2.1 Adaptors for pointers to functions

Collaboration diagram for Adaptors for pointers to functions:

Classes

- class `std::pointer_to_binary_function< _Arg1, _Arg2, _Result >`
- class `std::pointer_to_unary_function< _Arg, _Result >`

Functions

- `template<typename _Arg, typename _Result >`
`pointer_to_unary_function< _Arg, _Result > std::ptr_fun (_Result(*)(_Arg))`
- `template<typename _Arg1, typename _Arg2, typename _Result >`
`pointer_to_binary_function< _Arg1, _Arg2, _Result > std::ptr_fun (_Result(*)(_Arg1, _Arg2))`

2.1.1 Detailed Description

The advantage of function objects over pointers to functions is that the objects in the standard library declare nested typedefs describing their argument and result types with uniform names (e.g., `result_type` from the base classes `unary_function` and `binary_function`). Sometimes those typedefs are required, not just optional.

Adaptors are provided to turn pointers to unary (single-argument) and binary (double-argument) functions into function objects. The long-winded functor `pointer_to_unary_function` is constructed with a function pointer `f`, and its `operator()` called with argument `x` returns `f(x)`. The functor `pointer_to_binary_function` does the same thing, but with a double-argument `f` and `operator()`.

The function `ptr_fun` takes a pointer-to-function `f` and constructs an instance of the appropriate functor.

2.1.2 Function Documentation

2.1.2.1 `template<typename _Arg, typename _Result > pointer_to_unary_function< _Arg, _Result > std::ptr_fun (_Result(*)(_Arg) __x) [inline]`

One of the [adaptors for function pointers](#).

Definition at line 795 of file `stl_function.h`.

```
2.1.2.2  template<typename _Arg1, typename _Arg2, typename _Result > pointer_to_binary_function<_Arg1, _Arg2, _Result>  
        std::ptr_fun ( _Result(*)( _Arg1, _Arg2) __x )  [inline]
```

One of the [adaptors for function pointers](#).

Definition at line 821 of file `stl_function.h`.

2.2 Adaptors for pointers to members

Collaboration diagram for Adaptors for pointers to members:

Classes

- class `std::const_mem_fun1_ref_t<_Ret, _Tp, _Arg>`
- class `std::const_mem_fun1_t<_Ret, _Tp, _Arg>`
- class `std::const_mem_fun_ref_t<_Ret, _Tp>`
- class `std::const_mem_fun_t<_Ret, _Tp>`
- class `std::mem_fun1_ref_t<_Ret, _Tp, _Arg>`
- class `std::mem_fun1_t<_Ret, _Tp, _Arg>`
- class `std::mem_fun_ref_t<_Ret, _Tp>`
- class `std::mem_fun_t<_Ret, _Tp>`

Functions

- `template<typename _Ret, typename _Tp>`
`mem_fun_t<_Ret, _Tp> std::mem_fun (_Ret(_Tp::*__f)())`
- `template<typename _Ret, typename _Tp, typename _Arg>`
`mem_fun1_t<_Ret, _Tp, _Arg> std::mem_fun (_Ret(_Tp::*__f)(_Arg))`
- `template<typename _Ret, typename _Tp>`
`mem_fun_ref_t<_Ret, _Tp> std::mem_fun_ref (_Ret(_Tp::*__f)())`
- `template<typename _Ret, typename _Tp, typename _Arg>`
`mem_fun1_ref_t<_Ret, _Tp, _Arg> std::mem_fun_ref (_Ret(_Tp::*__f)(_Arg))`

2.2.1 Detailed Description

There are a total of $8 = 2^3$ function objects in this family. (1) Member functions taking no arguments vs member functions taking one argument. (2) Call through pointer vs call through reference. (3) Const vs non-const member function.

All of this complexity is in the function objects themselves. You can ignore it by using the helper function `mem_fun` and `mem_fun_ref`, which create whichever type of adaptor is appropriate.

2.3 Algorithms

- class `std::allocator<_Tp>`
- class `std::allocator<void>`
- struct `std::allocator_traits<_Alloc>`
- struct `std::uses_allocator<_Tp, _Alloc>`

Typedefs

- template<typename `_Tp`>
using `std::__allocator_base` = `__gnu_cxx::new_allocator<_Tp>`

Functions

- template<typename `_T1`, typename `_T2`>
bool **`std::operator!=`** (const allocator< `_T1` > &, const allocator< `_T2` > &)
- template<typename `_Tp`>
bool **`std::operator!=`** (const allocator< `_Tp` > &, const allocator< `_Tp` > &)

- template<typename `_Tp`>
bool **`std::operator==`** (const allocator< `_Tp` > &, const allocator< `_Tp` > &)

2.4.1 Detailed Description

Classes encapsulating memory operations.

2.4.2 Typedef Documentation

2.4.2.1 `template<typename _Tp> using std::__allocator_base = typedef __gnu_cxx::new_allocator<_Tp>`

An alias to the base class for `std::allocator`.

Used to set the `std::allocator` base class to `__gnu_cxx::new_allocator`.

Template Parameters

<code>_Tp</code>	Type of allocated object.
------------------	---------------------------

Definition at line 48 of file c++allocator.h.

2.5 Arithmetic Classes

Collaboration diagram for Arithmetic Classes:

Classes

- struct [std::divides<_Tp>](#)
- struct [std::minus<_Tp>](#)
- struct [std::modulus<_Tp>](#)
- struct [std::multiplies<_Tp>](#)
- struct [std::negate<_Tp>](#)
- struct [std::plus<_Tp>](#)

2.5.1 Detailed Description

Because basic math often needs to be done during an algorithm, the library provides functors for those operations. See the documentation for [the base classes](#) for examples of their use.

2.6 Associative

Collaboration diagram for Associative:

Classes

- class `std::map< _Key, _Tp, _Compare, _Alloc >`
- class `std::multimap< _Key, _Tp, _Compare, _Alloc >`
- class `std::multiset< _Key, _Compare, _Alloc >`
- class `std::set< _Key, _Compare, _Alloc >`

2.6.1 Detailed Description

Associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, and an ordering relation used to sort the elements of the container.

All associative containers must meet certain requirements, summarized in [tables](#).

2.14.1 Detailed Description

These algorithms are variations of a classic binary search, and all assume that the sequence being searched is already sorted.

The number of comparisons will be logarithmic (and as few as possible). The number of steps through the sequence will be logarithmic for random-access iterators (e.g., pointers), and linear otherwise.

The LWG has passed Defect Report 270, which notes: *The proposed resolution reinterprets binary search. Instead of thinking about searching for a value in a sorted range, we view that as an important special case of a more general algorithm: searching for the partition point in a partitioned range. We also add a guarantee that the old wording did not: we ensure that the upper bound is no earlier than the lower bound, that the pair returned by equal_range is a valid range, and that the first part of that pair is the lower bound.*

The actual effect of the first sentence is that a comparison functor passed by the user doesn't necessarily need to induce a strict weak ordering relation. Rather, it partitions the range.

2.14.2 Function Documentation

2.14.2.1 `template<typename _ForwardIterator, typename _Tp> bool std::binary_search (_ForwardIterator __first, _ForwardIterator __last, const _Tp & __val)`

Determines whether an element exists in a range.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

True if `__val` (or its equivalent) is in `[__first, __last]`.

Note that this does not actually return an iterator to `__val`. For that, use `std::find` or a container's specialized find member functions.

Definition at line 2258 of file `stl_algo.h`.

2.14.2.2 `template<typename _ForwardIterator, typename _Tp, typename _Compare> bool std::binary_search (_ForwardIterator __first, _ForwardIterator __last, const _Tp & __val, _Compare __comp)`

Determines whether an element exists in a range.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

True if `__val` (or its equivalent) is in `[__first, __last]`.

Note that this does not actually return an iterator to `__val`. For that, use `std::find` or a container's specialized find member functions.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 2293 of file `stl_algo.h`.

2.14.2.3 `template<typename _ForwardIterator, typename _Tp> pair<_ForwardIterator, _ForwardIterator> std::equal_range (_ForwardIterator __first, _ForwardIterator __last, const _Tp & __val) [inline]`

Finds the largest subrange in which `__val` could be inserted at any place in it without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val),
               upper_bound(__first, __last, __val))
```

but does not actually call those functions.

Definition at line 2185 of file `stl_algo.h`.

```
2.14.2.4 template<typename _ForwardIterator, typename _Tp, typename _Compare > pair<_ForwardIterator, _ForwardIterator>
std::equal_range ( _ForwardIterator __first, _ForwardIterator __last, const _Tp & __val, _Compare __comp )
[inline]
```

Finds the largest subrange in which `__val` could be inserted at any place in it without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val, __comp),
               upper_bound(__first, __last, __val, __comp))
```

but does not actually call those functions.

Definition at line 2222 of file `stl_algo.h`.

```
2.14.2.5 template<typename _ForwardIterator, typename _Tp > _ForwardIterator std::lower_bound ( _ForwardIterator __first,
_FForwardIterator __last, const _Tp & __val ) [inline]
```

Finds the first position in which `val` could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

An iterator pointing to the first element *not less than* `val`, or `end()` if every element is less than `val`.

Definition at line 996 of file `stl_algobase.h`.

2.14.2.6 `template<typename _ForwardIterator, typename _Tp, typename _Compare > _ForwardIterator std::lower_bound (`
`_ForwardIterator __first, _ForwardIterator __last, const _Tp & __val, _Compare __comp) [inline]`

Finds the first position in which `__val` could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

An iterator pointing to the first element *not less than* `__val`, or `end()` if every element is less than `__val`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 2022 of file `stl_algo.h`.

References `std::advance()`, and `std::distance()`.

2.14.2.7 `template<typename _ForwardIterator, typename _Tp > _ForwardIterator std::upper_bound (`
`_ForwardIterator __first, _ForwardIterator __last, const _Tp & __val) [inline]`

Finds the last position in which `__val` could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

An iterator pointing to the first element greater than `__val`, or `end()` if no elements are greater than `__val`.

Definition at line 2079 of file `stl_algo.h`.

2.14.2.8 `template<typename _ForwardIterator, typename _Tp, typename _Compare> _ForwardIterator std::upper_bound (`
`_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp) [inline]`

Finds the last position in which `__val` could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

An iterator pointing to the first element greater than `__val`, or `end()` if no elements are greater than `__val`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

2.15 Binder Classes

Collaboration diagram for Binder Classes:

Classes

- class `std::binder1st<_Operation>`
- class `std::binder2nd<_Operation>`

Functions

- template<typename `_Operation` , typename `_Tp` >
`binder1st<_Operation>` `std::bind1st` (const `_Operation` &`__fn`, const `_Tp` &`__x`)
- template<typename `_Operation` , typename `_Tp` >
`binder2nd<_Operation>` `std::bind2nd` (const `_Operation` &`__fn`, const `_Tp` &`__x`)

2.15.1 Detailed Description

Binders turn functions/functors with two arguments into functors with a single argument, storing an argument to be applied later. For example, a variable `B` of type `binder1st` is constructed from a functor `f` and an argument `x`. Later, `B`'s `operator()` is called with a single argument `y`. The return value is the value of `f(x, y)`. `B` can be *called* with various arguments (`y1`, `y2`, ...) and will in turn call `f(x, y1)`, `f(x, y2)`, ...

The function `bind1st` is provided to save some typing. It takes the function and an argument as parameters, and returns an instance of `binder1st`.

The type `binder2nd` and its creator function `bind2nd` do the same thing, but the stored argument is passed as the second parameter instead of the first, e.g., `bind2nd(std::minus<float>(), 1.3)` will create a functor whose `operator()` accepts a floating-point number, subtracts 1.3 from it, and returns the result. (If `bind1st` had been used, the functor would perform `1.3 - x` instead.

Creator-wrapper functions like `bind1st` are intended to be used in calling algorithms. Their return values will be temporary objects. (The goal is to not require you to type names like `std::binder1st<std::plus<int>>` for declaring a variable to hold the return value from `bind1st(std::plus<int>(), 5)`).

These become more useful when combined with the composition functions.

These functions are deprecated in C++11 and can be replaced by `std::bind` (or `std::tr1::bind`) which is more powerful and flexible, supporting functions with any number of arguments. Uses of `bind1st` can be replaced by `std::bind(f, x, std::placeholders::_1)` and `bind2nd` by `std::bind(f, std::placeholders::_1, x)`.

2.21 Containers

Collaboration diagram for Containers:

Modules

- [Associative](#)
- [Sequences](#)

2.21.1 Detailed Description

Containers are collections of objects.

A container may hold any type which meets certain requirements, but the type of contained object is chosen at compile time, and all objects in a given container must be of the same type. (Polymorphism is possible by declaring a container of pointers to a base class and then populating it with pointers to instances of derived classes. Variant value types such as the `any` class from `Boost` can also be used.

All contained types must be `Assignable` and `CopyConstructible`. Specific containers may place additional requirements on the types of their contained objects.

Containers manage memory allocation and deallocation themselves when storing your objects. The objects are destroyed when the container is itself destroyed. Note that if you are storing pointers in a container, `delete` is *not* automatically called on the pointers before destroying them.

All containers must meet certain requirements, summarized in `tables`.

The standard containers are further refined into [Sequences](#) and [Associative Containers](#). [Unordered Associative Containers](#).

2.27.1 Detailed Description

Function objects, or *functors*, are objects with an `operator()` defined and accessible. They can be passed as arguments to algorithm templates and used in place of a function pointer. Not only is the resulting expressiveness of the library increased, but the generated code can be more efficient than what you might write by hand. When we refer to *functors*, then, generally we include function pointers in the description as well.

Often, functors are only created as temporaries passed to algorithm calls, rather than being created as named variables.

Two examples taken from the standard itself follow. To perform a by-element addition of two vectors `a` and `b` containing `double`, and put the result in `a`, use

```
transform (a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
```

To negate every element in `a`, use

```
transform(a.begin(), a.end(), a.begin(), negate<double>());
```

The addition and negation functions will be inlined directly.

The standard functors are derived from structs named `unary_function` and `binary_function`. These two classes contain nothing but typedefs, to aid in generic (template) programming. If you write your own functors, you might consider doing the same.

2.30.1 Detailed Description

2.30.2 Function Documentation

2.30.2.1 `template<typename _RandomAccessIterator > bool std::is_heap (_RandomAccessIterator __first, _RandomAccessIterator __last) [inline]`

Determines whether a range is a heap.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

True if range is a heap, false otherwise.

Definition at line 511 of file `stl_heap.h`.

References `std::is_heap_until()`.

```
2.30.2.2 template<typename _RandomAccessIterator, typename _Compare> bool std::is_heap ( _RandomAccessIterator __first,  
_RandomAccessIterator __last, _Compare __comp ) [inline]
```

Determines whether a range is a heap using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor to use.

Returns

True if range is a heap, false otherwise.

Definition at line 524 of file `stl_heap.h`.

References `std::is_heap_until()`.

```
2.30.2.3 template<typename _RandomAccessIterator> _RandomAccessIterator std::is_heap_until ( _RandomAccessIterator  
__first, _RandomAccessIterator __last ) [inline]
```

Search the end of a heap.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

An iterator pointing to the first element not in the heap.

This operation returns the last iterator *i* in [*__first*, *__last*) for which the range [*__first*, *i*) is a heap.

Definition at line 462 of file `stl_heap.h`.

References `std::distance()`.

2.30.2.4 `template<typename _RandomAccessIterator, typename _Compare > _RandomAccessIterator std::is_heap_until (`
`_RandomAccessIterator __first, _RandomAccessIterator __last, _Compare __comp) [inline]`

Search the end of a heap using comparison functor.

Parameters

<i>__first</i>	Start of range.
<i>__last</i>	End of range.
<i>__comp</i>	Comparison functor to use.

Returns

An iterator pointing to the first element not in the heap.

This operation returns the last iterator *i* in [*__first*, *__last*) for which the range [*__first*, *i*) is a heap. Comparisons are made using *__comp*.

Definition at line 489 of file `stl_heap.h`.

References `std::distance()`.

Referenced by `std::is_heap()`.

2.30.2.5 `template<typename _RandomAccessIterator > void std::make_heap (_RandomAccessIterator __first,`
`_RandomAccessIterator __last) [inline]`

Construct a heap over a range.

Parameters

<i>__first</i>	Start of heap.
<i>__last</i>	End of heap.

This operation makes the elements in [*__first*, *__last*) into a heap.

Definition at line 351 of file `stl_heap.h`.

2.30.2.6 `template<typename _RandomAccessIterator, typename _Compare > void std::make_heap (_RandomAccessIterator`
`__first, _RandomAccessIterator __last, _Compare __comp) [inline]`

Construct a heap over a range using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation makes the elements in `[__first,__last)` into a heap. Comparisons are made using `__comp`.

Definition at line 376 of file `stl_heap.h`.

Referenced by `std::priority_queue<_Tp, _Sequence, _Compare >::priority_queue()`.

2.30.2.7 `template<typename _RandomAccessIterator > void std::pop_heap (_RandomAccessIterator __first, _RandomAccessIterator __last) [inline]`

Pop an element off a heap.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

Precondition

`[__first, __last)` is a valid, non-empty range.

This operation pops the top of the heap. The elements `__first` and `__last-1` are swapped and `[__first,__last-1)` is made into a heap.

Definition at line 263 of file `stl_heap.h`.

2.30.2.8 `template<typename _RandomAccessIterator, typename _Compare > void std::pop_heap (_RandomAccessIterator __first, _RandomAccessIterator __last, _Compare __comp) [inline]`

Pop an element off a heap using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation pops the top of the heap. The elements `__first` and `__last-1` are swapped and `[__first,__last-1)` is made into a heap. Comparisons are made using `comp`.

Definition at line 297 of file `stl_heap.h`.

Referenced by `std::priority_queue<_Tp, _Sequence, _Compare >::pop()`.

2.30.2.9 `template<typename _RandomAccessIterator > void std::push_heap (_RandomAccessIterator __first,
_RandomAccessIterator __last) [inline]`

Push an element onto a heap.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap + element.

This operation pushes the element at `last-1` onto the valid heap over the range `[__first,__last-1)`. After completion, `[__first,__last)` is a valid heap.

Definition at line 150 of file `stl_heap.h`.

2.30.2.10 `template<typename _RandomAccessIterator , typename _Compare > void std::push_heap (_RandomAccessIterator
__first, _RandomAccessIterator __last, _Compare __comp) [inline]`

Push an element onto a heap using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap + element.
<code>__comp</code>	Comparison functor.

This operation pushes the element at `__last-1` onto the valid heap over the range `[__first,__last-1)`. After completion, `[__first,__last)` is a valid heap. Compare operations are performed using `comp`.

Definition at line 184 of file `stl_heap.h`.

Referenced by `std::priority_queue<_Tp, _Sequence, _Compare >::push()`.

2.30.2.11 `template<typename _RandomAccessIterator > void std::sort_heap (_RandomAccessIterator __first,
_RandomAccessIterator __last) [inline]`

Sort a heap.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

This operation sorts the valid heap in the range `[__first,__last)`.

Definition at line 410 of file `stl_heap.h`.

2.30.2.12 `template<typename _RandomAccessIterator, typename _Compare> void std::sort_heap (_RandomAccessIterator
__first, _RandomAccessIterator __last, _Compare __comp) [inline]`

Sort a heap using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation sorts the valid heap in the range [`__first`,`__last`). Comparisons are made using `__comp`.

Definition at line 436 of file `stl_heap.h`.

2.33.1 Detailed Description

These are empty types, used to distinguish different iterators. The distinction is not made by what they contain, but simply by what they are. Different underlying algorithms can then be used based on the different operations supported by different iterator types.

2.34.1 Detailed Description

Abstractions for uniform iterating through various underlying types.

2.34.2 Function Documentation

2.34.2.1 `template<typename _Iter > iterator_traits<_Iter>::iterator_category std::__iterator_category (const _Iter &)`
`[inline]`

This function is not a part of the C++ standard but is syntactic sugar for internal library use only.

Definition at line 201 of file `stl_iterator_base_types.h`.

Referenced by `__gnu_debug::__check_string()`, `std::__find_if()`, `std::__find_if_not()`, `std::__search_n_aux()`, `__gnu_debug::__valid_range_aux()`, `std::advance()`, `std::copy_n()`, `std::distance()`, `std::find_end()`, `std::includes()`, `std::next_permutation()`, `std::partition()`, `std::reverse()`, `std::rotate()`, `std::uninitialized_copy_n()`, and `std::unique_copy()`.

2.34.2.2 `template<typename _Container > back_insert_iterator<_Container> std::back_inserter (_Container & __x)`
`[inline]`

Parameters

<code>__x</code>	A container of arbitrary type.
------------------	--------------------------------

Returns

An instance of `back_insert_iterator` working on `__x`.

This wrapper function helps in creating `back_insert_iterator` instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

Definition at line 480 of file `stl_iterator.h`.

Referenced by `std::match_results<_Bi_iter >::format()`, and `std::regex_replace()`.

2.34.2.3 `template<typename _Container > front_insert_iterator<_Container> std::front_inserter (_Container & __x)`
`[inline]`

Parameters

<code>__x</code>	A container of arbitrary type.
------------------	--------------------------------

Returns

An instance of `front_insert_iterator` working on `x`.

This wrapper function helps in creating `front_insert_iterator` instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

Definition at line 570 of file `stl_iterator.h`.

2.34.2.4 `template<typename _Container, typename _Iterator> insert_iterator<_Container> std::inserter (_Container & __x, _Iterator __i) [inline]`

Parameters

<code>__x</code>	A container of arbitrary type.
------------------	--------------------------------

Returns

An instance of `insert_iterator` working on `__x`.

This wrapper function helps in creating `insert_iterator` instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

Return false if `x` and `y` are both end or not end, or `x` and `y` are the same.

Definition at line 137 of file `stream_iterator.h`.

2.34.2.6 `template<typename _Tp, typename _CharT, typename _Traits, typename _Dist> bool std::operator==(const istream_iterator<_Tp, _CharT, _Traits, _Dist> & __x, const istream_iterator<_Tp, _CharT, _Traits, _Dist> & __y) [inline]`

Return true if `x` and `y` are both end or not end, or `x` and `y` are the same.

Definition at line 130 of file `stream_iterator.h`.

2.34.2.7 `template<typename _Iterator> bool std::operator==(const reverse_iterator<_Iterator> & __x, const reverse_iterator<_Iterator> & __y) [inline]`

Parameters

<code>__x</code>	A <code>reverse_iterator</code> .
<code>__y</code>	A <code>reverse_iterator</code> .

Returns

A simple bool.

Reverse iterators forward many operations to their underlying `base()` iterators. Others are implemented in terms of one another.

2.37.1 Detailed Description

2.37.2 Function Documentation

2.37.2.1 `template<typename _II, typename _OI > _OI std::copy (_II __first, _II __last, _OI __result) [inline]`

Copies the range [first,last) into result.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

`result + (first - last)`

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within [first,last); the `copy_backward` function should be used instead.

Note that the end of the output range is permitted to be contained within [first,last).

Definition at line 458 of file `stl_algobase.h`.

2.37.2.2 `template<typename _BI1, typename _BI2 > _BI2 std::copy_backward (_BI1 __first, _BI1 __last, _BI2 __result) [inline]`

Copies the range [first,last) into result.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	A bidirectional iterator.

Returns

`result - (first - last)`

The function has the same effect as `copy`, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random

access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range `(first,last]`. Use `copy` instead. Note that the start of the output range may overlap `[first,last)`.

Definition at line 634 of file `stl_algobase.h`.

2.37.2.3 `template<typename _Inputiterator , typename _Outputiterator , typename _Predicate > _Outputiterator std::copy_if (`
`_Inputiterator __first, _Inputiterator __last, _Outputiterator __result, _Predicate __pred)`

Copy the elements of a sequence for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` for which `__pred` returns true to the range beginning at `__result`.

`copy_if()` is stable, so the relative order of elements that are copied is unchanged.

Definition at line 734 of file `stl_algo.h`.

2.37.2.4 `template<typename _Inputiterator , typename _Size , typename _Outputiterator > _Outputiterator std::copy_n (`
`_Inputiterator __first, _Size __n, _Outputiterator __result) [inline]`

Copies the range `[first,first+n)` into `[result,result+n)`.

Parameters

<code>__first</code>	An input iterator.
<code>__n</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

Returns

`result+n`.

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Definition at line 796 of file `stl_algo.h`.

References `std::__iterator_category()`.

2.37.2.5 `template<typename _ForwardIterator, typename _Tp> void std::fill (_ForwardIterator __first, _ForwardIterator __last, const _Tp & __value) [inline]`

Fills the range `[first,last)` with copies of `value`.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__value</code>	A reference-to-const of arbitrary type.

Returns

Nothing.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `wmemset`.

Definition at line 736 of file `stl_algobase.h`.

2.37.2.6 `template<typename _OI, typename _Size, typename _Tp> _OI std::fill_n (_OI __first, _Size __n, const _Tp & __value) [inline]`

Fills the range `[first,first+n)` with copies of `value`.

Parameters

<code>__first</code>	An output iterator.
<code>__n</code>	The count of copies to perform.
<code>__value</code>	A reference-to-const of arbitrary type.

Returns

The iterator at `first+n`.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `@ wmemset`.

2.37.2.7 `template<typename _ForwardIterator, typename _Generator> void std::generate (_ForwardIterator __first, _ForwardIterator __last, _Generator __gen)`

Assign the result of a function object to each value in a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__gen</code>	A function object taking no arguments and returning <code>std::iterator_traits<_ForwardIterator>::value_type</code>

Returns

`generate()` returns no value.

Performs the assignment `*i = __gen()` for each `i` in the range `[__first, __last)`.

Definition at line 4286 of file `stl_algo.h`.

2.37.2.8 `template<typename _OutputIterator, typename _Size, typename _Generator> _OutputIterator std::generate_n (_OutputIterator __first, _Size __n, _Generator __gen)`

Assign the result of a function object to each value in a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__n</code>	The length of the sequence.
<code>__gen</code>	A function object taking no arguments and returning <code>std::iterator_traits<_ForwardIterator>::value_type</code>

Returns

The end of the sequence, `__first+__n`

Performs the assignment `*i = __gen()` for each `i` in the range `[__first, __first+__n)`.

2.37.2.9 `template<typename _InputIterator, typename _Predicate> bool std::is_partitioned (_InputIterator __first, _InputIterator __last, _Predicate __pred) [inline]`

Checks whether the sequence is partitioned.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

True if the range `[__first,__last)` is partitioned by `__pred`, i.e. if all elements that satisfy `__pred` appear before those that do not.

2.37.2.10 `template<typename _ForwardIterator1, typename _ForwardIterator2> void std::iter_swap (_ForwardIterator1 __a, _ForwardIterator2 __b) [inline]`

Swaps the contents of two iterators.

Parameters

<code>__↔ _a</code>	An iterator.
<code>__↔ _b</code>	Another iterator.

Returns

Nothing.

This function swaps the values pointed to by two iterators, not the iterators themselves.

Definition at line 120 of file `stl_algobase.h`.

2.37.2.11 `template<typename _II, typename _OI> _OI std::move (_II __first, _II __last, _OI __result) [inline]`

Moves the range `[first,last)` into `result`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

result + (first - last)

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within `[first,last)`; the `move_backward` function should be used instead.

Note that the end of the output range is permitted to be contained within `[first,last)`.

Definition at line 491 of file `stl_algobase.h`.

References `std::move()`.

```
2.37.2.12  template<typename _BI1 , typename _BI2 > _BI2 std::move_backward ( _BI1 __first, _BI1 __last, _BI2 __result )
           [inline]
```

Moves the range `[first,last)` into `result`.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	A bidirectional iterator.

Returns

result - (first - last)

The function has the same effect as `move`, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range `(first,last]`. Use `move` instead. Note that the start of the output range may overlap `[first,last)`.

           _ForwardIterator __last, _Predicate __pred ) [inline]
```

Move elements for which a predicate is true to the beginning of a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate functor.

Returns

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[_first,middle)` and false for each `i` in the range `[middle,__last)`.

`__pred` must not modify its operand. `partition()` does not preserve the relative ordering of elements in each group, use `stable_partition()` if this is needed.

    _OutputIterator1 __out_true, _OutputIterator2 __out_false, _Predicate __pred )
```

Copy the elements of a sequence to separate output sequences depending on the truth value of a predicate.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__out_true</code>	An output iterator.
<code>__out_false</code>	An output iterator.
<code>__pred</code>	A predicate.

Returns

A pair designating the ends of the resulting sequences.

Copies each element in the range `[_first,__last)` for which `__pred` returns true to the range beginning at `out_true` and each element for which `__pred` returns false to `__out_false`.

Find the partition point of a partitioned range.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__pred</code>	A predicate.

Returns

An iterator `mid` such that `all_of(__first, mid, __pred)` and `none_of(mid, __last, __pred)` are both true.

2.37.2.16 template<typename _RandomAccessIterator > void std::random_shuffle ( _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Randomly shuffle the elements of a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

Returns

Nothing.

Reorder the elements in the range `[__first,__last)` using a random distribution, so that every possible ordering of the sequence is equally likely.

```

Shuffle the elements of a sequence using a random number generator.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__rand</code>	The RNG functor or function.

Returns

Nothing.

Reorders the elements in the range `[__first,__last)` using `__rand` to provide a random distribution. Calling `__rand(↵N)` for a positive integer `N` should return a randomly chosen integer from the range `[0,N)`.

Definition at line 4458 of file `stl_algo.h`.

2.37.2.18 `template<typename _ForwardIterator, typename _Tp> _ForwardIterator std::remove (_ForwardIterator __first, _ForwardIterator __last, const _Tp & __value) [inline]`

Remove elements from a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__value</code>	The value to be removed.

Returns

An iterator designating the end of the resulting sequence.

All elements equal to `__value` are removed from the range `[__first, __last)`.

`remove()` is stable, so the relative order of elements that are not removed is unchanged.

Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

Definition at line 893 of file `stl_algo.h`.

2.37.2.19 `template<typename _InputIterator, typename _OutputIterator, typename _Tp> _OutputIterator std::remove_copy (_InputIterator __first, _InputIterator __last, _OutputIterator __result, const _Tp & __value) [inline]`

Copy a sequence, removing elements of a given value.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__value</code>	The value to be removed.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` not equal to `__value` to the range beginning at `__result`. `remove_copy()` is stable, so the relative order of elements that are copied is unchanged.

Definition at line 667 of file `stl_algo.h`.

2.37.2.20 `template<typename _InputIterator, typename _OutputIterator, typename _Predicate> _OutputIterator std::remove_copy_if (_InputIterator __first, _InputIterator __last, _OutputIterator __result, _Predicate __pred) [inline]`

Copy a sequence, removing elements for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` for which `__pred` returns false to the range beginning at `__result`.

`remove_copy_if()` is stable, so the relative order of elements that are copied is unchanged.

Definition at line 700 of file `stl_algo.h`.

Remove elements from a sequence using a predicate.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate.

Returns

An iterator designating the end of the resulting sequence.

All elements for which `__pred` returns true are removed from the range `[__first,__last)`.

```

Replace each occurrence of one value in a sequence with another value.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__old_value</code>	The value to be replaced.
<code>__new_value</code>	The replacement value.

Returns

`replace()` returns no value.

For each iterator `i` in the range `[__first,__last)` if `*i == __old_value` then the assignment `*i = __new_value` is performed.

Definition at line 4222 of file `stl_algo.h`.

```

& __new_value ) [inline]
```

Copy a sequence, replacing each value for which a predicate returns true with another value.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.
<code>__new_value</code>	The replacement value.

Returns

The end of the output sequence, `__result+(__last-__first)`.

Copies each element in the range `[__first,__last)` to the range `[__result,__result+(__last-__first))` replacing elements for which `__pred` returns true with `__new_value`.

Definition at line 3170 of file `stl_algo.h`.

Replace each value in a sequence for which a predicate returns true with another value.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate.
<code>__new_value</code>	The replacement value.

Returns

`replace_if()` returns no value.

For each iterator `i` in the range `[__first, __last)` if `__pred(*i)` is true then the assignment `*i = __new_value` is performed.

```
2.37.2.25  template<typename _BidirectionalIterator > void std::reverse ( _BidirectionalIterator __first, _BidirectionalIterator __last
    ) [inline]
```

Reverse a sequence.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.

Returns

`reverse()` returns no value.

Reverses the order of the elements in the range `[__first, __last)`, so that the first element becomes the last etc. For every `i` such that $0 \leq i \leq (_\text{last} - _\text{first})/2$, `reverse()` swaps `*(__first+i)` and `*(__last-(i+1))`

```

Copy a sequence, reversing its elements.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies the elements in the range `[__first, __last)` to the range `[__result, __result+(__last-__first))` such that the order of the elements is reversed. For every `i` such that $0 \leq i \leq (_\text{last} - _\text{first})$, `reverse_copy()` performs the assignment

$*(__result+(__last-__first)-1-i) = *(__first+i)$. The ranges $[__first, __last)$ and $[__result, __result+(__last-__first))$ must not overlap.

Definition at line 1204 of file `stl_algo.h`.

2.37.2.27 `template<typename _ForwardIterator > void std::rotate (_ForwardIterator __first, _ForwardIterator __middle, _ForwardIterator __last) [inline]`

Rotate the elements of a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__middle</code>	A forward iterator.
<code>__last</code>	A forward iterator.

Returns

Nothing.

Rotates the elements of the range $[__first, __last)$ by $(__middle - __first)$ positions so that the element at `__middle` is moved to `__first`, the element at `__middle+1` is moved to `__first+1` and so on for each element in the range $[__first, __last)$.

This effectively swaps the ranges $[__first, __middle)$ and $[__middle, __last)$.

Performs $*(__first+(n+(__last-__middle))\%(__last-__first))=*(__first+n)$ for each n in the range $[0, __last-__first)$.

Parameters

<code>__first</code>	A forward iterator.
<code>__middle</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__result</code>	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies the elements of the range `[__first,__last)` to the range beginning at

Returns

, rotating the copied elements by `(__middle-__first)` positions so that the element at `__middle` is moved to \leftarrow `__result`, the element at `__middle+1` is moved to `__result+1` and so on for each element in the range `[__first,__last)`.

Performs $*(__result+(n+(__last-__middle))\%(__last-__first))=*(__first+n)$ for each `n` in the range `[0,__last-__first)`.

Shuffle the elements of a sequence using a uniform random number generator.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__g</code>	A <code>UniformRandomNumberGenerator</code> (26.5.1.3).

Returns

Nothing.

Reorders the elements in the range `[__first,__last)` using `__g` to provide random numbers.

Definition at line 3706 of file `stl_algo.h`.

References `std::iter_swap()`.

2.37.2.30 `template<typename _ForwardIterator, typename _Predicate > _ForwardIterator std::stable_partition (`
`_ForwardIterator __first, _ForwardIterator __last, _Predicate __pred) [inline]`

Move elements for which a predicate is true to the beginning of a sequence, preserving relative ordering.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate functor.

Returns

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[first,middle)` and false for each `i` in the range `[middle,last)`.

Performs the same function as `partition()` with the additional guarantee that the relative ordering of elements in each group is preserved, so any two elements `x` and `y` in the range `[__first,__last)` such that `__pred(x) == __pred(y)` will have the same relative ordering after calling `stable_partition()`.

Swap the elements of two sequences.

Parameters

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.

Returns

An iterator equal to `first2+(last1-first1)`.

Swaps each element in the range `[first1,last1)` with the corresponding element in the range `[first2,(last1-first1))`. The ranges must not overlap.

Perform an operation on a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__unary_op</code>	A unary operator.

Returns

An output iterator equal to `__result+(__last-__first)`.

Applies the operator to each element in the input range and assigns the results to successive elements of the output sequence. Evaluates `*(__result+N)=unary_op(*(__first+N))` for each `N` in the range `[0,__last-__first)`.

`unary_op` must not alter its argument.

Perform an operation on corresponding elements of two sequences.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__binary_op</code>	A binary operator.

Returns

An output iterator equal to `result+(last-first)`.

Applies the operator to the corresponding elements in the two input ranges and assigns the results to successive elements of the output sequence. Evaluates `*(__result+N)=__binary_op(*(__first1+N),*(__first2+N))` for each `N` in the range `[0,__last1-__first1)`.

Copy a sequence, removing consecutive duplicate values.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` to the range beginning at `__result`, except that only the first element is copied from groups of consecutive elements that compare equal. `unique_copy()` is stable, so the relative order of elements that are copied is unchanged.

2.38 Negators

Collaboration diagram for Negators:

Classes

- class `std::binary_negate<_Predicate>`
- class `std::unary_negate<_Predicate>`

Functions

- `template<typename _Predicate>`
`unary_negate<_Predicate> std::not1 (const _Predicate &__pred)`
- `template<typename _Predicate>`
`binary_negate<_Predicate> std::not2 (const _Predicate &__pred)`

2.38.1 Detailed Description

The functions `not1` and `not2` each take a predicate functor and return an instance of `unary_negate` or `binary_negate`, respectively. These classes are functors whose `operator()` performs the stored predicate function and then returns the negation of the result.

For example, given a vector of integers and a trivial predicate,

```

struct IntGreaterThanThree
: public std::unary_function<int, bool>
{
    bool operator() (int x) { return x > 3; }
};

std::find_if (v.begin(), v.end(), not1(IntGreaterThanThree()));
  
```

The call to `find_if` will locate the first index (*i*) of *v* for which `!(v[i] > 3)` is true.

The `not1/unary_negate` combination works on predicates taking a single argument. The `not2/binary_negate` combination works on predicates which take two arguments.

2.39.1 Detailed Description

2.39.2 Function Documentation

2.39.2.1 `template<typename _ForwardIterator > _ForwardIterator std::adjacent_find (_ForwardIterator __first, _ForwardIterator __last) [inline]`

Find two adjacent values in a sequence that are equal.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

Returns

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first,__last)` and such that `*i == *(i+1)`, or `__last` if no such iterator exists.

Definition at line 3898 of file `stl_algo.h`.

2.39.2.2 `template<typename _ForwardIterator, typename _BinaryPredicate> _ForwardIterator std::adjacent_find (`
`_ForwardIterator __first, _ForwardIterator __last, _BinaryPredicate __binary_pred) [inline]`

Find two adjacent values in a sequence using a predicate.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__binary_pred</code>	A binary predicate.

Returns

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first, __last)` and such that `__binary_pred(*i, *(i+1))` is true, or `__last` if no such iterator exists.

Definition at line 3923 of file `stl_algo.h`.

2.39.2.3 `template<typename _InputIterator, typename _Predicate> bool std::all_of (_InputIterator __first, _InputIterator __last,`
`_Predicate __pred) [inline]`

Checks that a predicate is true for all the elements of a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if `__pred` is true for each element in the range `[__first, __last)`, and false otherwise.

Definition at line 508 of file `stl_algo.h`.

References `std::find_if_not()`.

2.39.2.4 `template<typename _InputIterator, typename _Predicate> bool std::any_of (_InputIterator __first, _InputIterator __last,`
`_Predicate __pred) [inline]`

Checks that a predicate is false for at least an element of a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if an element exists in the range `[__first,__last)` such that `__pred` is true, and false otherwise.

Definition at line 543 of file `stl_algo.h`.

References `std::none_of()`.

2.39.2.5 `template<typename _InputIterator, typename _Tp> iterator_traits<_InputIterator>::difference_type std::count (`
`_InputIterator __first, _InputIterator __last, const _Tp & __value) [inline]`

Count the number of copies of a value in a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__value</code>	The value to be counted.

Returns

The number of iterators `i` in the range `[__first,__last)` for which `*i == __value`

Definition at line 3948 of file `stl_algo.h`.

2.39.2.6 `template<typename _InputIterator, typename _Predicate> iterator_traits<_InputIterator>::difference_type std::count_if (`
`_InputIterator __first, _InputIterator __last, _Predicate __pred) [inline]`

Count the elements of a sequence for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

The number of iterators `i` in the range `[__first,__last)` for which `__pred(*i)` is true.

Definition at line 3971 of file `stl_algo.h`.

2.39.2.7 `template<typename _Iter1, typename _Iter2, typename _BinaryPredicate> bool std::equal (_Iter1 __first1, _Iter1`
`__last1, _Iter2 __first2, _BinaryPredicate __binary_pred) [inline]`

Tests a range for element-wise equality.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate functor .

Returns

A boolean true or false.

This compares the elements of two ranges using the `binary_pred` parameter, and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

Definition at line 1085 of file `stl_algobase.h`.

References `std::distance()`, and `std::equal()`.

2.39.2.8 `template<typename _I1, typename _I2 > bool std::equal (_I1 __first1, _I1 __last1, _I2 __first2) [inline]`

Tests a range for element-wise equality.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.

Returns

A boolean true or false.

This compares the elements of two ranges using `==` and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

Definition at line 1053 of file `stl_algobase.h`.

Referenced by `std::equal()`, `std::fill_n()`, `std::operator!=()`, and `std::operator==()`.

2.39.2.9 `template<typename _InputIterator, typename _Tp > _InputIterator std::find (_InputIterator __first, _InputIterator __last, const _Tp & __val) [inline]`

Find the first occurrence of a value in a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__val</code>	The value to find.

Returns

The first iterator `i` in the range `[__first, __last)` such that `*i == __val`, or `__last` if no such iterator exists.

Definition at line 3771 of file `stl_algo.h`.

References `std::__find_if()`.

    _ForwardIterator1 __first1, _ForwardIterator1 __last1, _ForwardIterator2 __first2, _ForwardIterator2 __last2 )
    [inline]
```

Find last matching subsequence in a sequence.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of sequence to match.
<code>__last2</code>	End of sequence to match.

Returns

The last iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `*(i+N) == *(__first2+N)` for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` and returns an iterator to the `__first` element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first1, __last1)`.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1 - (__last2 - __first2)` where `__last2 - __first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`.

2.39.2.11 template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate > _ForwardIterator1
    std::find_end ( _ForwardIterator1 __first1, _ForwardIterator1 __last1, _ForwardIterator2 __first2, _ForwardIterator2
        __last2, _BinaryPredicate __comp ) [inline]
```

Find last matching subsequence in a sequence using a predicate.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of sequence to match.
<code>__last2</code>	End of sequence to match.
<code>comp</code>	The predicate to use.

Returns

The last iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `predicate(*(i+N), (__first2+N))` is true for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` using `comp` as a predicate and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first1, __last1)`.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1 - (__last2 - __first2)` where `__last2 - __first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`

2.39.2.12 `template<typename _InputIterator, typename _ForwardIterator> _InputIterator std::find_first_of (_InputIterator __first1, _InputIterator __last1, _ForwardIterator __first2, _ForwardIterator __last2)`

Find element from a set in a sequence.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of match candidates.
<code>__last2</code>	End of match candidates.

Returns

The first iterator `i` in the range `[__first1, __last1)` such that `*i == *(i2)` such that `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[__first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

Definition at line 3826 of file `stl_algo.h`.

2.39.2.13 `template<typename _InputIterator, typename _ForwardIterator, typename _BinaryPredicate> _InputIterator std::find_first_of (_InputIterator __first1, _InputIterator __last1, _ForwardIterator __first2, _ForwardIterator __last2, _BinaryPredicate __comp)`

Find element from a set in a sequence using a predicate.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of match candidates.
<code>__last2</code>	End of match candidates.
<code>__comp</code>	Predicate to use.

Returns

The first iterator `i` in the range `[__first1, __last1)` such that `comp(*i, *(i2))` is true and `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[__first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

Definition at line 3867 of file `stl_algo.h`.

```
2.39.2.14  template<typename _InputIterator, typename _Predicate> _InputIterator std::find_if ( _InputIterator __first,
    _InputIterator __last, _Predicate __pred ) [inline]
```

Find the first element in a sequence for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

The first iterator `i` in the range `[__first, __last)` such that `__pred(*i)` is true, or `__last` if no such iterator exists.

Definition at line 3795 of file `stl_algo.h`.

References `std::__find_if()`.

```
2.39.2.15  template<typename _InputIterator, typename _Predicate> _InputIterator std::find_if_not ( _InputIterator __first,
    _InputIterator __last, _Predicate __pred ) [inline]
```

Find the first element in a sequence for which a predicate is false.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

The first iterator `i` in the range `[__first, __last)` such that `__pred(*i)` is false, or `__last` if no such iterator exists.

Definition at line 558 of file `stl_algo.h`.

References `std::__find_if_not()`.

2.39.2.16 `template<typename _InputIterator, typename _Function> _Function std::for_each (_InputIterator __first, _InputIterator __last, _Function __f)`

Apply a function to every element of a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__f</code>	A unary function object.

Returns

`__f` (`std::move(__f)` in C++0x).

Applies the function object `__f` to each element in the range `[first,last)`. `__f` must not modify the order of the sequence. If `__f` has a return value it is ignored.

Definition at line 3750 of file `stl_algo.h`.

2.39.2.17 `template<typename _ForwardIterator1, typename _ForwardIterator2> bool std::is_permutation (_ForwardIterator1 __first1, _ForwardIterator1 __last1, _ForwardIterator2 __first2) [inline]`

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.

Returns

true if there exists a permutation of the elements in the range `[__first2, __first2 + (__last1 - __first1))`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, begin)` returns true; otherwise, returns false.

Definition at line 3526 of file `stl_algo.h`.

2.39.2.18 `template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate> bool std::is_permutation (_ForwardIterator1 __first1, _ForwardIterator1 __last1, _ForwardIterator2 __first2, _BinaryPredicate __pred) [inline]`

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__pred</code>	A binary predicate.

Returns

true if there exists a permutation of the elements in the range `[__first2, __first2 + (__last1 - __first1))`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, __begin, __pred)` returns true; otherwise, returns false.

Definition at line 3558 of file `stl_algo.h`.

References `std::__find_if()`, and `std::distance()`.

2.39.2.19 `template<typename _InputIterator1, typename _InputIterator2> pair<_InputIterator1, _InputIterator2> std::mismatch (`
`_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2) [inline]`

Finds the places in ranges which don't match.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using `==` and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

Definition at line 1292 of file `stl_algobase.h`.

2.39.2.20 `template<typename _InputIterator1, typename _InputIterator2, typename _BinaryPredicate> pair<_InputIterator1,`
`_InputIterator2> std::mismatch (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2,`
`_BinaryPredicate __binary_pred) [inline]`

Finds the places in ranges which don't match.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate functor .

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using the `binary_pred` parameter, and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

Definition at line 1326 of file `stl_algobase.h`.

2.39.2.21 `template<typename _InputIterator, typename _Predicate> bool std::none_of (_InputIterator __first, _InputIterator __last, _Predicate __pred) [inline]`

Checks that a predicate is false for all the elements of a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if `__pred` is false for each element in the range `[__first,__last)`, and false otherwise.

Definition at line 525 of file `stl_algo.h`.

References `std::find_if()`.

Referenced by `std::any_of()`, and `std::is_partitioned()`.

2.39.2.22 `template<typename _ForwardIterator1, typename _ForwardIterator2> _ForwardIterator1 std::search (_ForwardIterator1 __first1, _ForwardIterator1 __last1, _ForwardIterator2 __first2, _ForwardIterator2 __last2) [inline]`

Search a sequence for a matching sub-sequence.

Parameters

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.
<code>__last2</code>	A forward iterator.

Returns

The first iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `*(i+N) == *(__first2+N)` for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1 - (__last2 - __first2)` where `__last2 - __first2` is the length of the sub-sequence.

This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`

Definition at line 4011 of file `stl_algo.h`.

```
2.39.2.23  template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate > _ForwardIterator1
std::search( _ForwardIterator1 __first1, _ForwardIterator1 __last1, _ForwardIterator2 __first2, _ForwardIterator2 __last2,
             _BinaryPredicate __predicate ) [inline]
```

Search a sequence for a matching sub-sequence using a predicate.

Parameters

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.
<code>__last2</code>	A forward iterator.
<code>__predicate</code>	A binary predicate.

Returns

The first iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `__predicate(*(i+N), *(__first2+N))` is true for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)`, using `__predicate` to determine equality, and returns an iterator to the first element of the sub-sequence, or `__last1` if no such iterator exists.

             _ForwardIterator __first, _ForwardIterator __last, _Integer __count, const _Tp & __val ) [inline]
```

Search a sequence for a number of consecutive values.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__count</code>	The number of consecutive values.
<code>__val</code>	The value to find.

Returns

The first iterator `i` in the range `[__first, __last-__count)` such that `*(i+N) == __val` for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `count` consecutive elements equal to `__val`.

```
2.39.2.25  template<typename _ForwardIterator, typename _Integer, typename _Tp, typename _BinaryPredicate > _ForwardIterator
std::search_n( _ForwardIterator __first, _ForwardIterator __last, _Integer __count, const _Tp & __val, _BinaryPredicate
__binary_pred ) [inline]
```

Search a sequence for a number of consecutive values using a predicate.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__count</code>	The number of consecutive values.
<code>__val</code>	The value to find.
<code>__binary_pred</code>	A binary predicate.

Returns

The first iterator `i` in the range `[__first, __last-__count)` such that `__binary_pred(*(i+N), __val)` is true for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `__count` consecutive elements for which the predicate returns true.

2.40.1 Detailed Description

2.40.2 Function Documentation

2.40.2.1 `template<typename _RealType> bool std::operator!=(const std::normal_distribution< _RealType> & __d1, const std::normal_distribution< _RealType> & __d2) [inline]`

Return true if two normal distributions are different.

Definition at line 2285 of file random.h.

2.40.2.2 `template<typename _RealType> bool std::operator!=(const std::lognormal_distribution< _RealType> & __d1, const std::lognormal_distribution< _RealType> & __d2) [inline]`

Return true if two lognormal distributions are different.

Definition at line 2489 of file random.h.

2.40.2.3 `template<typename _RealType> bool std::operator!=(const std::gamma_distribution< _RealType> & __d1, const std::gamma_distribution< _RealType> & __d2) [inline]`

Return true if two gamma distributions are different.

Definition at line 2709 of file random.h.

2.40.2.4 `template<typename _RealType> bool std::operator!=(const std::chi_squared_distribution< _RealType> & __d1, const std::chi_squared_distribution< _RealType> & __d2) [inline]`

Return true if two Chi-squared distributions are different.

Definition at line 2919 of file random.h.

2.40.2.5 `template<typename _RealType> bool std::operator!=(const std::cauchy_distribution< _RealType> & __d1, const std::cauchy_distribution< _RealType> & __d2) [inline]`

Return true if two Cauchy distributions have different parameters.

Definition at line 3086 of file random.h.

References `std::operator>>()`.

2.40.2.6 `template<typename _RealType> bool std::operator!=(const std::fisher_f_distribution< _RealType> & __d1, const std::fisher_f_distribution< _RealType> & __d2) [inline]`

Return true if two Fisher f distributions are different.

Definition at line 3342 of file random.h.

2.40.2.7 `template<typename _RealType> bool std::operator!=(const std::student_t_distribution< _RealType> & __d1, const std::student_t_distribution< _RealType> & __d2) [inline]`

Return true if two Student t distributions are different.

Definition at line 3555 of file random.h.

2.40.2.8 `template<typename _RealType, typename _CharT, typename _Traits> std::basic_ostream< _CharT, _Traits> & std::operator<< (std::basic_ostream< _CharT, _Traits> & __os, const std::cauchy_distribution< _RealType> & __x)`

Inserts a `cauchy_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>cauchy_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

2.40.2.9 `template<typename _RealType , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& std::operator>> (std::basic_istream<_CharT, _Traits> &__is, std::cauchy_distribution<_RealType> &__x)`

Extracts a `cauchy_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>cauchy_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

2.41.1 Detailed Description

2.41.2 Function Documentation

2.41.2.1 `std::gslice::gslice ()` [inline]

Construct an empty slice.

Definition at line 149 of file `gslice.h`.

2.41.2.2 `std::gslice::gslice (size_t __o, const valarray< size_t > & __l, const valarray< size_t > & __s)` [inline]

Construct a slice.

Constructs a slice with as many dimensions as the length of the `l` and `s` arrays.

Parameters

<code>__o</code>	Offset in array of first element.
<code>__l</code>	Array of dimension lengths.
<code>__s</code>	Array of dimension strides between array elements.

Definition at line 153 of file gslice.h.

2.41.2.3 `std::gslice::gslice (const gslice & __g) [inline]`

Copy constructor.

Definition at line 158 of file gslice.h.

2.41.2.4 `template<typename _Tp> std::gslice_array<_Tp>::gslice_array (const gslice_array<_Tp> & __a) [inline]`

Copy constructor. Both slices refer to the same underlying array.

Definition at line 143 of file gslice_array.h.

2.41.2.5 `template<typename _Tp> std::indirect_array<_Tp>::indirect_array (const indirect_array<_Tp> & __a) [inline]`

Copy constructor. Both slices refer to the same underlying array.

Definition at line 143 of file indirect_array.h.

2.41.2.6 `template<typename _Tp> std::mask_array<_Tp>::mask_array (const mask_array<_Tp> & a) [inline]`

Copy constructor. Both slices refer to the same underlying array.

Definition at line 139 of file mask_array.h.

2.41.2.7 `std::slice::slice () [inline]`

Construct an empty slice.

Definition at line 90 of file slice_array.h.

2.41.2.8 `std::slice::slice (size_t __o, size_t __d, size_t __s) [inline]`

Construct a slice.

Parameters

<code>__o</code>	Offset in array of first element.
<code>__d</code>	Number of elements in slice.
<code>__s</code>	Stride between array elements.

Definition at line 94 of file slice_array.h.

2.41.2.9 `template<typename _Tp> std::slice_array<_Tp>::slice_array (const slice_array<_Tp> & a) [inline]`

Copy constructor. Both slices refer to the same underlying array.

Definition at line 207 of file slice_array.h.

2.41.2.10 `std::gslice::~~gslice () [inline]`

Destructor.

Definition at line 163 of file gslice.h.

2.41.2.11 `template<typename _Tp> void std::gslice_array<_Tp>::operator%=(const valarray<_Tp> & __v) const [inline]`

Modulo slice elements by corresponding elements of *v*.

Definition at line 202 of file gslice_array.h.

2.41.2.12 `template<typename _Tp> void std::mask_array<_Tp>::operator%=(const valarray<_Tp> & __v) const [inline]`

Modulo slice elements by corresponding elements of *v*.

Definition at line 192 of file mask_array.h.

2.41.2.13 `template<typename _Tp> void std::indirect_array<_Tp>::operator%=(const valarray<_Tp> & __v) const [inline]`

Modulo slice elements by corresponding elements of *v*.

Definition at line 196 of file indirect_array.h.

2.41.2.14 `template<typename _Tp> void std::slice_array<_Tp>::operator%=(const valarray<_Tp> & __v) const [inline]`

Modulo slice elements by corresponding elements of *v*.

Definition at line 258 of file slice_array.h.

2.41.2.15 `template<typename _Tp> void std::gslice_array<_Tp>::operator&=(const valarray<_Tp> & __v) const [inline]`

Logical and slice elements with corresponding elements of *v*.

2.42.1 Detailed Description

2.42.2 Function Documentation

- 2.42.2.1 `template<typename _Tp, typename _Alloc, typename... _Args> shared_ptr<_Tp> std::allocate_shared (const _Alloc & __a, _Args &&... __args) [inline]`

Create an object that is owned by a `shared_ptr`.

Parameters

<code>__a</code>	An allocator.
<code>__args</code>	Arguments for the <code>_Tp</code> object's constructor.

Returns

A `shared_ptr` that owns the newly created object.

Exceptions

<i>An</i>	exception thrown from <code>_Alloc::allocate</code> or from the constructor of <code>_Tp</code> .
-----------	---

A copy of `__a` will be used to allocate memory for the `shared_ptr` and the new object.

Definition at line 591 of file `shared_ptr.h`.

---------------------	--

Returns

A `shared_ptr` that owns the newly created object.

Exceptions

<code>std::bad_alloc</code> , or	an exception thrown from the constructor of <code>_Tp</code> .

Return true if two piecewise linear distributions have different parameters.

Definition at line 6008 of file random.h.

2.43.2.8 `template<typename _RealType, typename _CharT, typename _Traits> std::basic_ostream< _CharT, _Traits> & std::operator<< (std::basic_ostream< _CharT, _Traits> &__os, const std::exponential_distribution< _RealType> &__x)`

Inserts a `exponential_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>exponential_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

2.43.2.9 `template<typename _RealType, typename _CharT, typename _Traits> std::basic_ostream< _CharT, _Traits> & std::operator<< (std::basic_ostream< _CharT, _Traits> &__os, const std::weibull_distribution< _RealType> &__x)`

Inserts a `weibull_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>weibull_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

```
2.43.2.10 template<typename _RealType , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>&
std::operator<< ( std::basic_ostream< _CharT, _Traits > & __os, const std::extreme_value_distribution<
_RealType > & __x )
```

Inserts a `extreme_value_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>extreme_value_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

```
2.43.2.11 template<typename _RealType , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>&
std::operator>> ( std::basic_istream< _CharT, _Traits > & __is, std::exponential_distribution< _RealType > &
__x )
```

Extracts a `exponential_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>exponential_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

```
2.43.2.12 template<typename _RealType , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>&
std::operator>> ( std::basic_istream< _CharT, _Traits > & __is, std::weibull_distribution< _RealType > & __x )
```

Extracts a `weibull_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>weibull_distribution</code> random number generator engine.

Returns

The input stream with ___x extracted or in an error state.

2.43.2.13 `template<typename _RealType , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& std::operator>> (std::basic_istream<_CharT, _Traits> & __is, std::extreme_value_distribution<_RealType> & __x)`

Extracts a `extreme_value_distribution` random number distribution ___x from the input stream ___is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>extreme_value_distribution</code> random number generator engine.

Returns

The input stream with ___x extracted or in an error state.

2.44 Policy-Based Data Structures

Collaboration diagram for Policy-Based Data Structures:

Modules

2.44.1 Detailed Description

This is a library of policy-based elementary data structures: associative containers and priority queues. It is designed for high-performance, flexibility, semantic safety, and conformance to the corresponding containers in std (except for some points where it differs by design).

For details, see: http://gcc.gnu.org/onlinedocs/libstdc++/ext/pb_ds/index.html

2.47.1 Detailed Description

These classes define objects which provide random or pseudorandom numbers, either from a discrete or a continuous interval. The random number generator supplied as a part of this library are all uniform random number generators which provide a sequence of random number uniformly distributed over their range.

A number generator is a function object with an operator() that takes zero arguments and returns a number.

A compliant random number generator must satisfy the following requirements.

Table 106 Random Number Generator Requirements

To be documented.

2.47.2 Typedef Documentation

2.47.2.1 `typedef linear_congruential_engine<uint_fast32_t, 48271UL, 0UL, 2147483647UL> std::minstd_rand`

An alternative LCR (Lehmer Generator function).

Definition at line 1529 of file random.h.

2.47.2.2 `typedef linear_congruential_engine<uint_fast32_t, 16807UL, 0UL, 2147483647UL> std::minstd_rand0`

The classic Minimum Standard rand0 of Lewis, Goodman, and Miller.

Definition at line 1523 of file random.h.

2.47.2.3 `typedef mersenne_twister_engine< uint_fast32_t, 32, 624, 397, 31, 0x9908b0dfUL, 11, 0xffffffffUL, 7, 0x9d2c5680UL, 15, 0xefc60000UL, 18, 1812433253UL> std::mt19937`

The classic Mersenne Twister.

2.47.3 Function Documentation

2.47.3.1 `template<typename UIntType, UIntType __a, UIntType __c, UIntType __m> bool std::operator!=(const std::linear_congruential_engine< UIntType, __a, __c, __m > & __lhs, const std::linear_congruential_engine< UIntType, __a, __c, __m > & __rhs) [inline]`

Compares two linear congruential random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A linear congruential random number generator object.
<code>__rhs</code>	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 411 of file random.h.

2.47.3.2 `template<typename UIntType, size_t __w, size_t __n, size_t __m, size_t __r, UIntType __a, size_t __u, UIntType __d, size_t __s, UIntType __b, size_t __t, UIntType __c, size_t __l, UIntType __f> bool std::operator!=(const std::mersenne_twister_engine< UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs, const std::mersenne_twister_engine< UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs) [inline]`

Compares two % mersenne_twister_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A % mersenne_twister_engine random number generator object.
<code>__rhs</code>	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 643 of file random.h.

2.47.3.3 `template<typename UIntType , size_t __w, size_t __s, size_t __r> bool std::operator!= (const std::subtract_with_carry_engine< UIntType, __w, __s, __r > & __lhs, const std::subtract_with_carry_engine< UIntType, __w, __s, __r > & __rhs) [inline]`

Compares two % subtract_with_carry_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A % subtract_with_carry_engine random number generator object.
<code>__rhs</code>	Another % subtract_with_carry_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 842 of file random.h.

2.47.3.4 `template<typename _RandomNumberEngine , size_t __p, size_t __r> bool std::operator!= (const std::discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs, const std::discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs) [inline]`

Compares two discard_block_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A discard_block_engine random number generator object.
<code>__rhs</code>	Another discard_block_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 1064 of file random.h.

2.47.3.5 `template<typename _RandomNumberEngine , size_t __w, typename UIntType > bool std::operator!= (const std::independent_bits_engine< _RandomNumberEngine, __w, UIntType > & __lhs, const std::independent_bits_engine< _RandomNumberEngine, __w, UIntType > & __rhs) [inline]`

Compares two independent_bits_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A independent_bits_engine random number generator object.
<code>__rhs</code>	Another independent_bits_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 1260 of file random.h.

2.47.3.6 template<typename _RandomNumberEngine, size_t __k> bool std::operator!=( const std::shuffle_order_engine<
    _RandomNumberEngine, __k> & __lhs, const std::shuffle_order_engine< _RandomNumberEngine, __k> & __rhs )
    [inline]
```

Compares two shuffle_order_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A shuffle_order_engine random number generator object.
<code>__rhs</code>	Another shuffle_order_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 1512 of file random.h.

```
2.47.3.7 template<typename _RandomNumberEngine, size_t __w, typename _UIntType, typename _CharT, typename _Traits
    > std::basic_ostream<_CharT, _Traits>& std::operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const
    std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType> & __x )
```

Inserts the current state of a independent_bits_engine random number generator engine `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A independent_bits_engine random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

Definition at line 1279 of file random.h.

2.49.1 Detailed Description

A facility for performing regular expression pattern matching.

2.49.2 Typedef Documentation

2.49.2.1 `typedef regex_token_iterator<const char*> std::cregex_token_iterator`

Token iterator for C-style NULL-terminated strings.

Definition at line 2737 of file `regex.h`.

2.49.2.2 `typedef sub_match<const char*> std::csub_match`

Standard regex submatch over a C-style null-terminated string.

Definition at line 950 of file `regex.h`.

2.49.2.3 `typedef basic_regex<char> std::regex`

Standard regular expressions.

Definition at line 822 of file `regex.h`.

2.49.2.4 `typedef regex_token_iterator<string::const_iterator> std::sregex_token_iterator`

Token iterator for standard strings.

Definition at line 2740 of file `regex.h`.

2.49.2.5 `typedef sub_match<string::const_iterator> std::ssub_match`

Standard regex submatch over a standard string.

Definition at line 953 of file `regex.h`.

2.49.2.6 `typedef regex_token_iterator<const wchar_t*> std::wcregex_token_iterator`

Token iterator for C-style NULL-terminated wide strings.

Definition at line 2744 of file `regex.h`.

2.49.2.7 `typedef sub_match<const wchar_t*> std::wcsub_match`

Regex submatch over a C-style null-terminated wide string.

Definition at line 957 of file regex.h.

2.49.2.8 `typedef basic_regex<wchar_t> std::wregex`

Standard wide-character regular expressions.

Definition at line 826 of file regex.h.

2.49.2.9 `typedef regex_token_iterator<wstring::const_iterator> std::wsregex_token_iterator`

Token iterator for standard wide-character strings.

Definition at line 2747 of file regex.h.

2.49.2.10 `typedef sub_match<wstring::const_iterator> std::wssub_match`

Regex submatch over a standard wide string.

Definition at line 960 of file regex.h.

2.49.3 Function Documentation

2.49.3.1 `template<typename _Bilter> bool std::operator!=(const sub_match<_Bilter> & __lhs, const sub_match<_Bilter> & __rhs) [inline]`

Tests the inequivalence of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 984 of file regex.h.

References `std::sub_match<_Bilter>::compare()`.

```
2.49.3.2 template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc > bool std::operator!= ( const  
    __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __lhs, const sub_match< _Bi_iter > & __rhs )  
    [inline]
```

Tests the inequivalence of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1059 of file `regex.h`.

2.49.3.3 `template<typename _Bi_iter, typename _Ch_traits, typename _Ch_alloc> bool std::operator!=(const sub_match<_Bi_iter> & __lhs, const __sub_match_string<_Bi_iter, _Ch_traits, _Ch_alloc> & __rhs) [inline]`

Tests the inequivalence of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1133 of file `regex.h`.

2.49.3.4 `template<typename _Bi_iter> bool std::operator!=(typename iterator_traits<_Bi_iter>::value_type const * __lhs, const sub_match<_Bi_iter> & __rhs) [inline]`

Tests the inequivalence of an iterator value and a regular expression submatch.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1207 of file `regex.h`.

2.49.3.5 `template<typename _Bi_iter> bool std::operator!=(const sub_match<_Bi_iter> & __lhs, typename iterator_traits<_Bi_iter>::value_type const * __rhs) [inline]`

Tests the inequivalence of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A pointer to a string.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1281 of file `regex.h`.

```
2.49.3.6 template<typename _Bi_iter > bool std::operator!=( typename iterator_traits< _Bi_iter >::value_type const & __lhs,
const sub_match< _Bi_iter > & __rhs ) [inline]
```

Tests the inequivalence of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1358 of file `regex.h`.

```
2.49.3.7 template<typename _Bi_iter > bool std::operator!=( const sub_match< _Bi_iter > & __lhs, typename iterator_traits<
_Bi_iter >::value_type const & __rhs ) [inline]
```

Tests the inequivalence of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A const string reference.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1438 of file `regex.h`.

```
2.49.3.8 template<typename _Bi_iter, class _Alloc > bool std::operator!=( const match_results< _Bi_iter, _Alloc > & __m1,
const match_results< _Bi_iter, _Alloc > & __m2 ) [inline]
```

Compares two `match_results` for inequality.

Returns

true if the two objects do not refer to the same match, false otherwise.

Definition at line 1953 of file regex.h.

2.49.3.9 `template<typename _Bilter> bool std::operator< (const sub_match< _Bilter> &__lhs, const sub_match< _Bilter> &__rhs) [inline]`

Tests the ordering of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 995 of file regex.h.

References `std::sub_match< _Bilter>::compare()`.

2.49.3.10 `template<typename _Bi_iter, typename _Ch_traits, typename _Ch_alloc> bool std::operator< (const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc> &__lhs, const sub_match< _Bi_iter> &__rhs) [inline]`

Tests the ordering of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1071 of file regex.h.

References `std::sub_match< _Bilter>::compare()`.

2.49.3.11 `template<typename _Bi_iter, class _Ch_traits, class _Ch_alloc> bool std::operator< (const sub_match< _Bi_iter> &__lhs, const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc> &__rhs) [inline]`

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1145 of file `regex.h`.

2.49.3.12 `template<typename _Bi_iter> bool std::operator< (typename iterator_traits<_Bi_iter>::value_type const * __lhs, const sub_match<_Bi_iter> & __rhs) [inline]`

Tests the ordering of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1219 of file `regex.h`.

References `std::sub_match<_Biter>::compare()`.

2.49.3.13 `template<typename _Bi_iter> bool std::operator< (const sub_match<_Bi_iter> & __lhs, typename iterator_traits<_Bi_iter>::value_type const * __rhs) [inline]`

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1293 of file `regex.h`.

2.49.3.14 `template<typename _Bi_iter > bool std::operator< (typename iterator_traits< _Bi_iter >::value_type const & __lhs, const sub_match< _Bi_iter > & __rhs) [inline]`

Tests the ordering of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1370 of file `regex.h`.

2.49.3.15 `template<typename _Bi_iter > bool std::operator< (const sub_match< _Bi_iter > & __lhs, typename iterator_traits< _Bi_iter >::value_type const & __rhs) [inline]`

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A const string reference.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1450 of file `regex.h`.

2.49.3.16 `template<typename _Ch_type , typename _Ch_traits , typename _Bi_iter > basic_ostream< _Ch_type, _Ch_traits>& std::operator<< (basic_ostream< _Ch_type, _Ch_traits > & __os, const sub_match< _Bi_iter > & __m) [inline]`

Inserts a matched string into an output stream.

Parameters

<code>__os</code>	The output stream.
<code>__m</code>	A submatch string.

Returns

the output stream with the submatch string inserted.

Definition at line 1504 of file regex.h.

```

Tests the ordering of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1006 of file regex.h.

```

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A const string reference.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

```

Determines if there is a match between the regular expression `e` and all of the character sequence `[first, last)`.

Parameters

<code>__s</code>	Start of the character sequence to match.
<code>__e</code>	One-past-the-end of the character sequence to match.
<code>__m</code>	The match results.
<code>__re</code>	The regular expression.
<code>__flags</code>	Controls how the regular expression is matched.

Return values

<code>true</code>	A match exists.
<code>false</code>	Otherwise.

2.50 SGI

Collaboration diagram for SGI:

Because libstdc++ based its implementation of the STL subsections of the library on the SGI 3.3 implementation, we inherited their extensions as well.

They are additionally documented in the [online documentation](#), a copy of which is also shipped with the library source code (in `.../docs/html/documentation.html`). You can also read the documentation [on SGI's site](#), which is still running even though the code is not maintained.

NB that the following notes are pulled from various comments all over the place, so they may seem stilted.

2.51 Sequences

Collaboration diagram for Sequences:

Classes

- class `std::basic_string<_CharT, _Traits, _Alloc>`
- class `std::deque<_Tp, _Alloc>`
- class `std::forward_list<_Tp, _Alloc>`
- class `std::list<_Tp, _Alloc>`
- class `std::priority_queue<_Tp, _Sequence, _Compare>`
- class `std::queue<_Tp, _Sequence>`
- class `std::stack<_Tp, _Sequence>`
- class `std::vector<_Tp, _Alloc>`
- class `std::vector<bool, _Alloc>`

2.51.1 Detailed Description

Sequences arrange a collection of objects into a strictly linear order.

The differences between sequences are usually due to one or both of the following:

- memory management
- algorithmic complexity

As an example of the first case, `vector` is required to use a contiguous memory layout, while other sequences such as `deque` are not.

The prime reason for choosing one sequence over another should be based on the second category of differences, algorithmic complexity. For example, if you need to perform many inserts and removals from the middle of a sequence, `list` would be ideal. But if you need to perform constant-time access to random elements of the sequence, then `list` should not be used.

All sequences must meet certain requirements, summarized in [tables](#).

2.52.1 Detailed Description

These algorithms are common set operations performed on sequences that are already sorted. The number of comparisons will be linear.

2.52.2 Function Documentation

2.52.2.1 `template<typename _InputIterator1, typename _InputIterator2 > bool std::includes (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2) [inline]`

Determines whether all elements of a sequence exists in a range.

Parameters

<code>__first1</code>	Start of search range.
<code>__last1</code>	End of search range.
<code>__first2</code>	Start of sequence
<code>__last2</code>	End of sequence.

Returns

True if each element in `[__first2,__last2)` is contained in order within `[__first1,__last1)`. False otherwise.

This operation expects both `[__first1,__last1)` and `[__first2,__last2)` to be sorted. Searches for the presence of each element in `[__first2,__last2)` within `[__first1,__last1)`. The iterators over each range only move forward, so this is a linear algorithm. If an element in `[__first2,__last2)` is not found before the search iterator reaches `__last2`, false is returned.

Definition at line 2833 of file `stl_algo.h`.

2.52.2.2 `template<typename _InputIterator1, typename _InputIterator2, typename _Compare > bool std::includes (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _Compare __comp) [inline]`

Determines whether all elements of a sequence exists in a range using comparison.

Parameters

<code>__first1</code>	Start of search range.
<code>__last1</code>	End of search range.
<code>__first2</code>	Start of sequence
<code>__last2</code>	End of sequence.
<code>__comp</code>	Comparison function to use.

Returns

True if each element in `[__first2,__last2)` is contained in order within `[__first1,__last1)` according to `comp`. False otherwise.

This operation expects both `[__first1,__last1)` and `[__first2,__last2)` to be sorted. Searches for the presence of each element in `[__first2,__last2)` within `[__first1,__last1)`, using `comp` to decide. The iterators over each range only move forward, so this is a linear algorithm. If an element in `[__first2,__last2)` is not found before the search iterator reaches `__last2`, false is returned.

    _OutputIterator __result ) [inline]
```

Return the difference of two sorted ranges.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. When the current element of the first range is less than the second, that element is copied and the iterator advances. If the current element of the second range is less, the iterator advances, but no element is copied. If an element is contained in both ranges, no elements are copied and both ranges advance. The output range may not overlap either input range.

    _InputIterator2 __last2, _OutputIterator __result, _Compare __comp ) [inline]
```

Return the difference of two sorted ranges using comparison functor.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__comp</code>	The comparison functor.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. 2.53.1 Detailed Description

2.53.2 Function Documentation

2.53.2.1 `template<typename _BidirectionalIterator > void std::inplace_merge (_BidirectionalIterator __first, _BidirectionalIterator __middle, _BidirectionalIterator __last) [inline]`

Merges two sorted ranges in place.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Merges two sorted and consecutive ranges, [`__first`,`__middle`) and [`__middle`,`__last`), and puts the result in [`__first`,`__last`). The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes (`__last`-`__first`)-1 comparisons. Otherwise an NlogN algorithm is used, where N is distance(`__first`,`__last`).

Definition at line 2586 of file `stl_algo.h`.

2.53.2.2 `template<typename _BidirectionalIterator, typename _Compare > void std::inplace_merge (_BidirectionalIterator __first, _BidirectionalIterator __middle, _BidirectionalIterator __last, _Compare __comp) [inline]`

Merges two sorted ranges in place.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A functor to use for comparisons.

Returns

Nothing.

Merges two sorted and consecutive ranges, [`__first`,`__middle`) and [`middle`,`last`), and puts the result in [`__first`,`last`). The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes $(\text{__last} - \text{__first}) - 1$ comparisons. Otherwise an $N \log N$ algorithm is used, where N is $\text{distance}(\text{__first}, \text{__last})$.

The comparison function should have the same effects on ordering as the function used for the initial sort.

```
2.53.2.3  template<typename _ForwardIterator > bool std::is_sorted ( _ForwardIterator __first, _ForwardIterator __last )
           [inline]
```

Determines whether the elements of a sequence are sorted.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

True if the elements are sorted, false otherwise.

Definition at line 3208 of file `stl_algo.h`.

References `std::is_sorted_until()`.

```
2.53.2.4  template<typename _ForwardIterator , typename _Compare > bool std::is_sorted ( _ForwardIterator __first,
           _ForwardIterator __last, _Compare __comp ) [inline]
```

Determines whether the elements of a sequence are sorted according to a comparison functor.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

True if the elements are sorted, false otherwise.

Definition at line 3222 of file `stl_algo.h`.

References `std::is_sorted_until()`.

2.53.2.5 `template<typename _ForwardIterator> _ForwardIterator std::is_sorted_until (_ForwardIterator __first, _ForwardIterator __last) [inline]`

Determines the end of a sorted sequence.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

An iterator pointing to the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is sorted.

Definition at line 3251 of file `stl_algo.h`.

2.53.2.6 `template<typename _ForwardIterator, typename _Compare> _ForwardIterator std::is_sorted_until (_ForwardIterator __first, _ForwardIterator __last, _Compare __comp) [inline]`

Determines the end of a sorted sequence using comparison functor.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

An iterator pointing to the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is sorted.

Definition at line 3274 of file `stl_algo.h`.

Referenced by `std::is_sorted()`.

2.53.2.7 `template<typename _I1, typename _I2> bool std::lexicographical_compare (_I1 __first1, _I1 __last1, _I2 __first2, _I2 __last2) [inline]`

Performs **dictionary** comparison on ranges.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

Returns

A boolean true or false.

Returns true if the sequence of elements defined by the range `[first1,last1)` is lexicographically less than the sequence of elements defined by the range `[first2,last2)`. Returns false otherwise. (Quoted from [25.3.8]/1.) If the iterators are all character pointers, then this is an inline call to `memcmp`.

Definition at line 1213 of file `stl_algobase.h`.

```
2.53.2.8  template<typename _I1, typename _I2, typename _Compare > bool std::lexicographical_compare ( _I1 __first1, _I1
    __last1, _I2 __first2, _I2 __last2, _Compare __comp ) [inline]
```

Performs **dictionary** comparison on ranges.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__comp</code>	A comparison functor .

Returns

A boolean true or false.

The same as the four-parameter `lexicographical_compare`, but uses the `comp` parameter instead of `<`.

Definition at line 1249 of file `stl_algobase.h`.

Referenced by `std::operator<()`.

```
2.53.2.9  template<typename _Tp > const _Tp & std::max ( const _Tp & __a, const _Tp & __b ) [inline]
```

This does what you think it does.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

Returns

The greater of the parameters.

This is the simple classic generic implementation. It will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

2.53.2.10 `template<typename _Tp, typename _Compare> const _Tp & std::max (const _Tp & __a, const _Tp & __b, _Compare __comp) [inline]`

This does what you think it does.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.
<code>__comp</code>	A comparison functor .

Returns

The greater of the parameters.

This will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

References `std::move()`.

2.53.2.11 `template<typename _ForwardIterator> _ForwardIterator std::max_element (_ForwardIterator __first, _ForwardIterator __last) [inline]`

Return the maximum element in a range.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

Iterator referencing the first instance of the largest value.

Definition at line 5488 of file `stl_algo.h`.

```
2.53.2.12 template<typename _ForwardIterator, typename _Compare> _ForwardIterator std::max_element ( _ForwardIterator
    __first, _ForwardIterator __last, _Compare __comp ) [inline]
```

Return the maximum element in a range using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

Returns

Iterator referencing the first instance of the largest value according to `__comp`.

```
2.53.2.13 template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator> _OutputIterator std::merge (
    _InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result )
    [inline]
```

Merges two sorted ranges.

Parameters

<code>__first1</code>	An iterator.
<code>__first2</code>	Another iterator.
<code>__last1</code>	Another iterator.
<code>__last2</code>	Another iterator.
<code>__result</code>	An iterator pointing to the end of the merged range.

Returns

An iterator pointing to the first element *not less than* *val*.

Merges the ranges `[__first1, __last1)` and `[__first2, __last2)` into the sorted range `[__result, __result + (__last1 - __first1) + (__last2 - __first2))`. Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

Definition at line 4767 of file `stl_algo.h`.

2.53.2.14 `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare >
_OutputIterator std::merge (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2
__last2, _OutputIterator __result, _Compare __comp) [inline]`

Merges two sorted ranges.

Parameters

<code>__first1</code>	An iterator.
<code>__first2</code>	Another iterator.
<code>__last1</code>	Another iterator.
<code>__last2</code>	Another iterator.
<code>__result</code>	An iterator pointing to the end of the merged range.
<code>__comp</code>	A functor to use for comparisons.

Returns

An iterator pointing to the first element "not less than" *val*.

Merges the ranges [`__first1`,`__last1`) and [`__first2`,`__last2`) into the sorted range [`__result`, `__result` + (`__last1`-`__first1`) + (`__last2`-`__first2`)). Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

Parameters

<code>__↵ __a</code>	A thing of arbitrary type.
<code>__↵ __b</code>	Another thing of arbitrary type.

Returns

A pair(`__b`, `__a`) if `__b` is smaller than `__a`, pair(`__a`, `__b`) otherwise.

Definition at line 3298 of file `stl_algo.h`.

Referenced by `std::minmax_element()`.

2.53.2.20 `template<typename _Tp, typename _Compare > pair< const _Tp &, const _Tp & > std::minmax (const _Tp & __a, const _Tp & __b, _Compare __comp)` `[inline]`

Determines min and max at once as an ordered pair.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.
<code>__comp</code>	A comparison functor .

Returns

A pair(`__b`, `__a`) if `__b` is smaller than `__a`, pair(`__a`, `__b`) otherwise.

References `std::make_pair()`.

2.53.2.21 `template<typename _ForwardIterator > pair<_ForwardIterator, _ForwardIterator> std::minmax_element (`
`_FForwardIterator __first, _ForwardIterator __last) [inline]`

Return a pair of iterators pointing to the minimum and maximum elements in a range.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

make_pair(`m`, `M`), where `m` is the first iterator `i` in [`__first`, `__last`) such that no other element in the range is smaller, and where `M` is the last iterator `i` in [`__first`, `__last`) such that no other element in the range is larger.

Definition at line 3396 of file `stl_algo.h`.

2.53.2.22 `template<typename _ForwardIterator, typename _Compare > pair<_ForwardIterator, _ForwardIterator>`
`std::minmax_element (_ForwardIterator __first, _ForwardIterator __last, _Compare __comp) [inline]`

Return a pair of iterators pointing to the minimum and maximum elements in a range.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

Returns

make_pair(`m`, `M`), where `m` is the first iterator `i` in [`__first`, `__last`) such that no other element in the range is smaller, and where `M` is the last iterator `i` in [`__first`, `__last`) such that no other element in the range is larger.

2.53.2.23 `template<typename _BidirectionalIterator > bool std::next_permutation (_BidirectionalIterator __first, _BidirectionalIterator __last) [inline]`

Permute range into the next *dictionary* ordering.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

Definition at line 2957 of file `stl_algo.h`.

2.53.2.24 `template<typename _BidirectionalIterator , typename _Compare > bool std::next_permutation (_BidirectionalIterator __first, _BidirectionalIterator __last, _Compare __comp) [inline]`

Permute range into the next *dictionary* ordering using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	A comparison functor.

Returns

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range [`__first`,`__last`) as a set of *dictionary* sorted sequences ordered by `__comp`. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

Definition at line 2988 of file `stl_algo.h`.

2.53.2.25 `template<typename _RandomAccessIterator > void std::nth_element (_RandomAccessIterator __first, _RandomAccessIterator __nth, _RandomAccessIterator __last) [inline]`

Sort a sequence just enough to find a particular position.

Parameters

<code>__first</code>	An iterator.
<code>__nth</code>	Another iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Rearranges the elements in the range `[__first,__last)` so that `*__nth` is the same element that would have been in that position had the whole sequence been sorted. The elements either side of `*__nth` are not completely sorted, but for any iterator *i* in the range `[__first,__nth)` and any iterator *j* in the range `[__nth,__last)` it holds that `*j < *i` is false.

Definition at line 4603 of file `stl_algo.h`.

    __first, _RandomAccessIterator __nth, _RandomAccessIterator __last, _Compare __comp ) [inline]
```

Sort a sequence just enough to find a particular position using a predicate for comparison.

Parameters

<code>__first</code>	An iterator.
<code>__nth</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Rearranges the elements in the range `[__first,__last)` so that `*__nth` is the same element that would have been in that position had the whole sequence been sorted. The elements either side of `*__nth` are not completely sorted, but for any iterator *i* in the range `[__first,__nth)` and any iterator *j* in the range `[__nth,__last)` it holds that `__comp(*j,*i)` is false.

```
2.53.2.27  template<typename _RandomAccessIterator> void std::partial_sort ( _RandomAccessIterator __first,
    _RandomAccessIterator __middle, _RandomAccessIterator __last ) [inline]
```

Sort the smallest elements of a sequence.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Sorts the smallest (`__middle-__first`) elements in the range `[first,last)` and moves them to the range `[__first,__middle)`. The order of the remaining elements in the range `[__middle,__last)` is undefined. After the sort if *i* and *j* are iterators in the range `[__first,__middle)` such that *i* precedes *j* and *k* is an iterator in the range `[__middle,__last)` then `*j < *i` and `*k < *i` are both false.

```

Sort the smallest elements of a sequence using a predicate for comparison.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Sorts the smallest (`__middle-__first`) elements in the range `[__first,__last)` and moves them to the range `[__first,__middle)`.     _InputIterator __first, _InputIterator __last, _RandomAccessIterator __result_first, _RandomAccessIterator __result_last )
    [inline]
```

Copy the smallest elements of a sequence.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__result_first</code>	A random-access iterator.
<code>__result_last</code>	Another random-access iterator.

Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest N values from the range $[_\text{first}, _\text{last})$ to the range beginning at `__result_first`, where the number of elements to be copied, N , is the smaller of $(_\text{last} - _\text{first})$ and $(_\text{result_last} - _\text{result_first})$. After the sort if i and j are iterators in the range $[_\text{result_first}, _\text{result_first} + N)$ such that i precedes j then $*j < *i$ is false. The value returned is `__result_first + N`.

std::partial_sort_copy ( _InputIterator __first, _InputIterator __last, _RandomAccessIterator __result_first,
    _RandomAccessIterator __result_last, _Compare __comp ) [inline]
```

Copy the smallest elements of a sequence using a predicate for comparison.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	Another input iterator.
<code>__result_first</code>	A random-access iterator.
<code>__result_last</code>	Another random-access iterator.
<code>__comp</code>	A comparison functor.

Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest N values from the range $[_\text{first}, _\text{last})$ to the range beginning at `result_first`, where the number of elements to be copied, N , is the smaller of $(_\text{last} - _\text{first})$ and $(_\text{result_last} - _\text{result_first})$. After the sort if i and j are iterators in the range $[_\text{result_first}, _\text{result_first} + N)$ such that i precedes j then `__comp(*j, *i)` is false. ```
2.53.2.31  template<typename _BidirectionalIterator> bool std::prev_permutation ( _BidirectionalIterator __first,
    _BidirectionalIterator __last ) [inline]
```

Permute range into the previous *dictionary* ordering.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

Definition at line 3055 of file `stl_algo.h`.

```
2.53.2.32  template<typename _BidirectionalIterator, typename _Compare> bool std::prev_permutation ( _BidirectionalIterator

Permute range into the previous *dictionary* ordering using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	A comparison functor.

Returns

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range [`__first`,`__last`) as a set of *dictionary* sorted sequences ordered by `__comp`. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

```

Sort the elements of a sequence.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Sorts the elements in the range $[_first, _last)$ in ascending order, such that for each iterator i in the range $[_first, _last-1)$, $*(i+1) < *i$ is false.

The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Sorts the elements in the range $[_first, _last)$ in ascending order, such that `__comp(*(i+1),*i)` is false for every iterator i in the range $[_first, _last-1)$.

The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

```
2.53.2.35 template<typename _RandomAccessIterator> void std::stable_sort ( _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Sort the elements of a sequence, preserving the relative order of equivalent elements.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Sorts the elements in the range $[_first, _last)$ in ascending order, such that for each iterator i in the range $[_first, _last-1)$, $*(i+1) < *i$ is false.

The relative ordering of equivalent elements is preserved, so any two elements x and y in the range $[_first, _last)$ such that $x < y$ is false and $y < x$ is false will have the same relative ordering after calling `stable_sort()`.

Definition at line 4876 of file `stl_algo.h`.

2.53.2.36 `template<typename _RandomAccessIterator, typename _Compare> void std::stable_sort (_RandomAccessIterator
__first, _RandomAccessIterator __last, _Compare __comp) [inline]`

Sort the elements of a sequence using a predicate for comparison, preserving the relative order of equivalent elements.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Sorts the elements in the range $[_first, _last)$ in ascending order, such that for each iterator i in the range $[_first, _last-1)$, `__comp(*(i+1),*i)` is false.

The relative ordering of equivalent elements is preserved, so any two elements x and y in the range $[_first, _last)$ such that `__comp(x,y)` is false and `__comp(y,x)` is false will have the same relative ordering after calling `stable_sort()`.

Inserts a `uniform_int_distribution` random number distribution `__x` into the output stream `os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>uniform_int_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

2.57.2.4 `template<typename _RealType, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& std::operator<< (std::basic_ostream<_CharT, _Traits> &, const std::uniform_real_distribution<_RealType> &)`

Inserts a `uniform_real_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>uniform_real_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

2.57.2.5 `template<typename _IntType, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& std::operator>> (std::basic_istream<_CharT, _Traits> &, std::uniform_int_distribution<_IntType> &)`

Extracts a `uniform_int_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>uniform_int_distribution</code> random number generator engine.

Returns

The input stream with ___x extracted or in an error state.

2.57.2.6 `template<typename _RealType, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& std::operator>>(std::basic_istream<_CharT, _Traits> &, std::uniform_real_distribution<_RealType> &)`

Extracts a `uniform_real_distribution` random number distribution ___x from the input stream ___is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>uniform_real_distribution</code> random number generator engine.

Returns

The input stream with ___x extracted or in an error state.

2.58.1 Detailed Description

Unordered associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, a `Hash` type providing a hashing functor, and an ordering relation used to sort the elements of the container.

All unordered associative containers must meet certain requirements, summarized in [tables](#).

2.59.1 Detailed Description

2.59.2 Function Documentation

2.59.2.1 `template<typename _Tp > _Tp* std::__addressof (_Tp &__r) [inline], [noexcept]`

Same as C++11 `std::addressof`.

Definition at line 47 of file `move.h`.

Referenced by `__gnu_debug::__valid_range()`, `std::_Destroy()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_↵
_match< _Bi_iter > > >::__M_allocate_and_copy()`, `__gnu_cxx::bitmap_allocator< _Tp >::__M_deallocate_single_↵
_object()`, `std::addressof()`, `std::_Temporary_buffer< _ForwardIterator, _Tp >::end()`, `__gnu_debug::_Safe_local_↵
iterator< _Iterator, _Sequence >::operator->()`, `__gnu_debug::_Safe_iterator< _Iterator, _Sequence >::operator->()`,
`std::list< __inp, __rebind_inp >::reverse()`, `std::uninitialized_copy()`, `std::uninitialized_fill()`, and `std::uninitialized_fill_n()`.

2.59.2.2 `template<typename _Tp > _Tp* std::addressof (_Tp &__r) [inline], [noexcept]`

Returns the actual address of the object or function referenced by `r`, even in the presence of an overloaded operator`&`.

Parameters

↵	Reference to an object or function.
↵	
↵	
↵	
<i>r</i>	

Returns

The actual address.

Definition at line 135 of file move.h.

References `std::__addressof()`.

Referenced by `__gnu_cxx::operator==(, and std::pointer_traits< _Tp * >::pointer_to().`

2.59.2.3 `template<typename _Tp > constexpr _Tp&& std::forward (typename std::remove_reference< _Tp >::type & __t)`
`[noexcept]`

Forward an lvalue.

Returns

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

Definition at line 76 of file move.h.

2.59.2.4 `template<typename _Tp > constexpr _Tp&& std::forward (typename std::remove_reference< _Tp >::type && __t)`
`[noexcept]`

Forward an rvalue.

Returns

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

Definition at line 87 of file move.h.

2.59.2.5 `template<class _T1 , class _T2 > constexpr pair<typename __decay_and_strip<_T1>::__type, typename`
`__decay_and_strip<_T2>::__type> std::make_pair (_T1 && __x, _T2 && __y)`

A convenience wrapper for creating a pair from two objects.

Parameters

<code>__x</code>	The first object.
<code>__y</code>	The second object.

Returns

A newly-constructed `pair<>` object of the appropriate type.

The standard requires that the objects be passed by reference-to-const, but LWG issue #181 says they should be passed by const value. We follow the LWG by default.

Definition at line 276 of file `stl_pair.h`.

2.59.2.6 `template<typename _Tp> constexpr std::remove_reference<_Tp>::type&& std::move (_Tp && __t) [noexcept]`

Convert a value to an rvalue.

Parameters

<code>__t</code>	A thing of arbitrary type.
<code>__t</code>	
<code>__t</code>	
<code>__t</code>	
<code>t</code>	

Returns

The parameter cast to an rvalue-reference to allow moving it.

Definition at line 101 of file `move.h`.

2.59.2.7 `template<typename _Tp> constexpr conditional<__move_if_noexcept_cond<_Tp>::value, const _Tp&, _Tp&&>::type
std::move_if_noexcept(_Tp &__x) [noexcept]`

Conditionally convert a value to an rvalue.

Parameters

<code>__x</code>	A thing of arbitrary type.
------------------	----------------------------

Returns

The parameter, possibly cast to an rvalue-reference.

Same as `std::move` unless the type's move constructor could throw and the type is copyable, in which case an lvalue-reference is returned instead.

Definition at line 254 of file `stl_pair.h`.

2.59.2.15 `template<typename _Tp> void std::swap(_Tp &__a, _Tp &__b) const [inline], [noexcept]`

Swaps two values.

Parameters

<code>__↔ _a</code>	A thing of arbitrary type.
<code>__↔ _b</code>	Another thing of arbitrary type.

Returns

Nothing.

3.1.1 Detailed Description

GNU extensions for public use.

3.1.2 Function Documentation

3.1.2.1 `template<typename _ToType , typename _FromType > _ToType __gnu_cxx::__static_pointer_cast (const _FromType & __arg) [inline]`

Casting operations for cases where `_FromType` is not a standard pointer. `_ToType` can be a standard or non-standard pointer. Given that `_FromType` is not a pointer, it must have a `get()` method that returns the standard pointer equivalent of the address it points to, and must have an `element_type` typedef which names the type it points to.

Definition at line 68 of file `cast.h`.

3.1.2.2 `template<typename _ToType , typename _FromType > _ToType __gnu_cxx::__static_pointer_cast (_FromType * __arg) [inline]`

Casting operations for cases where `_FromType` is a standard pointer. `_ToType` can be a standard or non-standard pointer.

Definition at line 96 of file `cast.h`.

3.1.2.3 `size_t __gnu_cxx::__Bit_scan_forward (size_t __num) [inline]`

Generic Version of the `bsf` instruction.

Definition at line 513 of file `bitmap_allocator.h`.

Referenced by `__gnu_cxx::bitmap_allocator< _Tp >::M_allocate_single_object()`.

3.1.2.4 `template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename, typename > class _Base> bool __gnu_cxx::operator!=(const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs, const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]`

Test difference of two strings.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

Returns

True if `__lhs.compare(__rhs) != 0`. False otherwise.

Definition at line 2388 of file `vstring.h`.

3.1.2.5 `template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename, typename > class _Base> bool __gnu_cxx::operator!=(const _CharT * __lhs, const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]`

Test difference of C string and string.

Parameters

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

Returns

True if `__rhs.compare(__lhs) != 0`. False otherwise.

Definition at line 2401 of file `vstring.h`.

```
3.1.2.6 template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class
_Base> bool __gnu_cxx::operator!=( const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs, const _CharT *
__rhs ) [inline]
```

Test difference of string and C string.

Parameters

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

Returns

True if `__lhs.compare(__rhs) != 0`. False otherwise.

Definition at line 2414 of file `vstring.h`.

```
3.1.2.7 template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class
_Base> __versa_string< _CharT, _Traits, _Alloc, _Base> __gnu_cxx::operator+ ( const __versa_string< _CharT,
_Traits, _Alloc, _Base > & __lhs, const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs )
```

Concatenate two strings.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

Returns

New string with value of `__lhs` followed by `__rhs`.

3.1.2.8 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> __versa_string<_CharT, _Traits, _Alloc, _Base> __gnu_cxx::operator+ (const _CharT * __lhs, const __versa_string<_CharT, _Traits, _Alloc, _Base > & __rhs)`

Concatenate C string and string.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

Returns

New string with value of `__lhs` followed by `__rhs`.

3.1.2.9 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> __versa_string<_CharT, _Traits, _Alloc, _Base> __gnu_cxx::operator+ (_CharT __lhs, const __versa_string<_CharT, _Traits, _Alloc, _Base > & __rhs)`

Concatenate character and string.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

Returns

New string with `__lhs` followed by `__rhs`.

3.1.2.10 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> __versa_string<_CharT, _Traits, _Alloc, _Base> __gnu_cxx::operator+ (const __versa_string<_CharT, _Traits, _Alloc, _Base > & __lhs, const _CharT * __rhs)`

Concatenate string and C string.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

Returns

New string with `__lhs` followed by `__rhs`.

3.1.2.11 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> __versa_string<_CharT, _Traits, _Alloc, _Base> __gnu_cxx::operator+ (const __versa_string<_CharT, _Traits, _Alloc, _Base> & __lhs, _CharT __rhs)`

Concatenate string and character.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

Returns

New string with `__lhs` followed by `__rhs`.

3.1.2.12 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> bool __gnu_cxx::operator< (const __versa_string<_CharT, _Traits, _Alloc, _Base> & __lhs, const __versa_string<_CharT, _Traits, _Alloc, _Base> & __rhs) [inline]`

Test if string precedes string.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

Returns

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 2428 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::compare()`.

3.1.2.13 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> bool __gnu_cxx::operator< (const __versa_string<_CharT, _Traits, _Alloc, _Base> & __lhs, const _CharT * __rhs) [inline]`

Test if string precedes C string.

Parameters

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

Returns

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 2441 of file `vstring.h`.

```
3.1.2.14 template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class
_Base> bool __gnu_cxx::operator< ( const _CharT* __lhs, const __versa_string< _CharT, _Traits, _Alloc, _Base > &
__rhs ) [inline]
```

Test if C string precedes string.

Parameters

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

Returns

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 2454 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

```

__versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs ) [inline]
```

Test if string doesn't follow string.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

Returns

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 2508 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

```

_Base> bool __gnu_cxx::operator<= ( const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs, const _CharT
* __rhs ) [inline]
```

Test if string doesn't follow C string.

Parameters

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

Returns

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 2521 of file `vstring.h`.

```
3.1.2.17 template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class
_Base> bool __gnu_cxx::operator<= ( const _CharT * __lhs, const __versa_string< _CharT, _Traits, _Alloc, _Base >
& __rhs ) [inline]
```

Test if C string doesn't follow string.

Parameters

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

Returns

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 2534 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

```
3.1.2.18 template<typename _Tp > bool __gnu_cxx::operator==( const _Pointer_adapter< _Tp > & __lhs, const
_PPointer_adapter< _Tp > & __rhs ) [inline]
```

Comparison operators for `_Pointer_adapter` defer to the base class' comparison operators, when possible.

Definition at line 529 of file `pointer.h`.

References `std::addressof()`.

```
3.1.2.19 template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class

__versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs ) [inline]
```

Test equivalence of two strings.

Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

Returns

True if `__lhs.compare(__rhs) == 0`. False otherwise.

3.4.1 Detailed Description

GNU debug classes for public use.

3.4.2 Enumeration Type Documentation

3.4.2.1 enum __gnu_debug::Distance_precision

The precision to which we can calculate the distance between two iterators.

Definition at line 68 of file `safe_iterator.h`.

3.4.3 Function Documentation

3.4.3.1 `template<typename _Iterator > _Siter_base<_Iterator>::iterator_type __gnu_debug::__base (_Iterator __it)`
`[inline]`

Helper function to extract base iterator of random access safe iterator in order to reduce performance impact of debug mode. Limited to random access iterator because it is the only category for which it is possible to check for correct iterators order in the `__valid_range` function thanks to the `<` operator.

Definition at line 558 of file `functions.h`.

Referenced by `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_debug::_Safe_iterator<_Iterator, _Sequence >::__M_before_dereferenceable()`, `std::boolalpha()`, `std::dec()`, `std::fixed()`, `std::getline()`, `std::hex()`, `std::internal()`, `std::left()`, `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nounitbuf()`, `std::nouppercase()`, `std::oct()`, `std::locale::operator!=()`, `std::right()`, `std::scientific()`, `std::showbase()`, `std::showpoint()`, `std::showpos()`, `std::skipws()`, `std::unitbuf()`, and `std::uppercase()`.

3.4.3.2 `template<typename _Iterator > bool __gnu_debug::__check_dereferenceable (const _Iterator &)` `[inline]`

Assume that some arbitrary iterator is dereferenceable, because we can't prove that it isn't.

Definition at line 79 of file `functions.h`.

3.4.3.3 `template<typename _Tp > bool __gnu_debug::__check_dereferenceable (const _Tp * __ptr)` `[inline]`

Non-NULL pointers are dereferenceable.

Definition at line 85 of file `functions.h`.

3.4.3.4 `template<typename _Iterator, typename _Sequence > bool __gnu_debug::__check_dereferenceable (const _Safe_iterator<_Iterator, _Sequence > & __x)` `[inline]`

Safe iterators know if they are dereferenceable.

Definition at line 91 of file `functions.h`.

References `__gnu_debug::_Safe_iterator<_Iterator, _Sequence >::__M_dereferenceable()`.

3.4.3.5 `template<typename _Iterator, typename _Sequence > bool __gnu_debug::__check_dereferenceable (const _Safe_local_iterator<_Iterator, _Sequence > & __x)` `[inline]`

Safe local iterators know if they are dereferenceable.

Definition at line 97 of file `functions.h`.

3.4.3.6 `template<typename _Tp > bool __gnu_debug::__check_singular (const _Tp * __ptr)` `[inline]`

Non-NULL pointers are nonsingular.

Definition at line 72 of file `functions.h`.

3.4.3.7 `bool __gnu_debug::__check_singular_aux (const _Safe_iterator_base * __x) [inline]`

Iterators that derive from `_Safe_iterator_base` can be determined singular or non-singular.

Definition at line 62 of file `safe_iterator.h`.

References `__gnu_debug::_Safe_iterator_base::M_singular()`.

3.4.3.8 `template<typename _CharT, typename _Integer> const _CharT* __gnu_debug::__check_string (const _CharT * __s, const _Integer & __n __attribute__((unused))) [inline]`

Checks that `__s` is non-NULL or `__n == 0`, and then returns `__s`.

Definition at line 300 of file `functions.h`.

3.4.3.9 `template<typename _CharT> const _CharT* __gnu_debug::__check_string (const _CharT * __s) [inline]`

Checks that `__s` is non-NULL and then returns `__s`.

Definition at line 312 of file `functions.h`.

References `std::__iterator_category()`.

3.4.3.10 `template<typename _Iterator, typename _Sequence, typename _OtherIterator> bool __gnu_debug::__foreign_iterator_↵
aux2 (const _Safe_iterator< _Iterator, _Sequence> & __it, const _Safe_iterator< _OtherIterator, _Sequence> &
__other, const _Safe_iterator< _OtherIterator, _Sequence> &) [inline]`

Handle debug iterators from the same type of container.

Definition at line 234 of file `functions.h`.

Referenced by `__foreign_iterator_aux2()`.

3.4.3.11 `template<typename _Iterator, typename _Sequence, typename _OtherIterator, typename _OtherSequence> bool
__gnu_debug::__foreign_iterator_aux2 (const _Safe_iterator< _Iterator, _Sequence> & __it, const _Safe_iterator<
_OtherIterator, _OtherSequence> &, const _Safe_iterator< _OtherIterator, _OtherSequence> &) [inline]`

Handle debug iterators from different types of container.

Definition at line 243 of file `functions.h`.

References `__foreign_iterator_aux2()`.

3.4.3.12 `template<typename _Iterator> std::pair<typename std::iterator_traits<_Iterator>::difference_type,
_Distance_precision> __gnu_debug::__get_distance (const _Iterator & __lhs, const _Iterator & __rhs,
std::random_access_iterator_tag) [inline]`

Determine the distance between two iterators with some known precision.

Definition at line 81 of file `safe_iterator.h`.

References `std::make_pair()`.

```
3.4.3.13 template<typename _InputIterator > bool __gnu_debug::__valid_range ( const _InputIterator & __first, const _InputIterator
& __last ) [inline]
```

Don't know what these iterators are, or if they are even iterators (we may get an integral type for `_InputIterator`), so see if they are integral and pass them on to the next phase otherwise.

Definition at line 147 of file `functions.h`.

References `__valid_range_aux()`.

```
3.4.3.14 template<typename _Iterator , typename _Sequence > bool __gnu_debug::__valid_range ( const _Safe_iterator<
_Iterator, _Sequence > & __first, const _Safe_iterator< _Iterator, _Sequence > & __last ) [inline]
```

Safe iterators know how to check if they form a valid range.

Definition at line 156 of file `functions.h`.

```
3.4.3.15 template<typename _Iterator , typename _Sequence > bool __gnu_debug::__valid_range ( const
_Safe_local_iterator< _Iterator, _Sequence > & __first, const _Safe_local_iterator< _Iterator, _Sequence > &
__last ) [inline]
```

Safe local iterators know how to check if they form a valid range.

Definition at line 163 of file `functions.h`.

References `std::__addressof()`.

```
3.4.3.16 template<typename _Integral > bool __gnu_debug::__valid_range_aux ( const _Integral & , const _Integral & ,
std::__true_type ) [inline]
```

We say that integral types for a valid range, and defer to other routines to realize what to do with integral types instead of iterators.

Definition at line 127 of file `functions.h`.

Referenced by `__valid_range()`.

```
3.4.3.17 template<typename _InputIterator > bool __gnu_debug::__valid_range_aux ( const _InputIterator & __first, const
_InputIterator & __last, std::__false_type ) [inline]
```

We have iterators, so figure out what kind of iterators that are to see if we can check the range ahead of time.

Definition at line 135 of file `functions.h`.

References `std::__iterator_category()`, and `__valid_range_aux2()`.

```
3.4.3.18 template<typename _RandomAccessIterator > bool __gnu_debug::__valid_range_aux2 ( const _RandomAccessIterator &
__first, const _RandomAccessIterator & __last, std::random_access_iterator_tag ) [inline]
```

If the distance between two random access iterators is nonnegative, assume the range is valid.

Definition at line 106 of file `functions.h`.

Referenced by `__valid_range_aux()`.

```
3.4.3.19 template<typename _InputIterator > bool __gnu_debug::__valid_range_aux2( const _InputIterator &, const _InputIterator
&, std::input_iterator_tag ) [inline]
```

Can't test for a valid range with input iterators, because iteration may be destructive. So we just assume that the range is valid.

Definition at line 117 of file functions.h.

3.6.1 Detailed Description

GNU parallel code for public use.

3.6.2 Typedef Documentation

3.6.2.1 `typedef unsigned short __gnu_parallel::_BinIndex`

Type to hold the index of a bin.

Since many variables of this type are allocated, it should be chosen as small as possible.

Definition at line 47 of file `random_shuffle.h`.

3.6.2.2 `typedef int64_t __gnu_parallel::_CASable`

Longest compare-and-swappable integer type on this platform.

Definition at line 127 of file `types.h`.

3.6.2.3 `typedef uint64_t __gnu_parallel::_SequenceIndex`

Unsigned integer to index `__elements`. The total number of elements for each algorithm must fit into this type.

Definition at line 117 of file `types.h`.

3.6.2.4 `typedef uint16_t __gnu_parallel::_ThreadIndex`

Unsigned integer to index a thread number. The maximum thread number (for each processor) must fit into this type.

Definition at line 123 of file types.h.

3.6.3 Enumeration Type Documentation

3.6.3.1 `enum __gnu_parallel::_AlgorithmStrategy`

Strategies for run-time algorithm selection:

Definition at line 67 of file types.h.

3.6.3.2 `enum __gnu_parallel::_FindAlgorithm`

Find algorithms:

Definition at line 106 of file types.h.

3.6.3.3 `enum __gnu_parallel::_MultiwayMergeAlgorithm`

Merging algorithms:

Definition at line 85 of file types.h.

3.6.3.4 `enum __gnu_parallel::_Parallelism`

Run-time equivalents for the compile-time tags.

Enumerator

sequential Not parallel.

parallel_unbalanced Parallel unbalanced (equal-sized chunks).

parallel_balanced Parallel balanced (work-stealing).

parallel_omp_loop Parallel with OpenMP dynamic load-balancing.

parallel_omp_loop_static Parallel with OpenMP static load-balancing.

parallel_taskqueue Parallel with OpenMP taskqueue construct.

Definition at line 44 of file types.h.

3.6.3.5 `enum __gnu_parallel::_PartialSumAlgorithm`

Partial sum algorithms: recursive, linear.

Definition at line 91 of file types.h.

3.6.3.6 `enum __gnu_parallel::_SortAlgorithm`

Sorting algorithms:

Definition at line 76 of file `types.h`.

3.6.3.7 `enum __gnu_parallel::_SplittingAlgorithm`

Sorting/merging algorithms: sampling, `__exact`.

Definition at line 98 of file `types.h`.

3.6.4 Function Documentation

3.6.4.1 `template<typename _RAIter, typename _DifferenceTp> void __gnu_parallel::_calc_borders (_RAIter __elements, _DifferenceTp __length, _DifferenceTp * __off)`

Precalculate `__advances` for Knuth-Morris-Pratt algorithm.

Parameters

<code>__elements</code>	Begin iterator of sequence to search for.
<code>__length</code>	Length of sequence to search for.
<code>__off</code>	Returned <code>__offsets</code> .

Definition at line 51 of file `search.h`.

Referenced by `__search_template()`.

3.6.4.2 `template<typename _Tp> bool __gnu_parallel::_compare_and_swap (volatile _Tp * __ptr, _Tp __comparand, _Tp __replacement) [inline]`

Compare-and-swap.

Compare `*__ptr` and `__comparand`. If equal, let `*__ptr=__replacement` and return true, return false otherwise.

Parameters

<code>__ptr</code>	Pointer to signed integer.
<code>__comparand</code>	Compare value.
<code>__replacement</code>	Replacement value.

Definition at line 108 of file `parallel/compatibility.h`.

Referenced by `__parallel_partition()`, `__gnu_parallel::_RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter`

> >::pop_back(), and __gnu_parallel::RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter > >::pop_↵front().

3.6.4.3 void __gnu_parallel::__decode2 (_CASable __x, int &__a, int &__b) [inline]

Decode two integers from one gnu_parallel::__CASable.

Parameters

↵ __x	__gnu_parallel::__CASable to decode integers from.
↵ __a	First integer, to be decoded from the most-significant _CASable_bits/2 bits of __x.
↵ __b	Second integer, to be encoded in the least-significant _CASable_bits/2 bits of __x.

3.6.4.4 template<typename _RAIter, typename _DifferenceTp> void __gnu_parallel::__determine_samples (_PMWMSSortingData< _RAIter > * __sd, _DifferenceTp __num_samples)

Select _M_samples from a sequence.

Parameters

__sd	Pointer to algorithm data. _Result will be placed in __sd->_M_samples.
__num_samples	Number of _M_samples to select.

Definition at line 97 of file multiway_mergesort.h.

References __equally_split(), __gnu_parallel::PMWMSSortingData< _RAIter >::_M_samples, ↵__gnu_parallel::P↵MWMSSortingData< _RAIter >::_M_source, and __gnu_parallel::PMWMSSortingData< _RAIter >::_M_starts.

3.6.4.5 _CASable __gnu_parallel::__encode2 (int __a, int __b) [inline]

Encode two integers into one gnu_parallel::__CASable.

Parameters

<code>__a</code>	First integer, to be encoded in the most-significant <code>_CASable_bits/2</code> bits.
<code>__b</code>	Second integer, to be encoded in the least-significant <code>_CASable_bits/2</code> bits.

Returns

value encoding `__a` and `__b`.

3.6.4.6 `template<typename _DifferenceType, typename _OutputIterator> _OutputIterator __gnu_parallel::__equally_split (_DifferenceType __n, _ThreadIndex __num_threads, _OutputIterator __s)`

function to split a sequence into parts of almost equal size.

The resulting sequence `__s` of length `__num_threads+1` contains the splitting positions when splitting the range `[0, __n)` into parts of almost equal size (plus minus 1). The first entry is 0, the last one `n`. There may result empty parts.

Parameters

<code>__n</code>	Number of elements
<code>__num_threads</code>	Number of parts
<code>__s</code>	Splitters

Returns

End of `__splitter` sequence, i.e. `__s+__num_threads+1`

Definition at line 48 of file `equally_split.h`.

Referenced by `__determine_samples()`, `__find_template()`, `__parallel_partial_sum_linear()`, `__parallel_unique_copy()`, `__search_template()`, and `multiway_merge_exact_splitting()`.

3.6.4.7 `template<typename _DifferenceType > _DifferenceType __gnu_parallel::__equally_split_point (_DifferenceType __n, _ThreadIndex __num_threads, _ThreadIndex __thread_no)`

function to split a sequence into parts of almost equal size.

Returns the position of the splitting point between thread number `__thread_no` (included) and thread number `__thread_no+1` (excluded).

Parameters

<code>__n</code>	Number of elements
<code>__num_threads</code>	Number of parts
<code>__thread_no</code>	Number of threads

Returns

splitting point

Definition at line 75 of file `equally_split.h`.

Referenced by `__for_each_template_random_access_ed()`.

3.6.4.8 `template<typename _Tp > _Tp __gnu_parallel::__fetch_and_add (volatile _Tp * __ptr, _Tp __addend) [inline]`

Add a value to a variable, atomically.

Parameters

<code>__ptr</code>	Pointer to a signed integer.
<code>__addend</code>	Value to add.

Definition at line 74 of file `parallel/compatibility.h`.

Referenced by `__parallel_partition()`, and `__gnu_parallel::__RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter > >::push_front()`.

3.6.4.9 `template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector > std::pair< _RAIter1, _RAIter2> __gnu_parallel::__find_template (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred, _Selector __selector) [inline]`

Parallel `std::find`, switch for different algorithms.

Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence. Must have same length as first sequence.
<code>__pred</code>	Find predicate.
<code>__selector</code>	<code>_Functionality</code> (e. g. <code>std::find_if()</code> , <code>std::equal()</code> ,...)

Returns

Place of finding in both sequences.

Definition at line 60 of file find.h.

References __gnu_parallel::_Settings::get(), and std::make_pair().

    _Selector __selector, equal_split_tag )
```

Parallel std::find, equal splitting variant.

Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence. Second __sequence must have same length as first sequence.
<code>__pred</code>	Find predicate.
<code>__selector</code>	_Functionality (e. g. std::find_if(), std::equal(),...)

Returns

    _Selector __selector, growing_blocks_tag )
```

Parallel std::find, growing block size variant.

Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence. Second __sequence must have same length as first sequence.
<code>__pred</code>	Find predicate.
<code>__selector</code>	_Functionality (e. g. std::find_if(), std::equal(),...)

Returns

Place of finding in both sequences.

Merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant. Static switch on whether to use the conditional-move variant.

Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.
<code>__end2</code>	End iterator of second sequence.

```

Merge routine fallback to sequential in case the iterators of the two input sequences are of different type.

Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.

Splits a sequence given by input iterators into parts of almost equal size.

The function needs only one pass over the sequence.

Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__starts</code>	Start iterators for the resulting parts, dimension <code>__num_parts+1</code> . For convenience, <code>__starts [__num_parts]</code> contains the end iterator of the sequence.
<code>__lengths</code>	Length of the resulting parts.
<code>__num_parts</code>	Number of parts to split the sequence into.
<code>__f</code>	Functor to be applied to each element by traversing <code>__it</code>
<code>__oversampling</code>	Oversampling factor. If 0, then the partitions will differ in at most $\{ \{ _end \} - \{ _begin \} \}$ elements. Otherwise, the ratio between the longest and the shortest part is bounded by $1 / (\{ _oversampling \} \{ num \})$

Returns

Splits several sorted sequences at a certain global `__rank`, resulting in a splitting point for each sequence. The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty. If there are several equal elements across the split, the ones on the `__left` side will be chosen from sequences with smaller number.

Parameters

<code>__begin_seqs</code>	Begin of the sequence of iterator pairs.
<code>__end_seqs</code>	End of the sequence of iterator pairs.
<code>__rank</code>	The global rank to partition at.
<code>__begin_offsets</code>	A random-access <code>__sequence</code> <code>__begin</code> where the <code>__result</code> will be stored in. Each element of the sequence is an iterator that points to the first element on the greater part of the respective <code>__sequence</code> .

Selects the element at a certain global `__rank` from several sorted sequences.

The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty.

Parameters

<code>__begin_seqs</code>	Begin of the sequence of iterator pairs.
<code>__end_seqs</code>	End of the sequence of iterator pairs.
<code>__rank</code>	The global rank to partition at.
<code>__offset</code>	The rank of the selected element in the global subsequence of elements equal to the selected element. If the selected element is unique, this number is 0.

    _RAIterOut __target, _DifferenceTp __length, _Compare __comp, __gnu_parallel::sequential_tag )
```

Multiway Merge Frontend.

Merge the sequences specified by `seqs_begin` and `__seqs_end` into `__target`. `__seqs_begin` and `__seqs_end` must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the `_M_end` of the same sequence in their second entry.

Ties are broken arbitrarily. See `stable_multiway_merge` for a variant that breaks ties by sequence number but is slower.

The first entries of the pairs (i.e. the begin iterators) will be moved forward.

The output sequence has to provide enough space for all elements that are written to it.

This function will merge the input sequences:

- not stable
- parallel, depending on the input size and Settings
- using sampling for splitting
- not using sentinels

Example:

```
int sequences[10][10];
for (int __i = 0; __i < 10; ++__i)
    for (int __j = 0; __j < 10; ++__j)
        sequences[__i][__j] = __j;

int __out[33];
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
    { seqs.push(std::make_pair<int*>(sequences[__i],
                                     sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);
```

Precondition

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

Postcondition

`[__target, return __value)` contains merged `__elements` from the input sequences.
`return __value - __target = min(__length, number of elements in all sequences).`

Template Parameters

<code>_RAIterPairIterator</code>	iterator over sequence of pairs of iterators
<code>_RAIterOut</code>	iterator over target sequence
<code>_DifferenceTp</code>	difference type for the sequence
<code>_Compare</code>	strict weak ordering type to compare elements in sequences

Parameters

<code>__seqs_begin</code>	__begin of sequence __sequence
<code>__seqs_end</code>	__M_end of sequence __sequence
<code>__target</code>	target sequence to merge to.
<code>__comp</code>	strict weak ordering to use for element comparison.
<code>__length</code>	Maximum length to merge, possibly larger than the number of elements available.

Returns

Highly efficient 3-way merging procedure.

Merging is done with the algorithm implementation described by Peter Sanders. Basically, the idea is to minimize the number of necessary comparison after merging an element. The implementation trick that makes this fast is that the order of the sequences is stored in the instruction pointer (translated into labels in C++).

This works well for merging up to 4 sequences.

Note that making the merging stable does *not* come at a performance hit.

Whether the merging is done guarded or unguarded is selected by the used iterator class.

Parameters

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, less equal than the total number of elements available.

Returns

Multiway Merge Frontend.

Merge the sequences specified by `seqs_begin` and `__seqs_end` into `__target`. `__seqs_begin` and `__seqs_end` must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the `_M_end` of the same sequence in their second entry.

Ties are broken arbitrarily. See `stable_multiway_merge` for a variant that breaks ties by sequence number but is slower.

The first entries of the pairs (i.e. the begin iterators) will be moved forward accordingly.

The output sequence has to provide enough space for all elements that are written to it.

This function will merge the input sequences:

- not stable
- parallel, depending on the input size and Settings
- using sampling for splitting
- using sentinels

You have to take care that the element the `_M_end` iterator points to is readable and contains a value that is greater than any other non-sentinel value in all sequences.

Example:

```
int sequences[10][11];
for (int __i = 0; __i < 10; ++__i)
    for (int __j = 0; __j < 11; ++__j)
        sequences[__i][__j] = __j; // __last one is sentinel!

int __out[33];
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
    { seqs.push(std::make_pair<int*>(sequences[__i],
                                     sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);
```

Precondition

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

For each `__i`, `__seqs_begin[__i].second` must be the end marker of the sequence, but also reference the one more `__sentinel` element.

Postcondition

`[__target, return __value)` contains merged `__elements` from the input sequences.

`return __value - __target = min(__length, number of elements in all sequences).`

3.8.1 Detailed Description

GNU profile code for public use.

3.8.2 Typedef Documentation

3.8.2.1 `typedef std:: ::unordered_map<std::string, std::string> __gnu_profile::__env_t`

Internal environment. Values can be set one of two ways: 1. In config file "var = value". The default config file path is libstdc++-profile.conf. 2. By setting process environment variables. For instance, in a Bash shell you can set the unit cost of iterating through a map like this: `export __map_iterate_cost_factor=5.0`. If a value is set both in the input file and through an environment variable, the environment value takes precedence.

Definition at line 65 of file `profiler_trace.h`.

3.8.3 Function Documentation

3.8.3.1 `bool __gnu_profile::__profcxx_init() [inline]`

This function must be called by each instrumentation point.

The common path is inlined fully.

Definition at line 649 of file `profiler_trace.h`.

3.8.3.2 `void __gnu_profile::__report(void) [inline]`

Final report method, registered with **atexit**.

This can also be called directly by user code, including signal handlers. It is protected against deadlocks by the reentrance guard in `profiler.h`. However, when called from a signal handler that triggers while within `__gnu_profile` (under the guarded zone), no output will be produced.

Definition at line 440 of file `profiler_trace.h`.

3.9 `__gnu_sequential` Namespace Reference

3.9.1 Detailed Description

GNU sequential classes for public use.

3.10 `abi` Namespace Reference

3.10.1 Detailed Description

The cross-vendor C++ Application Binary Interface. A namespace alias to `__cxxabiv1`, but user programs should use the alias `'abi'`.

A brief overview of an ABI is given in the libstdc++ FAQ, question 5.8 (you may have a copy of the FAQ locally, or you can view the online version at http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#5_8).

GCC subscribes to a cross-vendor ABI for C++, sometimes called the IA64 ABI because it happens to be the native ABI for that platform. It is summarized at <http://www.codesourcery.com/cxx-abi/> along with the current specification.

For users of GCC greater than or equal to 3.x, entry points are available in `<cxxabi.h>`, which notes, *'It is not normally necessary for user programs to include this header, or use the entry points directly. However, this header is available should that be needed.'*

3.11.2 Typedef Documentation

3.11.2.1 `template<bool _Cache> using std::__umap_traits = typedef __detail::__Hashtable_traits<_Cache, false, true>`

Base types for unordered_map.

Definition at line 39 of file unordered_map.h.

3.11.2.2 `template<bool _Cache> using std::__ummap_traits = typedef __detail::__Hashtable_traits<_Cache, false, false>`

Base types for unordered_multimap.

Definition at line 56 of file unordered_map.h.

3.11.2.3 `template<bool _Cache> using std::__umset_traits = typedef __detail::_Hashtable_traits<_Cache, true, false>`

Base types for `unordered_multiset`.

Definition at line 54 of file `unordered_set.h`.

3.11.2.4 `template<bool _Cache> using std::__uset_traits = typedef __detail::_Hashtable_traits<_Cache, true, true>`

Base types for `unordered_set`.

Definition at line 39 of file `unordered_set.h`.

3.11.2.5 `typedef long long std::streamoff`

Type used by `fpos`, `char_traits<char>`, and `char_traits<wchar_t>`.

In clauses 21.1.3.1 and 27.4.1 `streamoff` is described as an implementation defined type. Note: In versions of GCC up to and including GCC 3.3, `streamoff` was `typedef long`.

Definition at line 94 of file `postypes.h`.

3.11.2.6 `typedef fpos<mbstate_t> std::streampos`

File position for `char` streams.

Definition at line 228 of file `postypes.h`.

3.11.2.7 `typedef ptrdiff_t std::streamsize`

Integral type for I/O operation counts and buffer sizes.

Definition at line 98 of file `postypes.h`.

3.11.2.8 `typedef fpos<mbstate_t> std::u16streampos`

File position for `char16_t` streams.

Definition at line 234 of file `postypes.h`.

3.11.2.9 `typedef fpos<mbstate_t> std::u32streampos`

File position for `char32_t` streams.

Definition at line 236 of file `postypes.h`.

3.11.2.10 `typedef fpos<mbstate_t> std::wstreampos`

File position for `wchar_t` streams.

Definition at line 230 of file `postypes.h`.

3.11.3 Enumeration Type Documentation

3.11.3.1 anonymous enum

Todo Needs documentation! See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation+style.html> This controls some aspect of the sort routines.

Definition at line 1874 of file stl_algo.h.

3.11.4 Function Documentation

3.11.4.1 `template<typename _RandomAccessIterator, typename _Compare> void std::__final_insertion_sort (_RandomAccessIterator __first, _RandomAccessIterator __last, _Compare __comp)`

This is a helper function for the sort routine.

Definition at line 1879 of file stl_algo.h.

References `__insertion_sort()`, and `__unguarded_insertion_sort()`.

Referenced by `__introsort_loop()`.

3.11.4.2 `template<typename _InputIterator, typename _Predicate> _InputIterator std::__find_if (_InputIterator __first, _InputIterator __last, _Predicate __pred, input_iterator_tag) [inline]`

This is an overload used by find algos for the Input Iterator case.

Definition at line 101 of file stl_algo.h.

Referenced by `__find_if()`, `__find_if_not()`, `__find_if_not_n()`, `__search_n_aux()`, `find()`, `find_if()`, `is_permutation()`, `minmax_element()`, and `partition_copy()`.

3.11.4.3 `template<typename _RandomAccessIterator, typename _Predicate> _RandomAccessIterator std::__find_if (_RandomAccessIterator __first, _RandomAccessIterator __last, _Predicate __pred, random_access_iterator_tag)`

This is an overload used by find algos for the RAI case.

Definition at line 112 of file stl_algo.h.

References `__find_if()`, and `__iterator_category()`.

3.11.4.4 `template<typename _InputIterator, typename _Predicate> _InputIterator std::__find_if_not (_InputIterator __first, _InputIterator __last, _Predicate __pred) [inline]`

Provided for `stable_partition` to use.

Definition at line 168 of file stl_algo.h.

References `__find_if()`, and `__iterator_category()`.

Referenced by `__stable_partition_adaptive()`, and `find_if_not()`.

3.11.4.5 `template<typename _InputIterator, typename _Predicate, typename _Distance > _InputIterator std::__find_if_not_n (`
`_InputIterator __first, _Distance & __len, _Predicate __pred)`

Like `find_if_not()`, but uses and updates a count of the remaining range length instead of comparing against an end iterator.

Definition at line 181 of file `stl_algo.h`.

References `__find_if()`.

Referenced by `__inplace_stable_partition()`, and `__stable_partition_adaptive()`.

3.11.4.6 `template<typename _EuclideanRingElement > _EuclideanRingElement std::__gcd (_EuclideanRingElement __m,`
`_EuclideanRingElement __n)`

This is a helper function for the rotate algorithm specialized on RAIs. It returns the greatest common divisor of two integer values.

Definition at line 1229 of file `stl_algo.h`.

3.11.4.7 `template<typename _RandomAccessIterator, typename _Compare > void std::__heap_select (_RandomAccessIterator`
`__first, _RandomAccessIterator __middle, _RandomAccessIterator __last, _Compare __comp)`

This is a helper function for the sort routines.

Definition at line 1669 of file `stl_algo.h`.

Referenced by `__introsort_loop()`, and `__unguarded_partition_pivot()`.

3.11.4.8 `template<typename _ForwardIterator, typename _Predicate, typename _Distance > _ForwardIterator`
`std::__inplace_stable_partition (_ForwardIterator __first, _Predicate __pred, _Distance __len)`

This is a helper function... Requires `__len != 0` and `!__pred(*__first)`, same as `__stable_partition_adaptive`.

Definition at line 1519 of file `stl_algo.h`.

References `__find_if_not_n()`, `advance()`, `distance()`, and `rotate()`.

Referenced by `__stable_partition_adaptive()`.

3.11.4.9 `template<typename _RandomAccessIterator, typename _Compare > void std::__inplace_stable_sort (`
`_RandomAccessIterator __first, _RandomAccessIterator __last, _Compare __comp)`

This is a helper function for the stable sorting routines.

Definition at line 2771 of file `stl_algo.h`.

References `__insertion_sort()`, and `__merge_without_buffer()`.

Referenced by `merge()`.

3.11.4.10 `template<typename _RandomAccessIterator, typename _Compare> void std::__insertion_sort (_RandomAccessIterator __first, _RandomAccessIterator __last, _Compare __comp)`

This is a helper function for the sort routine.

Definition at line 1839 of file `stl_algo.h`.

References `__unguarded_linear_insert()`.

Referenced by `__final_insertion_sort()`, `__inplace_stable_sort()`, `__introsort_loop()`, and `__move_merge()`.

3.11.4.11 `template<typename _RandomAccessIterator, typename _Size, typename _Compare> void std::__introsort_loop (_RandomAccessIterator __first, _RandomAccessIterator __last, _Size __depth_limit, _Compare __comp)`

This is a helper function for the sort routine.

Definition at line 1939 of file `stl_algo.h`.

References `__final_insertion_sort()`, `__heap_select()`, `__insertion_sort()`, `__lg()`, `__unguarded_partition_pivot()`, and `iter_swap()`.

3.11.4.12 `constexpr int std::__lg (int __n) [inline]`

This is a helper function for the sort routines and for `random.tcc`.

Definition at line 1012 of file `stl_algobase.h`.

Referenced by `__introsort_loop()`, and `nth_element()`.

3.11.4.13 `template<typename _BidirectionalIterator, typename _Distance, typename _Pointer, typename _Compare> void std::__merge_adaptive (_BidirectionalIterator __first, _BidirectionalIterator __middle, _BidirectionalIterator __last, _Distance __len1, _Distance __len2, _Pointer __buffer, _Distance __buffer_size, _Compare __comp)`

This is a helper function for the merge routines.

Definition at line 2431 of file `stl_algo.h`.

References `__move_merge_adaptive()`, `__move_merge_adaptive_backward()`, `__rotate_adaptive()`, `advance()`, and `distance()`.

Referenced by `__merge_without_buffer()`, and `__move_merge()`.

3.11.4.14 `template<typename _BidirectionalIterator, typename _Distance, typename _Compare> void std::__merge_without_buffer (_BidirectionalIterator __first, _BidirectionalIterator __middle, _BidirectionalIterator __last, _Distance __len1, _Distance __len2, _Compare __comp)`

This is a helper function for the merge routines.

Definition at line 2491 of file `stl_algo.h`.

References `__merge_adaptive()`, `advance()`, `distance()`, `iter_swap()`, and `rotate()`.

Referenced by `__inplace_stable_sort()`.

3.11.4.15 `template<typename _Iterator, typename _Compare> void std::__move_median_to_first (_Iterator __result, _Iterator __a, _Iterator __b, _Iterator __c, _Compare __comp)`

Swaps the median value of *__a, *__b and *__c under __comp to *__result.

Definition at line 78 of file `stl_algo.h`.

References `iter_swap()`.

Referenced by `__unguarded_partition_pivot()`.

3.11.4.16 `template<typename _InputIterator, typename _OutputIterator, typename _Compare> _OutputIterator std::__move_merge (_InputIterator __first1, _InputIterator __last1, _InputIterator __first2, _InputIterator __last2, _OutputIterator __result, _Compare __comp)`

This is a helper function for the `__merge_sort_loop` routines.

Definition at line 2649 of file `stl_algo.h`.

References `__insertion_sort()`, `__merge_adaptive()`, and `min()`.

3.11.4.17 `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare> void std::__move_merge_adaptive (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp)`

This is a helper function for the `__merge_adaptive` routines.

Definition at line 2320 of file `stl_algo.h`.

Referenced by `__merge_adaptive()`.

3.11.4.18 `template<typename _BidirectionalIterator1, typename _BidirectionalIterator2, typename _BidirectionalIterator3, typename _Compare> void std::__move_merge_adaptive_backward (_BidirectionalIterator1 __first1, _BidirectionalIterator1 __last1, _BidirectionalIterator2 __first2, _BidirectionalIterator2 __last2, _BidirectionalIterator3 __result, _Compare __comp)`

This is a helper function for the `__merge_adaptive` routines.

Definition at line 2346 of file `stl_algo.h`.

Referenced by `__merge_adaptive()`.

3.11.4.19 `template<typename _ForwardIterator, typename _Predicate> _ForwardIterator std::__partition (_ForwardIterator __first, _ForwardIterator __last, _Predicate __pred, forward_iterator_tag)`

Definition at line 1462 of file `stl_algo.h`.

References `iter_swap()`.

Referenced by `partition()`.

3.11.4.20 `template<typename _BidirectionalIterator, typename _Predicate> _BidirectionalIterator std::__partition (`
`_BidirectionalIterator __first, _BidirectionalIterator __last, _Predicate __pred, bidirectional_iterator_tag)`

This is a helper function...

Definition at line 1487 of file `stl_algo.h`.

References `iter_swap()`.

3.11.4.21 `template<typename _BidirectionalIterator> void std::__reverse (_BidirectionalIterator __first, _BidirectionalIterator`
`__last, bidirectional_iterator_tag)`

This is an uglified `reverse(_BidirectionalIterator, _BidirectionalIterator)` overloaded for bidirectional iterators.

Definition at line 1129 of file `stl_algo.h`.

References `iter_swap()`.

Referenced by `__rotate()`, `includes()`, `next_permutation()`, and `reverse()`.

3.11.4.22 `template<typename _RandomAccessIterator> void std::__reverse (_RandomAccessIterator __first,`
`_RandomAccessIterator __last, random_access_iterator_tag)`

This is an uglified `reverse(_BidirectionalIterator, _BidirectionalIterator)` overloaded for random access iterators.

Definition at line 1149 of file `stl_algo.h`.

References `iter_swap()`.

3.11.4.23 `template<typename _ForwardIterator> void std::__rotate (_ForwardIterator __first, _ForwardIterator __middle,`
`_ForwardIterator __last, forward_iterator_tag)`

This is a helper function for the rotate algorithm.

Definition at line 1243 of file `stl_algo.h`.

References `iter_swap()`.

Referenced by `__gnu_cxx::bitmap_allocator<_Tp>::_M_deallocate_single_object()`, and `rotate()`.

3.11.4.24 `template<typename _BidirectionalIterator> void std::__rotate (_BidirectionalIterator __first, _BidirectionalIterator`
`__middle, _BidirectionalIterator __last, bidirectional_iterator_tag)`

```

Accumulate values in a range.

Accumulates the values in the range `[first,last)` using `operator+()`. The initial value is `init`. The values are processed in order.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.

```

A generalization of pointer arithmetic.

Parameters

$_i$	An input iterator.
$_n$	The <i>delta</i> by which to change $_i$.

Returns

Nothing.

This increments `i` by `n`. For bidirectional and random access iterators, `__n` may be negative, in which case `__i` is decremented.

For random access iterators, this uses their `+` and `-` operations and are constant time. For other iterator classes they are linear time.

3.11.4.58 `template<typename _Tp> pair<_Tp*, ptrdiff_t> std::get_temporary_buffer (ptrdiff_t __len) [noexcept]`

Allocates a temporary buffer.

Parameters

<code>__len</code>	The number of objects of type <code>Tp</code> .
--------------------	---

Returns

See full description.

Reinventing the wheel, but this time with prettier spokes!

This function tries to obtain storage for `__len` adjacent `Tp` objects. The objects themselves are not constructed, of course. A `pair<>` is returned containing *the buffer's address and capacity (in the units of `sizeof(_Tp)`)*, or a pair of 0 values if no storage can be obtained. Note that the capacity obtained may be less than that requested if the memory is unavailable; you should compare `len` with the `.second` return value.

Provides the nothrow exception guarantee.

Read a line from stream into a string.

Parameters

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.
<code>__delim</code>	Character marking end of line.

Returns

Reference to the input stream.

Stores characters from `__is` into `__str` until `__delim` is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased. 3.11.4.109 `template<typename _Tp, typename _Seq> bool std::operator< (const stack<_Tp, _Seq> &__x, const stack<_Tp, _Seq> &__y) [inline]`

Stack ordering relation.

Parameters

<code>__x</code>	A stack.
<code>__y</code>	A stack of the same type as <code>x</code> .

Returns

True iff `x` is lexicographically less than `__y`.

This is an total ordering relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, the elements must be comparable with `<`, and `std::lexicographical_compare()` is usually used to make the determination.

    _Compare, _Alloc > &__x, const set<_Key, _Compare, _Alloc > &__y ) [inline]
```

Set equality comparison.

Parameters

x	A set.
y	A set of the same type as x .

Returns

True iff the size and elements of the sets are equal.

This is an equivalence relation. It is linear in the size of the sets. Sets are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

```

Multimap equality comparison.

Parameters

\leftrightarrow __x	A multimap.
\leftrightarrow __y	A multimap of the same type as __x.

Returns

True iff the size and elements of the maps are equal.

Parameters

<code>__x</code>	A <code>forward_list</code>
<code>__y</code>	A <code>forward_list</code> of the same type as <code>__x</code> .

Returns

True iff the elements of the forward lists are equal.

This is an equivalence relation. It is linear in the number of elements of the forward lists. Deques are considered equivalent if corresponding elements compare equal.

Read stream into a string.

Parameters

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.

Returns

Reference to the input stream.

Stores characters from `__is` into `__str` until whitespace is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased.

) [inline]
```

Copy a sequence, replacing each element of one value with another value.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__old_value</code>	The value to be replaced.
<code>__new_value</code>	The replacement value.

Returns

The end of the output sequence, `result+(last-first)`.

Copies each element in the input range [`__first`,`__last`) to the output range [`__result`,`__result+(__last-__first)`) replacing elements equal to `__old_value` with `__new_value`.

Convenience interface to `ctype::toupper(__c)`.

Definition at line 2596 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT >::toupper()`.

3.11.4.202 `template<typename _InputIterator, typename _ForwardIterator > _ForwardIterator std::uninitialized_copy (_InputIterator __first, _InputIterator __last, _ForwardIterator __result) [inline]`

Copies the range `[first,last)` into `result`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

`__result + (__first - __last)`

Like `copy()`, but does not require an initialized output range.

Definition at line 107 of file `stl_uninitialized.h`.

References `__addressof()`, `_Construct()`, and `_Destroy()`.

3.11.4.203 `template<typename _InputIterator, typename _Size, typename _ForwardIterator> _ForwardIterator
std::uninitialized_copy_n(_InputIterator __first, _Size __n, _ForwardIterator __result) [inline]`

Copies the range `[first,first+n)` into `result`.

Parameters

<code>__first</code>	An input iterator.
<code>__n</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

Returns

`__result + __n`

Like `copy_n()`, but does not require an initialized output range.

Definition at line 674 of file `stl_uninitialized.h`.

References `__iterator_category()`.

3.11.4.204 `template<typename _ForwardIterator, typename _Tp> void std::uninitialized_fill(_ForwardIterator __first,
_ForwardIterator __last, const _Tp & __x) [inline]`

Copies the value `x` into the range `[first,last)`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__x</code>	The source value.

Returns

Nothing.

Like fill(), but does not require an initialized output range.

Definition at line 173 of file stl_uninitialized.h.

Referenced by uninitialized_fill_n().

3.11.4.205 `template<typename _ForwardIterator, typename _Size, typename _Tp> void std::uninitialized_fill_n (_ForwardIterator
__first, _Size __n, const _Tp & __x) [inline]`

Copies the value x into the range [first,first+n).

Parameters

<code>__first</code>	An input iterator.
<code>__n</code>	The number of copies to make.
<code>__x</code>	The source value.

Returns

Nothing.

Like fill_n(), but does not require an initialized output range.

Definition at line 233 of file stl_uninitialized.h.

References __addressof(), _Construct(), _Destroy(), fill_n(), uninitialized_copy(), and uninitialized_fill().

3.12.1 Detailed Description

GNU debug code, replaces standard behavior with debug behavior.

Macros and namespaces used by the implementation outside of debug wrappers to verify certain properties. The `__glibcxx_requires_xxx` macros are merely wrappers around the `__glibcxx_check_xxx` wrappers when we are compiling with debug mode, but disappear when we are in release mode so that there is no checking performed in, e.g., the standard library algorithms.

3.16.2 Enumeration Type Documentation

3.16.2.1 enum std::regex_constants::__match_flag

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 213 of file `regex_constants.h`.

3.16.2.2 enum std::regex_constants::__syntax_option

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 54 of file `regex_constants.h`.

3.16.2.3 enum std::regex_constants::error_type

The expression contained an invalid collating element name.

Definition at line 49 of file `regex_error.h`.

3.16.2.4 enum std::regex_constants::match_flag_type : unsigned int

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Enumerator

match_default The default matching rules.

match_not_bol The first character in the sequence [first, last) is treated as though it is not at the beginning of a line, so the character (^) in the regular expression shall not match [first, first).

match_not_eol The last character in the sequence [first, last) is treated as though it is not at the end of a line, so the character (\$) in the regular expression shall not match [last, last).

match_not_bow The expression \b is not matched against the sub-sequence [first,first).

match_not_eow The expression \b should not be matched against the sub-sequence [last,last).

match_any If more than one match is possible then any match is an acceptable result.

match_not_null The expression does not match an empty sequence.

match_continuous The expression only matches a sub-sequence that begins at first .

match_prev_avail –first is a valid iterator position. When this flag is set then the flags `match_not_bol` and `match_not_bow` are ignored by the regular expression algorithms 28.11 and iterators 28.12.

format_default When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the ECMAScript `replace` function in ECMA- 262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], part 15.5.4.11 `String.prototype.replace`. In addition, during search and replace operations all non-overlapping occurrences of the regular expression are located and replaced, and sections of the input that did not match the expression are copied unchanged to the output string.

Format strings (from ECMA-262 [15.5.4.11]):

- `$$` The dollar-sign itself (`$`)
- `$&` The matched substring.
- `$'` The portion of *string* that precedes the matched substring. This would be `match_results::prefix()`.
- `$'` The portion of *string* that follows the matched substring. This would be `match_results::suffix()`.
- `$n` The *n*th capture, where *n* is in [1,9] and `$n` is not followed by a decimal digit. If `n <= match_results::size()` and the *n*th capture is undefined, use the empty string instead. If `n > match_results::size()`, the result is implementation-defined.
- `$nn` The *nn*th capture, where *nn* is a two-digit decimal number on [01, 99]. If `nn <= match_results::size()` and the *n*th capture is undefined, use the empty string instead. If `nn > match_results::size()`, the result is implementation-defined.

format_sed When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the POSIX `sed` utility in IEEE Std 1003.1- 2001 [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

format_no_copy During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.

format_first_only When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.

Definition at line 236 of file `regex_constants.h`.

3.16.2.5 `enum std::regex_constants::syntax_option_type : unsigned int`

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Enumerator

icase Specifies that the matching of regular expressions against a character sequence shall be performed without regard to case.

nosubs Specifies that when a regular expression is matched against a character container sequence, no sub-expression matches are to be stored in the supplied `match_results` structure.

optimize Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.

collate Specifies that character ranges of the form `[a-b]` should be locale sensitive.

ECMAScript Specifies that the grammar recognized by the regular expression engine is that used by ECMAScript in ECMA-262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], as modified in section [28.13]. This grammar is similar to that defined in the PERL scripting language but extended with elements found in the POSIX regular expression grammar.

basic Specifies that the grammar recognized by the regular expression engine is that used by POSIX basic regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

extended Specifies that the grammar recognized by the regular expression engine is that used by POSIX extended regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions.

awk Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility awk in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type extended`, except that C-style escape sequences are supported. These sequences are: `\\`, `\a`, `\b`, `\f`, `\n`, `\r`, `\t`, `\v`, `\'`, `\'`, and `\ddd` (where ddd is one, two, or three octal digits).

grep Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility grep in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type basic`, except that newlines are treated as whitespace.

egrep Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility grep when given the `-E` option in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type extended`, except that newlines are treated as whitespace.

Definition at line 80 of file `regex_constants.h`.

3.16.3 Function Documentation

3.16.3.1 `constexpr error_type std::regex_constants::error_backref (_S_error_backref)`

The expression contained an invalid back reference.

3.16.3.2 `constexpr error_type std::regex_constants::error_badbrace (_S_error_badbrace)`

The expression contained an invalid range in a `{}` expression.

3.16.3.3 `constexpr error_type std::regex_constants::error_badrepeat (_S_error_badrepeat)`

One of `*?+{` was not preceded by a valid regular expression.

3.16.3.4 `constexpr error_type std::regex_constants::error_brace (_S_error_brace)`

The expression contained mismatched `{` and `}`

3.16.3.5 `constexpr error_type std::regex_constants::error_brack (_S_error_brack)`

The expression contained mismatched `[` and `]`.

3.16.3.6 `constexpr error_type std::regex_constants::error_collate (_S_error_collate)`

The expression contained an invalid collating element name.

3.16.3.7 `constexpr error_type std::regex_constants::error_complexity (_S_error_complexity)`

The complexity of an attempted match against a regular expression exceeded a pre-set level.

3.16.3.8 `constexpr error_type std::regex_constants::error_ctype (_S_error_ctype)`

The expression contained an invalid character class name.

3.16.3.9 `constexpr error_type std::regex_constants::error_escape (_S_error_escape)`

The expression contained an invalid escaped character, or a trailing escape.

3.16.3.10 `constexpr error_type std::regex_constants::error_paren (_S_error_paren)`

The expression contained mismatched (and).

3.16.3.11 `constexpr error_type std::regex_constants::error_range (_S_error_range)`

The expression contained an invalid character range, such as [b-a] in most encodings.

3.16.3.12 `constexpr error_type std::regex_constants::error_space (_S_error_space)`

There was insufficient memory to convert the expression into a finite state machine.

3.16.3.13 `constexpr error_type std::regex_constants::error_stack (_S_error_stack)`

There was insufficient memory to determine whether the regular expression could match the specified character sequence.

3.17.1 Detailed Description

The generated relational operators are sequestered here.

3.17.2 Function Documentation

3.17.2.1 `template<class _Tp> bool std::rel_ops::operator!=(const _Tp &__x, const _Tp &__y) [inline]`

Defines != for arbitrary types, in terms of ==.

Parameters

\longleftrightarrow __x	A thing.
\longleftrightarrow __y	Another thing.

Returns

`__x != __y`

This function uses == to determine its result.

Definition at line 87 of file stl_relops.h.

3.17.2.2 `template<class _Tp> bool std::rel_ops::operator<= (const _Tp &__x, const _Tp &__y) [inline]`

Defines <= for arbitrary types, in terms of <.

Parameters

\longleftrightarrow __x	A thing.
\longleftrightarrow __y	Another thing.

Returns

`__x <= __y`

This function uses < to determine its result.

Definition at line 113 of file stl_relops.h.

3.17.2.3 `template<class _Tp> bool std::rel_ops::operator> (const _Tp &__x, const _Tp &__y) [inline]`

Defines > for arbitrary types, in terms of <.

Parameters

$_x$	A thing.
$_y$	Another thing.

Returns

$_x > _y$

This function uses $<$ to determine its result.

Definition at line 100 of file stl_relops.h.

3.17.2.4 `template<class _Tp> bool std::rel_ops::operator>=(const _Tp & __x, const _Tp & __y) [inline]`

Defines $>=$ for arbitrary types, in terms of $<$.

Parameters

$_x$	A thing.
$_y$	Another thing.

Returns

$_x >= _y$

This function uses $<$ to determine its result.

Definition at line 126 of file stl_relops.h.

4.2.3 Member Function Documentation

4.2.3.1 `template<typename _Alloc> static pointer std::allocator_traits<_Alloc>::allocate (_Alloc &__a, size_type __n)` [inline], [static], [inherited]

Allocate memory.

Parameters

<code>__a</code>	An allocator.
<code>__n</code>	The number of objects to allocate space for.

Calls `a.allocate(n)`

Definition at line 356 of file `bits/alloc_traits.h`.

4.2.3.2 `template<typename _Alloc> static pointer std::allocator_traits<_Alloc>::allocate (_Alloc &__a, size_type __n, const_void_pointer __hint)` [inline], [static], [inherited]

Allocate memory.

Parameters

<code>__a</code>	An allocator.
<code>__n</code>	The number of objects to allocate space for.
<code>__hint</code>	Aid to locality.

Returns

Memory of suitable size and alignment for n objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

Definition at line 371 of file `bits/alloc_traits.h`.

4.2.3.3 `template<typename _Alloc> template<typename _Tp, typename... _Args> static auto std::allocator_traits<_Alloc>::construct (_Alloc & __a, _Tp * __p, _Args &&... __args) -> decltype(_S_construct(__a, __p, std::forward<_Args>(__args)...))` `[inline], [static], [inherited]`

Construct an object of type `_Tp`.

Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to memory of suitable size and alignment for <code>Tp</code>
<code>__args</code>	Constructor arguments.

Calls `__a.construct(__p, std::forward<Args>(__args)...) if that expression is well-formed, otherwise uses placement-new to construct an object of type _Tp at location __p from the arguments __args...`

Definition at line 397 of file `bits/alloc_traits.h`.

4.2.3.4 `template<typename _Alloc> static void std::allocator_traits<_Alloc>::deallocate (_Alloc & __a, pointer __p, size_type __n)` `[inline], [static], [inherited]`

Deallocate memory.

Parameters

<code>__↵ __a</code>	An allocator.
<code>__↵ __p</code>	Pointer to the memory to deallocate.
<code>__↵ __n</code>	The number of objects space was allocated for.

Calls `a.deallocate(p, n)`

Definition at line 382 of file `bits/alloc_traits.h`.

4.2.3.5 `template<typename _Alloc> template<typename _Tp> static void std::allocator_traits<_Alloc>::destroy (_Alloc & __a, _Tp* __p)` `[inline]`, `[static]`, `[inherited]`

Destroy an object of type `_Tp`.

Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to the object to destroy

Calls `__a.destroy(__p)` if that expression is well-formed, otherwise calls `__p->~Tp()`

Definition at line 410 of file `bits/alloc_traits.h`.

4.2.3.6 `template<typename _Alloc> static size_type std::allocator_traits<_Alloc>::max_size (const _Alloc & __a)` `[inline]`, `[static]`, `[noexcept]`, `[inherited]`

The maximum supported allocation size.

Parameters

<code>__a</code>	An allocator.
------------------	---------------

Returns

`__a.max_size()` or `numeric_limits<size_type>::max()`

Returns `__a.max_size()` if that expression is well-formed, otherwise returns `numeric_limits<size_type>::max()`

Definition at line 421 of file `bits/alloc_traits.h`.

4.2.3.7 `template<typename _Alloc> static _Alloc std::allocator_traits<_Alloc>::select_on_container_copy_construction (const _Alloc & __rhs)` `[inline]`, `[static]`, `[inherited]`

Obtain an allocator to use when copying a container.

Parameters

<code>__rhs</code>	An allocator.
--------------------	---------------

Returns

`__rhs.select_on_container_copy_construction()` or `__rhs`

Returns `__rhs.select_on_container_copy_construction()` if that expression is well-formed, otherwise returns `__rhs`

Definition at line 433 of file `bits/alloc_traits.h`.

4.4.1 Detailed Description

```
template<typename _Tp>
class __gnu_cxx::__detail::_mini_vector<_Tp>
```

`_mini_vector<>` is a stripped down version of the full-fledged `std::vector<>`.

It is to be used only for built-in types or PODs. Notable differences are:

1. Not all accessor functions are present. 2. Used ONLY for PODs. 3. No Allocator template argument. Uses operator `new()` to get memory, and operator `delete()` to free it. Caveat: The dtor does NOT free the memory allocated, so this a memory-leaking vector!

4.7.1 Detailed Description

```
template<typename _Tp, typename _Poolp = __common_pool_policy<__pool, true >>
class __gnu_cxx::__mt_alloc< _Tp, _Poolp >
```

This is a fixed size (power of 2) allocator which - when compiled with thread support - will maintain one freelist per size per thread plus a *global* one. Steps are taken to limit the per thread freelist sizes (by returning excess back to the *global* list).

4.14.1 Detailed Description

Base class for __pool_alloc.

Uses various allocators to fulfill underlying requests (and makes as few requests as possible when in default high-speed pool mode).

Important implementation properties: 0. If globally mandated, then allocate objects from new 1. If the clients request an object of size > _S_max_bytes, the resulting object will be obtained directly from new 2. In all other cases, we allocate an object of size exactly _S_round_up(requested_size). Thus the client has enough size information that we can return the object to the proper free list without permanently losing part of the object.

4.16.1 Detailed Description

```
template<typename _CharT, typename _Traits, typename _Alloc>
class __gnu_cxx::__rc_string_base< _CharT, _Traits, _Alloc >
```

Documentation? What's that? Nathan Myers ncm@cantrip.org.

A string looks like this:

```

                                     [_Rep]
                                     _M_length
[ __rc_string_base<char_type>]      _M_capacity
_M_datapointer                    _M_refcount
_M_p ----->                     unnamed array of char_type
```

Where the `_M_p` points to the first character in the string, and you cast it to a pointer-to-`_Rep` and subtract 1 to get a pointer to the header.

This approach has the enormous advantage that a string object requires only one allocation. All the ugliness is confined within a single pair of inline functions, which each compile to a single *add* instruction: `_Rep::_M_refdata()`, and `__rc_string_base::_M_rep()`; and the allocation function which gets a block of raw bytes and with room enough and constructs a `_Rep` object at the front.

The reason you want `_M_data` pointing to the character array and not the `_Rep` is so that the debugger can see the string contents. (Probably we should add a non-inline member to get the `_Rep` for the debugger to use, so users can check the actual string length.)

Note that the `_Rep` object is a POD so that you can have a static *empty string* `_Rep` object already *constructed* before static constructors have run. The reference-count encoding is chosen so that a 0 indicates one reference, so you never try to destroy the empty-string `_Rep` object.

All but the last paragraph is considered pretty conventional for a C++ string implementation.

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base>
class __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >
```

Template class `__versa_string`.

Data structure managing sequences of characters and character-like objects.

Definition at line 56 of file `vstring.h`.

4.18.2 Constructor & Destructor Documentation

4.18.2.1 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::__versa_string (const _Alloc & __a = _Alloc()) [inline], [explicit], [noexcept]`

Construct an empty string using allocator *a*.

Definition at line 137 of file `vstring.h`.

Referenced by `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::substr()`.

Construct string with copy of value of `__str`.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

Definition at line 145 of file `vstring.h`.

4.18.2.3 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::__versa_string (__versa_string<_CharT, _Traits, _Alloc, _Base> && __str) [inline], [noexcept]`

String move constructor.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

The newly-constructed string contains the exact contents of `__str`. The contents of `__str` are a valid, but unspecified string.

Definition at line 157 of file `vstring.h`.

Construct string from an initializer list.

Parameters

<code>_↔ _l</code>	std::initializer_list of characters.
<code>_↔ _a</code>	Allocator to use (default is default allocator).

Definition at line 165 of file vstring.h.

Construct string as multiple characters.

Parameters

<code>__n</code>	Number of characters.
<code>__c</code>	Character to use.
<code>__a</code>	Allocator to use (default is default allocator).

Definition at line 227 of file `vstring.h`.

```
4.18.2.10 template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename

_InputIterator __end, const _Alloc & __a = _Alloc() ) [inline]
```

Construct string as copy of a range.

Parameters

<code>__beg</code>	Start of range.
<code>__end</code>	End of range.
<code>__a</code>	Allocator to use (default is default allocator).

Append a substring.

Parameters

<code>__str</code>	The string to append.
<code>__pos</code>	Index of the first character of <code>str</code> to append.
<code>__n</code>	The number of characters to append.

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	if <code>pos</code> is not a valid index.
--------------------------------	---

This function appends `__n` characters from `__str` starting at `__pos` to this string. If `__n` is larger than the number of available characters in `__str`, the remainder of `__str` is appended.

        [inline]
```

Append a range of characters.

Parameters

<code>__first</code>	Iterator referencing the first character to append.
<code>__last</code>	Iterator marking the end of the range.

Returns

Reference to this string.

Appends characters in the range [first,last) to this string.

Set value to a substring of a string.

Parameters

<code>__str</code>	The string to use.
<code>__pos</code>	Index of the first character of str.
<code>__n</code>	Number of characters to use.

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	if <code>__pos</code> is not a valid index.
--------------------------------	---

Compare to a string.

Parameters

<code>__str</code>	String to compare against.
--------------------	----------------------------

Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before `__str`, 0 if their values are equivalent, or > 0 if this string is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and `str.size()`. Compare substring to a string.

Parameters

<code>__pos</code>	Index of first character of substring.
<code>__n</code>	Number of characters in substring.
<code>__str</code>	String to compare against.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n` characters starting at `__pos`. Returns an integer < 0 if the substring is ordered before `__str`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__str.size()`. Compare substring to a substring.

Parameters

<code>__pos1</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__str</code>	String to compare against.
<code>__pos2</code>	Index of first character of substring of <code>str</code> .
<code>__n2</code>	Number of characters in substring of <code>str</code> .

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos1`. Form the substring of `__str` from the `__n2` characters starting at `__pos2`. Returns an integer < 0 if this substring is ordered before the substring of `__str`, 0 if their values are equivalent, or > 0 if this substring is ordered after the substring of `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the lengths of the substrings. Compare to a C string.

Parameters

<code>__s</code>	C string to compare against.
------------------	------------------------------

Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before `__s`, 0 if their values are equivalent, or > 0 if this string is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and the length of a string constructed from `__s`. Compare substring to a C string.

Parameters

<code>__pos</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__s</code>	C string to compare against.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos`. Returns an integer < 0 if the substring is ordered before `__s`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and the length of a string constructed from `__s`. Compare substring against a character array.

Parameters

<code>__pos</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__s</code>	character array to compare against.
<code>__n2</code>	Number of characters of s.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos`. Form a string from the first `__n2` characters of `__s`. Returns an integer < 0 if this substring is ordered before the string from `__s`, 0 if their values are equivalent, or > 0 if this substring is ordered after the string from `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__n2`. The function then compares the two strings by calling `traits::compare(substring.data(),__s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

NB: `__s` must have at least `n2` characters, `l0` has no special meaning.

4.18.333 `template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base> size_type __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::copy (_CharT * __s, size_type __n, size_type __pos = 0) const`

Copy substring into C string.

Parameters

<code>__s</code>	C string to copy value into.
<code>__n</code>	Number of characters to copy.
<code>__pos</code>	Index of first character to copy.

Returns

Number of characters actually copied

Exceptions

<code>std::out_of_range</code>	If <code>pos > size()</code> .
--------------------------------	-----------------------------------

Copies up to `__n` characters starting at `__pos` into the C string `s`. If `__pos` is greater than `size()`, `out_of_range` is thrown.

Remove characters.

Parameters

<code>__pos</code>	Index of first character to remove (default 0).
<code>__n</code>	Number of characters to remove (default remainder).

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is beyond the end of this string.
--------------------------------	---

Removes `__n` characters from this string starting at `__pos`. The length of the string is reduced by `__n`. If there are `< __n` characters to remove, the remainder of the string is truncated. If `__p` is beyond end of string, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

           [inline]
```

Remove one character.

Parameters

<code>__position</code>	Iterator referencing the character to remove.
-------------------------	---

Returns

iterator referencing same location after removal.

Removes the character at `__position` from this string. The value of the string doesn't change if an error is thrown.

Definition at line 1190 of file `vstring.h`.

```

Remove a range of characters.

Parameters

<code>__first</code>	Iterator referencing the first character to remove.
<code>__last</code>	Iterator referencing the end of the range.

Returns

Iterator referencing location of first after removal.

Removes the characters in the range `[first,last)` from this string. The value of the string doesn't change if an error is thrown.

Find position of a C substring.

Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to search from.
<code>__n</code>	Number of characters from <code>__s</code> to search for.

Returns

Index of start of first occurrence.

Starting from `__pos`, searches forward for the first `__n` characters in `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Find position of a string.

Parameters

<code>__str</code>	String to locate.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of start of first occurrence.

```

Find position of a character not in string.

Parameters

<code>__str</code>	String containing characters to avoid.
<code>__pos</code>	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Insert value of a string.

Parameters

<code>__pos1</code>	Iterator referencing location in string to insert at.
<code>__str</code>	The string to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts value of `__str` starting at `__pos1`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Insert a substring.

Parameters

<code>__pos1</code>	Iterator referencing location in string to insert at.
<code>__str</code>	The string to insert.
<code>__pos2</code>	Start of characters in str to insert.
<code>__n</code>	Number of characters to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
<code>std::out_of_range</code>	If <code>__pos1 > size()</code> or <code>__pos2 > __str.size()</code> .

Starting at `__pos1`, insert `__n` character of `__str` beginning with `__pos2`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos1` is beyond the end of this string or `__pos2` is beyond the end of `__str`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Insert a C substring.

Parameters

<code>__pos</code>	Iterator referencing location in string to insert at.
<code>__s</code>	The C string to insert.
<code>__n</code>	The number of characters to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
<code>std::out_of_range</code>	If <code>__pos</code> is beyond the end of this string.

Inserts the first `__n` characters of `__s` starting at `__pos`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos` is beyond `end()`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Insert multiple characters.

Parameters

<code>__pos</code>	Index in string to insert at.
<code>__n</code>	Number of characters to insert
<code>__c</code>	The character to insert.

Returns

Reference to this string.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
<code>std::out_of_range</code>	If <code>__pos</code> is beyond the end of this string.

Inserts `__n` copies of character `__c` starting at index `__pos`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos > length()`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

```

Insert one character.

Parameters

<code>__p</code>	Iterator referencing position in string to insert at.
<code>__c</code>	The character to insert.

Returns

Iterator referencing newly inserted char.

Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts character `__c` at position referenced by `__p`. If adding character causes the length to exceed `max_size()`, `length_error` is thrown. If `__p` is beyond end of string, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
--------------------------	---

Removes the characters in the range `[i1,i2)`. In place, the characters of `__s` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

    const_iterator __i1, const_iterator __i2, size_type __n, _CharT __c ) [inline]
```

Replace range of characters with multiple characters.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__n</code>	Number of characters to insert.
<code>__c</code>	Character to insert.

Returns

Reference to this string.

Exceptions

Replace range of characters with range.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__k1</code>	Iterator referencing start of range to insert.
<code>__k2</code>	Iterator referencing end of range to insert.

Returns

Replace range of characters with `initializer_list`.

Parameters

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__l</code>	The <code>initializer_list</code> of characters to insert.

Returns

_Base> void __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::reserve ( size_type __res_arg = 0 )
[inline]
```

Attempt to preallocate enough memory for specified number of characters.

Parameters

<code>__res_arg</code>	Number of characters required.
------------------------	--------------------------------

Exceptions

<code>std::length_error</code>	If <code>__res_arg</code> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the string to hold the specified number of characters. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the string length that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of string data.

4.19.1 Detailed Description

```
template<typename _ToType>
struct __gnu_cxx::Caster<_ToType>
```

These functions are here to allow containers to support non standard pointer types. For normal pointers, these resolve to the use of the standard cast operation. For other types the functions will perform the appropriate cast to/from the custom pointer class so long as that class meets the following conditions: 1) has a typedef `element_type` which names the type it points to. 2) has a `get()` const method which returns `element_type*`. 3) has a constructor which can take one `element_type*` argument. This type supports the semantics of the pointer cast operators (below.)

4.23.1 Detailed Description

```
template<typename _Storage_policy>
class __gnu_cxx::Pointer_adapter<_Storage_policy>
```

The following provides an 'alternative pointer' that works with the containers when specified as the pointer typedef of the allocator.

The pointer type used with the containers doesn't have to be this class, but it must support the implicit conversions, pointer arithmetic, comparison operators, etc. that are supported by this class, and avoid raising compile-time ambiguities. Because creating a working pointer can be challenging, this pointer template was designed to wrapper an easier storage policy type, so that it becomes reusable for creating other pointer types.

A key point of this class is also that it allows container writers to 'assume' `Allocator::pointer` is a typedef for a normal pointer. This class supports most of the conventions of a true pointer, and can, for instance handle implicit conversion to `const` and base class pointer types. The only impositions on container writers to support extended pointers are: 1) use the `Allocator::pointer` typedef appropriately for pointer types. 2) if you need pointer casting, use the `__pointer_cast<>` functions from `ext/cast.h`. This allows pointer cast operations to be overloaded as necessary by custom pointers.

Note: The `const` qualifier works with this pointer adapter as follows:

```
_Tp* == _Pointer_adapter<_Std_pointer_impl<_Tp>>; const _Tp* == _Pointer_adapter<_Std_pointer_impl<const
_Tp>>; _Tp* const == const _Pointer_adapter<_Std_pointer_impl<_Tp>>; const _Tp* const == const _Pointer_
adapter<_Std_pointer_impl<const _Tp>>;

```
template<typename _Tp>
class __gnu_cxx::_Relative_pointer_impl< _Tp >
```

A storage policy for use with `_Pointer_adapter<>` which stores the pointer's address as an offset value which is relative to its own address.

This is intended for pointers within shared memory regions which might be mapped at different addresses by different processes. For null pointers, a value of 1 is used. (0 is legitimate sometimes for nodes in circularly linked lists) This value was chosen as the least likely to generate an incorrect null, As there is no reason why any normal pointer would point 1 byte into its own pointer address.

4.26.1 Detailed Description

```
template<typename _Tp>
class __gnu_cxx::Std_pointer_impl<_Tp>
```

A storage policy for use with `_Pointer_adapter<>` which yields a standard pointer.

A `_Storage_policy` is required to provide 4 things: 1) A `get()` API for returning the stored pointer value. 2) An `set()` API for storing a pointer value. 3) An `element_type` typedef to define the type this points to. 4) An `operator<()` to support pointer comparison. 5) An `operator==()` to support pointer comparison.

template<typename _Tp>

Definition at line 59 of file ext/alloc_traits.h.

4.31.2 Member Function Documentation

4.31.2.1 `template<typename _Tp> pointer __gnu_cxx::bitmap_allocator<_Tp>::_M_allocate_single_object () throw std::bad_alloc) [inline]`

Allocates memory for a single object of size `sizeof(_Tp)`.

Exceptions

<code>std::bad_alloc.</code>	If memory can not be allocated.
------------------------------	---------------------------------

Complexity: Worst case complexity is $O(N)$, but that is hardly ever hit. If and when this particular case is encountered, the next few cases are guaranteed to have a worst case complexity of $O(1)$! That's why this function performs very well on average. You can consider this function to have a complexity referred to commonly as: Amortized Constant time.

Definition at line 827 of file `bitmap_allocator.h`.

References `__gnu_cxx::__detail::__bit_allocate()`, `__gnu_cxx::__detail::__num_bitmaps()`, and `__gnu_cxx::_Bit_scan←_forward()`.

4.31.2.2 `template<typename _Tp> void __gnu_cxx::bitmap_allocator<_Tp>::_M_deallocate_single_object (pointer __p) throw) [inline]`

Deallocates memory that belongs to a single object of size `sizeof(_Tp)`.

Complexity: $O(\lg(N))$, but the worst case is not hit often! This is because containers usually deallocate memory close to each other and this case is handled in $O(1)$ time by the `deallocate` function.

4.32.1 Detailed Description

```
template<typename _CharT>
struct __gnu_cxx::char_traits<_CharT>
```

Base class used to implement `std::char_traits`.

Note

For any given actual character type, this definition is probably wrong. (Most of the member functions are likely to be right, but the `int_type` and `state_type` typedefs, and the `eof()` member function, are likely to be wrong.) The reason this class exists is so users can specialize it. Classes in namespace `std` may not be specialized for fundamental types, but classes in namespace `__gnu_cxx` may be.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt05ch13s03.html> for advice on how to make use of this class for *unusual* character types. Also, check out `include/ext/pod_char_traits.h`.

Exception thrown by `__cxa_guard_acquire`.

6.7[stmt.dcl]/4: If control re-enters the declaration (recursively) while the object is being initialized, the behavior is undefined.

Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

4.52.1 Detailed Description

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_filebuf< _CharT, _Traits >
```

Provides a layer of compatibility for C/POSIX.

This GNU extension provides extensions for working with standard C FILE*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

Definition at line 50 of file `stdio_filebuf.h`.

4.52.2 Constructor & Destructor Documentation

4.52.2.1 `template<typename _CharT, typename _Traits = std::char_traits<_CharT>> __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf ()` `[inline]`

deferred initialization

Definition at line 65 of file `stdio_filebuf.h`.

References `__gnu_cxx::stdio_filebuf< _CharT, _Traits >::~~stdio_filebuf()`.

Referenced by `__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf()`, and `__gnu_cxx::stdio_filebuf< _CharT, _↵ Traits >::~~stdio_filebuf()`.

4.52.2.2 `template<typename _CharT, typename _Traits > __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (int __fd, std::ios_base::openmode __mode, size_t __size = static_cast<size_t>(BUFSIZ))`

Parameters

<code>__fd</code>	An open file descriptor.
<code>__mode</code>	Same meaning as in a standard filebuf.
<code>__size</code>	Optimal or preferred size of internal buffer, in chars.

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automatically closed when the `stdio_filebuf` is closed/destroyed.

Definition at line 128 of file `stdio_filebuf.h`.

References `__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf()`.

4.52.2.3 `template<typename _CharT, typename _Traits > __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (std::_c_file * __f, std::ios_base::openmode __mode, size_t __size = static_cast<size_t>(BUFSIZ))`

Parameters

<code>__f</code>	An open <code>FILE*</code> .
<code>__mode</code>	Same meaning as in a standard <code>filebuf</code> .
<code>__size</code>	Optimal or preferred size of internal buffer, in chars. Defaults to system's <code>BUFSIZ</code> .

This constructor associates a file stream buffer with an open C `FILE*`. The `FILE*` will not be automatically closed when the `stdio_filebuf` is closed/destroyed.

Definition at line 144 of file `stdio_filebuf.h`.

4.52.2.4 `template<typename _CharT, typename _Traits> __gnu_cxx::stdio_filebuf<_CharT, _Traits>::~~stdio_filebuf ()`
`[virtual]`

Closes the external data stream if the file descriptor constructor was used.

Definition at line 123 of file `stdio_filebuf.h`.

References `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`.

Referenced by `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`.

4.52.3 Member Function Documentation

4.52.3.1 `template<typename _CharT, typename _Traits = std::char_traits<_CharT>> int __gnu_cxx::stdio_filebuf<_CharT, _Traits>::fd ()` `[inline]`

Returns

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor. Note that there is no way for the library to track what you do with the descriptor, so be careful.

Definition at line 109 of file `stdio_filebuf.h`.

4.52.3.2 `template<typename _CharT, typename _Traits = std::char_traits<_CharT>> std::_c_file* __gnu_cxx::stdio_filebuf<_CharT, _Traits>::file ()` `[inline]`

Returns

The underlying `FILE*`.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

Definition at line 119 of file `stdio_filebuf.h`.

4.64.1 Detailed Description

```
template<typename _Iterator, typename _Sequence>
class __gnu_debug::Safe_iterator< _Iterator, _Sequence >
```

Safe iterator wrapper.

The class template `_Safe_iterator` is a wrapper around an iterator that tracks the iterator's movement among sequences and checks that operations performed on the "safe" iterator are legal. In addition to the basic iterator operations (which are validated, and then passed to the underlying iterator), `_Safe_iterator` has member functions for iterator invalidation, attaching/detaching the iterator from sequences, and querying the iterator's state.

4.65.1 Detailed Description

Basic functionality for a *safe* iterator.

The `_Safe_iterator_base` base class implements the functionality of a safe iterator that is not specific to a particular iterator type. It contains a pointer back to the sequence it references along with iterator version information and pointers to form a doubly-linked list of iterators referenced by the container.

This class must not perform any operations that can throw an exception, or the exception guarantees of derived iterators will be broken.

4.67.1 Detailed Description

Basic functionality for a *safe* iterator.

The `_Safe_local_iterator_base` base class implements the functionality of a safe local iterator that is not specific to a particular iterator type. It contains a pointer back to the container it references along with iterator version information and pointers to form a doubly-linked list of local iterators referenced by the container.

This class must not perform any operations that can throw an exception, or the exception guarantees of derived iterators will be broken.

4.67.2 Constructor & Destructor Documentation

4.67.2.2 `__gnu_debug::_Safe_local_iterator_base::_Safe_local_iterator_base(const _Safe_sequence_base * __seq, bool __constant) [inline], [protected]`

Initialize the iterator to reference the container pointed to by `__seq`. `__constant` is true when we are initializing a constant local iterator, and false if it is a mutable local iterator. Note that `__seq` may be NULL, in which case the iterator will be singular. Otherwise, the iterator will reference `__seq` and be nonsingular.

4.68.1 Detailed Description

```
template<typename _Sequence>
class __gnu_debug::_Safe_sequence<_Sequence >
```

Base class for constructing a *safe* sequence type that tracks iterators that reference it.

The class template `_Safe_sequence` simplifies the construction of *safe* sequences that track the iterators that reference the sequence, so that the iterators are notified of changes in the sequence that may affect their operation, e.g., if the container invalidates its iterators or is destructed. This class template may only be used by deriving from it and passing the name of the derived class as its template parameter via the curiously recurring template pattern. The derived class must have `iterator` and `const_iterator` types that are instantiations of class template `_Safe_iterator` for this sequence. Iterators will then be tracked automatically.

4.68.2.9 template<typename _Sequence> template<typename _Predicate> void __gnu_debug::_Safe_sequence<_Sequence>::_M_invalidate_if (_Predicate __pred)

Invalidates all iterators x that reference this sequence, are not singular, and for which __pred(x) returns true. __pred will be invoked with the normal iterators nested in the safe ones.

4.68.2.10 `void __gnu_debug::Safe_sequence_base::_M_revalidate_singular ()` [protected],[inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.68.2.11 `void __gnu_debug::Safe_sequence_base::_M_swap (_Safe_sequence_base & __x)` [protected],[inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.68.2.12 `template<typename _Sequence> template<typename _Predicate > void __gnu_debug::Safe_sequence<_Sequence>::_M_transfer_from_if (_Safe_sequence<_Sequence> & __from, _Predicate __pred)`

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

4.69.1 Detailed Description

Base class that supports tracking of iterators that reference a sequence.

The `_Safe_sequence_base` class provides basic support for tracking iterators into a sequence. Sequences that track iterators must derived from `_Safe_sequence_base` publicly, so that safe iterators (which inherit `_Safe_iterator_base`) can attach to them. This class contains two linked lists of iterators, one for constant iterators and one for mutable iterators, and a version number that allows very fast invalidation of all iterators that reference the container.

This class must ensure that no operation on it may throw an exception, otherwise *safe* sequences may fail to provide the exception-safety guarantees required by the C++ standard.

4.70.1 Detailed Description

```
template<typename _Container>
class __gnu_debug::_Safe_unordered_container<_Container>
```

Base class for constructing a *safe* unordered container type that tracks iterators that reference it.

The class template `_Safe_unordered_container` simplifies the construction of *safe* unordered containers that track the iterators that reference the container, so that the iterators are notified of changes in the container that may affect their operation, e.g., if the container invalidates its iterators or is destructed. This class template may only be used by deriving from it and passing the name of the derived class as its template parameter via the curiously recurring template pattern. The derived class must have `iterator` and `const_iterator` types that are instantiations of class template `_Safe_iterator` for this container and `local_iterator` and `const_local_iterator` types that are instantiations of class template `_Safe_local_iterator` for this container. Iterators will then be tracked automatically.

4.117.1 Detailed Description

```
template<typename _Tp, typename _Compare>
class __gnu_parallel::_LoserTreeBase<_Tp, _Compare>
```

Guarded loser/tournament tree.

The smallest element is at the top.

Guarding is done explicitly through one flag `_M_sup` per element, `inf` is not needed due to a better initialization routine. This is a well-performing variant.

Parameters

<code>_Tp</code>	the element type
<code>_Compare</code>	the comparator to use, defaults to <code>std::less<_Tp></code>

Definition at line 55 of file `losertree.h`.

Static Public Attributes

- static const bool [_M_use_pointer](#)

4.126.1 Detailed Description

```
template<typename _Tp>
struct __gnu_parallel::_LoserTreeTraits<_Tp>
```

Traits for determining whether the loser tree should use pointers or copies.

The field "`_M_use_pointer`" is used to determine whether to use pointers in the loser trees or whether to copy the values into the loser tree.

The default behavior is to use pointers if the data type is 4 times as big as the pointer to it.

Specialize for your data type to customize the behavior.

Example:

```
template<> struct _LoserTreeTraits<int> { static const bool _M_use_pointer = false; };

template<> struct _LoserTreeTraits<heavyweight_type> { static const bool _M_use_pointer = true; };
```

Parameters

<code>_Tp</code>	type to give the loser tree traits for.

4.139.1 Detailed Description

```
template<typename _Tp>
class __gnu_parallel::_RestrictedBoundedConcurrentQueue<_Tp>
```

Double-ended queue of bounded size, allowing lock-free atomic access. `push_front()` and `pop_front()` must not be called concurrently to each other, while `pop_back()` can be called concurrently at all times. `empty()`, `size()`, and `top()` are intentionally not provided. Calling them would not make sense in a concurrent setting.

Parameters

<code>_Tp</code>	Contained element type.

```
template<typename Key, typename Mapped, typename Tag, typename Node_Update, typename Policy_Tl, typename _Alloc>
class __gnu_pbds::basic_branch< Key, Mapped, Tag, Node_Update, Policy_Tl, _Alloc >
```

A branched, tree-like (tree, trie) container abstraction.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Tag</i>	Instantiating data structure type, see <code>container_tag</code> .
<i>Node_Update</i>	Updates nodes, restores invariants.
<i>Policy_Tl</i>	Policy typelist.
<i>_Alloc</i>	Allocator type.

Base is dispatched at compile time via Tag, from the following choices: `tree_tag`, `trie_tag`, and their descendants.

Base choices are: `detail::ov_tree_map`, `detail::rb_tree_map`, `detail::splay_tree_map`, and `detail::pat_trie_map`.

4.173.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn
= typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn = detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename
_Alloc = std::allocator<char>>
class __gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash, _Alloc >
```

A collision-chaining hash-based associative container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Hash_Fn</i>	Hashing functor.
<i>Eq_Fn</i>	Equal functor.
<i>Comb_Hash_Fn</i>	Combining hash functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-hash functor; otherwise, this is the range-hashing functor. XXX(See Design::Hash-Based Containers::Hash Policies.)
<i>Resize_Policy</i>	Resizes hash.
<i>Store_Hash</i>	Indicates whether the hash value will be stored along with each key. If <i>Hash_Fn</i> is null_type, then the container will not compile if this value is true
<i>_Alloc</i>	Allocator type.

Base tag choices are: `cc_hash_tag`.

Base is `basic_hash_table`.

4.196.2 Member Typedef Documentation

4.196.2.1 `template<typename Key , class Cmp_Fn , template< typename Node_Cltr, class Node_Itr, class _Cmp_Fn, typename _Alloc > class Node_Update, class Node , typename _Alloc >` typedef `bin_search_tree_const_node_it` `< Node, point_const_iterator, point_iterator, _Alloc>` `__gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >::node_const_iterator`

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

4.204.1 Detailed Description

template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>

class __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Hash_Fn, Resize_Policy >

A collision-chaining hash-based container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Hash_Fn</i>	Hashing functor. Default is __gnu_cxx::hash.
<i>Eq_Fn</i>	Equal functor. Default std::equal_to<Key>
<i>_Alloc</i>	Allocator type.
<i>Store_Hash</i>	If key type stores extra metadata. Defaults to false.
<i>Comb_Hash_Fn</i>	Combining hash functor. If Hash_Fn is not null_type, then this is the ranged-hash functor; otherwise, this is the range-hashing functor. XXX(See Design::Hash-Based Containers::Hash Policies.) Default direct_mask_range_hashing.
<i>Resize_Policy</i>	Resizes hash. Defaults to hash_standard_resize_policy, using hash_exponential_size_policy and hash_load_check_resize_trigger.

Bases are: detail::hash_eq_fn, Resize_Policy, detail::ranged_hash_fn, detail::types_traits. (Optional: detail::debug_map_base.)

4.243.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename
Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
class __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy
>
```

A general-probing hash-based container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.

Template Parameters

<i>Hash_Fn</i>	Hashing functor. Default is <code>__gnu_cxx::hash</code> .
<i>Eq_Fn</i>	Equal functor. Default <code>std::equal_to<Key></code>
<i>_Alloc</i>	Allocator type.
<i>Store_Hash</i>	If key type stores extra metadata. Defaults to false.
<i>Comb_Probe_Fn</i>	Combining probe functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. Default <code>direct_mask_range_hashing</code> .
<i>Probe_Fn</i>	Probe functor. Defaults to <code>linear_probe_fn</code> , also <code>quadratic_probe_fn</code> .
<i>Resize_Policy</i>	Resizes hash. Defaults to <code>hash_standard_resize_policy</code> , using <code>hash_exponential_size_policy</code> and <code>hash_load_check_resize_trigger</code> .

Bases are: `detail::hash_eq_fn`, `Resize_Policy`, `detail::ranged_probe_fn`, `detail::types_traits`. (Optional: `detail::debug_map_base`.)

4.289.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>  
class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Red-Black tree.

This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

Definition at line 84 of file `rb_tree_.hpp`.

class __gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >
```

A general-probing hash-based associative container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Hash_Fn</i>	Hashing functor.
<i>Eq_Fn</i>	Equal functor.
<i>Comb_Probe_Fn</i>	Combining probe functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies.
<i>Probe_Fn</i>	Probe functor.
<i>Resize_Policy</i>	Resizes hash.
<i>Store_Hash</i>	Indicates whether the hash value will be stored along with each key. If <i>Hash_Fn</i> is null_type, then the container will not compile if this value is true
<i>_Alloc</i>	Allocator type.

Base tag choices are: `gp_hash_tag`.

Base is `basic_hash_table`.

__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
size_type order ) const [inline]
```

Finds an entry by `__order`. Returns a `const_iterator` to the entry with the `__order` order, or a `const_iterator` to the container object's end if order is at least the size of the container object.

Definition at line 72 of file tree_policy.hpp.

            node_iterator node_it, node_const_iterator end_nd_it ) const    [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

Definition at line 108 of file tree_policy.hpp.

```
4.372.2.4  template<typename Node_Cltr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >

struct __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >
```

Element access traits for string types.

Template Parameters

<i>String</i>	String type.
<i>Min_E_Val</i>	Minimal element value.
<i>Max_E_Val</i>	Maximum element value.
<i>Reverse</i>	Reverse iteration should be used. Default: false.
<i>_Alloc</i>	Allocator type.

Base type for atomic_flag.

Base type is POD with data, allowing atomic_flag to derive from it and meet the standard layout type requirement. In addition to compatibility with a C interface, this allows different implementations of atomic_flag to use the same atomic operation functions, via a standard conversion to the __atomic_flag_base argument.

4.408.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>
class std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >
```

Common base for codecvt functions.

This template class provides implementations of the public functions that forward to the protected virtual functions.

This template also provides abstract stubs for the protected virtual functions.

4.408.2 Member Function Documentation

4.408.2.1 `template<typename _InternT, typename _ExternT, typename _StateT> virtual result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * __from_next, extern_type * __to, extern_type * __to_end, extern_type * __to_next) const [protected], [pure virtual]`

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implemented in `std::codecvt< wchar_t, char, mbstate_t >`, `std::codecvt< char, char, mbstate_t >`, `std::codecvt< _InternT, _ExternT, _StateT >`, and `std::codecvt< _InternT, _ExternT, encoding_state >`.

```
4.408.2.2  template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::in ( state_type & __state, const extern_type * __from, const extern_type * __from_end,
    const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next ) const
    [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

```
4.408.2.3  template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::out ( state_type & __state, const intern_type * __from, const intern_type * __from_end,
    const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next ) const
    [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

4.408.2.4 `template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT>::unshift (state_type & __state, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const [inline]`

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

codecvt_base::result.

4.409.2 Member Typedef Documentation

4.409.2.1 `template<typename _CharT> typedef _CharT std::__ctype_abstract_base< _CharT >::char_type`

Typedef for the template parameter.

Definition at line 148 of file `locale_facets.h`.

4.409.3 Member Function Documentation

4.409.3.1 `template<typename _CharT> virtual bool std::__ctype_abstract_base< _CharT >::do_is (mask __m, char_type __c) const [protected], [pure virtual]`

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>char_type</code> to find the mask of.
<code>__m</code>	The mask to compare against.

Returns

(M & __m) != 0.

Implemented in [std::ctype<wchar_t>](#), [std::ctype<_CharT>](#), and [std::ctype<char_type>](#).

Referenced by [std::__ctype_abstract_base<wchar_t>::is\(\)](#), and [std::__ctype_abstract_base<wchar_t>::narrow\(\)](#).

4.409.3.2 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base<_CharT>::do_is (const char_type * __lo, const char_type * __hi, mask * __vec) const` [protected], [pure virtual]

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Implemented in [std::ctype<wchar_t>](#), [std::ctype<_CharT>](#), and [std::ctype<char_type>](#).
