale_facets.h`.

4.652.5 Member Data Documentation

4.652.5.1 `template<typename _CharT> locale::id std::numpunct<_CharT>::id [static]`

Numpunct facet id.

`[protected], [virtual], [inherited]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

`grouping()` for details.

Returns

String representing grouping specification.

Definition at line 1819 of file `locale_facets.h`.

4.653.2.5 `template<typename _CharT> virtual char_type std::num_punct<_CharT>::do_thousands_sep () const`
[inline], [protected], [virtual], [inherited]

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1806 of file `locale_facets.h`.

4.653.2.6 `template<typename _CharT> virtual string_type std::num_punct<_CharT>::do_truename () const`
[inline], [protected], [virtual], [inherited]

Return string representation of bool true.

Returns a `string_type` containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

`string_type` representing printed form of true.

Definition at line 1832 of file `locale_facets.h`.

4.653.2.7 `template<typename _CharT> string_type std::num_punct<_CharT>::falsename () const` [inline],
[inherited]

Return string representation of bool false.

This function returns a `string_type` containing the text representation for false bool variables. It does so by calling `num_punct<char_type>::do_falsename()`.

Returns

`string_type` representing printed form of false.

Definition at line 1777 of file `locale_facets.h`.

4.653.2.8 `template<typename _CharT> string std::numpunct<_CharT>::grouping () const [inline],
[inherited]`

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `numpunct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

Definition at line 1751 of file `locale_facets.h`.

4.653.2.9 `template<typename _CharT> char_type std::numpunct<_CharT>::thousands_sep () const [inline],
[inherited]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `numpunct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1720 of file `locale_facets.h`.

4.653.2.10 `template<typename _CharT> string_type std::numpunct<_CharT>::truename () const [inline],
[inherited]`

Return string representation of bool true.

This function returns a `string_type` containing the text representation for true bool variables. It does so by calling `numpunct<char_type>::do_truename()`.

Returns

`string_type` representing printed form of true.

Definition at line 1764 of file `locale_facets.h`.

4.653.3 Member Data Documentation

4.653.3.1 template<typename _CharT> locale::id std::numpunct<_CharT>::id [static], [inherited]

Numpunct facet id.

Definition at line 1657 of file locale_facets.h.

4.654.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
class std::ostream_iterator< _Tp, _CharT, _Traits >
```

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type `Tp` is the only type written by this iterator and there must be an `operator<<(Tp)` defined.

Template Parameters

<code>_Tp</code>	The type to write to the ostream.
<code>_CharT</code>	The ostream char_type.
<code>_Traits</code>	The ostream char_traits.

Definition at line 154 of file `stream_iterator.h`.

4.654.2 Member Typedef Documentation

4.654.2.1 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _CharT std::ostream_iterator< _Tp, _CharT, _Traits >::char_type`

Public typedef.

Definition at line 160 of file `stream_iterator.h`.

4.654.2.2 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::difference_type` `[inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.654.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator_category` `[inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.654.2.4 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef
basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_type`

Public typedef.

Definition at line 162 of file `stream_iterator.h`.

4.654.2.5 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]`

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.654.2.6 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]`

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.654.2.7 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _Traits
std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type`

Public typedef.

Definition at line 161 of file `stream_iterator.h`.

4.654.2.8 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.654.3 Constructor & Destructor Documentation

4.654.3.1 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (ostream_type &__s) [inline]`

Construct from an ostream.

Definition at line 171 of file `stream_iterator.h`.

4.654.3.2 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (ostream_type &__s, const _CharT * __c)
[inline]`

Construct from an ostream.

The delimiter string `c` is written to the stream after every `Tp` written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

Parameters

<code>_↔ _s</code>	Underlying ostream to write to.
<code>_↔ _c</code>	CharT delimiter string to insert.

Definition at line 183 of file stream_iterator.h.

```
4.654.3.3  template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
            std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator ( const ostream_iterator< _Tp, _CharT,
            _Traits > &__obj )  [inline]
```

Copy constructor.

Definition at line 187 of file stream_iterator.h.

4.654.4 Member Function Documentation

```
4.654.4.1  template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> ostream_iterator&
            std::ostream_iterator< _Tp, _CharT, _Traits >::operator= ( const _Tp &__value )  [inline]
```

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream.

Definition at line 193 of file stream_iterator.h.

4.660.1 Detailed Description

```
template<class _T1, class _T2>
struct std::pair<_T1, _T2>
```

Struct holding two objects of arbitrary type.

Template Parameters

<code>_T1</code>	Type of first object.
<code>_T2</code>	Type of second object.

Definition at line 96 of file `stl_pair.h`.

4.660.2 Member Typedef Documentation

4.660.2.1 `template<class _T1, class _T2> typedef _T2 std::pair<_T1, _T2>::second_type`

`first_type` is the first bound type

Definition at line 99 of file `stl_pair.h`.

4.660.3 Constructor & Destructor Documentation

4.660.3.1 `template<class _T1, class _T2> constexpr std::pair<_T1, _T2>::pair () [inline]`

`second` is a copy of the second object

The default constructor creates `first` and `second` using their respective default constructors.

Definition at line 108 of file `stl_pair.h`.

4.660.3.2 `template<class _T1, class _T2> constexpr std::pair<_T1, _T2>::pair (const _T1 & __a, const _T2 & __b) [inline]`

Two objects may be passed to a `pair` constructor to be copied.

Definition at line 112 of file `stl_pair.h`.

4.660.3.3 `template<class _T1, class _T2> template<class _U1, class _U2, class = typename enable_if<__and_<is_↵ convertible<const _U1&, _T1>, is_convertible<const _U2&, _T2>>::value>::type> constexpr std::pair<_T1, _T2>::pair (const pair<_U1, _U2> & __p) [inline]`

There is also a templated copy ctor for the `pair` class itself.

Definition at line 124 of file `stl_pair.h`.

4.660.4 Member Data Documentation

4.660.4.1 `template<class _T1, class _T2> _T1 std::pair<_T1, _T2>::first`

`second_type` is the second bound type

Definition at line 101 of file `stl_pair.h`.

4.661.1 Detailed Description

```
template<typename _RealType = double>
class std::piecewise_constant_distribution< _RealType >
```

A `piecewise_constant_distribution` random number distribution.

The formula for the piecewise constant probability mass function is

Definition at line 5483 of file `random.h`.

4.661.2 Member Typedef Documentation

4.661.2.1 `template<typename _RealType = double> typedef _RealType std::piecewise_constant_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 5486 of file random.h.

4.661.3 Member Function Documentation

4.661.3.1 `template<typename _RealType = double> std::vector<double> std::piecewise_constant_distribution<_RealType>::densities () const [inline]`

Returns a vector of the probability densities.

Definition at line 5604 of file random.h.

4.661.3.2 `template<typename _RealType = double> std::vector<_RealType> std::piecewise_constant_distribution<_RealType>::intervals () const [inline]`

Returns a vector of the intervals.

Definition at line 5588 of file random.h.

4.661.3.3 `template<typename _RealType = double> result_type std::piecewise_constant_distribution<_RealType>::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 5639 of file random.h.

4.661.3.4 `template<typename _RealType = double> result_type std::piecewise_constant_distribution<_RealType>::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 5629 of file random.h.

4.661.3.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type std::piecewise_constant_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 5650 of file random.h.

4.661.3.6 `template<typename _RealType = double> param_type std::piecewise_constant_distribution<_RealType>::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 5614 of file random.h.

4.661.3.7 `template<typename _RealType = double> void std::piecewise_constant_distribution<_RealType>::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5622 of file random.h.

4.661.3.8 `template<typename _RealType = double> void std::piecewise_constant_distribution<_RealType>::reset ()`
`[inline]`

Resets the distribution state.

Definition at line 5581 of file random.h.

4.661.4 Friends And Related Function Documentation

4.661.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits`
`> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::piecewise_constant_distribution<_RealType1> & __x) [friend]`

Inserts a `piecewise_constant_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_constant_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.661.4.2 `template<typename _RealType = double> bool operator==(const piecewise_constant_distribution<_RealType`
`> & __d1, const piecewise_constant_distribution<_RealType> & __d2) [friend]`

Return true if two `piecewise constant distributions` have the same parameters.

Definition at line 5685 of file random.h.

4.661.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename`
`_Traits> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is,`
`std::piecewise_constant_distribution<_RealType1> & __x) [friend]`

Extracts a `piecewise_constant_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A piecewise_constant_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

Generating functions.

Definition at line 5920 of file random.h.

4.664.3.6 `template<typename _RealType = double> param_type std::piecewise_linear_distribution< _RealType >::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 5884 of file random.h.

4.664.3.7 `template<typename _RealType = double> void std::piecewise_linear_distribution< _RealType >::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5892 of file random.h.

4.664.3.8 `template<typename _RealType = double> void std::piecewise_linear_distribution< _RealType >::reset () [inline]`

Resets the distribution state.

Definition at line 5850 of file random.h.

4.664.4 Friends And Related Function Documentation

4.664.4.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::piecewise_linear_distribution<_RealType1> & __x) [friend]`

Inserts a `piecewise_linear_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.664.4.2 `template<typename _RealType = double> bool operator==(const piecewise_linear_distribution<_RealType> & __d1, const piecewise_linear_distribution<_RealType> & __d2) [friend]`

Return true if two `piecewise_linear_distribution` have the same parameters.

Definition at line 5955 of file `random.h`.

4.664.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is, std::piecewise_linear_distribution<_RealType1> & __x) [friend]`

Extracts a `piecewise_linear_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.671.1 Detailed Description

```
template<typename _IntType = int>
class std::poisson_distribution<_IntType>
```

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$ where μ is the parameter of the distribution.

Definition at line 4432 of file random.h.

4.671.2 Member Typedef Documentation

4.671.2.1 `template<typename _IntType = int> typedef _IntType std::poisson_distribution<_IntType>::result_type`

The type of the range of the distribution.

Definition at line 4435 of file random.h.

4.671.3 Member Function Documentation

4.671.3.1 `template<typename _IntType = int> result_type std::poisson_distribution<_IntType>::max () const`
[inline]

Returns the least upper bound value of the distribution.

Definition at line 4526 of file random.h.

References std::max().

4.671.3.2 `template<typename _IntType = int> double std::poisson_distribution<_IntType>::mean () const` [inline]

Returns the distribution parameter `mean`.

Definition at line 4497 of file random.h.

4.671.3.3 `template<typename _IntType = int> result_type std::poisson_distribution<_IntType>::min () const`
[inline]

Returns the greatest lower bound value of the distribution.

Definition at line 4519 of file random.h.

4.671.3.4 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator> result_type`
`std::poisson_distribution<_IntType>::operator() (_UniformRandomNumberGenerator & __urng)` [inline]

Generating functions.

Definition at line 4534 of file random.h.

4.671.3.5 `template<typename _IntType = int> param_type std::poisson_distribution<_IntType>::param () const`
[inline]

Returns the parameter set of the distribution.

Definition at line 4504 of file random.h.

4.671.3.6 `template<typename _IntType = int> void std::poisson_distribution<_IntType>::param (const param_type &`
`__param)` [inline]

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4512 of file random.h.

4.671.3.7 `template<typename _IntType = int> void std::poisson_distribution<_IntType>::reset () [inline]`

Resets the distribution state.

Definition at line 4490 of file random.h.

4.671.4 Friends And Related Function Documentation

4.671.4.1 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::poisson_distribution<_IntType1> & __x) [friend]`

Inserts a poisson_distribution random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A poisson_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.671.4.2 `template<typename _IntType = int> bool operator== (const poisson_distribution<_IntType> & __d1, const poisson_distribution<_IntType> & __d2) [friend]`

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4570 of file random.h.

4.671.4.3 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is, std::poisson_distribution<_IntType1> & __x) [friend]`

Extracts a poisson_distribution random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A poisson_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.673.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
class std::priority_queue<_Tp, _Sequence, _Compare>
```

A standard container automatically sorting its contents.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>vector<_Tp></code> .
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Sequence::value_type></code> .

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

Definition at line 370 of file `stl_queue.h`.

4.673.2 Constructor & Destructor Documentation

4.673.2.1 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue (const _Compare &__x, const _Sequence &__s) [inline], [explicit]`

Default constructor creates no elements.

Definition at line 405 of file `stl_queue.h`.

References `std::queue<_Tp, _Sequence>::c`, `std::make_heap()`, and `std::move()`.

4.673.2.2 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> template<typename _InputIterator> std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue (_InputIterator __first, _InputIterator __last, const _Compare &__x, const _Sequence &__s) [inline]`

Builds a queue from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__x</code>	A comparison functor describing a strict weak ordering.
<code>__s</code>	An initial sequence with which to start.

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

Definition at line 445 of file `stl_queue.h`.

References `std::queue<_Tp, _Sequence >::c`, `std::make_heap()`, and `std::move()`.

4.673.3 Member Function Documentation

4.673.3.1 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename
_Sequence::value_type>> bool std::priority_queue<_Tp, _Sequence, _Compare >::empty () const
[inline]`

Returns true if the queue is empty.

Definition at line 471 of file `stl_queue.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

4.673.3.2 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename
_Sequence::value_type>> void std::priority_queue<_Tp, _Sequence, _Compare >::pop () [inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 534 of file `stl_queue.h`.

4.674.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::queue< _Tp, _Sequence >
```

A standard container giving FIFO behavior.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque<_Tp></code> .

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push` and `pop`, which are standard queue/FIFO operations.

Definition at line 96 of file `stl_queue.h`.

4.674.2 Constructor & Destructor Documentation

4.674.2.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> std::queue< _Tp, _Sequence >::queue (const _Sequence &_c) [inline], [explicit]`

Default constructor creates no elements.

References `std::queue< _Tp, _Sequence >::c`, and `std::move()`.

4.674.3 Member Function Documentation

4.674.3.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::queue<_Tp, _Sequence>::back ()`
`[inline]`

Returns a read/write reference to the data at the last element of the queue.

Definition at line 188 of file `stl_queue.h`.

4.674.3.2 `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::queue<_Tp, _Sequence>::back () const` `[inline]`

Returns a read-only (constant) reference to the data at the last element of the queue.

Definition at line 199 of file `stl_queue.h`.

4.674.3.3 `template<typename _Tp, typename _Sequence = deque<_Tp>> bool std::queue<_Tp, _Sequence>::empty ()`
`const` `[inline]`

Returns true if the queue is empty.

Definition at line 153 of file `stl_queue.h`.

4.674.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::queue<_Tp, _Sequence>::front ()`
`[inline]`

Returns a read/write reference to the data at the first element of the queue.

Definition at line 166 of file `stl_queue.h`.

4.674.3.5 `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::queue<_Tp, _Sequence>::front () const` `[inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 177 of file `stl_queue.h`.

4.674.3.6 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue<_Tp, _Sequence>::pop ()`
`[inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 241 of file `stl_queue.h`.

References `std::queue<_Tp, _Sequence>::c`, and `std::swap()`.

4.674.3.7 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue<_Tp, _Sequence>::push (const value_type &__x)` `[inline]`

Add data to the end of the queue.

Parameters

\leftrightarrow	Data to be added.
\times	

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 215 of file `stl_queue.h`.

References `std::move()`.

Referenced by `std::priority_queue<_Tp, _Sequence, _Compare>::push()`.

4.674.3.8 `template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::queue<_Tp, _Sequence>::size ()`
`const [inline]`

Returns the number of elements in the queue.

Definition at line 158 of file `stl_queue.h`.

4.674.4 Member Data Documentation

4.674.4.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> _Sequence std::queue<_Tp, _Sequence>::c`
`[protected]`

'c' is the underlying container. Maintainers wondering why this isn't uglified as per style guidelines should note that this name is specified in the standard, [23.2.3.1]. (Why? Presumably for the same reason that it's protected instead of private: to allow derivation. But none of the other containers allow for derivation. Odd.)

Definition at line 129 of file `stl_queue.h`.

Referenced by `std::operator<()`, `std::operator==()`, `std::queue<_Tp, _Sequence>::pop()`, `std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue()`, and `std::queue<_Tp, _Sequence>::queue()`.

4.679.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Definition at line 2420 of file `regex.h`.

4.679.2 Constructor & Destructor Documentation

```
4.679.2.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( )
[inline]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Definition at line 2434 of file `regex.h`.

```
4.679.2.2 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator
( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, regex_constants::match_flag_type __m =
regex_constants::match_default ) [inline]
```

Constructs a `regex_iterator`...

Parameters

<code>__a</code>	[IN] The start of a text range to search.
<code>__b</code>	[IN] One-past-the-end of the text range to search.
<code>__re</code>	[IN] The regular expression to match.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2445 of file `regex.h`.

References `std::regex_search()`.

```
4.679.2.3 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( const
regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) [default]
```

Copy constructs a `regex_iterator`.

4.679.3 Member Function Documentation

4.679.3.1 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const [inline]`

Tests the inequivalence of two regex iterators.

Definition at line 2475 of file regex.h.

4.679.3.2 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* () const [inline]`

Dereferences a regex_iterator.

Definition at line 2482 of file regex.h.

4.679.3.3 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()`

Increments a regex_iterator.

4.679.3.4 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (int) [inline]`

Postincrements a regex_iterator.

Definition at line 2502 of file regex.h.

4.679.3.5 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type* std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> () const [inline]`

Selects a regex_iterator member.

Definition at line 2489 of file regex.h.

4.679.3.6 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) [default]`

Assigns one regex_iterator to another.

```
4.679.3.7 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> bool std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits >::operator==( const
regex_iterator<_Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const
```

Tests the equivalence of two regex iterators.

The documentation for this class was generated from the following file:

4.680.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a std::sub_match object.

Definition at line 2535 of file regex.h.

4.680.2 Constructor & Destructor Documentation

```
4.680.2.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator
( ) [inline]
```

Default constructs a regex_token_iterator.

A default-constructed regex_token_iterator is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

Definition at line 2553 of file regex.h.

```
4.680.2.2 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator
( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, int __submatch = 0, regex_constants::match_flag_type
__m = regex_constants::match_default ) [inline]
```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatch</code>	[IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> • -1 each enumerated subexpression does NOT match the regular expression (aka field splitting) • 0 the entire string matching the subexpression is returned for each match within the text. • >0 enumerates only the indicated subexpression from a match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2575 of file regex.h.

```
4.680.2.3  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::regex_token_iterator
           ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, const std::vector< int > & __submatches,
             regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a `regex_token_iterator`...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2591 of file `regex.h`.

```
4.680.2.4  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
           _Rx_traits = regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
           >::regex_token_iterator ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, initializer_list< int >
           __submatches, regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a `regex_token_iterator`...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2608 of file `regex.h`.

```
4.680.2.5  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> template<std::size_t _Nm> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
           >::regex_token_iterator ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, const int(&) __submatches[_Nm],
           regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a `regex_token_iterator`...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2626 of file regex.h.

```
4.680.2.6 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::regex_token_iterator
( const regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs ) [inline]
```

Copy constructs a regex_token_iterator.

Parameters

<code>__rhs</code>	[IN] A regex_token_iterator to copy.
--------------------	--------------------------------------

Definition at line 2639 of file regex.h.

4.680.3 Member Function Documentation

```
4.680.3.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> bool std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator!=( const
regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs ) const [inline]
```

Compares a regex_token_iterator to another for inequality.

Definition at line 2661 of file regex.h.

```
4.680.3.2 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> const value_type& std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
>::operator*( ) const [inline]
```

Dereferences a regex_token_iterator.

Definition at line 2668 of file regex.h.

```
4.680.3.3 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> regex_token_iterator& std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
>::operator++( )
```

Increments a regex_token_iterator.

```
4.680.3.4 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> regex_token_iterator std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
>::operator++( int ) [inline]
```

Postincrements a regex_token_iterator.

Definition at line 2688 of file regex.h.

```
4.680.3.5  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> const value_type* std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
           >::operator-> ( ) const    [inline]
```

Selects a `regex_token_iterator` member.

Definition at line 2675 of file `regex.h`.

```
4.680.3.6  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> regex_token_iterator& std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
           >::operator= ( const regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

Assigns a `regex_token_iterator` to another.

Parameters

<code>__rhs</code>	[IN] A <code>regex_token_iterator</code> to copy.
--------------------	---

```
4.680.3.7  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> bool std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits >::operator== ( const
           regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const
```

Compares a `regex_token_iterator` to another for equality.

4.681.1 Detailed Description

```
template<typename _Ch_type>
struct std::regex_traits<_Ch_type>
```

Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class regex is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Definition at line 91 of file regex.h.

4.681.2 Constructor & Destructor Documentation

4.681.2.1 template<typename _Ch_type> std::regex_traits<_Ch_type>::regex_traits () [inline]

Constructs a default traits object.

Definition at line 171 of file regex.h.

4.681.3 Member Function Documentation

4.681.3.1 template<typename _Ch_type> locale_type std::regex_traits<_Ch_type>::getloc () const [inline]

Gets a copy of the current locale in use by the regex_traits object.

Definition at line 384 of file regex.h.

References std::regex_constants::awk, std::regex_constants::basic, std::regex_constants::collate, std::regex_constants::ECMAScript, std::regex_constants::egrep, std::regex_constants::extended, std::regex_constants::grep, std::regex_constants::icase, std::regex_constants::nosubs, and std::regex_constants::optimize.

4.681.3.2 template<typename _Ch_type> locale_type std::regex_traits<_Ch_type>::imbue (locale_type __loc) [inline]

Imbues the regex_traits object with a copy of a new locale.

Parameters

<code>__loc</code>	A locale.
--------------------	-----------

Returns

a copy of the previous locale in use by the `regex_traits` object.

Note

Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`.

Definition at line 373 of file `regex.h`.

References `std::swap()`.

4.681.3.3 `template<typename _Ch_type > bool std::regex_traits<_Ch_type>::isctype (_Ch_type __c, char_class_type __f) const`

Determines if `c` is a member of an identified class.

Parameters

<code>__c</code>	a character.
<code>__f</code>	a class type (as returned from <code>lookup_classname</code>).

Returns

true if the character `__c` is a member of the classification represented by `__f`, false otherwise.

Exceptions

<code>std::bad_cast</code>	if the current locale does not have a ctype facet.
----------------------------	--

4.681.3.4 `template<typename _Ch_type > static std::size_t std::regex_traits<_Ch_type>::length (const char_type * __p) [inline], [static]`

Gives the length of a C-style string starting at `__p`.

Parameters

<code>__p</code>	a pointer to the start of a character sequence.
------------------	---

Returns

the number of characters between *__p and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

Definition at line 184 of file `regex.h`.

4.681.3.5 `template<typename _Ch_type > template<typename _Fwd_iter > char_class_type std::regex_traits<_Ch_type >::lookup_classname (_Fwd_iter __first, _Fwd_iter __last, bool __icase = false) const`

Maps one or more characters to a named character classification.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.
<code>__icase</code>	ignores the case of the classification name.

Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[[:lower:]]` is the same as `[[:alpha:]]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- `d`
- `w`
- `s`
- `alnum`
- `alpha`
- `blank`
- `cntrl`
- `digit`
- `graph`
- `lower`
- `print`
- `punct`
- `space`
- `upper`
- `xdigit`

4.681.3.6 `template<typename _Ch_type > template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::lookup_collatename (_Fwd_iter __first, _Fwd_iter __last) const`

Gets a collation element by name.

Parameters

<code>__first</code>	beginning of the collation element name.
<code>__last</code>	one-past-the-end of the collation element name.

Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [`__first`, `__last`). Returns an empty string if the character sequence is not a valid collating element.

4.681.3.7 `template<typename _Ch_type > template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::transform (_Fwd_iter __first, _Fwd_iter __last) const [inline]`

Gets a sort key for a character sequence.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range [`F1`, `F2`) such that if the character sequence [`G1`, `G2`) sorts before the character sequence [`H1`, `H2`) then `v.transform(G1, G2) < v.transform(H1, H2)`.

What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

Returns

a locale-specific sort key equivalent to the input range.

Exceptions

<code>std::bad_cast</code>	if the current locale does not have a collate facet.
----------------------------	--

Definition at line 237 of file `regex.h`.

References `std::basic_string< _CharT, _Traits, _Alloc >::data()`, and `std::basic_string< _CharT, _Traits, _Alloc >::size()`.

4.681.3.8 `template<typename _Ch_type> template<typename _Fwd_iter> string_type std::regex_traits<_Ch_type>::transform_primary (_Fwd_iter __first, _Fwd_iter __last) const [inline]`

Gets a sort key for a character sequence, independent of case.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Effects: if `typeid(use_facet<collate<_Ch_type>>) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

Todo Implement this function correctly.

Definition at line 261 of file `regex.h`.

References `std::vector<_Tp, _Alloc>::data()`, and `std::vector<_Tp, _Alloc>::size()`.

4.681.3.9 `template<typename _Ch_type> char_type std::regex_traits<_Ch_type>::translate (char_type __c) const [inline]`

Performs the identity translation.

Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---

Returns

`__c`.

Definition at line 195 of file `regex.h`.

4.681.3.10 `template<typename _Ch_type> char_type std::regex_traits<_Ch_type>::translate_nocase (char_type __c) const [inline]`

Translates a character into a case-insensitive equivalent.

Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---

Returns

the locale-specific lower-case equivalent of `__c`.

Exceptions

<code>std::bad_cast</code>	if the imbued locale does not support the ctype facet.
----------------------------	--

Definition at line 208 of file `regex.h`.

4.681.3.11 `template<typename _Ch_type> int std::regex_traits<_Ch_type>::value (_Ch_type __ch, int __radix) const`

Converts a digit to an int.

Parameters

<code>__ch</code>	a character representing a digit.
<code>__radix</code>	the radix if the numeric conversion (limited to 8, 10, or 16).

Returns

the value represented by the digit `__ch` in base `radix` if the character `__ch` is a valid digit in base `radix`; otherwise returns -1.

4.682.1 Detailed Description

```
template<typename _Iterator>
class std::reverse_iterator<_Iterator>
```

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator *i* is established by the identity:

```
&*(reverse_iterator(i)) == &(i - 1)
```

This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

Definition at line 97 of file stl_iterator.h.

4.682.2 Member Typedef Documentation

4.682.2.1 `typedef iterator_traits<_Iterator>::iterator_category std::iterator< iterator_traits<_Iterator>::iterator_category, iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type, iterator_traits<_Iterator>::pointer, iterator_traits<_Iterator>::reference>::iterator_category` `[inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.682.2.2 `typedef iterator_traits<_Iterator>::value_type std::iterator< iterator_traits<_Iterator>::iterator_category, iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type, iterator_traits<_Iterator>::pointer, iterator_traits<_Iterator>::reference>::value_type` `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.682.3 Constructor & Destructor Documentation

4.682.3.1 `template<typename _Iterator> std::reverse_iterator<_Iterator>::reverse_iterator ()` `[inline]`

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Definition at line 121 of file `stl_iterator.h`.

Referenced by `std::reverse_iterator<_Iterator>::operator+()`, and `std::reverse_iterator<_Iterator>::operator-()`.

4.682.3.2 `template<typename _Iterator> std::reverse_iterator<_Iterator>::reverse_iterator (iterator_type __x)` `[inline], [explicit]`

This iterator will move in the opposite direction that `x` does.

Definition at line 127 of file `stl_iterator.h`.

4.682.3.3 `template<typename _Iterator> std::reverse_iterator<_Iterator>::reverse_iterator (const reverse_iterator<_Iterator> &__x)` `[inline]`

The copy constructor is normal.

Definition at line 132 of file `stl_iterator.h`.

4.682.3.4 `template<typename _Iterator> template<typename _Iter> std::reverse_iterator<_Iterator>::reverse_iterator (const reverse_iterator<_Iter> &__x)` `[inline]`

A `reverse_iterator` across other types can be copied if the underlying iterator can be converted to the type of `current`.

Definition at line 140 of file `stl_iterator.h`.

4.682.4 Member Function Documentation

4.682.4.1 `template<typename _Iterator> iterator_type std::reverse_iterator<_Iterator>::base () const [inline]`

Returns

`current`, the iterator used for underlying work.

Definition at line 147 of file `stl_iterator.h`.

Referenced by `std::inserter()`, and `std::operator==()`.

4.682.4.2 `template<typename _Iterator> reference std::reverse_iterator<_Iterator>::operator* () const [inline]`

Returns

A reference to the value at `-current`

This requires that `-current` is dereferenceable.

Warning

This implementation requires that for an iterator of the underlying iterator type, `x`, a reference obtained by `*x` remains valid after `x` has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

Definition at line 161 of file `stl_iterator.h`.

Referenced by `std::inserter()`, and `std::reverse_iterator<_Iterator>::operator->()`.

4.682.4.3 `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator+ (difference_type __n) const [inline]`

Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

Definition at line 232 of file `stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::reverse_iterator()`.

Referenced by `std::inserter()`, and `std::operator==()`.

4.682.4.4 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator++ () [inline]`

Returns

`*this`

Decrements the underlying iterator.

Definition at line 182 of file `stl_iterator.h`.

Referenced by `std::inserter()`.

4.682.4.5 `template<typename _Iterator> reverse_iterator std::reverse_iterator< _Iterator >::operator++ (int)`
`[inline]`

Returns

The original value of `*this`

Decrements the underlying iterator.

Definition at line 194 of file `stl_iterator.h`.

4.682.4.6 `template<typename _Iterator> reverse_iterator& std::reverse_iterator< _Iterator >::operator+= (difference_type __n)` `[inline]`

Returns

`*this`

Moves the underlying iterator backwards `__n` steps. The underlying iterator must be a Random Access Iterator.

Definition at line 242 of file `stl_iterator.h`.

Referenced by `std::inserter()`.

4.682.4.7 `template<typename _Iterator> reverse_iterator std::reverse_iterator< _Iterator >::operator- (difference_type __n) const` `[inline]`

Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

Definition at line 254 of file `stl_iterator.h`.

References `std::reverse_iterator< _Iterator >::reverse_iterator()`.

Referenced by `std::inserter()`, and `std::operator==()`.

4.682.4.8 `template<typename _Iterator> reverse_iterator& std::reverse_iterator< _Iterator >::operator-- ()`
`[inline]`

Returns

`*this`

Increments the underlying iterator.

Definition at line 207 of file `stl_iterator.h`.

Referenced by `std::inserter()`.

4.682.4.9 `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator-- (int)`
`[inline]`

Returns

A `reverse_iterator` with the previous value of `*this`

Increments the underlying iterator.

Definition at line 219 of file `stl_iterator.h`.

4.682.4.10 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator= (`
`difference_type __n) [inline]`

Returns

`*this`

Moves the underlying iterator forwards `__n` steps. The underlying iterator must be a Random Access Iterator.

Definition at line 264 of file `stl_iterator.h`.

Referenced by `std::inserter()`.

4.682.4.11 `template<typename _Iterator> pointer std::reverse_iterator<_Iterator>::operator-> () const [inline]`

Returns

A pointer to the value at `-current`

This requires that `-current` is dereferenceable.

Definition at line 173 of file `stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::operator*()`.

Referenced by `std::inserter()`.

4.682.4.12 `template<typename _Iterator> reference std::reverse_iterator<_Iterator>::operator[] (difference_type __n)`
`const [inline]`

Returns

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

Definition at line 276 of file `stl_iterator.h`.

Referenced by `std::inserter()`.

4.684.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::set< _Key, _Compare, _Alloc >
```

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 90 of file `stl_set.h`.

4.684.3 Constructor & Destructor Documentation

4.684.3.1 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set () [inline]`

Default constructor creates no elements.

Definition at line 142 of file `stl_set.h`.

4.684.3.2 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (const _Compare & __comp, const allocator_type & __a =
allocator_type()) [inline], [explicit]`

Creates a set with no elements.

Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

Definition at line 151 of file `stl_set.h`.

```
4.684.3.3  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator
            __last ) [inline]
```

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and $N\log N$ otherwise (where N is `distance(__first,__last)`).

Definition at line 166 of file `stl_set.h`.

```
4.684.3.4  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator
            __last, const _Compare & __comp, const allocator_type & __a = allocator_type() ) [inline]
```

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and $N\log N$ otherwise (where N is `distance(__first,__last)`).

Definition at line 183 of file `stl_set.h`.

```
4.684.3.5  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( const set<_Key, _Compare, _Alloc> & __x ) [inline]
```

Set copy constructor.

Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The newly-created set uses a copy of the allocation object used by `__x`.

Definition at line 196 of file stl_set.h.

4.684.3.6 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (set<_Key, _Compare, _Alloc> && __x) [inline], [noexcept]`

Set move constructor

Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The newly-created set contains the exact contents of x. The contents of x are a valid, but unspecified set.

Definition at line 207 of file stl_set.h.

4.684.3.7 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (initializer_list<value_type> __l, const _Compare & __comp =
_Compare(), const allocator_type & __a = allocator_type()) [inline]`

Builds a set from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 221 of file stl_set.h.

4.684.3.8 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (const allocator_type & __a) [inline], [explicit]`

Allocator-extended default constructor.

Definition at line 229 of file stl_set.h.

4.684.3.9 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (const set<_Key, _Compare, _Alloc> & __x, const allocator_type & __a
) [inline]`

Allocator-extended copy constructor.

Definition at line 233 of file stl_set.h.

```
4.684.3.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set ( set<_Key, _Compare, _Alloc> && __x, const allocator_type & __a )
[inline], [noexcept]
```

Allocator-extended move constructor.

Definition at line 237 of file stl_set.h.

```
4.684.3.11 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set ( initializer_list<value_type> __l, const allocator_type & __a )
[inline]
```

Allocator-extended initializer-list constructor.

Definition at line 243 of file stl_set.h.

```
4.684.3.12 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator> std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator
__last, const allocator_type & __a ) [inline]
```

Allocator-extended range constructor.

Definition at line 249 of file stl_set.h.

4.684.4 Member Function Documentation

```
4.684.4.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::set<_Key, _Compare, _Alloc>::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 334 of file stl_set.h.

```
4.684.4.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::set<_Key, _Compare, _Alloc>::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 371 of file stl_set.h.

```
4.684.4.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::set<_Key, _Compare, _Alloc>::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 380 of file stl_set.h.

4.684.4.4 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
std::set<_Key, _Compare, _Alloc>::clear () [inline], [noexcept]`

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 669 of file `stl_set.h`.

Referenced by `std::set< _Key, _Compare, _Alloc >::operator=()`.

4.684.4.5 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set<_Key, _Compare, _Alloc>::count (const key_type & __x) const [inline]`

Finds the number of elements.

Parameters

<code>__x</code>	Element to located.
------------------	---------------------

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

Definition at line 683 of file `stl_set.h`.

4.684.4.6 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set<_Key, _Compare, _Alloc>::crbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 389 of file `stl_set.h`.

4.684.4.7 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set<_Key, _Compare, _Alloc>::crend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 398 of file `stl_set.h`.

4.684.4.8 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args> std::pair<iterator, bool> std::set<_Key, _Compare, _Alloc>::emplace (_Args
&&... __args) [inline]`

Attempts to build and insert an element into the set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 452 of file `stl_set.h`.

```
4.684.4.9  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
           template<typename... _Args> iterator std::set<_Key, _Compare, _Alloc>::emplace_hint ( const_iterator __pos,
           _Args &&... __args ) [inline]
```

Attempts to insert an element into the set.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 478 of file `stl_set.h`.

```
4.684.4.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> bool
           std::set<_Key, _Compare, _Alloc>::empty ( ) const [inline], [noexcept]
```

Returns true if the set is empty.

Definition at line 404 of file `stl_set.h`.

4.684.4.11 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
 iterator std::set<_Key, _Compare, _Alloc>::end () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 343 of file stl_set.h.

4.684.4.12 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
 std::pair<iterator, iterator> std::set<_Key, _Compare, _Alloc>::equal_range (const key_type & __x)
 [inline]`

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 763 of file stl_set.h.

4.684.4.13 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
 std::pair<const_iterator, const_iterator> std::set<_Key, _Compare, _Alloc>::equal_range (const
 key_type & __x) const [inline]`

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 767 of file stl_set.h.

```
4.684.4.14  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
             _GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase ( const_iterator __position )
             [inline]
```

Erases an element from a set.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 590 of file stl_set.h.

Referenced by `std::set< _Key, _Compare, _Alloc >::erase()`.

```
4.684.4.15  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
             size_type std::set< _Key, _Compare, _Alloc >::erase ( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 620 of file stl_set.h.

```
4.684.4.16  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            _GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase ( const_iterator __first,
            const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from a set.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 642 of file stl_set.h.

References `std::set< _Key, _Compare, _Alloc >::erase()`.

```
4.684.4.17  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            iterator std::set< _Key, _Compare, _Alloc >::find ( const key_type & __x ) [inline]
```

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 701 of file `stl_set.h`.

```
4.684.4.18  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            const_iterator std::set<_Key, _Compare, _Alloc>::find ( const key_type & __x ) const  [inline]
```

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 705 of file `stl_set.h`.

```
4.684.4.19  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            allocator_type std::set<_Key, _Compare, _Alloc>::get_allocator ( ) const  [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

Definition at line 325 of file `stl_set.h`.

```
4.684.4.20  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::pair<iterator, bool> std::set<_Key, _Compare, _Alloc>::insert ( const value_type & __x )  [inline]
```

Attempts to insert an element into the set.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 499 of file stl_set.h.

References std::pair< _T1, _T2 >::first, std::move(), and std::pair< _T1, _T2 >::second.

Referenced by std::set< _Key, _Compare, _Alloc >::insert(), and std::set< _Key, _Compare, _Alloc >::operator=().

```
4.684.4.21 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            iterator std::set< _Key, _Compare, _Alloc >::insert ( const_iterator __position, const value_type & __x )
            [inline]
```

Attempts to insert an element into the set.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.↵

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 536 of file stl_set.h.

References std::set< _Key, _Compare, _Alloc >::insert(), and std::move().

```
4.684.4.22 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > void std::set< _Key, _Compare, _Alloc >::insert ( _InputIterator __first,
            _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 556 of file stl_set.h.

4.684.4.23 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
std::set<_Key, _Compare, _Alloc>::insert (initializer_list< value_type > __l) [inline]`

Attempts to insert a list of elements into the set.

Parameters

↔	A std::initializer_list<value_type> of elements to be inserted.
__↔	
↔	
__↔	
l	

Complexity similar to that of the range constructor.

Definition at line 568 of file stl_set.h.

References std::set<_Key, _Compare, _Alloc>::insert().

4.684.4.24 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::set<_Key, _Compare, _Alloc>::key_comp () const [inline]`

Returns the comparison object with which the set was constructed.

Definition at line 317 of file stl_set.h.

4.684.4.25 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::lower_bound (const key_type & __x) [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

__↔	Key to be located.
__x	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 722 of file stl_set.h.

4.684.4.26 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::lower_bound (const key_type & __x) const [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_x</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 726 of file stl_set.h.

```
4.684.4.27 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    size_type std::set< _Key, _Compare, _Alloc >::max_size( ) const    [inline], [noexcept]
```

Returns the maximum size of the set.

Definition at line 414 of file stl_set.h.

```
4.684.4.28 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set&
    std::set< _Key, _Compare, _Alloc >::operator=( const set< _Key, _Compare, _Alloc > &_x )    [inline]
```

Set assignment operator.

Parameters

<code>_↔</code>	A set of identical element and allocator types.
<code>_x</code>	

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 263 of file stl_set.h.

```
4.684.4.29 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set&
    std::set< _Key, _Compare, _Alloc >::operator=( set< _Key, _Compare, _Alloc > &&_x )    [inline],
    [noexcept]
```

Set move assignment operator.

Parameters

<code>_↔</code>	A set of identical element and allocator types.
<code>_x</code>	

The contents of `__x` are moved into this set (without copying if the allocators compare equal or get moved on assign-

ment). Afterwards `__x` is in a valid, but unspecified state.

Definition at line 279 of file `stl_set.h`.

References `std::set<_Key, _Compare, _Alloc>::clear()`, and `std::set<_Key, _Compare, _Alloc>::insert()`.

4.684.4.30 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set& std::set<_Key, _Compare, _Alloc>::operator= (initializer_list<value_type> __l) [inline]`

Set list assignment operator.

Parameters

↩	An initializer_list.
↩	
↩	
↩	
↩	
↩	

This function fills a set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 305 of file `stl_set.h`.

References `std::set<_Key, _Compare, _Alloc>::clear()`, and `std::set<_Key, _Compare, _Alloc>::insert()`.

4.684.4.31 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set<_Key, _Compare, _Alloc>::rbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 352 of file `stl_set.h`.

4.684.4.32 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set<_Key, _Compare, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 361 of file `stl_set.h`.

4.684.4.33 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::set<_Key, _Compare, _Alloc>::size () const [inline], [noexcept]`

Returns the size of the set.

Definition at line 409 of file `stl_set.h`.

4.684.4.34 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void std::set<_Key, _Compare, _Alloc>::swap (set<_Key, _Compare, _Alloc> & __x) [inline], [noexcept]`

Swaps data with another set.

Parameters

<code>_↔</code>	A set of the same element and allocator types.
<code>_X</code>	

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 429 of file `stl_set.h`.

Referenced by `std::swap()`.

4.684.4.35 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc >::upper_bound (const key_type & __x) [inline]`

Finds the end of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 738 of file `stl_set.h`.

4.684.4.36 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc >::upper_bound (const key_type & __x) const [inline]`

Finds the end of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 742 of file `stl_set.h`.

4.684.4.37 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::set<_Key, _Compare, _Alloc>::value_comp () const [inline]`

Returns the comparison object with which the set was constructed.

Definition at line 321 of file `stl_set.h`.

4.685.1 Detailed Description

```
template<typename _Tp>
class std::shared_ptr< _Tp >
```

A smart pointer with reference-counted copy semantics.

The object pointed to is deleted when the last **shared_ptr** pointing to it is destroyed or reset.

Definition at line 93 of file **shared_ptr.h**.

4.685.2 Constructor & Destructor Documentation

4.685.2.1 `template<typename _Tp> constexpr std::shared_ptr<_Tp>::shared_ptr () [inline], [noexcept]`

Construct an empty `shared_ptr`.

Postcondition

`use_count()==0 && get()==0`

Definition at line 100 of file `shared_ptr.h`.

Referenced by `std::auto_ptr<_Tp>::auto_ptr()`, and `std::shared_ptr<__detail::_NFA<_Rx_traits>>::shared_ptr()`.

4.685.2.2 `template<typename _Tp> template<typename _Tp1> std::shared_ptr<_Tp>::shared_ptr (_Tp1 * __p) [inline], [explicit]`

Construct a `shared_ptr` that owns the pointer `__p`.

Parameters

<code>__p</code>	A pointer that is convertible to <code>element_type*</code> .
------------------	---

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

<code>std::bad_alloc</code> , in	which case <code>delete __p</code> is called.
----------------------------------	---

Definition at line 112 of file `shared_ptr.h`.

4.685.2.3 `template<typename _Tp> template<typename _Tp1, typename _Deleter> std::shared_ptr<_Tp>::shared_ptr (_Tp1 * __p, _Deleter __d) [inline]`

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

Parameters

<code>__p</code>	A pointer.
<code>__d</code>	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

<i>std::bad_alloc</i> , in	which case __d(__p) is called.
----------------------------	--------------------------------

Requirements: _Deleter's copy constructor and destructor must not throw

__shared_ptr will release __p by calling __d(__p)

Definition at line 129 of file shared_ptr.h.

4.685.2.4 `template<typename _Tp> template<typename _Deleter > std::shared_ptr< _Tp >::shared_ptr (nullptr_t __p, _Deleter __d) [inline]`

Construct a shared_ptr that owns a null pointer and the deleter __d.

Parameters

<code>__p</code>	A null pointer constant.
<code>__d</code>	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

<i>std::bad_alloc</i> , in	which case __d(__p) is called.
----------------------------	--------------------------------

Requirements: _Deleter's copy constructor and destructor must not throw

The last owner will call __d(__p)

Definition at line 146 of file shared_ptr.h.

4.685.2.5 `template<typename _Tp> template<typename _Tp1, typename _Deleter, typename _Alloc > std::shared_ptr< _Tp >::shared_ptr (_Tp1 * __p, _Deleter __d, _Alloc __a) [inline]`

Construct a shared_ptr that owns the pointer __p and the deleter __d.

Parameters

$_p$	A pointer.
$_d$	A deleter.
$_a$	An allocator.

Postcondition

`use_count() == 1 && get() == $_p$`

Exceptions

<code><i>std::bad_alloc</i></code> , in	which case <code>$_d(_p)$</code> is called.
---	--

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

`__shared_ptr` will release `__p` by calling `__d(__p)`

Definition at line 165 of file `shared_ptr.h`.

4.685.2.6 `template<typename _Tp> template<typename _Deleter, typename _Alloc> std::shared_ptr<_Tp>::shared_ptr (nullptr_t __p, _Deleter __d, _Alloc __a) [inline]`

Construct a `shared_ptr` that owns a null pointer and the deleter `__d`.

Parameters

$_p$	A null pointer constant.
$_d$	A deleter.
$_a$	An allocator.

Postcondition

`use_count() == 1 && get() == $_p$`

Exceptions

<code><i>std::bad_alloc</i></code> , in	which case <code>$_d(_p)$</code> is called.
---	--

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.

The last owner will call __d(__p)

Definition at line 184 of file shared_ptr.h.

4.685.2.7 `template<typename _Tp> template<typename _Tp1 > std::shared_ptr< _Tp >::shared_ptr (const shared_ptr< _Tp1 > & __r, _Tp* __p) [inline], [noexcept]`

Constructs a shared_ptr instance that stores __p and shares ownership with __r.

Parameters

<code>__r</code>	A shared_ptr.
<code>__p</code>	A pointer that will remain valid while *__r is valid.

Postcondition

`get() == __p && use_count() == __r.use_count()`

This can be used to construct a shared_ptr to a sub-object of an object managed by an existing shared_ptr.

```
shared_ptr< pair<int,int> > pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

Definition at line 206 of file shared_ptr.h.

4.685.2.8 `template<typename _Tp> template<typename _Tp1, typename = typename std::enable_if<std::is_convertible<_Tp1*, _Tp*>::value>::type> std::shared_ptr< _Tp >::shared_ptr (const shared_ptr< _Tp1 > & __r) [inline], [noexcept]`

If __r is empty, constructs an empty shared_ptr; otherwise construct a shared_ptr that shares ownership with __r.

Parameters

<code>__r</code>	A shared_ptr.
------------------	---------------

Postcondition

`get() == __r.get() && use_count() == __r.use_count()`

Definition at line 218 of file shared_ptr.h.

4.685.2.9 `template<typename _Tp> std::shared_ptr<_Tp>::shared_ptr(shared_ptr<_Tp> && __r) [inline],
[noexcept]`

Move-constructs a shared_ptr instance from __r.

Parameters

↩	A shared_ptr rvalue.
__↩	
↩	
__↩	
<i>r</i>	

Postcondition

*this contains the old value of __r, __r is empty.

Definition at line 226 of file shared_ptr.h.

4.685.2.10 `template<typename _Tp> template<typename _Tp1, typename = typename std::enable_if<std::is_convertible<_Tp1*,
_Tp*>::value>::type> std::shared_ptr<_Tp>::shared_ptr(shared_ptr<_Tp1> && __r) [inline],
[noexcept]`

Move-constructs a shared_ptr instance from __r.

Parameters

↩	A shared_ptr rvalue.
__↩	
↩	
__↩	
<i>r</i>	

Postcondition

*this contains the old value of __r, __r is empty.

Definition at line 236 of file shared_ptr.h.

4.685.2.11 `template<typename _Tp> template<typename _Tp1> std::shared_ptr<_Tp>::shared_ptr(const weak_ptr<
_Tp1> & __r) [inline], [explicit]`

Constructs a shared_ptr that shares ownership with __r and stores a copy of the pointer stored in __r.

Parameters

\leftrightarrow	A weak_ptr.
$_ \leftrightarrow$	
\leftarrow	
$_ \leftarrow$	
<i>r</i>	

Postcondition

use_count() == $_r$.use_count()

Exceptions

<i>bad_weak_ptr</i>	when $_r$.expired(), in which case the constructor has no effect.
---------------------	---

Definition at line 248 of file shared_ptr.h.

4.685.2.12 `template<typename _Tp> constexpr std::shared_ptr<_Tp>::shared_ptr(nullptr_t __p) [inline],
[noexcept]`

Construct an empty shared_ptr.

Parameters

$_ \leftrightarrow$	A null pointer constant.
$_p$	

Postcondition

use_count() == 0 && get() == nullptr

Definition at line 265 of file shared_ptr.h.

4.685.3 Friends And Related Function Documentation

4.685.3.1 `template<typename _Tp> template<typename _Tp1, typename _Alloc, typename... _Args> shared_ptr<_Tp1>
allocate_shared(const _Alloc & __a, _Args &&... __args) [friend]`

Create an object that is owned by a shared_ptr.

Parameters

$_a$	An allocator.
$_args$	Arguments for the $_Tp$ object's constructor.

Returns

A `shared_ptr` that owns the newly created object.

Exceptions

<i>An</i>	exception thrown from <code>_Alloc::allocate</code> or from the constructor of <code>_Tp</code> .
-----------	---

A copy of `__a` will be used to allocate memory for the `shared_ptr` and the new object.

Definition at line 591 of file `shared_ptr.h`.

_RandomNumberEngine>::value> ::type> std::shuffle_order_engine< _RandomNumberEngine, __k
>::shuffle_order_engine ( _Sseq & __q ) [inline],[explicit]
```

Generator construct a shuffle_order_engine engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 1357 of file random.h.

4.686.4 Member Function Documentation

4.686.4.1 `template<typename _RandomNumberEngine, size_t __k> const _RandomNumberEngine& std::shuffle_order_engine<_RandomNumberEngine, __k>::base() const [inline], [noexcept]`

Gets a const reference to the underlying generator engine object.

Definition at line 1400 of file random.h.

4.686.4.2 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine<_RandomNumberEngine, __k>::discard(unsigned long long __z) [inline]`

Discard a sequence of random numbers.

Definition at line 1421 of file random.h.

4.686.4.3 `template<typename _RandomNumberEngine, size_t __k> static constexpr result_type std::shuffle_order_engine<_RandomNumberEngine, __k>::max() [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 1414 of file random.h.

References std::max().

4.686.4.4 `template<typename _RandomNumberEngine, size_t __k> static constexpr result_type std::shuffle_order_engine<_RandomNumberEngine, __k>::min() [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 1407 of file random.h.

References std::min().

4.686.4.5 `template<typename _RandomNumberEngine, size_t __k> result_type std::shuffle_order_engine<_RandomNumberEngine, __k>::operator()()`

Gets the next value in the generated random number sequence.

4.686.4.6 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine<_RandomNumberEngine, __k>::seed() [inline]`

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.

Definition at line 1366 of file random.h.

4.686.4.7 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine<_RandomNumberEngine, __k>::seed(result_type __s) [inline]`

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.

Definition at line 1377 of file random.h.

4.686.4.8 `template<typename _RandomNumberEngine, size_t __k> template<typename _Sseq> void std::shuffle_order_engine<_RandomNumberEngine, __k>::seed(_Sseq & __q) [inline]`

Reseeds the shuffle_order_engine object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 1390 of file random.h.

4.686.5 Friends And Related Function Documentation

4.686.5.1 `template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::shuffle_order_engine<_RandomNumberEngine1, __k1> & __x)`
`[friend]`

Inserts the current state of a shuffle_order_engine random number generator engine `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A shuffle_order_engine random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.686.5.2 `template<typename _RandomNumberEngine, size_t __k> bool operator==(const shuffle_order_engine<_RandomNumberEngine, __k> & __lhs, const shuffle_order_engine<_RandomNumberEngine, __k> & __rhs)`
`[friend]`

Compares two shuffle_order_engine random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A shuffle_order_engine random number generator object.
<code>__rhs</code>	Another shuffle_order_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1445 of file random.h.

```
4.686.5.3 template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1, size_t __k1,
typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<
_CharT, _Traits > & __is, std::shuffle_order_engine<_RandomNumberEngine1, __k1> & __x ) [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A shuffle_order_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

- [slice](#) ()
- [slice](#) (size_t __o, size_t __d, size_t __s)
- size_t [size](#) () const
- size_t [start](#) () const
- size_t [stride](#) () const

4.687.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

Definition at line 59 of file slice_array.h.

4.688.1 Detailed Description

```
template<typename _Tp>
class std::slice_array<_Tp>
```

Reference to one-dimensional subset of an array.

A `slice_array` is a reference to the actual elements of an array specified by a slice. The way to get a `slice_array` is to call `operator[]`(slice) on a `valarray`. The returned `slice_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying `valarray` this `slice_array` refers to.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 123 of file `slice_array.h`.

The documentation for this class was generated from the following file:

`bool operator== (const stack< _Tp1, _Seq1 > &, const stack< _Tp1, _Seq1 > &)`

4.689.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::stack< _Tp, _Sequence >
```

A standard container giving FILO behavior.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque<_Tp></code> .

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_front`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

Definition at line 99 of file `stl_stack.h`.

4.689.2 Constructor & Destructor Documentation

4.689.2.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> std::stack< _Tp, _Sequence >::stack (const _Sequence &_c) [inline], [explicit]`

Default constructor creates no elements.

Definition at line 137 of file `stl_stack.h`.

Referenced by `std::stack< _StateSeqT >::stack()`.

4.689.3 Member Function Documentation

4.689.3.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> bool std::stack< _Tp, _Sequence >::empty ()`
`const [inline]`

Returns true if the stack is empty.

Definition at line 149 of file `stl_stack.h`.

4.689.3.2 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack< _Tp, _Sequence >::pop ()`
`[inline]`

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 215 of file `stl_stack.h`.

4.689.3.3 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack< _Tp, _Sequence >::push (const`
`value_type &__x) [inline]`

Add data to the top of the stack.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 189 of file `stl_stack.h`.

Referenced by `std::stack< _StateSeqT >::push()`.

4.689.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::stack< _Tp, _Sequence >::size ()`
`const [inline]`

Returns the number of elements in the stack.

Definition at line 154 of file `stl_stack.h`.

4.689.3.5 `template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::stack< _Tp, _Sequence >::top ()`
`[inline]`

Returns a read/write reference to the data at the first element of the stack.

Definition at line 162 of file `stl_stack.h`.

4.689.3.6 `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::stack<_Tp, _Sequence>::top
() const [inline]`

Returns a read-only (constant) reference to the data at the first element of the stack.

Definition at line 173 of file `stl_stack.h`.

4.690.4 Friends And Related Function Documentation

4.690.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits`
`> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::student_t_distribution<_RealType1> & __x) [friend]`

Inserts a `student_t_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A student_t_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.690.4.2 `template<typename _RealType = double> bool operator==(const student_t_distribution<_RealType> &__d1, const student_t_distribution<_RealType> &__d2) [friend]`

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3496 of file random.h.

4.690.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> &__is, std::student_t_distribution<_RealType1> &__x) [friend]`

Extracts a student_t_distribution random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A student_t_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.692.1 Detailed Description

```
template<typename _Bilter>
class std::sub_match<_Bilter >
```

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with std::basic_string objects of a similar base character type as the pattern matched by the regular expression.

The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Definition at line 857 of file regex.h.

4.692.2 Member Typedef Documentation

4.692.2.1 typedef [_Bilter](#) [std::pair](#)<[_Bilter](#), [_Bilter](#)>::[second_type](#) [inherited]

[first_type](#) is the first bound type

Definition at line 99 of file stl_pair.h.

4.692.3 Member Function Documentation

4.692.3.1 template<typename [_Bilter](#)> int [std::sub_match](#)<[_Bilter](#)>::[compare](#) (const [sub_match](#)<[_Bilter](#)> &__s)
const [inline]

Compares this and another matched sequence.

Parameters

<code>__s</code>	Another matched sequence to compare to this one.
------------------	--

Return values

<code>< 0</code>	this matched sequence will collate before <code>__s</code> .
<code>= 0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>> 0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 918 of file regex.h.

Referenced by `std::operator!=()`, `std::operator<()`, `std::operator<=()`, `std::operator==()`, `std::operator>()`, and `std::operator>=()`.

4.692.3.2 `template<typename _Bilter> int std::sub_match<_Bilter>::compare (const string_type & __s) const`
`[inline]`

Compares this `sub_match` to a string.

Parameters

<code>__s</code>	A string to compare to this <code>sub_match</code> .
------------------	--

Return values

<code>< 0</code>	this matched sequence will collate before <code>__s</code> .
<code>= 0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>> 0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 931 of file regex.h.

4.692.3.3 `template<typename _Bilter> int std::sub_match<_Bilter>::compare (const value_type * __s) const`
`[inline]`

Compares this `sub_match` to a C-style string.

Parameters

<code>__s</code>	A C-style string to compare to this <code>sub_match</code> .
------------------	--

Return values

<code><0</code>	this matched sequence will collate before <code>__s</code> .
<code>=0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>>0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 944 of file regex.h.

4.692.3.4 `template<typename _Bilter> difference_type std::sub_match<_Bilter>::length () const [inline]`

Gets the length of the matching sequence.

Definition at line 875 of file regex.h.

4.692.3.5 `template<typename _Bilter> std::sub_match<_Bilter>::operator string_type () const [inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the `str()` member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

Definition at line 888 of file regex.h.

4.692.3.6 `template<typename _Bilter> string_type std::sub_match<_Bilter>::str () const [inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

Definition at line 901 of file regex.h.

Referenced by `std::sub_match<_Bi_iter>::compare()`, and `std::operator<<()`.

4.692.4 Member Data Documentation

4.692.4.1 `_Bilter std::pair<_Bilter, _Bilter>::first [inherited]`

`second_type` is the second bound type

Definition at line 101 of file stl_pair.h.

4.692.4.2 `_Bilter std::pair<_Bilter, _Bilter>::second` [inherited]

`first` is a copy of the first object

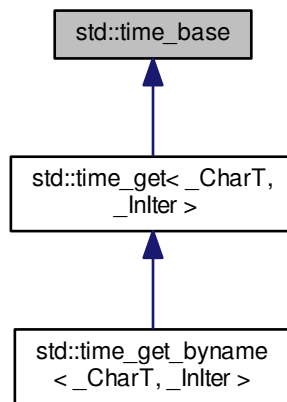

Definition at line 102 of file `stl_pair.h`.

4.694.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get<_CharT, _InIter>
```

Primary class template `time_get`.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The `time_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_get` facet.

Definition at line 368 of file `locale_facets_nonio.h`.

4.694.2 Member Typedef Documentation

4.694.2.1 `template<typename _CharT, typename _InIter> typedef _CharT std::time_get<_CharT, _InIter>::char_type`

Public typedefs.

Definition at line 374 of file locale_facets_nonio.h.

4.694.2.2 `template<typename _CharT, typename _InIter> typedef _InIter std::time_get<_CharT, _InIter>::iter_type`

Public typedefs.

Definition at line 375 of file locale_facets_nonio.h.

4.694.3 Constructor & Destructor Documentation

4.694.3.1 `template<typename _CharT, typename _InIter> std::time_get<_CharT, _InIter>::time_get (size_t __refs = 0)
[inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 390 of file locale_facets_nonio.h.

4.694.3.2 `template<typename _CharT, typename _InIter> virtual std::time_get<_CharT, _InIter>::~time_get ()
[inline], [protected], [virtual]`

Destructor.

Definition at line 546 of file locale_facets_nonio.h.

4.694.4 Member Function Documentation

4.694.4.1 `template<typename _CharT, typename _InIter> dateorder std::time_get<_CharT, _InIter>::date_order () const
[inline]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put<_CharT, _InIter>::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `timebase::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

Returns

A member of `timebase::dateorder`.

Definition at line 407 of file `locale_facets_nonio.h`.

```
4.694.4.2  template<typename _CharT, typename _InIter > virtual dateorder std::time_get<_CharT, _InIter >::do_date_order (
            ) const    [protected], [virtual]
```

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put<_CharT, _InIter >::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of `timebase::dateorder`.

```
4.694.4.3  template<typename _CharT, typename _InIter > virtual iter_type std::time_get<_CharT, _InIter >::do_get_date
            ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
            [protected], [virtual]
```

Parse input date string.

This function parses a date according to the format `X` and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See also

`get_date()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <code>tm</code> to fill in.

Returns

Iterator to first char beyond date string.

```
4.694.4.4  template<typename _CharT, typename _InIter > virtual iter_type std::time_get<_CharT, _InIter
            >::do_get_monthname ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm )
            const    [protected], [virtual]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_monthname() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

```
4.694.4.5 template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter >::do_get_time
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
[protected], [virtual]
```

Parse input time string.

This function parses a time according to the format x and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_time() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

```
4.694.4.6  template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter >::do_get_weekday
           ( iter_type __beg, iter_type __end, ios_base & , ios_base::iostate & __err, tm * __tm ) const
           [protected], [virtual]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_weekday() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

```
4.694.4.7  template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter >::do_get_year
           ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
           [protected], [virtual]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_year() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

4.694.4.8 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_date (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 456 of file `locale_facets_nonio.h`.

4.694.4.9 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_monthname (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 513 of file locale_facets_nonio.h.

4.694.4.10 `template<typename _CharT, typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_time (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 431 of file locale_facets_nonio.h.

4.694.4.11 `template<typename _CharT, typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_weekday (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 484 of file locale_facets_nonio.h.

4.694.4.12 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_year (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 539 of file locale_facets_nonio.h.

4.695.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get_byname<_CharT, _InIter>
```

class `time_get_byname` [22.2.5.2].

Definition at line 686 of file `locale_facets_nonio.h`.

4.695.2 Member Function Documentation

4.695.2.1 `template<typename _CharT, typename _InIter > dateorder std::time_get< _CharT, _InIter >::date_order () const`
`[inline], [inherited]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `timebase::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

Returns

A member of `timebase::dateorder`.

Definition at line 407 of file `locale_facets_nonio.h`.

4.695.2.2 `template<typename _CharT, typename _InIter > virtual dateorder std::time_get< _CharT, _InIter >::do_date_order () const`
`[protected], [virtual], [inherited]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of `timebase::dateorder`.

4.695.2.3 `template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter >::do_get_date (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const`
`[protected], [virtual], [inherited]`

Parse input date string.

This function parses a date according to the format `X` and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See also

`get_date()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <code>tm</code> to fill in.

Returns

Iterator to first char beyond date string.

```
4.695.2.4 template<typename _CharT, typename _InIter> virtual iter_type std::time_get<_CharT, _InIter>::do_get_monthname( iter_type __beg, iter_type __end, ios_base &, ios_base::iostate & __err, tm * __tm ) const [protected], [virtual], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_monthname() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

```
4.695.2.5 template<typename _CharT, typename _InIter> virtual iter_type std::time_get<_CharT, _InIter>::do_get_time( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [protected], [virtual], [inherited]
```

Parse input time string.

This function parses a time according to the format x and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_time() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

```
4.695.2.6  template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter >::do_get_weekday
           ( iter_type __beg, iter_type __end, ios_base & , ios_base::iostate & __err, tm * __tm ) const
           [protected],[virtual],[inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_weekday() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

```
4.695.2.7  template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter >::do_get_year
           ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
           [protected],[virtual],[inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_year() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

4.695.2.8 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_date (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline], [inherited]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 456 of file `locale_facets_nonio.h`.

4.695.2.9 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_monthname (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline], [inherited]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 513 of file locale_facets_nonio.h.

```
4.695.2.10 template<typename _CharT, typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_time ( iter_type
    __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline],
    [inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_time().

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 431 of file locale_facets_nonio.h.

```
4.695.2.11 template<typename _CharT, typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_weekday
    ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
    [inline],[inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 484 of file locale_facets_nonio.h.

```
4.695.2.12 template<typename _CharT, typename _InIter > iter_type std::time_get<_CharT, _InIter >::get_year ( iter_type
    __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline],
    [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 539 of file locale_facets_nonio.h.

4.696.1 Detailed Description

```
template<typename _CharT, typename _Outiter>
class std::time_put<_CharT, _Outiter>
```

Primary class template `time_put`.

This facet encapsulates the code to format and output dates and times according to formats used by `strftime()`.

The `time_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_put` facet.

Definition at line 715 of file `locale_facets_nonio.h`.

4.696.2 Member Typedef Documentation

4.696.3.1 `template<typename _CharT, typename _Outiter> std::time_put<_CharT, _Outiter>::time_put (size_t __refs = 0)`
`[inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 736 of file `locale_facets_nonio.h`.

4.696.3.2 `template<typename _CharT, typename _Outiter > virtual std::time_put< _CharT, _Outiter >::~time_put ()`
`[inline], [protected], [virtual]`

Destructor.

Definition at line 782 of file `locale_facets_nonio.h`.

4.696.4 Member Function Documentation

4.696.4.1 `template<typename _CharT, typename _Outiter > virtual iter_type std::time_put< _CharT, _Outiter >::do_put (`
`iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod) const`
`[protected], [virtual]`

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

`put()` for more details.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

4.696.4.2 `template<typename _CharT, typename _Outiter > iter_type std::time_put< _CharT, _Outiter >::put (iter_type`
`__s, ios_base & __io, char_type __fill, const tm * __tm, const _CharT * __beg, const _CharT * __end) const`

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by `strftime()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

Returns

Iterator after writing.

4.696.4.3 `template<typename _CharT, typename _Outiter> iter_type std::time_put<_CharT, _Outiter>::put (iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod = 0) const [inline]`

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format char and optional modifier. The format and modifier are interpreted as by `strftime()`. It does so by returning `time_put::do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

Definition at line 775 of file `locale_facets_nonio.h`.

4.700.1 Detailed Description

```
template<typename _IntType = int>
class std::uniform_int_distribution< _IntType >
```

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.

Definition at line 1668 of file random.h.

4.700.2 Member Typedef Documentation

4.700.2.1 [template](#)<typename _IntType = int> typedef _IntType [std::uniform_int_distribution](#)< _IntType >::[result_type](#)

The type of the range of the distribution.

Definition at line 1671 of file random.h.

4.700.3 Constructor & Destructor Documentation

4.700.3.1 `template<typename _IntType = int> std::uniform_int_distribution< _IntType >::uniform_int_distribution (_IntType __a = 0, _IntType __b = std::numeric_limits<_IntType>::max()) [inline], [explicit]`

Constructs a uniform distribution object.

Definition at line 1711 of file random.h.

4.700.4 Member Function Documentation

4.700.4.1 `template<typename _IntType = int> result_type std::uniform_int_distribution< _IntType >::max () const [inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1763 of file random.h.

4.700.4.2 `template<typename _IntType = int> result_type std::uniform_int_distribution< _IntType >::min () const [inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1756 of file random.h.

4.700.4.3 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type std::uniform_int_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 1771 of file random.h.

4.700.4.4 `template<typename _IntType = int> param_type std::uniform_int_distribution< _IntType >::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 1741 of file random.h.

4.700.4.5 `template<typename _IntType = int> void std::uniform_int_distribution< _IntType >::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 1749 of file `random.h`.

4.700.4.6 `template<typename _IntType = int> void std::uniform_int_distribution<_IntType>::reset () [inline]`

Resets the distribution state.

Does nothing for the uniform integer distribution.

Definition at line 1727 of file `random.h`.

4.700.5 Friends And Related Function Documentation

4.700.5.1 `template<typename _IntType = int> bool operator== (const uniform_int_distribution<_IntType> &__d1, const uniform_int_distribution<_IntType> &__d2) [friend]`

Return true if two uniform integer distributions have the same parameters.

Definition at line 1806 of file `random.h`.

The documentation for this class was generated from the following file:

4.702.1 Detailed Description

```
template<typename _RealType = double>
class std::uniform_real_distribution<_RealType>
```

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Definition at line 1869 of file random.h.

4.702.2 Member Typedef Documentation

4.702.2.1 `template<typename _RealType = double> typedef _RealType std::uniform_real_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 1872 of file random.h.

4.702.3 Constructor & Destructor Documentation

4.702.3.1 `template<typename _RealType = double> std::uniform_real_distribution<_RealType>::uniform_real_distribution (_RealType __a = _RealType(0), _RealType __b = _RealType(1))`
`[inline], [explicit]`

Constructs a `uniform_real_distribution` object.

Parameters

<code>↔</code> __a	[IN] The lower bound of the distribution.
<code>↔</code> __b	[IN] The upper bound of the distribution.

Definition at line 1915 of file random.h.

4.702.4 Member Function Documentation

4.702.4.1 `template<typename _RealType = double> result_type std::uniform_real_distribution< _RealType >::max ()`
`const [inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1967 of file random.h.

4.702.4.2 `template<typename _RealType = double> result_type std::uniform_real_distribution< _RealType >::min ()`
`const [inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1960 of file random.h.

4.702.4.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type`
`std::uniform_real_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & __urng)`
`[inline]`

Generating functions.

Definition at line 1975 of file random.h.

4.702.4.4 `template<typename _RealType = double> param_type std::uniform_real_distribution< _RealType >::param ()`
`const [inline]`

Returns the parameter set of the distribution.

Definition at line 1945 of file random.h.

4.702.4.5 `template<typename _RealType = double> void std::uniform_real_distribution< _RealType >::param (const`
`param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 1953 of file random.h.

4.702.4.6 `template<typename _RealType = double> void std::uniform_real_distribution< _RealType >::reset ()`
`[inline]`

Resets the distribution state.

Does nothing for the uniform real distribution.

Definition at line 1931 of file random.h.

4.702.5 Friends And Related Function Documentation

4.702.5.1 `template<typename _RealType = double> bool operator==(const uniform_real_distribution<_RealType> &__d1, const uniform_real_distribution<_RealType> &__d2) [friend]`

Return true if two uniform real distributions have the same parameters.

Definition at line 2015 of file random.h.

4.704.1 Detailed Description

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
class std::unique_ptr<_Tp, _Dp>
```

20.7.1.2 unique_ptr for single objects.

Definition at line 129 of file unique_ptr.h.

4.704.2 Constructor & Destructor Documentation

4.704.2.1 `template<typename _Tp, typename _Dp = default_delete<_Tp>> constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr () [inline], [noexcept]`

Default constructor, creates a unique_ptr that owns nothing.

Definition at line 157 of file unique_ptr.h.

Referenced by std::auto_ptr< _Tp >::auto_ptr().

4.704.2.2 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::unique_ptr (pointer __p) [inline], [explicit], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an object of <code>element_type</code>
------------------	---

The deleter will be value-initialized.

Definition at line 169 of file unique_ptr.h.

4.704.2.3 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::unique_ptr (pointer __p, typename conditional< is_reference< deleter_type >::value, deleter_type, const deleter_type & >::type __d) [inline], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an object of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `__d`

Definition at line 181 of file unique_ptr.h.

4.704.2.4 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::unique_ptr (pointer __p, typename remove_reference< deleter_type >::type && __d) [inline], [noexcept]`

Takes ownership of a pointer.

Parameters

\leftrightarrow _p	A pointer to an object of <code>element_type</code>
\leftrightarrow _d	An rvalue reference to a deleter.

The deleter will be initialized with `std::move(__d)`

Definition at line 193 of file `unique_ptr.h`.

4.704.2.5 `template<typename _Tp, typename _Dp = default_delete<_Tp>> constexpr std::unique_ptr<_Tp, _Dp>::unique_ptr(nullptr_t) [inline], [noexcept]`

Creates a `unique_ptr` that owns nothing.

Definition at line 200 of file `unique_ptr.h`.

4.704.2.6 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr<_Tp, _Dp>::unique_ptr(unique_ptr<_Tp, _Dp> && __u) [inline], [noexcept]`

Move constructor.

Definition at line 205 of file `unique_ptr.h`.

4.704.2.7 `template<typename _Tp, typename _Dp = default_delete<_Tp>> template<typename _Up, typename _Ep, typename = Require< is_convertible<typename unique_ptr<_Up, _Ep>::pointer, pointer>, __not__<is_array<_Up>>, typename conditional<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>>::type>> std::unique_ptr<_Tp, _Dp>::unique_ptr(unique_ptr<_Up, _Ep> && __u) [inline], [noexcept]`

Converting constructor from another type.

Requires that the pointer owned by `__u` is convertible to the type of pointer owned by this object, `__u` does not own an array, and `__u` has a compatible deleter type.

Definition at line 220 of file `unique_ptr.h`.

4.704.2.8 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr<_Tp, _Dp>::~~unique_ptr() [inline], [noexcept]`

Destructor, invokes the deleter if the stored pointer is not null.

Definition at line 232 of file `unique_ptr.h`.

4.704.3 Member Function Documentation

4.704.3.1 `template<typename _Tp, typename _Dp = default_delete<_Tp>> pointer std::unique_ptr< _Tp, _Dp >::get ()
const [inline], [noexcept]`

Return the stored pointer.

Definition at line 304 of file `unique_ptr.h`.

Referenced by `std::unique_ptr< _Tp[], _Dp >::swap()`.

4.704.3.2 `template<typename _Tp, typename _Dp = default_delete<_Tp>> deleter_type& std::unique_ptr< _Tp, _Dp
>::get_deleter () [inline], [noexcept]`

Return a reference to the stored deleter.

Definition at line 309 of file `unique_ptr.h`.

4.704.3.3 `template<typename _Tp, typename _Dp = default_delete<_Tp>> const deleter_type& std::unique_ptr< _Tp, _Dp
>::get_deleter () const [inline], [noexcept]`

Return a reference to the stored deleter.

Definition at line 314 of file `unique_ptr.h`.

4.704.3.4 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::operator bool ()
const [inline], [explicit], [noexcept]`

Return `true` if the stored pointer is not null.

Definition at line 318 of file `unique_ptr.h`.

4.704.3.5 `template<typename _Tp, typename _Dp = default_delete<_Tp>> add_lvalue_reference<element_type>::type
std::unique_ptr< _Tp, _Dp >::operator*() const [inline]`

Dereference the stored pointer.

Definition at line 288 of file `unique_ptr.h`.

4.704.3.6 `template<typename _Tp, typename _Dp = default_delete<_Tp>> pointer std::unique_ptr< _Tp, _Dp >::operator-> () const [inline], [noexcept]`

Return the stored pointer.

Definition at line 296 of file `unique_ptr.h`.

4.704.3.7 `template<typename _Tp, typename _Dp = default_delete<_Tp>> unique_ptr& std::unique_ptr< _Tp, _Dp
>::operator=(unique_ptr< _Tp, _Dp > && __u) [inline], [noexcept]`

Move assignment operator.

Parameters

<code>_↔</code>	The object to transfer ownership from.
<code>_u</code>	

Invokes the deleter first if this object owns a pointer.

Definition at line 249 of file `unique_ptr.h`.

```
4.704.3.8 template<typename _Tp, typename _Dp = default_delete<_Tp>> template<typename _Up, typename _Ep >
enable_if< __and_< is_convertible<typename unique_ptr<_Up, _Ep>::pointer, pointer>, __not_<is_array<_Up>
> >::value, unique_ptr<>::type std::unique_ptr<_Tp, _Dp >::operator= ( unique_ptr<_Up, _Ep > && _u )
[inline], [noexcept]
```

Assignment from another type.

Parameters

<code>_↔</code>	The object to transfer ownership from, which owns a convertible pointer to a non-array object.
<code>_u</code>	

Invokes the deleter first if this object owns a pointer.

Definition at line 269 of file `unique_ptr.h`.

```
4.704.3.9 template<typename _Tp, typename _Dp = default_delete<_Tp>> unique_ptr& std::unique_ptr<_Tp, _Dp
>::operator= ( nullptr_t ) [inline], [noexcept]
```

Reset the `unique_ptr` to empty, invoking the deleter if necessary.

Definition at line 278 of file `unique_ptr.h`.

```
4.704.3.10 template<typename _Tp, typename _Dp = default_delete<_Tp>> pointer std::unique_ptr<_Tp, _Dp >::release ( )
[inline], [noexcept]
```

Release ownership of any stored pointer.

Definition at line 325 of file `unique_ptr.h`.

```
4.704.3.11 template<typename _Tp, typename _Dp = default_delete<_Tp>> void std::unique_ptr<_Tp, _Dp >::reset ( pointer
_p=pointer() ) [inline], [noexcept]
```

Replace the stored pointer.

Parameters

<code>_↔</code>	The new pointer to store.
<code>_p</code>	

The deleter will be invoked if a pointer is already owned.

Definition at line 339 of file unique_ptr.h.

4.704.3.12 `template<typename _Tp, typename _Dp = default_delete<_Tp>> void std::unique_ptr<_Tp, _Dp>::swap (unique_ptr<_Tp, _Dp> &__u) [inline], [noexcept]`

Exchange the pointer and deleter with another object.

Definition at line 349 of file unique_ptr.h.

Referenced by `std::unique_ptr<_Tp[], _Dp>::swap()`.

4.705.1 Detailed Description

```
template<typename _Tp, typename _Dp>
class std::unique_ptr< _Tp[], _Dp >
```

20.7.1.3 unique_ptr for array objects with a runtime length

Definition at line 365 of file `unique_ptr.h`.

4.705.2 Constructor & Destructor Documentation

4.705.2.1 `template<typename _Tp, typename _Dp > constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr ()
[inline], [noexcept]`

Default constructor, creates a `unique_ptr` that owns nothing.

Definition at line 414 of file `unique_ptr.h`.

4.705.2.2 `template<typename _Tp, typename _Dp > std::unique_ptr< _Tp[], _Dp >::unique_ptr (pointer __p)
[inline], [explicit], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of <code>element_type</code>
------------------	--

The deleter will be value-initialized.

Definition at line 426 of file `unique_ptr.h`.

4.705.2.3 `template<typename _Tp, typename _Dp > std::unique_ptr< _Tp[], _Dp >::unique_ptr (pointer __p, typename conditional< is_reference< deleter_type >::value, deleter_type, const deleter_type & >::type __d) [inline], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `__d`

Definition at line 444 of file `unique_ptr.h`.

4.705.2.4 `template<typename _Tp, typename _Dp > std::unique_ptr< _Tp[], _Dp >::unique_ptr (pointer __p, typename remove_reference< deleter_type >::type && __d) [inline], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `std::move(__d)`

Definition at line 456 of file `unique_ptr.h`.

4.705.2.5 `template<typename _Tp, typename _Dp > std::unique_ptr< _Tp[], _Dp >::unique_ptr (unique_ptr< _Tp[], _Dp > && __u) [inline], [noexcept]`

Move constructor.

Definition at line 463 of file `unique_ptr.h`.

4.705.2.6 `template<typename _Tp, typename _Dp > constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr (nullptr_t) [inline], [noexcept]`

Creates a `unique_ptr` that owns nothing.

Definition at line 467 of file `unique_ptr.h`.

4.705.2.7 `template<typename _Tp, typename _Dp> std::unique_ptr<_Tp[], _Dp>::~~unique_ptr () [inline]`

Destructor, invokes the deleter if the stored pointer is not null.

Definition at line 480 of file `unique_ptr.h`.

References `std::get_deleter()`.

4.705.3 Member Function Documentation

4.705.3.1 `template<typename _Tp, typename _Dp> pointer std::unique_ptr<_Tp[], _Dp>::get () const [inline], [noexcept]`

Return the stored pointer.

Definition at line 541 of file `unique_ptr.h`.

4.705.3.2 `template<typename _Tp, typename _Dp> deleter_type& std::unique_ptr<_Tp[], _Dp>::get_deleter () [inline], [noexcept]`

Return a reference to the stored deleter.

Definition at line 546 of file `unique_ptr.h`.

4.705.3.3 `template<typename _Tp, typename _Dp> const deleter_type& std::unique_ptr<_Tp[], _Dp>::get_deleter () const [inline], [noexcept]`

Return a reference to the stored deleter.

Definition at line 551 of file `unique_ptr.h`.

4.705.3.4 `template<typename _Tp, typename _Dp> std::unique_ptr<_Tp[], _Dp>::operator bool () const [inline], [explicit], [noexcept]`

Return `true` if the stored pointer is not null.

Definition at line 555 of file `unique_ptr.h`.

4.705.3.5 `template<typename _Tp, typename _Dp> unique_ptr& std::unique_ptr<_Tp[], _Dp>::operator= (unique_ptr<_Tp[], _Dp> && __u) [inline], [noexcept]`

Move assignment operator.

Parameters

<code>__u</code>	The object to transfer ownership from.
------------------	--

Invokes the deleter first if this object owns a pointer.

Definition at line 497 of file unique_ptr.h.

References std::get_deleter().

```
4.705.3.6 template<typename _Tp, typename _Dp > template<typename _Up, typename _Ep > enable_if<__safe_↔
conversion<_Up, _Ep>::value, unique_ptr<>::type std::unique_ptr< _Tp[], _Dp >::operator= ( unique_ptr<
_Up, _Ep > && __u ) [inline], [noexcept]
```

Assignment from another type.

Parameters

<code>↔</code> <code>_u</code>	The object to transfer ownership from, which owns a convertible pointer to an array object.
-----------------------------------	---

Invokes the deleter first if this object owns a pointer.

Definition at line 514 of file unique_ptr.h.

References std::get_deleter().

```
4.705.3.7 template<typename _Tp, typename _Dp > unique_ptr& std::unique_ptr< _Tp[], _Dp >::operator= ( nullptr_t )
[inline], [noexcept]
```

Reset the unique_ptr to empty, invoking the deleter if necessary.

Definition at line 523 of file unique_ptr.h.

```
4.705.3.8 template<typename _Tp, typename _Dp > std::add_lvalue_reference<element_type>::type std::unique_ptr< _Tp[],
_Dp >::operator[]( size_t __i ) const [inline]
```

Access an element of owned array.

Definition at line 533 of file unique_ptr.h.

```
4.705.3.9 template<typename _Tp, typename _Dp > pointer std::unique_ptr< _Tp[], _Dp >::release ( ) [inline],
[noexcept]
```

Release ownership of any stored pointer.

Definition at line 562 of file unique_ptr.h.

```
4.705.3.10 template<typename _Tp, typename _Dp > void std::unique_ptr< _Tp[], _Dp >::reset ( pointer __p = pointer ( )
) [inline], [noexcept]
```

Replace the stored pointer.

Parameters

<code>_↔</code>	The new pointer to store.
<code>_p</code>	

The deleter will be invoked if a pointer is already owned.

Definition at line 576 of file `unique_ptr.h`.

References `std::get_deleter()`, and `std::swap()`.

4.705.3.11 `template<typename _Tp, typename _Dp> void std::unique_ptr<_Tp[], _Dp>::swap(unique_ptr<_Tp[], _Dp> &_u) [inline], [noexcept]`

Exchange the pointer and deleter with another object.

Definition at line 591 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::get()`, `std::operator>()`, `std::operator>=()`, `std::unique_ptr<_Tp, _Dp> <↔ ::swap()`, and `std::swap()`.

The documentation for this class was generated from the following file:

4.706.1 Detailed Description

```
template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::
::allocator<std::pair<const _Key, _Tp> >>
class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator<std::pair<const _Key, _Tp>></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

Definition at line 98 of file `unordered_map.h`.

4.706.3 Constructor & Destructor Documentation

4.706.3.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map (size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eq = key_equal(), const allocator_type & __a = allocator_type()) [inline], [explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 139 of file `unordered_map.h`.

Referenced by `std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map()`.

```
4.706.3.2 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map ( _InputIterator __f, _InputIterator __l, size_type __n = 0,
const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a =
allocator_type() ) [inline]
```

Builds an `unordered_map` from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_map` consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

Definition at line 160 of file `unordered_map.h`.

References `std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map()`.

```
4.706.3.3 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_map ( const unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> & ) [default]
```

Copy constructor.

```
4.706.3.4 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_map ( unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> && ) [default]
```

Move constructor.

```
4.706.3.5 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_map ( const allocator_type & __a ) [inline], [explicit]
```

Creates an `unordered_map` with no elements.

Parameters

\longleftrightarrow _a	An allocator object.
-----------------------------	----------------------

Definition at line 179 of file unordered_map.h.

References std::move(), and std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map().

4.706.3.6 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (initializer_list< value_type > __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]

Builds an unordered_map from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eqf	A key equality functor.
__a	An allocator object.

Create an unordered_map consisting of copies of the elements in the list. This is linear in N (where N is __l.size()).

Definition at line 214 of file unordered_map.h.

References std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator=().

4.706.4 Member Function Documentation

4.706.4.1 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (const key_type & __k) [inline]

Access to unordered_map data.

Parameters

\longleftrightarrow _k	The key for which data should be retrieved.
-----------------------------	---

Returns

A reference to the data whose key is equal to __k, if such a data is present in the unordered_map.

Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

Definition at line 643 of file `unordered_map.h`.

```
4.706.4.2  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const mapped_type& std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::at ( const key_type & __k ) const    [inline]
```

Access to `unordered_map` data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

Definition at line 647 of file `unordered_map.h`.

```
4.706.4.3  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_map`.

Definition at line 278 of file `unordered_map.h`.

```
4.706.4.4  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::begin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

Definition at line 287 of file `unordered_map.h`.

```
4.706.4.5  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::begin ( size_type __n )    [inline]
```

Returns a read/write iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read/write local iterator.

Definition at line 688 of file unordered_map.h.

```
4.706.4.6  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::begin ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 699 of file unordered_map.h.

```
4.706.4.7  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::bucket_count ( ) const    [inline], [noexcept]
```

Returns the number of buckets of the unordered_map.

Definition at line 655 of file unordered_map.h.

```
4.706.4.8  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::cbegin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_map.

Definition at line 291 of file unordered_map.h.

```
4.706.4.9  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::cbegin ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

\leftarrow _n	The bucket index.
--------------------	-------------------

Returns

A read-only local iterator.

Definition at line 703 of file unordered_map.h.

```
4.706.4.10 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::cend( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.

Definition at line 313 of file unordered_map.h.

```
4.706.4.11 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::cend( size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

\leftarrow _n	The bucket index.
--------------------	-------------------

Returns

A read-only local iterator.

Definition at line 729 of file unordered_map.h.

```
4.706.4.12 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::clear( ) [inline], [noexcept]
```

Erases all elements in an unordered_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 527 of file unordered_map.h.

```
4.706.4.13 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::count( const key_type &__x ) const [inline]
```

Finds the number of elements.

Parameters

<code>_↔</code>	Key to count.
<code>_X</code>	

Returns

Number of elements with specified key.

This function only makes sense for `unordered_multimap`; for `unordered_map` the result will either be 0 (not present) or 1 (present).

Definition at line 591 of file `unordered_map.h`.

```
4.706.4.14 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> std::pair<iterator, bool>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace ( _Args &&... _args ) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 340 of file `unordered_map.h`.

```
4.706.4.15 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... _args ) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 370 of file `unordered_map.h`.

```
4.706.4.16  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::empty( ) const    [inline], [noexcept]
```

Returns true if the `unordered_map` is empty.

Definition at line 258 of file `unordered_map.h`.

```
4.706.4.17  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =

            _Alloc >::end( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_map`.

Definition at line 309 of file `unordered_map.h`.

```
4.706.4.19  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
            _Alloc >::end( size_type __n )    [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read/write local iterator.

Definition at line 714 of file unordered_map.h.

```
4.706.4.20 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::end ( size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_↔$	The bucket index.
$_n$	

Returns

A read-only local iterator.

Definition at line 725 of file unordered_map.h.

```
4.706.4.21 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::unordered_map<_Key, _Tp,
_Hash, _Pred, _Alloc>::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

$_↔$	Key to be located.
$_x$	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

Definition at line 604 of file unordered_map.h.

```
4.706.4.22 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::pair<const_iterator, const_iterator>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::equal_range ( const key_type & __x ) const
[inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_x</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

Definition at line 608 of file `unordered_map.h`.

```
4.706.4.23  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::erase( const_iterator __position ) [inline]
```

Erases an element from an `unordered_map`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 477 of file `unordered_map.h`.

```
4.706.4.24  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::erase( iterator __it ) [inline]
```

Erases an element from an `unordered_map`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 482 of file `unordered_map.h`.

```
4.706.4.25  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::erase( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_map`. For an `unordered_map` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 499 of file `unordered_map.h`.

```
4.706.4.26  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::erase( const_iterator __first, const_iterator __last ) [inline]
```

Erases a `[__first, __last)` range of elements from an `unordered_map`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_map`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 517 of file `unordered_map.h`.

```
4.706.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::find ( const key_type & __x ) [inline]
```

Tries to locate an element in an `unordered_map`.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 573 of file `unordered_map.h`.

```
4.706.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::find ( const key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_map`.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 577 of file `unordered_map.h`.

```
4.706.4.29 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the unordered_map was constructed.

Definition at line 251 of file unordered_map.h.

```
4.706.4.30 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> hasher std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_map was constructed.

Definition at line 549 of file unordered_map.h.

```
4.706.4.31 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, bool> std::unordered_map<_Key, _Tp,
_Hash, _Pred, _Alloc>::insert ( const value_type & __x ) [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

	Pair to be inserted (see std::make_pair for easy creation of pairs).
	

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.

Insertion requires amortized constant time.

Definition at line 392 of file unordered_map.h.

```
4.706.4.32 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _Pair, typename = typename
std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> std::pair<iterator, bool>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::insert ( _Pair && __x ) [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 399 of file `unordered_map.h`.

```
4.706.4.33 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::insert ( const_iterator __hint, const value_type & __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 426 of file `unordered_map.h`.

std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_map<_Key,
_Tp, _Hash, _Pred, _Alloc>::insert ( const_iterator __hint, _Pair && __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 433 of file `unordered_map.h`.

```
4.706.4.35  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > void std::unordered_map<
            _Key, _Tp, _Hash, _Pred, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 448 of file `unordered_map.h`.

```
4.706.4.36  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =

>::max_load_factor( float __z ) [inline]
```

Change the unordered_map maximum load factor.

Parameters

	The new maximum load factor.
<code>__z</code>	

Definition at line 751 of file unordered_map.h.

```
4.706.4.42 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the unordered_map.

Definition at line 268 of file unordered_map.h.

```
4.706.4.43 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::operator= ( const unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> & ) [default]
```

Copy assignment operator.

Referenced by std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map(), and std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_multimap().

```
4.706.4.44 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::operator= ( unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> && ) [default]
```

Move assignment operator.

```
4.706.4.45 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::operator= ( initializer_list<value_type> __l ) [inline]
```

Unordered_map list assignment operator.

Parameters

↵	An initializer_list.
↵	
↵	
↵	
l	

This function fills an unordered_map with copies of the elements in the initializer list __l.

Note that the assignment completely changes the unordered_map and that the resulting unordered_map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 242 of file unordered_map.h.

```
4.706.4.46 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::operator[] ( const key_type & __k ) [inline]
```

Subscript ([]) access to unordered_map data.

Parameters

\leftrightarrow _k	The key for which data should be retrieved.
-------------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 626 of file unordered_map.h.

```
4.706.4.47  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred,
            _Alloc>::operator[]( key_type &&_k ) [inline]
```

Subscript ([]) access to unordered_map data.

Parameters

\leftrightarrow _k	The key for which data should be retrieved.
-------------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 630 of file unordered_map.h.

References std::move().

```
4.706.4.48  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::rehash( size_type __n ) [inline]
```

May rehash the unordered_map.

Parameters

<code>_↔</code>	The new number of buckets.
<code>_n</code>	

Rehash will occur only if the new number of buckets respect the unordered_map maximum load factor.

Definition at line 762 of file unordered_map.h.

```
4.706.4.49 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::reserve ( size_type __n ) [inline]
```

Prepare the unordered_map for a specified number of elements.

Parameters

<code>_↔</code>	Number of elements required.
<code>_n</code>	

Same as rehash(ceil(n / max_load_factor())).

Definition at line 773 of file unordered_map.h.

```
4.706.4.50 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::size ( ) const [inline], [noexcept]
```

Returns the size of the unordered_map.

Definition at line 263 of file unordered_map.h.

```
4.706.4.51 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::swap ( unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> &__x ) [inline], [noexcept]
```

Swaps data with another unordered_map.

Parameters

<code>_↔</code>	An unordered_map of the same element and allocator types.
<code>_x</code>	

This exchanges the elements between two unordered_map in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

Definition at line 540 of file unordered_map.h.

4.707.1 Detailed Description

```
template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator<std::pair<const _Key, _Tp>></code> .

Meets the requirements of a `container`, and `unordered associative container`

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

Definition at line 810 of file `unordered_map.h`.

4.707.3 Constructor & Destructor Documentation

4.707.3.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline], [explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 851 of file unordered_map.h.

4.707.3.2 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (_InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]`

Builds an unordered_multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multimap` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

Definition at line 872 of file `unordered_map.h`.

```
4.707.3.3  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
           = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
           >::unordered_multimap ( const unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> & ) [default]
```

Copy constructor.

```
4.707.3.4  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
           = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
           >::unordered_multimap ( unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> && ) [default]
```

Move constructor.

```
4.707.3.5  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
           = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
           >::unordered_multimap ( const allocator_type & __a ) [inline],[explicit]
```

Creates an `unordered_multimap` with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 891 of file `unordered_map.h`.

References `std::move()`.

```
4.707.3.6  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
           = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
           >::unordered_multimap ( initializer_list<value_type> __l, size_type __n = 0, const hasher & __hf
           = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() )
           [inline]
```

Builds an `unordered_multimap` from an `initializer_list`.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_multimap consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 926 of file unordered_map.h.

References `std::unordered_map<_Key,_Tp,_Hash,_Pred,_Alloc>::operator=()`.

4.707.4 Member Function Documentation

4.707.4.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin () [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the unordered_multimap.

Definition at line 990 of file unordered_map.h.

4.707.4.2 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

Definition at line 999 of file unordered_map.h.

4.707.4.3 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin (size_type __n) [inline]`

Returns a read/write iterator pointing to the first bucket element.

Parameters

<code>__↔</code>	The bucket index.
<code>__n</code>	

Returns

A read/write local iterator.

Definition at line 1339 of file unordered_map.h.

```
4.707.4.4  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>> const_local_iterator std::unordered_multimap<_Key, _Tp,
_Hash, _Pred, _Alloc >::begin ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 1350 of file unordered_map.h.

```
4.707.4.5  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc >::bucket_count ( ) const    [inline], [noexcept]
```

Returns the number of buckets of the unordered_multimap.

Definition at line 1306 of file unordered_map.h.

```
4.707.4.6  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash,
_Pred, _Alloc >::cbegin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

Definition at line 1003 of file unordered_map.h.

```
4.707.4.7  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>> const_local_iterator std::unordered_multimap<_Key, _Tp,
_Hash, _Pred, _Alloc >::cbegin ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 1354 of file unordered_map.h.

4.707.4.8 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cend() const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

Definition at line 1025 of file unordered_map.h.

4.707.4.9 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cend(size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1380 of file unordered_map.h.

4.707.4.10 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::clear() [inline], [noexcept]`

Erases all elements in an unordered_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1222 of file unordered_map.h.

4.707.4.11 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::count(const key_type &__x) const [inline]`

Finds the number of elements.

Parameters

<code>__x</code>	Key to count.
------------------	---------------

Returns

Number of elements with specified key.

Definition at line 1283 of file unordered_map.h.

```
4.707.4.12 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>,
class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered_multimap.

Insertion requires amortized constant time.

Definition at line 1048 of file unordered_map.h.

```
4.707.4.13 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>,
class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args
&&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from `__args`.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1074 of file unordered_map.h.

_Pred, _Alloc >::end( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

Definition at line 1021 of file unordered_map.h.

```
4.707.4.17 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_multimap< _Key, _Tp, _Hash,
_Pred, _Alloc >::end( size_type __n ) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read/write local iterator.

Definition at line 1365 of file unordered_map.h.

```
4.707.4.18 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap< _Key, _Tp,
_Hash, _Pred, _Alloc >::end( size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

Definition at line 1376 of file `unordered_map.h`.

```
4.707.4.19 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, iterator> std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_x</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1294 of file `unordered_map.h`.

```
4.707.4.20 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class

std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) const
[inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_x</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1298 of file `unordered_map.h`.

4.707.4.21 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::erase (const_iterator __position) [inline]`

Erases an element from an unordered_multimap.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1172 of file unordered_map.h.

4.707.4.22 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::erase (iterator __it) [inline]`

Erases an element from an unordered_multimap.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1177 of file unordered_map.h.

4.707.4.23 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::erase (const key_type & __x) [inline]`

Erases elements according to the provided key.

Parameters

<code>_↔</code>	Key of elements to be erased.
<code>_x</code>	

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1193 of file `unordered_map.h`.

```
4.707.4.24  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
             std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
             _Alloc>::erase ( const_iterator __first, const_iterator __last )  [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multimap`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1212 of file `unordered_map.h`.

```
4.707.4.25  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
             std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
             _Alloc>::find ( const key_type & __x )  [inline]
```

Tries to locate an element in an `unordered_multimap`.

Parameters

<code>_↔</code>	Key to be located.
<code>_x</code>	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 1269 of file unordered_map.h.

```
4.707.4.26 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash,
_Pred, _Alloc>::find ( const key_type & __x ) const [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

\leftrightarrow	Key to be located.
$_x$	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 1273 of file unordered_map.h.

```
4.707.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::unordered_multimap<_Key, _Tp, _Hash,
_Pred, _Alloc>::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the unordered_multimap was constructed.

Definition at line 963 of file unordered_map.h.

```
4.707.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> hasher std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_multimap was constructed.

Definition at line 1245 of file unordered_map.h.

```
4.707.4.29 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::insert ( const value_type & __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1088 of file `unordered_map.h`.

```
4.707.4.30  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
              _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair, typename = typename
              std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap<
              _Key, _Tp, _Hash, _Pred, _Alloc >::insert( _Pair && __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1095 of file `unordered_map.h`.

```
4.707.4.31  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
              std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
              _Alloc >::insert( const_iterator __hint, const value_type & __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1120 of file unordered_map.h.

```
4.707.4.32 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class

        std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap<
        _Key, _Tp, _Hash, _Pred, _Alloc >::insert( const_iterator __hint, _Pair && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1127 of file unordered_map.h.

```
4.707.4.33 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
        _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > void
        std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert( _InputIterator __first, _InputIterator __last )
        [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 1142 of file unordered_map.h.

```
4.707.4.34 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::insert( initializer_list<value_type> __l ) [inline]
```

Attempts to insert a list of elements into the unordered_multimap.

Parameters

↔	A std::initializer_list<value_type> of elements to be inserted.
↔	
↔	
↔	
/	

Complexity similar to that of the range constructor.

Definition at line 1154 of file unordered_map.h.

```
4.707.4.35 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =

             _Tp, _Hash, _Pred, _Alloc>::operator=( const unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> & )
             [default]
```

Copy assignment operator.

```
4.707.4.42  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
             std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key,
             _Tp, _Hash, _Pred, _Alloc>::operator=( unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> && )
             [default]
```

Move assignment operator.

```
4.707.4.43  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
             std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key, _Tp,
             _Hash, _Pred, _Alloc>::operator=( initializer_list<value_type> __l )    [inline]
```

Unordered_multimap list assignment operator.

Parameters

<code>↔</code>	An initializer_list.
<code>_↔</code>	
<code>↔</code>	
<code>_↔</code>	
<code>/</code>	

This function fills an unordered_multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_multimap and that the resulting unordered_multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 954 of file unordered_map.h.

4.707.4.44 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::rehash(size_type __n) [inline]`

May rehash the unordered_multimap.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered_multimap maximum load factor.

Definition at line 1413 of file unordered_map.h.

4.707.4.45 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::reserve(size_type __n) [inline]`

Prepare the unordered_multimap for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 1424 of file unordered_map.h.

References `std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::swap()`, and `std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::swap()`.

4.707.4.46 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::size() const [inline], [noexcept]`

Returns the size of the unordered_multimap.

Definition at line 975 of file unordered_map.h.

4.707.4.47 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::swap(unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> &__x) [inline], [noexcept]`

Swaps data with another unordered_multimap.

Parameters

<code>_↔</code>	An unordered_multimap of the same element and allocator types.
<code>_X</code>	

This exchanges the elements between two unordered_multimap in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 1236 of file unordered_map.h.

Referenced by `std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::reserve()`.

4.708.1 Detailed Description

```
template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>
class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is _Hashtable, dispatched at compile time via template alias __umset_hashtable.

Definition at line 728 of file unordered_set.h.

4.708.3 Constructor & Destructor Documentation

```
4.708.3.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset
( size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const
allocator_type & __a = allocator_type() ) [inline],[explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 767 of file unordered_set.h.

```
4.708.3.2 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename _InputIterator > std::unordered_multiset< _Value, _Hash, _Pred,
_Alloc >::unordered_multiset ( _InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf
= hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() )
[inline]
```

Builds an unordered_multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_multiset consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

Definition at line 788 of file unordered_set.h.

```
4.708.3.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

```
4.708.3.4 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

```
4.708.3.5 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
initializer_list< value_type > __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf
= key_equal(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_multiset from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_multiset consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 813 of file unordered_set.h.

References `std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator=()`.

```
4.708.3.6 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
const allocator_type & __a ) [inline], [explicit]
```

Creates an unordered_multiset with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 834 of file unordered_set.h.

References `std::move()`.

4.708.4 Member Function Documentation

```
4.708.4.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( )
[inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 907 of file unordered_set.h.

```
4.708.4.2 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 911 of file unordered_set.h.

```
4.708.4.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_ \leftrightarrow$	The bucket index.
$_n$	

Returns

A read-only local iterator.

Definition at line 1235 of file unordered_set.h.

```
4.708.4.4  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::begin
( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_ \leftrightarrow$	The bucket index.
$_n$	

Returns

A read-only local iterator.

Definition at line 1239 of file unordered_set.h.

```
4.708.4.5  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::bucket_count ( )
const    [inline], [noexcept]
```

Returns the number of buckets of the unordered_multiset.

Definition at line 1201 of file unordered_set.h.

```
4.708.4.6  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cbegin ( )
const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 934 of file unordered_set.h.

```
4.708.4.7  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc
>::cbegin ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 1243 of file unordered_set.h.

```
4.708.4.8  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 942 of file unordered_set.h.

```
4.708.4.9  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend
( size_type _n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 1263 of file unordered_set.h.

```
4.708.4.10 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear ( )
[inline], [noexcept]
```

Erases all elements in an unordered_multiset.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1118 of file unordered_set.h.

```
4.708.4.11 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count( const
key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>_↔</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

Definition at line 1178 of file unordered_set.h.

```
4.708.4.12  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash,
            _Pred, _Alloc >::emplace ( _Args &&... __args )  [inline]
```

Builds and insert an element into the unordered_multiset.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 956 of file unordered_set.h.

```
4.708.4.13  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash,
            _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args )  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.↵

Insertion requires amortized constant time.

Definition at line 978 of file unordered_set.h.

```
4.708.4.14 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> bool std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::empty ( ) const
[inline], [noexcept]
```

Returns true if the unordered_multiset is empty.

Definition at line 886 of file unordered_set.h.

```
4.708.4.15 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end ( )
[inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 921 of file unordered_set.h.

```
4.708.4.16 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 925 of file unordered_set.h.

```
4.708.4.17 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end (
size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<u>↵</u>	The bucket index.
<u><i>n</i></u>	

Returns

A read-only local iterator.

Definition at line 1255 of file unordered_set.h.

```
4.708.4.18  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end
            ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1259 of file unordered_set.h.

```
4.708.4.19  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_multiset< _Value, _Hash, _Pred,
            _Alloc >::equal_range ( const key_type & __x )    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1189 of file unordered_set.h.

```
4.708.4.20  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_multiset< _Value,
            _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) const    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1193 of file unordered_set.h.

```
4.708.4.21 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
const_iterator __position ) [inline]
```

Erases an element from an unordered_multiset.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1064 of file unordered_set.h.

```
4.708.4.22 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase ( iterator
__it ) [inline]
```

Erases an element from an unordered_multiset.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1069 of file unordered_set.h.

```
4.708.4.23  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::erase( const
            key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1087 of file `unordered_set.h`.

```
4.708.4.24  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multiset`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1107 of file `unordered_set.h`.

```
4.708.4.25  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::find ( const
            key_type & __x ) [inline]
```

Tries to locate an element in an `unordered_multiset`.

Parameters

$_x$	Element to be located.
-------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 1164 of file unordered_set.h.

```
4.708.4.26 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find ( const
key_type & _x ) const [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

$_x$	Element to be located.
-------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 1168 of file unordered_set.h.

```
4.708.4.27 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the unordered_multiset was constructed.

Definition at line 879 of file unordered_set.h.

```
4.708.4.28 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function ( )
const [inline]
```

Returns the hash functor object with which the unordered_multiset was constructed.

Definition at line 1140 of file unordered_set.h.

4.708.4.29 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (const
value_type & __x) [inline]`

Inserts an element into the unordered_multiset.

Parameters

<code>_↔</code>	Element to be inserted.
<code>_x</code>	

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 990 of file unordered_set.h.

```
4.708.4.30 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
value_type && _x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>_↔</code>	Element to be inserted.
<code>_x</code>	

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 994 of file unordered_set.h.

References std::move().

```
4.708.4.31 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
const_iterator __hint, const value_type & _x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17>.↵

```
4.708.4.33  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> template<typename _InputIterator > void std::unordered_multiset<_Value, _Hash,
            _Pred, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that inserts a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 1034 of file unordered_set.h.

```
4.708.4.34 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert ( initializer_list<
value_type> &_l ) [inline]
```

Inserts a list of elements into the unordered_multiset.

Parameters

↩	A std::initializer_list<value_type> of elements to be inserted.
↩	
↩	
↩	
↩	
↩	

Complexity similar to that of the range constructor.

Definition at line 1045 of file unordered_set.h.

```
4.708.4.35 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq ( )
const [inline]
```

Returns the key comparison object with which the unordered_multiset was constructed.

Definition at line 1146 of file unordered_set.h.

```
4.708.4.36 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const
[inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 1271 of file unordered_set.h.

```
4.708.4.37 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::max_bucket_count ( ) const [inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multiset.

Definition at line 1206 of file unordered_set.h.

```
4.708.4.38 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( )
const [inline], [noexcept]
```

Returns a positive number that the unordered_multiset tries to keep the load factor less than or equal to.

Definition at line 1277 of file unordered_set.h.

4.708.4.39 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_load_factor (float
__z) [inline]`

Change the unordered_multiset maximum load factor.

Parameters

<code>_Z</code>	The new maximum load factor.
-----------------	------------------------------

Definition at line 1285 of file unordered_set.h.

```
4.708.4.40 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size ( )
const [inline], [noexcept]
```

Returns the maximum size of the unordered_multiset.

Definition at line 896 of file unordered_set.h.

```
4.708.4.41 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::operator= ( const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

```
4.708.4.42 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::operator= ( unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

```
4.708.4.43 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::operator= ( initializer_list< value_type > __l ) [inline]
```

Unordered_multiset list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered_multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_multiset and that the resulting unordered_set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 870 of file unordered_set.h.

4.708.4.44 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::rehash (size_type __n) [inline]`

May rehash the unordered_multiset.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered_multiset maximum load factor.

Definition at line 1296 of file unordered_set.h.

4.708.4.45 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::reserve (size_type __n) [inline]`

Prepare the unordered_multiset for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 1307 of file unordered_set.h.

References `std::unordered_set<_Value, _Hash, _Pred, _Alloc>::swap()`, and `std::unordered_multiset<_Value, __Hash, _Pred, _Alloc>::swap()`.

4.708.4.46 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::size () const [inline], [noexcept]`

Returns the size of the unordered_multiset.

Definition at line 891 of file unordered_set.h.

4.708.4.47 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::swap (unordered_multiset<_Value, _Hash, _Pred, _Alloc> &__x) [inline], [noexcept]`

Swaps data with another unordered_multiset.

Parameters

<code>_↔</code>	An unordered_multiset of the same element and allocator types.
<code>_X</code>	

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 1131 of file `unordered_set.h`.

Referenced by `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve()`.

4.709.1 Detailed Description

```
template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>
class std::unordered_set< _Value, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a `container`, and `unordered associative container`

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

Definition at line 93 of file `unordered_set.h`.

4.709.3 Constructor & Destructor Documentation

4.709.3.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set(size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline], [explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 132 of file unordered_set.h.

Referenced by std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set().

4.709.3.2 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename _InputIterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (_InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]`

Builds an unordered_set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_set consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first,__last)`).

Definition at line 153 of file unordered_set.h.

References std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set().

4.709.3.3 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (const unordered_set< _Value, _Hash, _Pred, _Alloc > &) [default]`

Copy constructor.

4.709.3.4 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (unordered_set< _Value, _Hash, _Pred, _Alloc > &&) [default]`

Move constructor.

4.709.3.5 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (const allocator_type & __a) [inline],[explicit]`

Creates an unordered_set with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 172 of file unordered_set.h.

References `std::move()`, and `std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set()`.

4.709.3.6 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set(initializer_list<value_type> __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]`

Builds an `unordered_set` from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_set` consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 207 of file unordered_set.h.

References `std::unordered_set<_Value, _Hash, _Pred, _Alloc>::operator=()`.

4.709.4 Member Function Documentation

4.709.4.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin() [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 272 of file unordered_set.h.

4.709.4.2 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin() const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 276 of file unordered_set.h.

4.709.4.3 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>> local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin(size_type __n) [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 623 of file unordered_set.h.

```
4.709.4.4  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin (
size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 627 of file unordered_set.h.

```
4.709.4.5  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::bucket_count ( ) const
[inline], [noexcept]
```

Returns the number of buckets of the unordered_set.

Definition at line 589 of file unordered_set.h.

```
4.709.4.6  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cbegin ( ) const
[inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

Definition at line 299 of file unordered_set.h.

```
4.709.4.7  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cbegin (
size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_ \leftrightarrow$ $_n$	The bucket index.
-------------------------------	-------------------

Returns

A read-only local iterator.

Definition at line 631 of file unordered_set.h.

```
4.709.4.8  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end ( ) const
[inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

Definition at line 307 of file unordered_set.h.

```
4.709.4.9  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end (
size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_ \leftrightarrow$ $_n$	The bucket index.
-------------------------------	-------------------

Returns

A read-only local iterator.

Definition at line 651 of file unordered_set.h.

```
4.709.4.10 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::clear ( ) [inline],
[noexcept]
```

Erases all elements in an unordered_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 500 of file unordered_set.h.

```
4.709.4.11 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::count ( const
key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>_↔</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).

Definition at line 564 of file unordered_set.h.

```
4.709.4.12 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename... _Args> std::pair<iterator, bool> std::unordered_set<
_Value, _Hash, _Pred, _Alloc >::emplace ( _Args &&... _args ) [inline]
```

Attempts to build and insert an element into the unordered_set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

Definition at line 329 of file unordered_set.h.

```
4.709.4.13 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename... _Args> iterator std::unordered_set< _Value, _Hash, _Pred,
_Alloc >::emplace_hint ( const_iterator __pos, _Args &&... _args ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires amortized constant time.

Definition at line 355 of file `unordered_set.h`.

4.709.4.14  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> bool std::unordered_set<_Value, _Hash, _Pred, _Alloc >::empty ( ) const
            [inline], [noexcept]
```

Returns true if the `unordered_set` is empty.

Definition at line 251 of file `unordered_set.h`.

```
4.709.4.15  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::end ( ) [inline],
            [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 286 of file `unordered_set.h`.

```
4.709.4.16  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::end ( ) const
            [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 290 of file `unordered_set.h`.

```
4.709.4.17  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::end ( size_type
            __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 643 of file unordered_set.h.

```
4.709.4.18 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end (
size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

Definition at line 647 of file unordered_set.h.

```
4.709.4.19 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::
equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

$_x$	Key to be located.
-------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 577 of file unordered_set.h.

```
4.709.4.20 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_set<_Value, _Hash,
_Pred, _Alloc>::equal_range ( const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__key</code>	Key to be located.
--------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 581 of file `unordered_set.h`.

```
4.709.4.21  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
             std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( const_iterator
             __position ) [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 450 of file `unordered_set.h`.

```
4.709.4.22  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
             std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( iterator __it )
             [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 455 of file `unordered_set.h`.

```
4.709.4.23  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc >::erase ( const
            key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 472 of file `unordered_set.h`.

```
4.709.4.24  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::erase ( const_iterator
            __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_set`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 490 of file `unordered_set.h`.

```
4.709.4.25  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::find ( const key_type &
            __x ) [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 546 of file `unordered_set.h`.

```
4.709.4.26  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::find ( const
            key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 550 of file `unordered_set.h`.

```
4.709.4.27 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> allocator_type std::unordered_set<_Value, _Hash, _Pred, _Alloc >::get_allocator ( )
const [inline],[noexcept]
```

Returns the allocator object with which the unordered_set was constructed.

Definition at line 244 of file unordered_set.h.

```
4.709.4.28 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> hasher std::unordered_set<_Value, _Hash, _Pred, _Alloc >::hash_function ( ) const
[inline]
```

Returns the hash functor object with which the unordered_set was constructed.

Definition at line 522 of file unordered_set.h.

```
4.709.4.29 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert
( const value_type & __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

Definition at line 373 of file unordered_set.h.

```
4.709.4.30 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert
( value_type && __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

Definition at line 377 of file `unordered_set.h`.

References `std::move()`.

```
4.709.4.31  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::insert ( const_iterator
            __hint, const value_type & __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.↔

Insertion requires amortized constant.

```
4.709.4.32  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::insert ( const_iterator
            __hint, value_type && __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

std::allocator<_Value>> template<typename _InputIterator> void std::unordered_set<_Value, _Hash, _Pred,
_Alloc>::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 421 of file `unordered_set.h`.

```
4.709.4.34 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::insert ( initializer_list<
value_type> __l ) [inline]
```

Attempts to insert a list of elements into the `unordered_set`.

Parameters

<code>__l</code>	A <code>std::initializer_list<value_type></code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 432 of file `unordered_set.h`.

```
4.709.4.35 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =

```

Returns the average number of elements per bucket.

Definition at line 659 of file unordered_set.h.

```
4.709.4.37 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_bucket_count ( )
const [inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_set.

Definition at line 594 of file unordered_set.h.

```
4.709.4.38 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_load_factor ( ) const
[inline], [noexcept]
```

Returns a positive number that the unordered_set tries to keep the load factor less than or equal to.

Definition at line 665 of file unordered_set.h.

```
4.709.4.39 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_load_factor ( float __z )
[inline]
```

Change the unordered_set maximum load factor.

Parameters

	The new maximum load factor.
__z	

Definition at line 673 of file unordered_set.h.

```
4.709.4.40 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_size ( ) const
[inline], [noexcept]
```

Returns the maximum size of the unordered_set.

Rehash will occur only if the new number of buckets respect the unordered_set maximum load factor.

Definition at line 684 of file unordered_set.h.

```
4.709.4.45  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve ( size_type __n )
            [inline]
```

Prepare the unordered_set for a specified number of elements.

Parameters

 <code>__n</code>	Number of elements required.
--	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 695 of file unordered_set.h.

```
4.709.4.46  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size ( ) const
            [inline], [noexcept]
```

Returns the size of the unordered_set.

Definition at line 256 of file unordered_set.h.

```
4.709.4.47  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap ( unordered_set<
            _Value, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_set.

Parameters

 <code>__x</code>	An unordered_set of the same element and allocator types.
--	---

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 513 of file unordered_set.h.

Referenced by `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve()`.

4.710 std::uses_allocator< _Tp, _Alloc > Struct Template Reference

Inherits integral_constant< bool, __uses_allocator_helper< _Tp, _Alloc >::value >.

4.710.1 Detailed Description

```
template<typename _Tp, typename _Alloc>
struct std::uses_allocator< _Tp, _Alloc >
```

Declare uses_allocator so it can be specialized in <queue> etc.

[allocator.uses.trait]

Definition at line 71 of file memoryfwd.h.

The documentation for this struct was generated from the following file:

- [memoryfwd.h](#)

4.711.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector< _Tp, _Alloc >
```

A standard container which offers fixed time access to individual elements in any order.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

Definition at line 214 of file `stl_vector.h`.

4.711.2 Constructor & Destructor Documentation

4.711.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ()`
`[inline], [noexcept]`

Creates a vector with no elements.

Definition at line 253 of file `stl_vector.h`.

4.711.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (const allocator_type &__a)` `[inline], [explicit], [noexcept]`

Creates a vector with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 264 of file `stl_vector.h`.

4.711.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (size_type __n, const allocator_type &__a = allocator_type())` `[inline], [explicit]`

Creates a vector with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` default constructed elements.

Definition at line 277 of file `stl_vector.h`.

4.711.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (size_type __n, const value_type &__value, const allocator_type &__a = allocator_type())` `[inline]`

Creates a vector with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` copies of `__value`.

Definition at line 289 of file `stl_vector.h`.

4.711.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (const vector<_Tp, _Alloc> &__x) [inline]`

Vector copy constructor.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The newly-created vector uses a copy of the allocation object used by `__x`. All the elements of `__x` are copied, but any extra memory in `__x` (for fast expansion) will not be copied.

Definition at line 318 of file `stl_vector.h`.

4.711.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (vector<_Tp, _Alloc> &&__x) [inline], [noexcept]`

Vector move constructor.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The newly-created vector contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified vector.

Definition at line 335 of file `stl_vector.h`.

4.711.2.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (const vector<_Tp, _Alloc> &__x, const allocator_type &__a) [inline]`

Copy constructor with alternative allocator.

Definition at line 339 of file `stl_vector.h`.

4.711.2.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (vector<_Tp, _Alloc> &&__rv, const allocator_type &__m) [inline], [noexcept]`

Move constructor with alternative allocator.

Definition at line 348 of file `stl_vector.h`.

4.711.2.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (initializer_list<value_type> __l, const allocator_type &__a = allocator_type()) [inline]`

Builds a vector from an initializer list.

Parameters

$_l$	An initializer_list.
$_a$	An allocator.

Create a vector consisting of copies of the elements in the initializer_list $_l$.

This will call the element type's copy constructor N times (where N is $_l.size()$) and do no memory reallocation.

Definition at line 373 of file stl_vector.h.

```
4.711.2.10 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
std::_RequireInputIter<_InputIterator>> std::vector<_Tp, _Alloc>::vector ( _InputIterator __first, _InputIterator
__last, const allocator_type & __a = allocator_type() ) [inline]
```

Builds a vector from a range.

Parameters

$_first$	An input iterator.
$_last$	An input iterator.
$_a$	An allocator.

Create a vector consisting of copies of the elements from [first,last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

Definition at line 401 of file stl_vector.h.

```
4.711.2.11 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::~~vector ( )
[inline], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 423 of file stl_vector.h.

4.711.3 Member Function Documentation

```
4.711.3.1 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _ForwardIterator> pointer
std::vector<_Tp, _Alloc>::M_allocate_and_copy ( size_type __n, _ForwardIterator __first, _ForwardIterator __last )
[inline], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain n bytes of memory, and then copies [first,last) into it.

Definition at line 1221 of file stl_vector.h.

4.711.3.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::_M_range_check (size_type __n) const [inline], [protected]`

Safety check used only from `at()`.

Definition at line 800 of file `stl_vector.h`.

4.711.3.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::assign (size_type __n, const value_type & __val) [inline]`

Assigns a given value to a vector.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 488 of file `stl_vector.h`.

4.711.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> void std::vector<_Tp, _Alloc>::assign (_InputIterator __first, _InputIterator __last) [inline]`

Assigns a range to a vector.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a vector with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 507 of file `stl_vector.h`.

4.711.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::assign (initializer_list<value_type> & __l) [inline]`

Assigns an initializer list to a vector.

Parameters

\leftrightarrow	An initializer_list.
$_ \leftrightarrow$	
\leftarrow	
$_ \leftarrow$	
l	

This function fills a vector with copies of the elements in the initializer list $_l$.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 533 of file stl_vector.h.

4.711.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::at (size_type __n) [inline]`

Provides access to the data contained in the vector.

Parameters

$_ \leftrightarrow$	The index of the element for which data should be accessed.
$_n$	

Returns

Read/write reference to data.

Exceptions

<i>std::out_of_range</i>	If $_n$ is an invalid index.
--------------------------	-------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws *out_of_range* if the check fails.

Definition at line 822 of file stl_vector.h.

4.711.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc >::at (size_type __n) const [inline]`

Provides access to the data contained in the vector.

Parameters

$_ \leftrightarrow$	The index of the element for which data should be accessed.
$_n$	

Returns

Read-only (constant) reference to data.

Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 840 of file `stl_vector.h`.

4.711.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::back ()`
`[inline], [noexcept]`

Returns a read/write reference to the data at the last element of the vector.

Definition at line 867 of file `stl_vector.h`.

Referenced by `std::piecewise_linear_distribution<_RealType>::max()`.

4.711.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::back () const` `[inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 875 of file `stl_vector.h`.

4.711.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::begin ()`
`[inline], [noexcept]`

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 547 of file `stl_vector.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_↔merge_exact_splitting()`, `std::operator==()`, and `std::vector< sub_match<_Bi_iter>, allocator< sub_match<_Bi_iter>>>::vector()`.

4.711.3.11 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::begin () const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 556 of file `stl_vector.h`.

4.711.3.12 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector<_Tp, _Alloc>::capacity () const [inline], [noexcept]`

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 734 of file `stl_vector.h`.

4.711.3.13 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 620 of file `stl_vector.h`.

4.711.3.14 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 629 of file `stl_vector.h`.

4.711.3.15 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::clear () [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1211 of file `stl_vector.h`.

4.711.3.16 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 638 of file `stl_vector.h`.

4.711.3.17 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 647 of file `stl_vector.h`.

4.711.3.18 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> _Tp* std::vector<_Tp, _Alloc>::data () [inline], [noexcept]`

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

Definition at line 890 of file `stl_vector.h`.

Referenced by `std::regex_traits<_Ch_type>::transform_primary()`.

4.711.3.19 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator std::vector<_Tp, _Alloc>::emplace (const_iterator __position, _Args &&... __args)`

Inserts an object in vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.`

4.711.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::vector<_Tp, _Alloc>::empty ()`
`const [inline], [noexcept]`

Returns true if the vector is empty. (Thus `begin()` would equal `end()`.)

Definition at line 743 of file `stl_vector.h`.

Referenced by `std::piecewise_linear_distribution<_RealType>::densities()`, `std::piecewise_linear_distribution<_RealType>::intervals()`, `std::piecewise_linear_distribution<_RealType>::max()`, and `std::piecewise_linear_distribution<_RealType>::min()`.

4.711.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 565 of file `stl_vector.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator==()`, and `std::vector<sub_match<_Bi_iter>, allocator<sub_match<_Bi_iter>>>::vector()`.

4.711.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::end ()`
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 574 of file `stl_vector.h`.

4.711.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::erase (`
`const_iterator __position) [inline]`

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1146 of file `stl_vector.h`.

```
4.711.3.24 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::erase (
    const_iterator __first, const_iterator __last ) [inline]
```

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by `__last` prior to erasing (or end()).

This function will erase the elements in the range `[__first,__last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1173 of file `stl_vector.h`.

```
4.711.3.25 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::front ( )
    [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.

Definition at line 851 of file `stl_vector.h`.

Referenced by `std::piecewise_linear_distribution< _RealType >::min()`.

4.711.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::front () const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 859 of file `stl_vector.h`.

4.711.3.27 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::insert (const_iterator __position, const value_type & __x)`

Inserts given value into vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

4.711.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::insert (const_iterator __position, value_type && __x) [inline]`

Inserts given rvalue into vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1014 of file `stl_vector.h`.

4.711.3.29 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::insert (const_iterator __position, initializer_list<value_type> & __l) [inline]`

Inserts an `initializer_list` into the vector.

Parameters

<code>__position</code>	An iterator into the vector.
<code>__l</code>	An initializer_list.

This function will insert copies of the data in the initializer_list *l* into the vector before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1031 of file `stl_vector.h`.

4.711.3.30 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::insert (const_iterator __position, size_type __n, const value_type & __x) [inline]`

Inserts a number of copies of given data into the vector.

Parameters

<code>__position</code>	A const_iterator into the vector.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1051 of file `stl_vector.h`.

4.711.3.31 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> iterator std::vector<_Tp, _Alloc>::insert (const_iterator __position, _InputIterator __first, _InputIterator __last) [inline]`

Inserts a range into the vector.

Parameters

<code>__position</code>	A const_iterator into the vector.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1095 of file `stl_vector.h`.

```
4.711.3.32  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector<_Tp, _Alloc>::max_size (
            ) const    [inline], [noexcept]
```

Returns the `size()` of the largest possible vector.

Definition at line 659 of file `stl_vector.h`.

```
4.711.3.33  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= (
            const vector<_Tp, _Alloc> & __x )
```

Vector assignment operator.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but any extra memory in `__x` (for fast expansion) will not be copied. Unlike the copy constructor, the allocator object is not copied.

```
4.711.3.34  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= (
            vector<_Tp, _Alloc> && __x )    [inline], [noexcept]
```

Vector move assignment operator.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). `__x` is a valid, but unspecified vector.

Definition at line 448 of file `stl_vector.h`.

```
4.711.3.35  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= (
            initializer_list< value_type > __l )    [inline]
```

Vector list assignment operator.

Parameters

\leftrightarrow	An initializer_list.
$_ \leftrightarrow$	
\leftrightarrow	
$_ \leftrightarrow$	
l	

This function fills a vector with copies of the elements in the initializer list $_l$.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 470 of file stl_vector.h.

```
4.711.3.36  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::operator[]
            ( size_type __n )  [inline], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

$_ \leftrightarrow$	The index of the element for which data should be accessed.
$_n$	

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

Definition at line 779 of file stl_vector.h.

```
4.711.3.37  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc
            >::operator[]( size_type __n ) const  [inline], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

$_ \leftrightarrow$	The index of the element for which data should be accessed.
$_n$	

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 794 of file `stl_vector.h`.

4.711.3.38 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::pop_back ()`
`[inline], [noexcept]`

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 949 of file `stl_vector.h`.

4.711.3.39 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::push_back (`
`const value_type &__x) [inline]`

Add data to the end of the vector.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 913 of file `stl_vector.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

4.711.3.40 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector<_Tp, _Alloc>::rbegin ()`
`[inline], [noexcept]`

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 583 of file `stl_vector.h`.

4.711.3.41 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin () const`
`[inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 592 of file `stl_vector.h`.

4.711.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector<_Tp, _Alloc>::rend () [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 601 of file `stl_vector.h`.

4.711.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 610 of file `stl_vector.h`.

4.711.3.44 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::reserve (size_type __n)`

Attempt to preallocate enough memory for specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Exceptions

<code>std::length_error</code>	If <code>n</code> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

4.711.3.45 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::resize (size_type __new_size) [inline]`

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
-------------------------	---

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 673 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink_and_double()`, and `__gnu_parallel::multiway_merge_exact_splitting()`.

4.711.3.46 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::resize (`
`size_type __new_size, const value_type & __x) [inline]`

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 693 of file `stl_vector.h`.

4.711.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::shrink_to_fit (`
`) [inline]`

A non-binding request to reduce `capacity()` to `size()`.

Definition at line 725 of file `stl_vector.h`.

4.711.3.48 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector<_Tp, _Alloc>::size ()`
`const [inline], [noexcept]`

Returns the number of elements in the vector.

Definition at line 654 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink()`, `__gnu_parallel::__shrink_and_double()`, `__gnu_parallel::list_partition()`, `std::operator==()`, and `std::regex_traits<_Ch_type>::transform_primary()`.

4.711.3.49 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::swap (`
`vector<_Tp, _Alloc> & __x) [inline], [noexcept]`

Swaps data with another vector.

Parameters

<code>__x</code>	A vector of the same element and allocator types.
------------------	---

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Definition at line 1194 of file `stl_vector.h`.

Referenced by `std::swap()`.

4.712.1 Detailed Description

```
template<typename _Alloc>
class std::vector< bool, _Alloc >
```

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Template Parameters

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

See also

`vector` for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

Definition at line 526 of file `stl_bvector.h`.

The documentation for this class was generated from the following file:

4.714.1 Detailed Description

```
template<typename _RealType = double>
class std::weibull_distribution< _RealType >
```

A weibull_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

References `std::max()`.

4.714.3.4 `template<typename _RealType = double> result_type std::weibull_distribution<_RealType>::min () const`
[inline]

Returns the greatest lower bound value of the distribution.

Definition at line 4937 of file random.h.

4.714.3.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type
std::weibull_distribution<_RealType>::operator() (_UniformRandomNumberGenerator &__urng)` [inline]

Generating functions.

Definition at line 4952 of file random.h.

4.714.3.6 `template<typename _RealType = double> param_type std::weibull_distribution<_RealType>::param () const`
[inline]

Returns the parameter set of the distribution.

Definition at line 4922 of file random.h.

4.714.3.7 `template<typename _RealType = double> void std::weibull_distribution<_RealType>::param (const
param_type &__param)` [inline]

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4930 of file random.h.

4.714.3.8 `template<typename _RealType = double> void std::weibull_distribution<_RealType>::reset() [inline]`

Resets the distribution state.

Definition at line 4901 of file random.h.

4.714.4 Friends And Related Function Documentation

4.714.4.1 `template<typename _RealType = double> bool operator==(const weibull_distribution<_RealType> &__d1, const weibull_distribution<_RealType> &__d2) [friend]`

Return true if two Weibull distributions have the same parameters.

Definition at line 4987 of file random.h.

The documentation for this class was generated from the following file:

4.715.1 Detailed Description

```
template<typename _RealType = double>
struct std::weibull_distribution< _RealType >::param_type
```

Parameter type.

Definition at line 4859 of file random.h.

5.1.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

5.2 `algbase.h` File Reference

5.17.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

Typedefs

- typedef __PTRDIFF_TYPE__ std::ptrdiff_t
- typedef __SIZE_TYPE__ std::size_t

Variables

- `decltype(nullptr)` typedef **`std::nullptr_t`**

5.35.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

5.36 `c++io.h` File Reference

Namespaces

- [`std`](#)

Typedefs

- typedef FILE **`std::__c_file`**
- typedef `__pthread_mutex_t` **`std::__c_lock`**

5.36.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ios>`.

5.37 `c++locale.h` File Reference

Namespaces

- [`std`](#)

Macros

- `#define` **`_GLIBCXX_C_LOCALE_GNU`**
- `#define` **`_GLIBCXX_NUM_CATEGORIES`**

Typedefs

- typedef `__locale_t` **`std::__c_locale`**

Functions

- int **std::__convert_from_v** (const __c_locale &__cloc __attribute__((__unused__)), char *__out, const int __size __attribute__((__unused__)), const char *__fmt,...)

5.37.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

5.38 c++locale_internal.h File Reference

5.38.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

5.39 cast.h File Reference

Classes

- struct [__gnu_cxx::_Caster<_ToType>](#)

Namespaces

- [__gnu_cxx](#)

Functions

- template<typename _ToType, typename _FromType >
_ToType [__gnu_cxx::const_pointer_cast](#) (const _FromType &__arg)
- template<typename _ToType, typename _FromType >
_ToType [__gnu_cxx::const_pointer_cast](#) (_FromType *__arg)

_ToType [__gnu_cxx::static_pointer_cast](#) (const _FromType &__arg)
- template<typename _ToType, typename _FromType >
_ToType [__gnu_cxx::static_pointer_cast](#) (_FromType *__arg)

5.39.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/pointer.h>`.

5.40 cc_hash_max_collision_check_resize_trigger_imp.hpp File Reference

5.40.1 Detailed Description

Contains a resize trigger implementation.

5.41 cc_ht_map.hpp File Reference

Classes

- class [__gnu_pbds::detail::cc_ht_map](#)< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Hash_Fn, Resize_Policy >

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_CC_HASH_NAME`
- `#define PB_DS_CC_HASH_TRAITS_BASE`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_HASH_EQ_FN_C_DEC`
- `#define PB_DS_RANGED_HASH_FN_C_DEC`

5.41.1 Detailed Description

Contains an implementation class for `cc_ht_map_`.

5.42 char_traits.h File Reference

Classes

- struct [__gnu_cxx::Char_types](#)< _CharT >
- struct [__gnu_cxx::char_traits](#)< _CharT >
- struct [std::char_traits](#)< _CharT >
- struct [std::char_traits](#)< char >
- struct [std::char_traits](#)< wchar_t >

Namespaces

- [__gnu_cxx](#)
- [std](#)

5.42.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<string>`.

5.43 `checkers.h` File Reference

Namespaces

- [__gnu_parallel](#)

Functions

- `template<typename _Iter , typename _Compare >`
`bool __gnu_parallel::__is_sorted (_Iter __begin, _Iter __end, _Compare __comp)`

5.43.1 Detailed Description

Routines for checking the correctness of algorithm results. This file is a GNU parallel extension to the Standard C++ Library.

5.44 `cmp_fn_imps.hpp` File Reference

5.44.1 Detailed Description

Contains implementations of `cc_ht_map_'s` entire container comparison related functions.

5.45 `codecvt.h` File Reference

Classes

- class [std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >](#)
- class [std::codecvt< _InternT, _ExternT, _StateT >](#)
- class [std::codecvt< char, char, mbstate_t >](#)
- class [std::codecvt< wchar_t, char, mbstate_t >](#)
- class [std::codecvt_base](#)
- class [std::codecvt_byname< _InternT, _ExternT, _StateT >](#)

Namespaces

- [std](#)

5.45.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

5.46 `codecvt_specializations.h` File Reference

Classes

- struct [__gnu_cxx::encoding_char_traits<_CharT>](#)
- class [__gnu_cxx::encoding_state](#)
- class [std::codecvt<_InternT, _ExternT, encoding_state>](#)

Namespaces

- [__gnu_cxx](#)
- [std](#)

Functions

- template<typename _Tp>
size_t **std::__iconv_adaptor** (size_t(*__func)(iconv_t, _Tp, size_t *, char **, size_t *), iconv_t __cd, char **↵
__inbuf, size_t *__inbytes, char **__outbuf, size_t *__outbytes)

5.46.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.47 `compatibility.h` File Reference

5.47.1 Detailed Description

This is an internal header file, included by other library sources. You should not attempt to use it directly.

5.48 `compatibility.h` File Reference

Namespaces

- [__gnu_parallel](#)

Functions

- `template<typename _Tp >`
`_Tp __gnu_parallel::__add_omp (volatile _Tp *__ptr, _Tp __addend)`
- `template<typename _Tp >`
`bool __gnu_parallel::__cas_omp (volatile _Tp *__ptr, _Tp __comparand, _Tp __replacement)`
- `template<typename _Tp >`
`bool __gnu_parallel::__compare_and_swap (volatile _Tp *__ptr, _Tp __comparand, _Tp __replacement)`
- `template<typename _Tp >`
`_Tp __gnu_parallel::__fetch_and_add (volatile _Tp *__ptr, _Tp __addend)`
- `void __gnu_parallel::__yield ()`

5.48.1 Detailed Description

Compatibility layer, mostly concerned with atomic operations.

This file is a GNU parallel extension to the Standard C++ Library and contains implementation details for the library's internal use.

5.49 compiletime_settings.h File Reference

Macros

- `#define _GLIBCXX_ASSERTIONS`
- `#define _GLIBCXX_CALL(__n)`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`
- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

5.49.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

5.49.2 Macro Definition Documentation

5.49.2.1 `#define _GLIBCXX_ASSERTIONS`

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Definition at line 61 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__qsb_local_sort_with_helping()`.

5.49.2.2 `#define _GLIBCXX_CALL(__n)`

Macro to produce log message when entering a function.

Parameters

<code>↔</code>	Input size.
<code>n</code>	

See also

`_GLIBCXX_VERBOSE_LEVEL`

Definition at line 44 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__find_template()`, `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_parallel::__merge_advance()`, `__gnu_parallel::__parallel_nth_element()`, `__gnu_parallel::__parallel_partial↔sum()`, `__gnu_parallel::__parallel_partition()`, `__gnu_parallel::__parallel_random_shuffle_drs()`, `__gnu_parallel::__↔parallel_sort()`, `__gnu_parallel::__parallel_sort_qs()`, `__gnu_parallel::__parallel_sort_qsb()`, `__gnu_parallel::__↔parallel_unique_copy()`, `__gnu_parallel::__search_template()`, `__gnu_parallel::__sequential_multiway_merge()`, `__↔gnu_parallel::__multiseq_partition()`, `__gnu_parallel::__multiseq_selection()`, `__gnu_parallel::__multiway_merge()`, `__gnu_↔parallel::__multiway_merge_3_variant()`, `__gnu_parallel::__multiway_merge_4_variant()`, `__gnu_parallel::__multiway_merge_↔loser_tree()`, `__gnu_parallel::__multiway_merge_loser_tree_sentinel()`, `__gnu_parallel::__multiway_merge_loser_tree_↔unguarded()`, `__gnu_parallel::__multiway_merge_sentinels()`, `__gnu_parallel::__parallel_multiway_merge()`, and `__gnu_↔parallel::__parallel_sort_mwms()`.

5.49.2.3 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`

Switch on many `_GLIBCXX_PARALLEL_ASSERTions` in parallel code. Consider the size of the L1 cache for `gnu_↔parallel::__parallel_random_shuffle()`.

Definition at line 68 of file `compiletime_settings.h`.

5.49.2.4 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`

Switch on many `_GLIBCXX_PARALLEL_ASSERTions` in parallel code. Consider the size of the TLB for `gnu_parallel_↔::__parallel_random_shuffle()`.

Definition at line 74 of file `compiletime_settings.h`.

5.49.2.5 `#define _GLIBCXX_SCALE_DOWN_FPU`

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

Definition at line 55 of file `compiletime_settings.h`.

5.49.2.6 `#define _GLIBCXX_VERBOSE_LEVEL`

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

Definition at line 37 of file `compiletime_settings.h`.

5.50 `complex.h` File Reference

Macros

- `#define __GLIBCXX_COMPLEX_H`

5.50.1 Detailed Description

This is a Standard C++ Library header.

5.51 `concept_check.h` File Reference

Macros

- `#define __glibcxx_class_requires(_a, _b)`
- `#define __glibcxx_class_requires2(_a, _b, _c)`
- `#define __glibcxx_class_requires3(_a, _b, _c, _d)`
- `#define __glibcxx_class_requires4(_a, _b, _c, _d, _e)`
- `#define __glibcxx_function_requires(...)`

5.51.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

5.52 `concurrency.h` File Reference

Classes

- class [`__gnu_cxx::__scoped_lock`](#)

Namespaces

- [`__gnu_cxx`](#)

Enumerations

- enum `_Lock_policy` { `_S_single`, `_S_mutex`, `_S_atomic` }

Functions

- void `__gnu_cxx::__throw_concurrency_lock_error()`
- void `__gnu_cxx::__throw_concurrency_unlock_error()`

Variables

- static const _Lock_policy [__gnu_cxx::__default_lock_policy](#)

5.52.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.53 cond_dealtor.hpp File Reference

Classes

- class [__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.53.1 Detailed Description

Contains a conditional deallocator.

5.54 cond_key_dtor_entry_dealtor.hpp File Reference

Classes

- class [__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.54.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

5.55 const_iterator.hpp File Reference

Classes

- class [__gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry, Simple, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_BIN_HEAP_CIT_BASE`

5.55.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

5.56 `const_iterator.hpp` File Reference

Classes

- class [__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_BASIC_HEAP_CIT_BASE`
- `#define PB_DS_CLASS_C_DEC`

5.56.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

5.57 `const_iterator.hpp` File Reference

Classes

- class [const_iterator_](#)

5.57.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.

5.58 constructor_destructor_fn_imps.hpp File Reference

5.58.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

5.59 constructor_destructor_fn_imps.hpp File Reference

5.59.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

5.60 constructor_destructor_fn_imps.hpp File Reference

5.61 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.61.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

5.62 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.62.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

5.63 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.63.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

5.64 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.64.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

5.65 constructors_destructor_fn_imps.hpp File Reference

5.65.1 Detailed Description

Contains an implementation class for binary_heap_.

5.66 constructors_destructor_fn_imps.hpp File Reference

5.66.1 Detailed Description

Contains an implementation for binomial_heap_.

5.67 constructors_destructor_fn_imps.hpp File Reference

5.67.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.68 constructors_destructor_fn_imps.hpp File Reference

5.68.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.69 constructors_destructor_fn_imps.hpp File Reference

5.69.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.70 constructors_destructor_fn_imps.hpp File Reference

5.70.1 Detailed Description

Contains an implementation class for ov_tree_.

5.71 constructors_destructor_fn_imps.hpp File Reference

5.71.1 Detailed Description

Contains an implementation class for a pairing heap.

5.72 constructors_destructor_fn_imps.hpp File Reference

5.72.1 Detailed Description

Contains an implementation class for pat_trie.

5.73 constructors_destructor_fn_imps.hpp File Reference

5.73.1 Detailed Description

Contains an implementation for rb_tree_.

5.74 constructors_destructor_fn_imps.hpp File Reference

5.74.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

5.75 constructors_destructor_fn_imps.hpp File Reference

5.75.1 Detailed Description

Contains an implementation class for splay_tree_.

5.76 constructors_destructor_fn_imps.hpp File Reference

5.76.1 Detailed Description

Contains an implementation for thin_heap_.

5.77 container_base_dispatch.hpp File Reference

5.82.1 Detailed Description

The header provides an interface to the C++ ABI.

5.82.2 Function Documentation

5.82.2.1 `char* __cxxabiv1::__cxa_demangle (const char * __mangled_name, char * __output_buffer, size_t * __length, int * __status)`

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

Parameters

<code>__mangled_name</code>	A NUL-terminated character string containing the name to be demangled.
<code>__output_buffer</code>	A region of memory, allocated with malloc, of * <code>__length</code> bytes, into which the demangled name is stored. If <code>__output_buffer</code> is not long enough, it is expanded using realloc. <code>__output_buffer</code> may instead be NULL; in that case, the demangled name is placed in a region of memory allocated with malloc.
<code>__length</code>	If <code>__length</code> is non-NULL, the length of the buffer containing the demangled name is placed in * <code>__length</code> .
<code>__status</code>	* <code>__status</code> is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: <code>mangled_name</code> is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

Returns

A pointer to the start of the NUL-terminated demangled name, or NULL if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in `__gnu_cxx::__verbose_terminate_handler`.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt12ch39.html> for other examples of use.

Note

The same demangling functionality is available via `libiberty` (`<libiberty/demangle.h>` and `libiberty.a`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

5.83 cxxabi_forced.h File Reference**Classes**

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 74 of file features.h.

5.141.2.4 `#define _GLIBCXX_FIND_GROWING_BLOCKS`

Include the growing blocks variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 61 of file features.h.

5.141.2.5 `#define _GLIBCXX_MERGESORT`

Include parallel multi-way mergesort.

See also

`__gnu_parallel::Settings::sort_algorithm`

Definition at line 41 of file features.h.

5.141.2.6 `#define _GLIBCXX_QUICKSORT`

Include parallel unbalanced quicksort.

See also

`__gnu_parallel::Settings::sort_algorithm`

Definition at line 48 of file features.h.

5.141.2.7 `#define _GLIBCXX_TREE_DYNAMIC_BALANCING`

Include the dynamic balancing variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 91 of file features.h.

5.141.2.8 `#define _GLIBCXX_TREE_FULL_COPY`

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 100 of file features.h.

5.141.2.9 `#define _GLIBCXX_TREE_INITIAL_SPLITTING`

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 83 of file features.h.

5.142 fenv.h File Reference

5.142.1 Detailed Description

This is a Standard C++ Library header.

5.143 find.h File Reference

Namespaces

- [__gnu_parallel](#)

Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector >

5.143.1 Detailed Description

Parallel implementation base for `std::find()`, `std::equal()` and related functions. This file is a GNU parallel extension to the Standard C++ Library.

5.144 find_fn_imps.hpp File Reference

5.144.1 Detailed Description

Contains an implementation class for a binary_heap.

5.145 find_fn_imps.hpp File Reference

5.145.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.146 find_fn_imps.hpp File Reference

5.146.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.147 find_fn_imps.hpp File Reference

5.147.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions.

5.148 find_fn_imps.hpp File Reference

5.148.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions.

5.149 find_fn_imps.hpp File Reference

5.149.1 Detailed Description

Contains implementations of lu_map_.

5.150 find_fn_imps.hpp File Reference

5.150.1 Detailed Description

Contains an implementation class for a pairing heap.

5.151 find_fn_imps.hpp File Reference

5.151.1 Detailed Description

Contains an implementation class for pat_trie.

5.152 find_fn_imps.hpp File Reference

5.152.1 Detailed Description

Contains an implementation for rb_tree_.

5.153 find_fn_imps.hpp File Reference

5.153.1 Detailed Description

Contains an implementation class for splay_tree_.

5.154 find_fn_imps.hpp File Reference

5.154.1 Detailed Description

Contains an implementation for thin_heap_.

5.155 find_no_store_hash_fn_imps.hpp File Reference

5.155.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions, when the hash value is not stored.

5.156 find_selectors.h File Reference

Classes

5.156.1 Detailed Description

_Function objects representing different tasks to be plugged into the parallel find algorithm. This file is a GNU parallel extension to the Standard C++ Library.

5.157 find_store_hash_fn_imps.hpp File Reference

5.157.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions, when the hash value is stored.

5.158 find_store_hash_fn_imps.hpp File Reference

5.158.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions, when the hash value is stored.

5.159 for_each.h File Reference

Namespaces

- [__gnu_parallel](#)

Functions

- `template<typename _Iter , typename _UserOp , typename _Functionality , typename _Red , typename _Result >
_UserOp __gnu_parallel::__for_each_template_random_access (_Iter __begin, _Iter __end, _UserOp __user↵
_op, _Functionality &__functionality, _Red __reduction, _Result __reduction_start, _Result &__output, typename
std::iterator_traits< _Iter >::difference_type __bound, _Parallelism __parallelism_tag)`

5.159.1 Detailed Description

Main interface for embarrassingly parallel functions.

The explicit implementation are in other header files, like workstealing.h, par_loop.h, omp_loop.h, and omp_loop_↵
static.h. This file is a GNU parallel extension to the Standard C++ Library.

5.181.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

5.182 `info_fn_imps.hpp` File Reference

5.182.1 Detailed Description

Contains an implementation class for a `binary_heap`.

5.183 `info_fn_imps.hpp` File Reference

5.183.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

5.184 `info_fn_imps.hpp` File Reference

5.184.1 Detailed Description

Contains implementations of `cc_ht_map_`'s entire container info related functions.

5.185 info_fn_imps.hpp File Reference

5.185.1 Detailed Description

Contains implementations of gp_ht_map_'s entire container info related functions.

5.186 info_fn_imps.hpp File Reference

5.186.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.187 info_fn_imps.hpp File Reference

5.187.1 Detailed Description

Contains implementations of lu_map_.

5.188 info_fn_imps.hpp File Reference

5.188.1 Detailed Description

Contains an implementation class for ov_tree_.

5.189 info_fn_imps.hpp File Reference

5.189.1 Detailed Description

Contains an implementation class for pat_trie.

5.190 info_fn_imps.hpp File Reference

5.190.1 Detailed Description

Contains an implementation for rb_tree_.

5.191 info_fn_imps.hpp File Reference

5.191.1 Detailed Description

Contains an implementation.

5.192 insert_fn_imps.hpp File Reference

5.192.1 Detailed Description

Contains an implementation class for a binary_heap.

5.193 insert_fn_imps.hpp File Reference

5.193.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.194 insert_fn_imps.hpp File Reference

5.194.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.195 insert_fn_imps.hpp File Reference

5.195.1 Detailed Description

Contains implementations of cc_ht_map_'s insert related functions.

5.196 insert_fn_imps.hpp File Reference

5.196.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions.

5.197 insert_fn_imps.hpp File Reference

5.197.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.198 insert_fn_imps.hpp File Reference

5.198.1 Detailed Description

Contains implementations of lu_map_.

5.199 insert_fn_imps.hpp File Reference

5.199.1 Detailed Description

Contains an implementation class for ov_tree_.

5.200 insert_fn_imps.hpp File Reference

5.200.1 Detailed Description

Contains an implementation class for a pairing heap.

5.201 insert_fn_imps.hpp File Reference

5.201.1 Detailed Description

Contains an implementation for rb_tree_.

5.202 insert_fn_imps.hpp File Reference

5.202.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

5.203 `insert_fn_imps.hpp` File Reference

5.203.1 Detailed Description

Contains an implementation class for `splay_tree_`.

5.204 `insert_fn_imps.hpp` File Reference

5.204.1 Detailed Description

Contains an implementation for `thin_heap_`.

5.205 `insert_join_fn_imps.hpp` File Reference

5.205.1 Detailed Description

Contains an implementation class for `pat_trie`.

5.206 `insert_no_store_hash_fn_imps.hpp` File Reference

5.206.1 Detailed Description

Contains implementations of `cc_ht_map_`'s insert related functions, when the hash value is not stored.

5.207 `insert_no_store_hash_fn_imps.hpp` File Reference

5.207.1 Detailed Description

Contains implementations of `gp_ht_map_`'s insert related functions, when the hash value is not stored.

5.208 `insert_store_hash_fn_imps.hpp` File Reference

5.208.1 Detailed Description

Contains implementations of `cc_ht_map_`'s insert related functions, when the hash value is stored.

5.209 insert_store_hash_fn_imps.hpp File Reference

5.209.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions, when the hash value is stored.

5.214.1 Detailed Description

This file is a GNU profile extension to the Standard C++ Library.

5.215 iterators_fn_imps.hpp File Reference

5.215.1 Detailed Description

Contains an implementation class for a binary_heap.

5.216 iterators_fn_imps.hpp File Reference

5.216.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.217 iterators_fn_imps.hpp File Reference

5.217.1 Detailed Description

Contains implementations of cc_ht_map_'s iterators related functions, e.g., begin().

5.218 iterators_fn_imps.hpp File Reference

5.218.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.219 iterators_fn_imps.hpp File Reference

5.219.1 Detailed Description

Contains implementations of lu_map_.

5.220 iterators_fn_imps.hpp File Reference

5.220.1 Detailed Description

Contains an implementation class for ov_tree_.

5.221 iterators_fn_imps.hpp File Reference

5.221.1 Detailed Description

Contains an implementation class for pat_trie.

5.222 left_child_next_sibling_heap_.hpp File Reference

Classes

- class [__gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

5.222.1 Detailed Description

Contains an implementation class for a basic heap.

5.223 `linear_probe_fn_imp.hpp` File Reference

5.223.1 Detailed Description

Contains a probe policy implementation

5.224 `list_partition.h` File Reference

Namespaces

- [`__gnu_parallel`](#)

Functions

- `template<typename _Iter >`
`void __gnu_parallel::__shrink (std::vector< _Iter > &__os_starts, size_t &__count_to_two, size_t &__range_length)`
- `template<typename _Iter >`
`void __gnu_parallel::__shrink_and_double (std::vector< _Iter > &__os_starts, size_t &__count_to_two, size_t &__range_length, const bool __make_twice)`
- `template<typename _Iter, typename _FunctorType >`
`size_t __gnu_parallel::list_partition (const _Iter __begin, const _Iter __end, _Iter * __starts, size_t * __lengths, const int __num_parts, _FunctorType & __f, int __oversampling=0)`

5.224.1 Detailed Description

Functionality to split __sequence referenced by only input iterators. This file is a GNU parallel extension to the Standard C++ Library.

5.225 `list_update_policy.hpp` File Reference

Classes

- class [`__gnu_pbds::lu_counter_policy< Max_Count, _Alloc >`](#)
- class [`__gnu_pbds::lu_move_to_front_policy< _Alloc >`](#)

Namespaces

5.233.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

5.233.2 Macro Definition Documentation

5.233.2.1 `#define __glibcxx_check_erase(_Position)`

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

Definition at line 139 of file `macros.h`.

5.233.2.2 `#define __glibcxx_check_erase_after(_Position)`

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

Definition at line 153 of file `macros.h`.

5.233.2.3 `#define __glibcxx_check_erase_range(_First, _Last)`

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

Definition at line 167 of file `macros.h`.

5.233.2.4 `#define __glibcxx_check_erase_range_after(_First, _Last)`

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

Definition at line 179 of file `macros.h`.

5.233.2.5 `#define __glibcxx_check_heap_pred(_First, _Last, _Pred)`

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

Definition at line 329 of file `macros.h`.

5.233.2.6 `#define __glibcxx_check_insert(_Position)`

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 73 of file `macros.h`.

5.233.2.7 `#define __glibcxx_check_insert_after(_Position)`

Verify that we can insert into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 90 of file `macros.h`.

5.233.2.8 `#define __glibcxx_check_insert_range(_Position, _First, _Last)`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

Definition at line 107 of file `macros.h`.

5.233.2.9 `#define __glibcxx_check_insert_range_after(_Position, _First, _Last)`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

Definition at line 126 of file `macros.h`.

5.233.2.10 `#define __glibcxx_check_partitioned_lower(_First, _Last, _Value)`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

Definition at line 273 of file `macros.h`.

5.233.2.11 `#define __glibcxx_check_partitioned_lower_pred(_First, _Last, _Value, _Pred)`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 295 of file `macros.h`.

5.233.2.12 `#define __glibcxx_check_partitioned_upper_pred(_First, _Last, _Value, _Pred)`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 308 of file `macros.h`.

5.233.2.13 `#define __glibcxx_check_sorted_pred(_First, _Last, _Pred)`

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

Definition at line 239 of file `macros.h`.

5.233.2.14 `#define _GLIBCXX_DEBUG_VERIFY_AT(_Condition, _ErrorMessage, _File, _Line)`

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 41 of file `macros.h`.

5.234 malloc_allocator.h File Reference

Classes

5.250.1 Detailed Description

Implementation of sequential and parallel multiway merge.

Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

5.250.2 Macro Definition Documentation

5.250.2.1 `#define _GLIBCXX_PARALLEL_LENGTH(__s)`

Length of a sequence described by a pair of iterators.

Definition at line 54 of file multiway_merge.h.

Referenced by `__gnu_parallel::sequential_multiway_merge()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `__gnu_parallel::multiway_merge_loser_tree()`, `__gnu_parallel::multiway_merge_sampling_splitting()`, and `__gnu_parallel::parallel_multiway_merge()`.

5.251.1 Detailed Description

Parallel multiway merge sort. This file is a GNU parallel extension to the Standard C++ Library.

5.252 nested_exception.h File Reference

Classes

- class [std::nested_exception](#)

Namespaces

- [std](#)

Functions

- `template<typename _Ex >`
`const nested_exception * std::__get_nested_exception (const _Ex &__ex)`
- `template<typename _Ex >`
`void std::__throw_with_nested (_Ex &&, const nested_exception *=0) __attribute__((__noreturn__))`
- `template<typename _Ex >`
`void std::__throw_with_nested (_Ex &&,...) __attribute__((__noreturn__))`
- `template<typename _Ex >`
`void std::rethrow_if_nested (const _Ex &__ex)`
- `void std::rethrow_if_nested (const nested_exception &__ex)`
- `template<typename _Ex >`
`void std::throw_with_nested (_Ex __ex)`

5.252.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<exception>`.

5.253 `new_allocator.h` File Reference

Classes

- class [__gnu_cxx::new_allocator< _Tp >](#)

Namespaces

- [__gnu_cxx](#)

Functions

- `template<typename _Tp >`
`bool __gnu_cxx::operator!= (const new_allocator< _Tp > &, const new_allocator< _Tp > &)`
- `template<typename _Tp >`
`bool __gnu_cxx::operator== (const new_allocator< _Tp > &, const new_allocator< _Tp > &)`

5.253.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.254 node.hpp File Reference

Classes

- struct [__gnu_pbds::detail::left_child_next_sibling_heap_node_< _Value, _Metadata, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.254.1 Detailed Description

Contains an implementation struct for this type of heap's node.

5.255 node.hpp File Reference

Classes

- struct [__gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.255.1 Detailed Description

Contains an implementation for rb_tree_.

5.256 node.hpp File Reference

Classes

- struct [__gnu_pbds::detail::splay_tree_node_< Value_Type, Metadata, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.256.1 Detailed Description

Contains an implementation struct for splay_tree_'s node.

5.257 node_iterators.hpp File Reference

Classes

- class [__gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >](#)
- class [__gnu_pbds::detail::bin_search_tree_node_it_< Node, Const_Iterator, Iterator, _Alloc >](#)

Namespaces

5.263.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

5.264 omp_loop.h File Reference

Namespaces

- [__gnu_parallel](#)

Functions

- `template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result >`
`_Op __gnu_parallel::for_each_template_random_access_omp_loop (_RAIter __begin, _RAIter __end, _Op __o, _Fu &__f, _Red __r, _Result __base, _Result &__output, typename std::iterator_traits< _RAIter >::difference_type __bound)`

5.264.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of an OpenMP for loop. This file is a GNU parallel extension to the Standard C++ Library.

5.265 omp_loop_static.h File Reference

Namespaces

- [__gnu_parallel](#)

Functions

- `template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result >
_Op __gnu_parallel::__for_each_template_random_access_omp_loop_static (_RAIter __begin, _RAIter __end,
_Op __o, _Fu & __f, _Red __r, _Result __base, _Result & __output, typename std::iterator_traits< _RAIter >::difference_type __bound)`

5.265.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of an OpenMP for loop with static scheduling. This file is a GNU parallel extension to the Standard C++ Library.

5.266 opt_random.h File Reference

Namespaces

- [std](#)

5.266.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<random>`.

5.267 order_statistics_imp.hpp File Reference

5.267.1 Detailed Description

Contains forward declarations for `order_statistics_key`

5.268 order_statistics_imp.hpp File Reference

5.268.1 Detailed Description

Contains forward declarations for `order_statistics_key`

5.269 `os_defines.h` File Reference

Macros

- `#define __NO_CTYPE`

5.269.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

5.270 `ostream_insert.h` File Reference

Namespaces

- [std](#)

Functions

- `template<typename _CharT, typename _Traits >`

5.286.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

Provides reusable `_Pointer_adapter` for assisting in the development of custom pointer types that can be used with the standard containers via the `allocator::pointer` and `allocator::const_pointer` typedefs.

5.287 policy_access_fn_imps.hpp File Reference

5.287.1 Detailed Description

Contains an implementation class for a `binary_heap`.

5.288 policy_access_fn_imps.hpp File Reference

5.288.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

5.289 policy_access_fn_imps.hpp File Reference

5.289.1 Detailed Description

Contains implementations of `cc_ht_map_`'s policy access functions.

5.290 `policy_access_fn_imps.hpp` File Reference

5.290.1 Detailed Description

Contains implementations of `gp_ht_map_`'s policy access functions.

5.291 `policy_access_fn_imps.hpp` File Reference

5.291.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

5.292 `policy_access_fn_imps.hpp` File Reference

5.292.1 Detailed Description

Contains an implementation class for `ov_tree`.

5.293 `policy_access_fn_imps.hpp` File Reference

5.293.1 Detailed Description

Contains an implementation class for `pat_trie`.

5.294 `pool_allocator.h` File Reference

Classes

- class [__gnu_cxx::__pool_alloc<_Tp>](#)

5.302.1 Detailed Description

Algorithms used by the profile extension.

This file is needed to avoid including `<algorithm>` or `<bits/stl_algo.h>`. Including those files would result in recursive includes. These implementations are oversimplified. In general, efficiency may be sacrificed to minimize maintenance overhead.

5.303 profiler_container_size.h File Reference

5.320.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<random>`.

5.321 random_number.h File Reference

Classes

- class [__gnu_parallel::_RandomNumber](#)

Namespaces

- [__gnu_parallel](#)

5.321.1 Detailed Description

Random number generator based on the Mersenne twister. This file is a GNU parallel extension to the Standard C++ Library.

5.322 random_shuffle.h File Reference

Classes

- struct [__gnu_parallel::_DRandomShufflingGlobalData<_RAIter>](#)
- struct [__gnu_parallel::_DRSSorterPU<_RAIter, _RandomNumberGenerator>](#)

Namespaces

- [__gnu_parallel](#)

Typedefs

- typedef unsigned short [__gnu_parallel::_BinIndex](#)

Functions

- `template<typename _RAIter, typename _RandomNumberGenerator >`
`void __gnu_parallel::__parallel_random_shuffle (_RAIter __begin, _RAIter __end, _RandomNumberGenerator &__rng)`
- `template<typename _RAIter, typename _RandomNumberGenerator >`
`void __gnu_parallel::__parallel_random_shuffle_drs (_RAIter __begin, _RAIter __end, typename std::iterator_traits<_RAIter>::difference_type __n, _ThreadIndex __num_threads, _RandomNumberGenerator &__rng)`
- `template<typename _RAIter, typename _RandomNumberGenerator >`
`void __gnu_parallel::__parallel_random_shuffle_drs_pu (_DRSSorterPU<_RAIter, _RandomNumberGenerator> *__pus)`
- `template<typename _RandomNumberGenerator >`
`int __gnu_parallel::__random_number_pow2 (int __logp, _RandomNumberGenerator &__rng)`
- `template<typename _Tp >`
`_Tp __gnu_parallel::__round_up_to_pow2 (_Tp __x)`
- `template<typename _RAIter, typename _RandomNumberGenerator >`
`void __gnu_parallel::__sequential_random_shuffle (_RAIter __begin, _RAIter __end, _RandomNumberGenerator &__rng)`

5.322.1 Detailed Description

Parallel implementation of `std::random_shuffle()`. This file is a GNU parallel extension to the Standard C++ Library.

5.323 range_access.h File Reference

Namespaces

- `std`

Functions

- `template<class _Container >`
`auto std::begin (_Container &__cont) -> decltype(__cont.begin())`
- `template<class _Container >`
`auto std::begin (const _Container &__cont) -> decltype(__cont.begin())`
- `template<class _Tp, size_t _Nm >`
`_Tp * std::begin (_Tp(&__arr)[_Nm])`
- `template<class _Container >`
`auto std::end (_Container &__cont) -> decltype(__cont.end())`
- `template<class _Container >`
`auto std::end (const _Container &__cont) -> decltype(__cont.end())`
- `template<class _Tp, size_t _Nm >`
`_Tp * std::end (_Tp(&__arr)[_Nm])`

5.323.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

5.324 ranged_hash_fn.hpp File Reference

Classes

- class [__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >](#)
- class [__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >](#)

`_S_opcode_line_end_assertion, _S_opcode_word_boundary, _S_opcode_subexpr_lookahead, _S_`
`opcode_subexpr_begin,`
`_S_opcode_subexpr_end, _S_opcode_dummy, _S_opcode_match, _S_opcode_accept }`

Variables

- `static const _StatelD std::__detail::_S_invalid_state_id`

5.331.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

5.332 `regex_compiler.h` File Reference

Classes

- `struct std::__detail::_BracketMatcher< _TraitsT, __icase, __collate >`
- `struct std::__detail::_BracketMatcher< _TraitsT, __icase, __collate >`
- `class std::__detail::_Compiler< _TraitsT >`

Namespaces

- [std](#)
- [std::__detail](#)

Functions

- `template<typename _TraitsT >
std::shared_ptr<_NFA<_TraitsT > > std::__detail::__compile_nfa (const typename _TraitsT::char_type *__↵
_first, const typename _TraitsT::char_type *__last, const _TraitsT &__traits, regex_constants::syntax_option_type
__flags)`

5.332.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

5.333 `regex_constants.h` File Reference

Namespaces

- [std](#)
- [std::regex_constants](#)

5.1 Regular Expression Syntax Options

- `enum std::regex_constants::__syntax_option {
_S_icode, _S_nosubs, _S_optimize, _S_collate,
_S_ECMAScript, _S_basic, _S_extended, _S_awk,
_S_grep, _S_egrep, _S_syntax_last }`
- `enum std::regex_constants::syntax_option_type : unsigned int {
std::regex_constants::icode, std::regex_constants::nosubs, std::regex_constants::optimize, std::regex_↵
constants::collate,
std::regex_constants::ECMAScript, std::regex_constants::basic, std::regex_constants::extended, std::regex_↵
constants::awk,
std::regex_constants::grep, std::regex_constants::egrep }`
- `constexpr syntax_option_type std::regex_constants::operator& (syntax_option_type __a, syntax_option_type __↵
__b)`
- `constexpr syntax_option_type std::regex_constants::operator| (syntax_option_type __a, syntax_option_type __b)`
- `constexpr syntax_option_type std::regex_constants::operator^ (syntax_option_type __a, syntax_option_type __↵
__b)`
- `constexpr syntax_option_type std::regex_constants::operator~ (syntax_option_type __a)`
- `syntax_option_type & std::regex_constants::operator&= (syntax_option_type &__a, syntax_option_type __b)`
- `syntax_option_type & std::regex_constants::operator|= (syntax_option_type &__a, syntax_option_type __b)`
- `syntax_option_type & std::regex_constants::operator^= (syntax_option_type &__a, syntax_option_type __b)`

5.2 Matching Rules

Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed below for any bitmask elements set.

- enum `std::regex_constants::__match_flag` {
`_S_not_bol`, `_S_not_eol`, `_S_not_bow`, `_S_not_eow`,
`_S_any`, `_S_not_null`, `_S_continuous`, `_S_prev_avail`,
`_S_sed`, `_S_no_copy`, `_S_first_only`, `_S_match_flag_last` }
- enum `std::regex_constants::match_flag_type` : unsigned int {
`std::regex_constants::match_default`, `std::regex_constants::match_not_bol`, `std::regex_constants::match_not_↵
eol`, `std::regex_constants::match_not_bow`,
`std::regex_constants::match_not_eow`, `std::regex_constants::match_any`, `std::regex_constants::match_not_null`,
`std::regex_constants::match_continuous`,
`std::regex_constants::match_prev_avail`, `std::regex_constants::format_default`, `std::regex_constants::format_sed`,
`std::regex_constants::format_no_copy`,
`std::regex_constants::format_first_only` }
- constexpr `match_flag_type` `std::regex_constants::operator&` (`match_flag_type __a`, `match_flag_type __b`)
- constexpr `match_flag_type` `std::regex_constants::operator|` (`match_flag_type __a`, `match_flag_type __b`)
- constexpr `match_flag_type` `std::regex_constants::operator^` (`match_flag_type __a`, `match_flag_type __b`)
- constexpr `match_flag_type` `std::regex_constants::operator~` (`match_flag_type __a`)
- `match_flag_type &` `std::regex_constants::operator&=` (`match_flag_type &__a`, `match_flag_type __b`)
- `match_flag_type &` `std::regex_constants::operator|=` (`match_flag_type &__a`, `match_flag_type __b`)
- `match_flag_type &` `std::regex_constants::operator^=` (`match_flag_type &__a`, `match_flag_type __b`)

5.333.1 Detailed Description

Constant definitions for the std regex library.

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

5.334 `regex_error.h` File Reference

Classes

- class `std::regex_error`

Namespaces

- `std`
- `std::regex_constants`

Functions

- void `std::__throw_regex_error` (`regex_constants::error_type __ecode`)

5.3 Error Types

5.334.1 Detailed Description

Error and exception objects for the std regex library.

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

5.335 `regex_executor.h` File Reference

Classes

- class [std::__detail::_Executor<_Bilter, _Alloc, _TraitsT, __dfs_mode>](#)

Namespaces

- [std](#)
- [std::__detail](#)

5.335.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

5.336 `regex_scanner.h` File Reference

Classes

- class `std::__detail::_Scanner<_CharT>`

Namespaces

- `std`
- `std::__detail`

5.336.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

5.337 `resize_fn_imps.hpp` File Reference

5.337.1 Detailed Description

Contains implementations of `cc_ht_map_'s` resize related functions.

5.338 `resize_fn_imps.hpp` File Reference

5.338.1 Detailed Description

Contains implementations of `gp_ht_map_'s` resize related functions.

5.339 `resize_no_store_hash_fn_imps.hpp` File Reference

5.339.1 Detailed Description

Contains implementations of `cc_ht_map_'s` resize related functions, when the hash value is not stored.

5.340 `resize_no_store_hash_fn_imps.hpp` File Reference

5.340.1 Detailed Description

Contains implementations of `gp_ht_map_'s` resize related functions, when the hash value is not stored.

5.341 `resize_policy.hpp` File Reference

Classes

- class [__gnu_pbds::detail::resize_policy< _Tp >](#)

Namespaces

- [__gnu_pbds](#)

5.341.1 Detailed Description

Contains an implementation class for a `binary_heap`.

5.342 `resize_store_hash_fn_imps.hpp` File Reference

5.342.1 Detailed Description

Contains implementations of `cc_ht_map_'s` `resize` related functions, when the hash value is stored.

5.343 `resize_store_hash_fn_imps.hpp` File Reference

5.343.1 Detailed Description

Contains implementations of `gp_ht_map_'s` `resize` related functions, when the hash value is stored.

5.344 `ropeimpl.h` File Reference

Namespaces

- [__gnu_cxx](#)

Functions

- `template<class _CharT, class _Traits >`
`void __gnu_cxx::Rope_fill (basic_ostream< _CharT, _Traits > &__o, size_t __n)`
- `template<class _CharT >`
`bool __gnu_cxx::Rope_is_simple (_CharT *)`

5.367.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

5.368 settings.h File Reference

Classes

- `struct __gnu_parallel::Settings`

Namespaces

- `__gnu_parallel`

Macros

- `#define _GLIBCXX_PARALLEL_CONDITION(__c)`

5.368.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

5.368.2 parallelization_decision

The decision whether to run an algorithm in parallel.

There are several ways the user can switch on and __off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel↵::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. `__`It is a tristate variable corresponding to:

a. `force_sequential`, meaning the sequential algorithm is executed. b. `force_parallel`, meaning the parallel algorithm is executed. c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

5.368.3 Macro Definition Documentation

5.368.3.1 `#define GLIBCXX_PARALLEL_CONDITION(__c)`

Determine at compile(?) -time if the parallel variant of an algorithm should be called.

Parameters

<code>__↵</code>	A condition that is convertible to bool that is overruled by <code>__gnu_parallel::_Settings::algorithm_strategy</code> .
<code>__c</code>	Usually a decision based on the input size.

Definition at line 95 of file `settings.h`.

Referenced by `__gnu_parallel::multiway_merge()`, and `__gnu_parallel::multiway_merge_sentinels()`.

5.396.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<deque>`.

5.396.2 Macro Definition Documentation

5.396.2.1 `#define _GLIBCXX_DEQUE_BUF_SIZE`

This function controls the size of memory nodes.

Parameters

<code>__size</code>	The size of an element.
---------------------	-------------------------

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

Definition at line 85 of file `stl_deque.h`.

5.399.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

This file implements `reverse_iterator`, `back_insert_iterator`, `front_insert_iterator`, `insert_iterator`, `__normal_iterator`, and their supporting functions and overloaded operators.

5.409.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

5.410 `std_relops.h` File Reference

Namespaces

- `std`
- `std::rel_ops`

Functions

- `template<class _Tp>`
`bool std::rel_ops::operator!= (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp>`
`bool std::rel_ops::operator<= (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp>`
`bool std::rel_ops::operator> (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp>`
`bool std::rel_ops::operator>= (const _Tp &__x, const _Tp &__y)`

5.410.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<utility>`.

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except `std_utility.h`. For more information, see the thread of about twenty messages starting with <http://gcc.gnu.org/ml/libstdc++/2001-01/msg00223.html>, or http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous_overloads

Short summary: the `rel_ops` operators should be avoided for the present.

5.426.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (throw_value, throw_allocator) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type forced_exception_error.

5.427 time_members.h File Reference

5.437.1 Detailed Description

Contains an implementation class for tree-like classes.

5.438 traits.hpp File Reference

Classes

- struct [__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >](#)
- struct [__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.438.1 Detailed Description

Contains an implementation class for ov_tree_.

5.439 traits.hpp File Reference

Classes

- struct [__gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >](#)
- struct [__gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.439.1 Detailed Description

Contains an implementation class for pat_trie_.

5.440 traits.hpp File Reference

Classes

- struct [__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >](#)
- struct [__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.440.1 Detailed Description

Contains an implementation for `rb_tree_`.

5.441 `traits.hpp` File Reference

Classes

- struct [__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >](#)
- struct [__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

5.441.1 Detailed Description

Contains an implementation for `splay_tree_`.

5.442 `tree_policy.hpp` File Reference

Classes

- class [__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_BRANCH_POLICY_BASE`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

5.442.1 Detailed Description

Contains tree-related policies.

5.443 tree_trace_base.hpp File Reference

5.443.1 Detailed Description

Contains tree-related policies.

5.444 trie_policy.hpp File Reference

Classes

- class [__gnu_pbds::trie_order_statistics_node_update](#)< Node_Cltr, Node_Itr, _ATraits, _Alloc >
- class [__gnu_pbds::trie_prefix_search_node_update](#)< Node_Cltr, Node_Itr, _ATraits, _Alloc >
- struct [__gnu_pbds::trie_string_access_traits](#)< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_TRIE_POLICY_BASE`

5.444.1 Detailed Description

Contains trie-related policies.

5.445 trie_policy_base.hpp File Reference

Classes

- class [__gnu_pbds::detail::trie_policy_base](#)< Node_Cltr, Node_Itr, _ATraits, _Alloc >

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

5.445.1 Detailed Description

Contains an implementation of `trie_policy_base`.

5.446 `trie_string_access_traits_imp.hpp` File Reference

5.446.1 Detailed Description

Contains a policy for extracting character positions from a string for a vector-based PATRICIA tree

5.447 `type_traits.h` File Reference

Namespaces

- [`__gnu_cxx`](#)

Functions

- `template<typename _Type >`
`bool __gnu_cxx::__is_null_pointer (_Type *__ptr)`
- `template<typename _Type >`
`bool __gnu_cxx::__is_null_pointer (_Type)`
- `bool __gnu_cxx::__is_null_pointer (std::nullptr_t)`

5.447.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.448 `type_utils.hpp` File Reference

Namespaces

- [`__gnu_pbds`](#)

Macros

- `#define PB_DS_STATIC_ASSERT(UNIQUE, E)`

Typedefs

- typedef std::tr1::integral_constant< int, 0 > **__gnu_pbds::detail::false_type**
- typedef std::tr1::integral_constant< int, 1 > **__gnu_pbds::detail::true_type**

5.448.1 Detailed Description

Contains utilities for handling types. All of these classes are based on Modern C++ by Andrei Alexandrescu.

5.449 typelist.h File Reference

Namespaces

- [__gnu_cxx](#)
- [__gnu_cxx::typelist](#)

Macros

- #define **_GLIBCXX_TYPELIST_CHAIN1**(X0)
- #define **_GLIBCXX_TYPELIST_CHAIN10**(X0, X1, X2, X3, X4, X5, X6, X7, X8, X9)

5.458.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

5.464.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of work-stealing.

Work stealing is described in

R. D. Blumofe and C. E. Leiserson. Scheduling multithreaded computations by work stealing. *Journal of the ACM*, 46(5):720–748, 1999.

This file is a GNU parallel extension to the Standard C++ Library.
