- [How to bind the data](#)

## Data Binding

The DropDownList loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of [array](#) or [DataManager](#).

The DropDownList also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of [DataManager](#) adaptors.

Fields	Type	Description
text	string	Specifies the display text of each list item.
value	number or string	Specifies the hidden data value mapped to each list item that should contain a unique value.
groupBy	string	Specifies the category under which the list item has to be grouped.
iconCss	string	Specifies the icon class of each list item.

**Note:** When binding complex data to the DropDownList, fields should be mapped correctly. Otherwise, the selected item remains undefined.

## Binding local data

Local data can be represented in two ways as described below.

### 1. Array of simple data

The DropDownList has support to load array of primitive data such as strings and numbers. Here, both value and text field acts the same.

## CSHTML

```
@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Re
nder()
```

**ARRAYOFSTRINGS.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult arrayofstrings()
 {
 ViewBag.data = new string[] { "Badminton", "Basketball",
"Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
 return View();
 }
 }
}

```

*2. Array of JSON data*

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Vegetable** column from complex data have been mapped to the **value** field.

**CSHTML**

```

@Html.EJS().DropDownList("vegetables").Placeholder("Select a
Vegetables").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.da
ta).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value =
"Vegetable" }).Render()

```

**VEGETABLES.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Vegetables
 {
 public string Vegetable { get; set; }
 public string Category { get; set; }
 public string Id { get; set; }
 public List<Vegetables> VegetablesList()
 {
 List<Vegetables> veg = new List<Vegetables>();
 veg.Add(new Vegetables { Vegetable = "Cabbage", Category= "Leafy and
Salad", Id= "item1" });
 veg.Add(new Vegetables { Vegetable = "Chickpea", Category= "Beans",
Id= "item2" });
 veg.Add(new Vegetables { Vegetable = "Garlic", Category= "Bulb and
Stem", Id= "item3" });
 }
 }
}

```

```

 veg.Add(new Vegetables { Vegetable = "Green bean", Category=
"Beans", Id= "item4" });
 veg.Add(new Vegetables { Vegetable = "Horse gram", Category=
"Beans", Id= "item5" });
 veg.Add(new Vegetables { Vegetable = "Nopal", Category= "Bulb and
Stem", Id= "item6" });
 veg.Add(new Vegetables { Vegetable = "Onion", Category= "Bulb and
Stem", Id= "item7" });
 veg.Add(new Vegetables { Vegetable = "Pumpkins", Category= "Leafy
and Salad", Id= "item8" });
 veg.Add(new Vegetables { Vegetable = "Spinach", Category= "Leafy and
Salad", Id= "item9" });
 veg.Add(new Vegetables { Vegetable = "Wheat grass", Category= "Leafy
and Salad", Id= "item10" });
 veg.Add(new Vegetables { Vegetable = "Yarrow", Category = "Leafy and
Salad", Id = "item11" });
 return veg;
 }
}

```

### 3. Array of Complex data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, `Code.Id` column and `Country.CountryId` column from complex data have been mapped to the `value` field and `text` field, respectively.

#### CSHTML

```

@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<Object>)ViewBag.data).Fi
elds(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text =
"Country.CountryId", Value = "Code.Id" }).Render()

```

#### COMPLEX.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Code
 {
 public string Id { get; set; }
 }
 public class Country
 {
 public string CountryId { get; set; }
 }
 public class Complex
 {
 public Country Country { get; set; }
 public Code Code { get; set; }
 }
}

```

```

public List<Complex> GetData()
{
 List<Complex> data = new List<Complex>();
 data.Add(new Complex() { Country = new Country() { CountryId =
"Australia" }, Code = new Code() { Id = "AU" } });
 data.Add(new Complex() { Country = new Country() { CountryId =
"Bermuda" }, Code = new Code() { Id = "BM" } });
 data.Add(new Complex() { Country = new Country() { CountryId =
"Canada" }, Code = new Code() { Id = "CA" } });
 data.Add(new Complex() { Country = new Country() { CountryId =
"Cameroon" }, Code = new Code() { Id = "CM" } });
 data.Add(new Complex() { Country = new Country() { CountryId =
"Denmark" }, Code = new Code() { Id = "DK" } });
 data.Add(new Complex() { Country = new Country() { CountryId =
"France" }, Code = new Code() { Id = "FR" } });
 return data;
}
}

```

### Binding remote data

The DropDownList supports retrieval of data from remote data services with the help of [DataManager](#) control. The [Query](#) property is used to fetch data from the database and bind it to the DropDownList.

The following sample displays the first 6 contacts from **Customers** table of the **Northwind** Data Service.

### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Text = "ContactName",
 Value = "CustomerID"
}).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()

```

### REMOTEDATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult remotedata()
 {
 return View();
 }
 }
}

```

```

 }
}
}

```

### *Bind to URL Adaptor*

The DropDownList supports retrieval of data from URL adaptor.

### **CSHTML**

```

@Html.EJS().DropDownList("games").Placeholder("Select a
Country").PopUpHeight("200px").DataSource(dataManger =>

dataManger.Url("/ComboBox/UrlDatasource").Adaptor("UrlAdaptor").CrossDomain(
true).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "ShipCountry"
}).Render()

```

### **URLDATA.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropdownlistController : Controller
 {
 public ActionResult Index()
 {
 return View();
 }
 public ActionResult UrlDatasource([FromBody]Data dm)
 {
 var val = OrdersDetails.GetAllRecords();
 var Data = val.ToList();
 var count = val.Count();
 if (dm.where != null)
 {
 Data = (from cust in Data
 where
cust.ShipCountry.ToLower().StartsWith(dm.@where[0].value.ToString())
 select cust).ToList();
 }
 if (dm.take != 0)
 Data = Data.Take(dm.take).ToList();
 return Json(Data);
 }
 public class Data
 {
 public int take { get; set; }
 public List<Wheres> where { get; set; }
 }
 public class Wheres

```

```

 {
 public string field { get; set; }
 public bool ignoreAccent { get; set; }
 public bool ignoreCase { get; set; }
 public bool isComplex { get; set; }
 public string value { get; set; }
 public string Operator { get; set; }
 }
 public class OrdersDetails
 {
 public static List<OrdersDetails> order = new
List<OrdersDetails>();
 public OrdersDetails()
 {
 }
 public OrdersDetails(int OrderID, string CustomerId, int
EmployeeId, double Freight, bool Verified, DateTime OrderDate, string
ShipCity, string ShipName, string ShipCountry, DateTime ShippedDate, string
ShipAddress)
 {
 this.OrderID = OrderID;
 this.CustomerID = CustomerId;
 this.EmployeeID = EmployeeId;
 this.Freight = Freight;
 this.ShipCity = ShipCity;
 this.Verified = Verified;
 this.OrderDate = OrderDate;
 this.ShipName = ShipName;
 this.ShipCountry = ShipCountry;
 this.ShippedDate = ShippedDate;
 this.ShipAddress = ShipAddress;
 }
 public static List<OrdersDetails> GetAllRecords()
 {
 if (order.Count() == 0)
 {
 int code = 10000;
 for (int i = 1; i < 10; i++)
 {
 order.Add(new OrdersDetails(code + 1, "ALFKI", i +
0, 2.3 * i, false, new DateTime(1991, 05, 15), "Berlin", "Simons bistro",
"Denmark", new DateTime(1996, 7, 16), "Kirchgasse 6"));
 order.Add(new OrdersDetails(code + 2, "ANATR", i +
2, 3.3 * i, true, new DateTime(1990, 04, 04), "Madrid", "Queen Cozinha",
"Brazil", new DateTime(1996, 9, 11), "Avda. Azteca 123"));
 order.Add(new OrdersDetails(code + 3, "ANTON", i +
1, 4.3 * i, true, new DateTime(1957, 11, 30), "Cholchester",
"Frankenversand", "Germany", new DateTime(1996, 10, 7), "Carrera 52 con Ave.
Bolívar #65-98 Llano Largo"));
 order.Add(new OrdersDetails(code + 4, "BLONP", i +
3, 5.3 * i, false, new DateTime(1930, 10, 22), "Marseille", "Ernst Handel",
"Austria", new DateTime(1996, 12, 30), "Magazinweg 7"));
 order.Add(new OrdersDetails(code + 5, "BOLID", i +
4, 6.3 * i, true, new DateTime(1953, 02, 18), "Tsawassen", "Hanari Carnes",
"Switzerland", new DateTime(1997, 12, 3), "1029 - 12th Ave. S.));
 code += 5;
 }
 }
 }
 }

```

```

 }
 return order;
}
public int? OrderID { get; set; }
public string CustomerID { get; set; }
public int? EmployeeID { get; set; }
public double? Freight { get; set; }
public string ShipCity { get; set; }
public bool Verified { get; set; }
public DateTime OrderDate { get; set; }
public string ShipName { get; set; }
public string ShipCountry { get; set; }
public DateTime ShippedDate { get; set; }
public string ShipAddress { get; set; }
}
}
}

```

### Web API Adaptor

Use the **WebApiAdaptor** to bind DropDownList with Web API created using OData.

### CSHTML

```

<div id='web-data' class='col-lg-6' style='padding-top:15px'>
 <div class='content'>
 @Html.EJS().DropDownList("games").DataSource(dataManger =>
dataManger.Url("/api/Dropdownlist/").Adaptor("WebApiAdaptor")).Render()
 </div>
</div>

```

### WEBAPI.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 [Route("api/[controller]")]
 public class DropdownlistController : Controller
 {
 List<string> game = new List<string>();
 [HttpGet]
 public List<string> Get()
 {
 game.Add("Badminton");
 game.Add("Basketball");
 game.Add("Cricket");
 game.Add("Golf");
 game.Add("Gymnastics");
 game.Add("Tennis");
 game.Add("Hockey");
 return game;
 }
 }
}

```

```

 }
}
}

```

### Binding with OData services

**OData** is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the **DataManger**.

### CSHTML

```

<div id='o-data' class='col-lg-6' style='padding-top:15px'>
 <div class='content'>
 @Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://js.syncfusion.com/ejServices/Wcf/Northwind.svc/Order
s/").Adaptor("ODataAdaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
 {
 Value = "CustomerID"
 }).Query("new
ej.data.Query().select(['CustomerID']).take(7)").Render()
 </div>
</div>

```

### ODATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropdownlistController : Controller
 {
 public ActionResult odata()
 {
 return View();
 }
 }
}

```

### Offline mode

To avoid post back for every action, set the DropDownList to load all data on initialization and make the actions process in client-side. To enable this behavior, use the **Offline** property of **DataManager**.

### CSHTML

```

<div id='o-data' class='col-lg-6' style='padding-top:15px'>
 <div class='content'>
 @Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

```

```
dataManger.Url("http://js.syncfusion.com/ejServices/Wcf/Northwind.svc/Orders/").Offline(true).Adaptor("ODataAdaptor").CrossDomain(true)).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "CustomerID"
}).Query("new
ej.data.Query().select(['CustomerID']).take(7)").Render()
</div>
</div>
```

### OFFLINE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropdownlistController : Controller
 {
 public ActionResult offline()
 {
 return View();
 }
 }
}
```

### Templates

The DropDownList has been provided with several options to customize each list item, group title, selected value, header, and footer elements. It uses the Essential JS 2 **Template engine** to compile and render the elements properly.

#### Item template

The content of each list item within the DropDownList can be customized with the help of [itemTemplate](#) property.

### CSHTML

```
@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor("O
DataV4Adaptor").CrossDomain(true)).ItemTemplate("${FirstName}<span class
='city'>${City}").Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "FirstName"
}).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6)").Render()
<style>
.city {
 right: 15px;
 position: absolute;
}
</style>
```

### ITEMTEMPLATE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult Itemtemplate()
 {
 return View();
 }
 }
}
```

### Value template

The currently selected value that is displayed by default on the DropDownList input element can be customized using the [valueTemplate](#) property.

In the following sample, the selected value is displayed as a combined text of both **FirstName** and **City** in the DropDownList input, which is separated by a hyphen.

### CSHTML

```
@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).ItemTemplate("${FirstName}<span class
='city'>${City}").ValueTemplate("${FirstName} -
```

```

${City}").Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
 {
 Value = "FirstName",
 }).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6)").Render()
<style>
 .city {
 right: 15px;
 position: absolute;
 }
</style>

```

### VALUETEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult valuetemplate()
 {
 return View();
 }
 }
}

```

### Group template

The group header title under which appropriate sub-items are categorized can also be customized with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).GroupTemplate("${City}</st
rong>").Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
 {
 Value = "FirstName",
 GroupBy = "City"
 }).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6).where(new ej.data.Predicate('City',
'equal','london').or('City','equal','seattle'))").Render()

```

**GROUPTEMPLATE.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult grouptemplate()
 {
 return View();
 }
 }
}

```

## Header template

The header element is shown statically at the top of the popup list items within the DropDownList, and any custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

**CSHTML**

```

@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).ItemTemplate("<span class='item'
>${FirstName}${City}").HeaderTemplate("NameCity").Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "FirstName",
}).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6)").Render()
<style>
 .head, .item {
 display: table;
 width: 100%;
 margin: auto;
 }
 .head {
 height: 40px;
 font-size: 15px;
 font-weight: 600;
 }
 .name, .city {
 display: table-cell;

```

```

 vertical-align: middle;
 width: 50%;
 }
 .head .name {
 text-indent: 16px;
 }
 .head .city {
 text-indent: 10px;
 }
</style>

```

### HEADERTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult headertemplate()
 {
 return View();
 }
 }
}

```

### Footer template

The DropDownList has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the DropDownList.

### CSHTML

```

@Html.EJS().DropDownList("games").DataSource((IEnumerable<object>)ViewBag.data).Placeholder("Select a game").PopupHeight("270px").FooterTemplate(" Total list items: " + 5 + "").Render()
<style>
 .foot {
 text-indent: 1.2em;
 display: block;
 font-size: 15px;
 line-height: 40px;
 border-top: 1px solid #e0e0e0;
 }
</style>

```

### FOOTERTEMPLATE.CS

```

using System;

```

```

using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult footertemplate()
 {
 ViewBag.data = new string[] { "Badminton", "Basketball",
 "Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
 return View();
 }
 }
}

```

### No records template

The DropDownList is provided with support to custom design the popup list content when no data is found and no matches are found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

### CSHTML

```

@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).No
RecordsTemplate(" NO DATA AVAILABLE").Render()

```

### NORECORDSTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult norecords()
 {
 ViewBag.data = new string[] { };
 return View();
 }
 }
}

```

### Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the DropDownList displays the notification.

## CSHTML

```
@Html.EJS().DropDownList("customers").Placeholder("Select a customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/") .Adaptor("ODataV4Adaptor").CrossDomain(true).ActionFailureTemplate(" Data fetch get fails").Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "FirstName"
}).Query("new
ej.data.Query().from('Employees').select(['FirstName']).take(6)").Render()
```

## ACTIONFAILURETEMPLATE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult actionfailure()
 {
 return View();
 }
 }
}
```

## Virtualization in DropDown List

Dropdown list virtualization is a technique used to efficiently render extensive lists of items while minimizing the impact on performance. This method is particularly advantageous when dealing with large datasets because it ensures that only a fixed number of DOM (Document Object Model) elements are created. When scrolling through the list, existing DOM elements are reused to display relevant data instead of generating new elements for each item. This recycling process is managed internally.

During virtual scrolling, the data retrieved from the data source depends on the popup height and the calculation of the list item height. Enabling the [enableVirtualization](#) option in a dropdown list activates this virtualization technique.

When fetching data from the data source, the [actionBegin](#) event is triggered before data retrieval begins. Then, the [actionComplete](#) event is triggered once the data is successfully fetched.

Furthermore, Incremental Search is supported with virtualization in the DropDownList component. When a key is typed, the focus is moved to the respective element, and the value is updated in the component in the open popup state. In the closed popup state, the respective value is updated in the component based on the typed key. The Incremental Search functionality is well-suited for scenarios involving remote data binding.

When the enableVirtualization property is enabled, the skip and take properties provided by the user within the Query class at the initial state or during the actionBegin or actionComplete events will not be considered, since it is internally managed and calculated based on certain dimensions with respect to the popup height.

#### Binding local data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property. When using virtual scrolling, the list updates based on the scroll offset value, triggering a request to fetch more data from the server. As the data is being fetched, the actionBegin event occurs before the data retrieval starts. Once the data retrieval is successful, the actionComplete event is triggered, indicating that the data fetch process is complete.

In the following example, id column and text column from complex data have been mapped to the value field and text field, respectively.

#### CSHTML

```
@Html.EJS().DropDownList("records").Placeholder("Select a
item").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).En
ableVirtualization(true).AllowFiltering(false).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "ID",
Text="Text" }).Render()
```

#### VIRTUALSCROLL.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult virtualscroll()
 {
 ViewBag.data = new Record().RecordModelList();
 return View();
 }
 }
}
```

#### Binding remote data

The DropDownList supports retrieval of data from remote data services with the help of DataManager component. When using remote data, it initially fetches all the data from the server, triggering the actionBegin and actionComplete events, and then stores the data locally. During virtual scrolling,

additional data is retrieved from the locally stored data, triggering the `actionBegin` and `actionComplete` events at that time as well.

The following sample displays the OrderId from the `Orders` Data Service.

#### CSHTML

```
@Html.EJS().DropDownList("records").Placeholder("Select a
item").PopupHeight("200px").DataSource(obj
=>obj.Url("https://ej2services.syncfusion.com/aspnet/development/api/orders"
).CrossDomain(true).Adaptor("WebApiAdaptor")).EnableVirtualization(true).All
owFiltering(true).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "OrderID", Value
= "OrderID" }).Render()
```

#### VIRTUALSCROLL.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult virtualscroll()
 {
 ViewBag.data = new Record().RecordModelList();
 return View();
 }
 }
}
```

#### Grouping

The DropDownList component supports grouping with Virtualization. It allows you to organize elements into groups based on different categories. Each item in the list can be classified using the `groupBy` field in the data table. After grouping, virtualization works similarly to local data binding, providing a seamless user experience. When the data source is bound to remote data, an initial request is made to retrieve all data for the purpose of grouping. Subsequently, the grouped data works in the same way as local data binding on virtualization.

The following sample shows the example for Grouping with Virtualization.

#### CSHTML

```
@Html.EJS().DropDownList("records").Placeholder("Select a
item").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).En
ableVirtualization(true).AllowFiltering(true).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { GroupBy = "Group",
Value = "ID", Text="Text" }).Render()
```

#### VIRTUALSCROLL.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult virtualscroll()
 {
 ViewBag.data = new Record().RecordModelList();
 return View();
 }
 }
}
```

### Filtering with Virtualization

The DropDownList component supports Filtering with Virtualization. The DropDownList includes a built-in feature that enables data filtering when the [allowFiltering](#) option is enabled. In the context of Virtual Scrolling, the filtering process operates in response to the typed characters. Specifically, the DropDownList sends a request to the server, utilizing the full data source, to achieve filtering. Before initiating the request, an action event is triggered. Upon successful retrieval of data from the server, an action complete event is triggered. The initial data is loaded when the popup is opened. Whether the filter list has a selection or not, the popup closes.

The following sample shows the example for Filtering with Virtualization.

### CSHTML

```
@Html.EJS().DropDownList("records").Placeholder("Select a
item").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).En
ableVirtualization(true).AllowFiltering(true).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "ID",
Text="Text" }).Render()
```

### VIRTUALSCROLL.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult virtualscroll()
 {
 ViewBag.data = new Record().RecordModelList();
 return View();
 }
 }
}
```

```
}
```

## Grouping

The DropDownList supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupBy](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

In the following sample, vegetables are grouped according on its category using `groupBy` field.

### CSHTML

```
@Html.EJS().DropDownList("Vegetable").Placeholder("Select a
Vegetable").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data)
.Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value =
"Vegetable", GroupBy = "Category" }).Render()
```

### VEGETABLES.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Vegetables
 {
 public string Vegetable { get; set; }
 public string Category { get; set; }
 public string Id { get; set; }
 public List<Vegetables> VegetablesList()
 {
 List<Vegetables> veg = new List<Vegetables>();
 veg.Add(new Vegetables { Vegetable = "Cabbage", Category= "Leafy and
Salad", Id= "item1" });
 veg.Add(new Vegetables { Vegetable = "Chickpea", Category= "Beans",
Id= "item2" });
 veg.Add(new Vegetables { Vegetable = "Garlic", Category= "Bulb and
Stem", Id= "item3" });
 veg.Add(new Vegetables { Vegetable = "Green bean", Category=
"Beans", Id= "item4" });
 veg.Add(new Vegetables { Vegetable = "Horse gram", Category=
"Beans", Id= "item5" });
 veg.Add(new Vegetables { Vegetable = "Nopal", Category= "Bulb and
Stem", Id= "item6" });
 veg.Add(new Vegetables { Vegetable = "Onion", Category= "Bulb and
Stem", Id= "item7" });
 veg.Add(new Vegetables { Vegetable = "Pumpkins", Category= "Leafy
and Salad", Id= "item8" });
 veg.Add(new Vegetables { Vegetable = "Spinach", Category= "Leafy and
Salad", Id= "item9" });
 veg.Add(new Vegetables { Vegetable = "Wheat grass", Category= "Leafy
and Salad", Id= "item10" });
 veg.Add(new Vegetables { Vegetable = "Yarrow", Category = "Leafy and
Salad", Id = "item11" });
 }
 }
}
```

```

 return veg;
 }
}

```

### Customization

The grouping header is also provided with customization option. This allows custom designing using the `groupTemplate` property for both inline and fixed headers as referred here:

[Group Template support to DropDownList.](#)

### Filtering

The DropDownList has built-in support to filter data items when [allowFiltering](#) is enabled. The filter operation starts as soon as you start typing characters in the search box.

To display the filtered items in the popup, filter the required data and return it to the DropDownList via `updateData` method by using the [filtering](#) event.

The following sample illustrates how to query the data source and pass the data to the DropDownList through the `updateData` method in `filtering` event.

### CSHTML

```

@Html.EJS().DropDownList("country").Placeholder("Select a
Country").PopupHeight(
 "230px").DataSource((IEnumerable<object>)ViewBag.data).AllowFiltering(true).
Filtering("onfiltering").Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "Name"
}).Render()
<script>
 function onfiltering(e) {
 var query = new ej.data.Query();
 query = (e.text !== '') ? query.where('Name', 'startswith',
e.text, true) : query;

e.updateData(@Html.Raw(JsonConvert.SerializeObject(ViewBag.data)), query)
 }
</script>

```

### COUNTRIES.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Countries
 {
 public string Name { get; set; }
 public string Code { get; set; }
 public List<Countries> CountriesList()
 {
 List<Countries> country = new List<Countries>();

```

```

country.Add(new Countries { Name = "Australia", Code = "AU" });
country.Add(new Countries { Name = "Bermuda", Code = "BM" });
country.Add(new Countries { Name = "Canada", Code = "CA" });
country.Add(new Countries { Name = "Cameroon", Code = "CM" });
country.Add(new Countries { Name = "Denmark", Code = "DK" });
country.Add(new Countries { Name = "France", Code = "FR" });
country.Add(new Countries { Name = "Finland", Code = "FI" });
country.Add(new Countries { Name = "Germany", Code = "DE" });
country.Add(new Countries { Name = "Greenland", Code = "GL" });
country.Add(new Countries { Name = "Hong Kong", Code = "HK" });
country.Add(new Countries { Name = "India", Code = "IN" });
country.Add(new Countries { Name = "Italy", Code = "IT" });
country.Add(new Countries { Name = "Japan", Code = "JP" });
country.Add(new Countries { Name = "Mexico", Code = "MX" });
country.Add(new Countries { Name = "Norway", Code = "NO" });
country.Add(new Countries { Name = "Poland", Code = "PL" });
country.Add(new Countries { Name = "Switzerland", Code = "CH"
});
country.Add(new Countries { Name = "United Kingdom", Code = "GB"
});
country.Add(new Countries { Name = "United States", Code = "US"
});
return country;
}
}
}

```

### Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the DropDownList. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").Filtering("onfiltering").AllowFiltering(true).PopupHeight("200px"
).DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor(
"ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "ContactName",
Value = "CustomerID" }).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()
<script>
function onfiltering(e) {
 var CBObj = document.getElementById("customers").ej2_instances[0];
 // load overall data when search key empty.
 if (e.text == '' && e.text.length < 3) {
 e.updateData(CBObj.dataSource);
 }
 let query = new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6);

```

```

 query = (e.text !== '' && e.text.length >= 3) ?
 query.where('ContactName', 'startswith', e.text, true) : query;
 e.updateData(CBObj.dataSource, query);
 }
</script>

```

### FILTERLIMIT.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public IActionResult filteringlimit()
 {
 return View();
 }
 }
}

```

### Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler.

In the following examples, data filtering is done with `endsWith` type.

### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a customer").AllowFiltering(true).Filtering("onfiltering").PopupHeight("200px")
.DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor(
 "ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "ContactName",
Value = "CustomerID" }).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()
<script>
 function onfiltering(e) {
 var CBObj = document.getElementById("customers").ej2_instances[0];
 // load overall data when search key empty.
 if (e.text == '')
 e.updateData(CBObj.dataSource);
 else {
 var query = new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6);
 query = (e.text !== '') ? query.where('ContactName', 'endswith',
e.text, true) : query;
 e.updateData(CBObj.dataSource, query);
 }
 }

```

```

 }
}
</script>

```

### FILTERTYPE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult filtertype()
 {
 return View();
 }
 }
}

```

### Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the `where` clause.

### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a customer").Filtering("onfiltering").AllowFiltering(true).PopupHeight("200px").DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor("ODataV4Adaptor").CrossDomain(true)).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "ContactName", Value = "CustomerID" }).Query("new ej.data.Query().from('Customers').select(['ContactName', 'CustomerID']).take(6)").Render()
<script>
 function onfiltering(e) {
 var CBObj = document.getElementById("customers").ej2_instances[0];
 // load overall data when search key empty.
 if (e.text == '')
 e.updateData(CBObj.dataSource);
 else {
 var query = new
ej.data.Query().from('Customers').select(['ContactName', 'CustomerID']).take(6);
 query = (e.text != '') ? query.where('ContactName', 'startswith', e.text, false) : query;
 e.updateData(CBObj.dataSource, query);
 }
 }
</script>

```

### CASESENSITIVE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult casesensitive()
 {
 return View();
 }
 }
}
```

### Diacritics Filtering

DropDownList supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

### CSHTML

```
@Html.EJS().DropDownList("list").DataSource((string[])ViewBag.data).Placeholder("e.g: aero").IgnoreAccent(true).AllowFiltering(true).Render()
```

### DIACRITICS.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult diacritics()
 {
 ViewBag.data = new string[] { "Aeróbics", "Aeróbics en Agua",
"Aerografía", "Aeromodelaje", "Águilas", "Ajedrez", "Ala Delta", "Álbumes de
Música", "Alusivos", "Análisis de Escritura a Mano" };
 return View();
 }
 }
}
```

### Localization in ASP.NET MVC DropDownList control

The Localization library allows to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) properties according to the culture currently assigned to the DropDownList.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

### Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the DropDownList and no data is loaded. Hence, the [noRecordsTemplate](#) property displays its text in French culture initially, and if the sample is run offline, the [actionFailureTemplate](#) property displays its text appropriately.

### CSHTML

```
@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").Locale("fr-BE").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "ContactName"
}).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(0)").Render()
<script>
 ej.base.L10n.load({
 'fr-BE': {
 'dropdowns': {
 'noRecordsTemplate': "Aucun enregistrement trouvé",
 'actionFailureTemplate': "Modèle d'échec d'action"
 }
 }
 });
</script>
```

### LOCALIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
```

```
public ActionResult localization()
{
 return View();
}
}
```

### CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
`css
.e-ddl.e-input-group.e-control-wrapper .e-input {
font-size: 20px;
font-family: emoji;
color: #ab3243;
background: #32a5ab;
}
,
```

#### Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

```
`css
.e-ddl.e-input-group .e-input-group-icon,.e-ddl.e-input-group.e-control-wrapper .e-input-group-
icon:hover {
color: #bb233d;
font-size: 13px;
}
,
```

#### Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
`css
.e-ddl.e-input-group.e-control-wrapper.e-input-focus::before, .e-ddl.e-input-group.e-control-wrapper.e-
input-focus::after {
```

```
background: #c000ff;
}
```

### Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
`css

.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {

border-color: #b1bd15;

box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;

}
```

### Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```
`css

.e-input-group.e-control-wrapper .e-input[disabled] {

-webkit-text-fill-color: #0d9133;

}
```

### Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
`css

.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::after {

background-color: #2319b8;

}

.e-ddl.e-lib.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top {

color: #2319b8;

}
```

### Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
`css
.e-ddl.e-input-group input.e-input::placeholder {
color: red;
}
`
```

### Customizing the placeholder to add mandatory indicator(\*)

Use the following CSS to add the mandatory indicator \* to the float label element.

```
`css
.e-input-group.e-control-wrapper.e-float-input .e-float-text::after{
content: "*";
color: red;
}
`
```

### Customizing the background color of focus, hover, and active item

Use the following CSS to customize the background color of focus, hover and active item.

```
`css
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-
list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
color: #2319b8;
}
`
```

### Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```
`css
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px;
}
`
```

## Accessibility

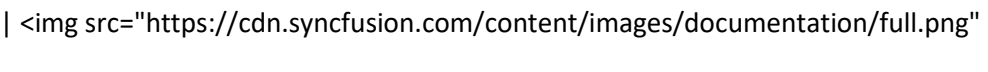

The DropDownList control has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This control is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The DropDownList component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DropDownList component is outlined below.

| Accessibility Criteria | Compatibility |

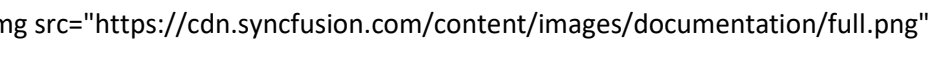

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div><img alt="Yes" data-bbox="271 822 862 856"/> - All features of the component meet the requirement.</div>

<div><img alt="Intermediate" data-bbox="271 863 791 898"/> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The DropDownList control uses the **Listbox** role, and each list item has an **option** role. The following ARIA attributes denotes the DropDownList state.

#### | Properties | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the DropDownList input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the DropDownList element. |

| aria-disabled | Indicates whether the DropDownList control is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

### Keyboard interaction

You can use the following key shortcuts to access the DropDownList without interruptions.

#### | Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | Selects the first item in the DropDownList when no item is selected. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Page Down | Scrolls down to the next page and selects the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and selects the first item when popup list opens. |

| Enter | Selects the focused item, and when it is in an open state the popup list closes. Otherwise, toggles the popup list. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the control. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the control. |

| Alt + Down | Opens the popup list. |

| Alt + Up | Closes the popup list. |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | Selects the first item. |

| End | Selects the last item. |

**Note:** In the below sample, focus the DropDownList control using alt+t keys.

#### CSHTML

```
@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Re
nder()
<script>
 document.onkeyup = function (e) {
 if (e.altKey && e.keyCode === 84 /* t */) {
 var dropObj = document.getElementById("games"); //to get
dropdown list object
 dropObj.ej2_instances[0].focusIn(); // call the focusIn method
to focus the element.
 }
 };
</script>
```

#### ACCESSIBILITY.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult accessibility()
 {
 ViewBag.data = new string[] { "Badminton", "Basketball",
"Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
 return View();
 }
 }
}
```

#### Ensuring accessibility

The DropDownList component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DropDownList component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DropDownList component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET MVC components](#)

## How To

### Add item in between in DropDownList

You can add item in between based on item [index](#). If you add new item without item index, item will be added as last item in list.

#### CSHTML

```
@Html.EJS().Button("first").Content("add item (Hockey) in first").Render()
@Html.EJS().Button("between").Content("add item (Golf) in Between").Render()
@Html.EJS().Button("last").Content("add item (Cricket) in last").Render()
@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Fields(
new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "Game"
}).Render()
<script>
 document.getElementById('first').onclick = () => {
 var dropObject = document.getElementById("games").ej2_instances[0];
 dropObject.addItem({ Game: 'Hockey' }, 0);
 };
 // add item in between
 document.getElementById('between').onclick = () => {
 var dropObject = document.getElementById("games").ej2_instances[0];
 dropObject.addItem({ Game: "Golf" }, 2);
 };
 // add item at last
 document.getElementById('last').onclick = () => {
 var dropObject = document.getElementById("games").ej2_instances[0];
 dropObject.addItem({ Game: "Cricket" });
 };
</script>
```

#### GAMELIST.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class GameList
 {
 public string Id { get; set; }
 public string Game { get; set; }
 public List<GameList> GameLists()
 {
 List<GameList> game = new List<GameList>();
 game.Add(new GameList { Id = "Game1", Game = "American Football"
 });
 game.Add(new GameList { Id = "Game2", Game = "Badminton" });
 game.Add(new GameList { Id = "Game3", Game = "Basketball" });
 game.Add(new GameList { Id = "Game3", Game = "Basketball" });
 game.Add(new GameList { Id = "Game4", Game = "Cricket" });
 game.Add(new GameList { Id = "Game5", Game = "Football" });
 game.Add(new GameList { Id = "Game6", Game = "Golf" });
 game.Add(new GameList { Id = "Game7", Game = "Hockey" });
 game.Add(new GameList { Id = "Game8", Game = "Rugby" });
 }
 }
}
```

```

 game.Add(new GameList { Id = "Game9", Game = "Snooker" });
 game.Add(new GameList { Id = "Game10", Game = "Tennis" });
 return game;
 }
}

```

### Configure the Cascading DropDownList

The cascading DropDownList is a series of DropDownList, where the value of one DropDownList depends upon another's value. This can be configured by using the [change](#) event of the parent DropDownList. Within that change event handler, data has to be loaded to the child DropDownList based on the selected value of the parent DropDownList.

The following example, shows the cascade behavior of country, state, and city DropDownList. Here, the [dataBind](#) method is used to reflect the property changes immediately to the DropDownList.

### CSHTML

```

<div class="padding-top">
 @Html.EJS().DropDownList("country").Placeholder("Select a
country").PopupHeight(@ViewBag.popupHeight).Change("countrychange").DataSou
rce((IEnumerable<Object>)ViewBag.country).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "CountryName",
Value = "CountryId" }).Render()
</div>
<div class="padding-top">
 @Html.EJS().DropDownList("state").Placeholder("Select a
state").Enabled(false).PopupHeight(ViewBag.popupHeight).Change("statechange"
).DataSource((IEnumerable<Object>)ViewBag.state).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "StateName",
Value = "StateId" }).Render()
</div>
<div class="padding-top">
 @Html.EJS().DropDownList("city").Placeholder("Select a
city").Enabled(false).PopupHeight(ViewBag.popupHeight).DataSource((IEnumerableab
le<Object>)ViewBag.cities).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "CityName",
Value = "CityId" }).Render()
</div>
<script type="text/javascript">
 function countrychange() {
 // disable the state DropDownList
 var countryObj =
document.getElementById('country').ej2_instances[0];
 var state = document.getElementById('state').ej2_instances[0];
 var city = document.getElementById('city').ej2_instances[0];
 state.enabled = true;
 //frame the query based on selected value in country DropDownList.
 var tempQuery = new ej.data.Query().where('CountryId', 'equal',
countryObj.value);
 // set the framed query based on selected value in country
DropDownList.
 state.query = tempQuery;
 // set null value to state DropDownList text property
 state.text = null;
 // bind the property changes to state DropDownList
 }

```

```

 state.dataBind();
 // set null value to city DropDownList text property
 city.text = null;
 // disable the city DropDownList
 city.enabled = false;
 // bind the property changes to City DropDownList
 city.dataBind();
 }
 function statechange() {
 var stateObj = document.getElementById('state').ej2_instances[0];
 var city = document.getElementById('city').ej2_instances[0];
 city.enabled = true;
 //Query the data source based on state DropDownList selected value
 var tempQuery = new ej.data.Query().where('StateId', 'equal',
stateObj.value);
 //set the framed query based on selected value in city DropDownList.
 city.query = tempQuery;
 //clear the existing selection
 city.text = null;
 //bind the property change to city DropDownList
 city.dataBind();
 }
</script>

```

## COUNTRY.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Country
 {
 public string CountryName { get; set; }
 public string CountryId { get; set; }
 public List<Country> CountryList()
 {
 List<Country> country = new List<Country>();
 country.Add(new Country() { CountryName = "Australia", CountryId
= "2" });
 country.Add(new Country() { CountryName = "United States",
CountryId = "1" });
 return country;
 }
 }
}

```

### Preselect value from model in Cascading DropDownList

The cascading DropDownList is a series of DropDownList, where the value of one DropDownList depends upon another's value. Values can be preselected in these DropDownList from model. Use the dataManager to perform the filtering operation on the JSON data for cascading through create event.

## CSHTML

```

<div class="padding-top">
 @Html.EJS().DropDownListFor(model =>
model.CountryId).Placeholder("Select a
country").Width("300").PopupHeight("auto").Change("countrychange").DataSourc
e((IEnumerable<Object>)ViewBag.country).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "CountryName",
Value = "CountryId" }).Render()
</div>
<div class="padding-top">
 @Html.EJS().DropDownListFor(model => model.StateId).Placeholder("Select
a
state").Width("300").PopupHeight("auto").Created("stateCreated").DataSource(
(IEnumerable<object>)ViewBag.state).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "StateName",
Value = "StateId" }).Render()
</div>
<script type="text/javascript">
 var totalData;
 function stateCreated() {
 // disable the state DropDownList
 var countryObj =
document.getElementById('CountryId').ej2_instances[0];
 var state = document.getElementById('StateId').ej2_instances[0];
 totalData = state.dataSource
 //frame the query based on selected value in country DropDownList.
 var dataManager = new ej.data.DataManager(totalData);
 var tempQuery = new ej.data.Query().where('CountryId', 'equal',
countryObj.value);
 // set the framed query based on selected value in country
DropDownList.
 state.dataSource = tempQuery.executeLocal(dataManager);
 }
 function countrychange() {
 // disable the state DropDownList
 var countryObj =
document.getElementById('CountryId').ej2_instances[0];
 var state = document.getElementById('StateId').ej2_instances[0];
 state.enabled = true;
 var dataManager = new ej.data.DataManager(totalData);
 //frame the query based on selected value in country DropDownList.
 var tempQuery = new ej.data.Query().where('CountryId', 'equal',
countryObj.value);
 // set the framed query based on selected value in country
DropDownList.
 state.dataSource = tempQuery.executeLocal(dataManager);
 state.dataBind();
 }
</script>

```

## COUNTRY.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models

```

```

{
 public class Country
 {
 public string CountryName { get; set; }
 public string CountryId { get; set; }
 public List<Country> CountryList()
 {
 List<Country> country = new List<Country>();
 country.Add(new Country() { CountryName = "Australia", CountryId
= "2" });
 country.Add(new Country() { CountryName = "United States",
CountryId = "1" });
 return country;
 }
 }
}

```

### Model binding with nested class

The following example demonstrate on how to model bind data to DropDownList with nested classes in controller.

#### CSHTML

```

<div class="container">
 @Html.EJS().DropDownList(Html.IdFor(m =>
m.SelectedAccountNumber).ToString()).DataSource(Model.BeneficiaryList).Width
("300").Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings()
 {
 Text = "PersonName.FullName",
 Value = "AccountNumber"
 }).ItemTemplate("${PersonName.FullName} -
${AccountNumber}").ValueTemplate("${PersonName.FullName} -
${AccountNumber}").Render()
</div>

```

#### NESTEDDATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult nesteddata()
 {
 BeneficiaryViewModel model = new BeneficiaryViewModel();
 List<Person> person = new List<Person>();
 person.Add(new Person { AccountNumber = "5000102394555",
PersonName = new Name { FirstName = "Mary", LastName = "Elizabeth", FullName
= "Mary Elizabeth" } });

```

```

 person.Add(new Person { AccountNumber = "5000102394556",
 PersonName = new Name { FirstName = "Liz ", LastName = "Smith", FullName =
 "Liz Smith" } });
 person.Add(new Person { AccountNumber = "5000102394557",
 PersonName = new Name { FirstName = "Ada", LastName = "Maria", FullName =
 "Ada Maria" } });
 person.Add(new Person { AccountNumber = "5000102394558",
 PersonName = new Name { FirstName = "Elizabeth", LastName = "Smith",
 FullName = "Elizabeth Smith" } });
 person.Add(new Person { AccountNumber = "5000102394559",
 PersonName = new Name { FirstName = "George", LastName = "David", FullName =
 "George David" } });
 person.Add(new Person { AccountNumber = "5000102394560",
 PersonName = new Name { FirstName = "Nancy", LastName = "Rose", FullName =
 "Nancy Rose" } });
 model.BeneficiaryList = person;
 model.SelectedAccountNumber = "persondetails";
 return View(model);
 }
}

public class BeneficiaryViewModel
{
 public string SelectedAccountNumber { get; set; }
 public List<Person> BeneficiaryList { get; set; }
}

public class Person
{
 public string AccountNumber { get; set; }
 public Name PersonName { get; set; }
}

public class Name
{
 public string FirstName { get; set; }
 public string LastName { get; set; }
 public string FullName { get; set; }
}
}

```

### Clear the selected item in DropDownList

You can clear the selected item in the below two different ways.

By clicking on the **clear icon** which is shown in DropDownList element, you can clear the selected item in DropDownList through **interaction**. By using [showClearButton](#) property, you can enable the clear icon in DropDownList element.

Through **programmatic** you can set **null** value to anyone of the index, text or value property to clear the selected item in DropDownList.

### CSHTML

```

@Html.EJS().Button("btn").Content("Set Null value to property").Render()
@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Re
nder()
<script>
 document.getElementById('btn').onclick = () => {

```

```

 var dropObj = document.getElementById("games"); //to get dropdown
 list object
 dropObj.value = null;
 };
</script>

```

### CLEARSELECTION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult tooltip()
 {
 ViewBag.data = new string[] { "American Football", "Badminton",
 "Basketball", "Cricket", "Football", "Golf", "Hockey", "Rugby", "Snooker",
 "Tennis" };
 return View();
 }
 }
}

```

### Close the popup on scroll

By using the `hidePopup` method in DropDownList, you can close the popup on scroll when triggered the windows scroll event.

### CSHTML

```

@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Re
nder()
<script>
 window.onscroll = () => {
 var dropObj = document.getElementById("games"); //to get dropdown
 list object
 dropObj.ej2_instances[0].hidePopup(); // hide the popup using
 hidePopup method
 }
</script>

```

### CLOSEPOPUP.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers

```

```

{
 public class DropDownListController : Controller
 {
 public IActionResult closepopup()
 {
 ViewBag.data = new string[] { "American Football", "Badminton",
 "Basketball", "Cricket", "Football", "Golf", "Hockey", "Rugby", "Snooker",
 "Tennis" };
 return View();
 }
 }
}

```

### Disable the Fixed group header in DropDownList

The following example demonstrate about how to disable the Fixed group header in DropDownList through CSS by using `visibility` attribute.

#### CSHTML

```

@Html.EJS().DropDownList("Vegetable").Placeholder("Select a
Vegetable").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value =
"Vegetable", GroupBy = "Category" }).Render()
<style>
 .e-ddl .e-dropdownbase .e-fixed-head {
 visibility: hidden;
 }
</style>

```

#### VEGETABLES.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Vegetables
 {
 public string Vegetable { get; set; }
 public string Category { get; set; }
 public string Id { get; set; }
 public List<Vegetables> VegetablesList()
 {
 List<Vegetables> veg = new List<Vegetables>();
 veg.Add(new Vegetables { Vegetable = "Cabbage", Category= "Leafy and
 Salad", Id= "item1" });
 veg.Add(new Vegetables { Vegetable = "Chickpea", Category= "Beans",
 Id= "item2" });
 veg.Add(new Vegetables { Vegetable = "Garlic", Category= "Bulb and
 Stem", Id= "item3" });
 veg.Add(new Vegetables { Vegetable = "Green bean", Category=
 "Beans", Id= "item4" });
 veg.Add(new Vegetables { Vegetable = "Horse gram", Category=
 "Beans", Id= "item5" });
 }
 }
}

```

```

 veg.Add(new Vegetables { Vegetable = "Nopal", Category= "Bulb and Stem", Id= "item6" });
 veg.Add(new Vegetables { Vegetable = "Onion", Category= "Bulb and Stem", Id= "item7" });
 veg.Add(new Vegetables { Vegetable = "Pumpkins", Category= "Leafy and Salad", Id= "item8" });
 veg.Add(new Vegetables { Vegetable = "Spinach", Category= "Leafy and Salad", Id= "item9" });
 veg.Add(new Vegetables { Vegetable = "Wheat grass", Category= "Leafy and Salad", Id= "item10" });
 veg.Add(new Vegetables { Vegetable = "Yarrow", Category = "Leafy and Salad", Id = "item11" });
 return veg;
 }
}

```

### Highlight the matched character in filtering

By using the **highlightSearch** method, you can highlight the matched character in DropDownList filtering.

### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a customer").Filtering("filtering").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor("ODataV4Adaptor").CrossDomain(true).AllowFiltering(true).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "CustomerID", Text = "ContactName"
}).Query("new
ej.data.Query().from('Customers').select(['ContactName', 'CustomerID']).take(6)").Render()
<script>
 var queryString;
 document.addEventListener('DOMContentLoaded', function () {
 var ddlObj = document.getElementById("customers")
 ddlObj.ej2_instances[0].fields = {
 text: "ContactName", value: "CustomerID", itemCreated: function
(e) {
 new ej.dropdowns.highlightSearch(e.item, queryString, true, 'StartsWith');
 }
 }, false);
 function filtering(e) {
 var data = document.getElementById('customers').ej2_instances[0];
 // take text for highlight the character in list items.
 queryString = e.text;
 var query = new
ej.data.Query().from('Customers').select(['ContactName', 'CustomerID']).take(6);
 //frame the query based on search string with filter type.
 query = (e.text !== '') ? query.where('ContactName', 'startswith', e.text, true) : query;

```

```
//pass the filter data source, filter query to updateData method.
e.updateData(data.dataSource, query);
}
</script>
```

### HIGHLIGHT.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public IActionResult highlight()
 {
 return View();
 }
 }
}
```

### Show the list items with icons

You can render **icons** to the list items by mapping the [iconCss](#) field. This **iconCss** field creates a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with **iconCss** field.

### CSHTML

```
@Html.EJS().DropDownList("icons").Placeholder("Select a social
media").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.icondat
a).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value =
"SocialMediaName", IconCss = "Class" }).Render()
<style>
 @@font-face {
 font-family: 'Socialicons';

"WhatsApp", Id= "media9" });
 media.Add(new SocialMedia { Class = "youtube", SocialMediaName=
"YouTube", Id = "media10" });
 return media;
 }
}

```

### Do incremental search in the DropDownList

DropDownList supports incremental search, by default. You can search the list item by focusing the DropDownList and typing the characters in it. The closely matched items are selected sequentially.

**Note:** If the same key is searched once again, the next matched item is selected.

### Modify the result data before passing to DropDownList when binding remote data source

When binding the remote data source, by using the [actionComplete](#) event, you can modify the result data before passing it to DropDownList.

### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").ActionComplete("actionComplete").PopupHeight("200px").DataSource(
dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Text = "ContactName",
 Value = "CustomerID"
}).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()
<script>
function actionComplete(e) {
 // initially result contains 6 items
 console.log("Before modified the result: " + e.result.length);

```

```

 // remove first 2 items from result.
 e.result.splice(0, 2);
 // now displays the result count is 4.
 console.log("After modified the result: " + e.result.length);
 }
</script>

```

### **MODIFYDATA.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult modifydata()
 {
 return View();
 }
 }
}

```

Preselect the list items in multiple cascading DropDownList

### **CSHTML**

```

<div class="padding-top">
 @Html.EJS().DropDownList("country").Placeholder("Select a
country").PopupHeight(@ViewBag.popupHeight).Change("countrychange").DataSou
rce((IEnumerable<Object>)ViewBag.country).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "CountryName",
Value = "CountryId" }).Render()
</div>
<div class="padding-top">
 @Html.EJS().DropDownList("state").Placeholder("Select a
state").Enabled(false).PopupHeight(ViewBag.popupHeight).Change("statechange"
).DataSource((IEnumerable<Object>)ViewBag.state).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "StateName",
Value = "StateId" }).Render()
</div>
<div class="padding-top">
 @Html.EJS().DropDownList("city").Placeholder("Select a
city").Enabled(false).PopupHeight(ViewBag.popupHeight).DataSource((IEnumerableab
le<Object>)ViewBag.cities).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "CityName",
Value = "CityId" }).Render()
</div>
<script type="text/javascript">
 function countrychange() {
 // disable the state DropDownList
 var countryObj =
document.getElementById('country').ej2_instances[0];

```

```

var state = document.getElementById('state').ej2_instances[0];
var city = document.getElementById('city').ej2_instances[0];
state.enabled = true;
//frame the query based on selected value in country DropDownList.
var tempQuery = new ej.data.Query().where('CountryId', 'equal',
countryObj.value);
// set the framed query based on selected value in country
DropDownList.
state.query = tempQuery;
// set null value to state DropDownList text property
state.text = null;
// bind the property changes to state DropDownList
state.dataBind();
// set null value to city DropDownList text property
city.text = null;
// disable the city DropDownList
city.enabled = false;
// bind the property changes to City DropDownList
city.dataBind();
}
function statechange() {
var stateObj = document.getElementById('state').ej2_instances[0];
var city = document.getElementById('city').ej2_instances[0];
city.enabled = true;
//Query the data source based on state DropDownList selected value
var tempQuery = new ej.data.Query().where('StateId', 'equal',
stateObj.value);
//set the framed query based on selected value in city DropDownList.
city.query = tempQuery;
//clear the existing selection
city.text = null;
//bind the property change to city DropDownList
city.dataBind();
}
</script>

```

## COUNTRY.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Country
 {
 public string CountryName { get; set; }
 public string CountryId { get; set; }
 public List<Country> CountryList()
 {
 List<Country> country = new List<Country>();
 country.Add(new Country() { CountryName = "Australia", CountryId
= "2" });
 country.Add(new Country() { CountryName = "United States",
CountryId = "1" });
 return country;
 }
 }
}

```

```

 }
}
}

```

Get the total count of data when remote data bind with DropDownList

Before control rendering, you can get the total items count by using [actionComplete](#) event with its result arguments. After rendering this control, you can get the total items count by using [getItems](#) method.

### CSHTML

```

@Html.EJS().Button("btn").Content("Get Items").Render()
@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("http://services.odata.org/V4/Northwind/Northwind.svc/").Adap
tor("ODataV4Adaptor").CrossDomain(true)).Fields(new
DropDownListFieldSettings
{
 Text = "ContactName",
 Value = "CustomerID"
}).Query((string)ViewBag.query).Render()
<script>
function actionComplete (e) {
 // get total items count
 console.log("Total items count: " + e.result.length);
 var element = document.createElement('p');
 element.innerText = "Total items count: " + e.result.length;
 document.getElementById('event').append(element);
}
document.getElementById('btn').onclick = () => {
 var Obj = document.getElementById("customers").ej2_instances[0];
 // get items count using getItems method
 console.log("Total items count: " + Obj.getItems().length);
 let element = document.createElement('p');
 element.innerText = "Total items count: " + Obj.getItems().length;
 document.getElementById('event').append(element);
};
</script>

```

### TOTALCOUNT.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class DropDownListController : Controller
 {
 public ActionResult totalcount()
 {
 return View();
 }
 }
}

```

```
}
}
```

## Remove an item from DropDownList

### CSHTML

```
@Html.EJS().Button("first").Content("Remove 0th Item").Render()
@Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Fi
elds(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "Game"
}).Render()
<script>
 document.getElementById('first').onclick = () => {
 // create DropDownList object
 let obj = document.getElementById('games');
 if (obj.ej2_instances[0].list) {
 // Remove the selected value if 0th index selected
 var dropObject = document.getElementById("games");
 var dropDownListObject = dropObject.ej2_instances[0];
 if (dropDownListObject.index === 0) {
 dropDownListObject.value = null;
 dropDownListObject.dataBind();
 }
 // remove first item in list
 (obj.ej2_instances[0].list.querySelectorAll('li')[0]).remove();
 if (!obj.ej2_instances[0].list.querySelectorAll('li')[0]) {
 dropDownListObject.dataSource = [];
 // enable the nodata template when no data source is empty.
 obj.ej2_instances[0].list.classList.add('e-nodata');
 }
 }
 else {
 // remove first item in list
 dropDownListObject.dataSource.splice(0, 1);
 }
 };
</script>
```

### GAMELIST.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class GameList
 {
 public string Id { get; set; }
 public string Game { get; set; }
 public List<GameList> GameLists()
 {
 List<GameList> game = new List<GameList>();
 game.Add(new GameList { Id = "Game1", Game = "American Football"
 });
 }
}
```

```

 game.Add(new GameList { Id = "Game2", Game = "Badminton" });
 game.Add(new GameList { Id = "Game3", Game = "Basketball" });
 game.Add(new GameList { Id = "Game3", Game = "Basketball" });
 game.Add(new GameList { Id = "Game4", Game = "Cricket" });
 game.Add(new GameList { Id = "Game5", Game = "Football" });
 game.Add(new GameList { Id = "Game6", Game = "Golf" });
 game.Add(new GameList { Id = "Game7", Game = "Hockey" });
 game.Add(new GameList { Id = "Game8", Game = "Rugby" });
 game.Add(new GameList { Id = "Game9", Game = "Snooker" });
 game.Add(new GameList { Id = "Game10", Game = "Tennis" });
 return game;
 }
}

```

### Limit the search result on filtering

#### CSHTML

```

@Html.EJS().DropDownList("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true).AllowFiltering(true).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings
{
 Value = "ContactName",
}).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()
<script>
 function onfiltering(e) {
 var CBObj =
document.getElementById("customers").ej2_instances[0];
 // load overall data when search key empty.
 if (e.text == '' && e.text.length < 3) {
 e.updateData(CBObj.dataSource);
 }
 let query = new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6);
 query = (e.text != '' && e.text.length >= 3) ?
query.where('ContactName', 'startswith', e.text, true) : query;
 e.updateData(CBObj.dataSource, query);
 }
</script>

```

#### LIMITSEARCH.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers

```

```
{
 public class DropDownListController : Controller
 {
 public ActionResult limitsearch()
 {
 return View();
 }
 }
}
```

### DropDownList options with tooltip

You can achieve this behavior by using **ej2-tooltip** component. When the mouse hovers on the DropDownList option, the tooltip displays some details related to hovered list item.

### CSHTML

```
@Html.EJS().DropDownList("country").Placeholder("Select a
country").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data)
.Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text =
"Name", Value = "Code" }).Render()
<script>
 var tooltip = new ej.popups.Tooltip({
 // default content of tooltip
 content: 'Loading...',
 // set target element to tooltip
 target: '.e-list-item',
 // set position of tooltip
 position: 'top center',
 // bind beforeRender event
 beforeRender: onBeforeRender
 });
 tooltip.appendTo('body');
 function onBeforeRender(args) {
 // get the target element
 var listElement = document.getElementById('country');
 var result = listElement.ej2_instances[0].dataSource;
 var i;
 for (i = 0; i < result.length; i++) {
 if (result[i].Name === args.target.textContent) {
 this.content = result[i].Name;
 this.dataBind();
 break;
 }
 }
 }
</script>
```

### COUNTRIES.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
```

```

public class Countries
{
 public string Name { get; set; }
 public string Code { get; set; }
 public List<Countries> CountriesList()
 {
 List<Countries> country = new List<Countries>();
 country.Add(new Countries { Name = "Australia", Code = "AU" });
 country.Add(new Countries { Name = "Bermuda", Code = "BM" });
 country.Add(new Countries { Name = "Canada", Code = "CA" });
 country.Add(new Countries { Name = "Cameroon", Code = "CM" });
 country.Add(new Countries { Name = "Denmark", Code = "DK" });
 country.Add(new Countries { Name = "France", Code = "FR" });
 country.Add(new Countries { Name = "Finland", Code = "FI" });
 country.Add(new Countries { Name = "Germany", Code = "DE" });
 country.Add(new Countries { Name = "Greenland", Code = "GL" });
 country.Add(new Countries { Name = "Hong Kong", Code = "HK" });
 country.Add(new Countries { Name = "India", Code = "IN" });
 country.Add(new Countries { Name = "Italy", Code = "IT" });
 country.Add(new Countries { Name = "Japan", Code = "JP" });
 country.Add(new Countries { Name = "Mexico", Code = "MX" });
 country.Add(new Countries { Name = "Norway", Code = "NO" });
 country.Add(new Countries { Name = "Poland", Code = "PL" });
 country.Add(new Countries { Name = "Switzerland", Code = "CH"
 });
 country.Add(new Countries { Name = "United Kingdom", Code = "GB"
 });
 country.Add(new Countries { Name = "United States", Code = "US"
 });
 return country;
 }
}

```

Detect whether the value change happened by manual or programmatic

You can check whether the value change happened by manual or programmatic by using [change](#) event argument, that argument name is `isInteracted`.

### CSHTML

```

@Html.EJS().Button("change").Content("Change the value dynamically").Render()
<div class="control-wrapper">
 <div id="default" style='padding-top:75px;'>
 @Html.EJS().DropDownList("employee").Placeholder("Select a employee").Index(2).Change("onChange").PopupHeight("200px").DataSource((IEnumerableable<object>)ViewBag.data).Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "Name" })
 .Render()
 </div>
</div>
<p id='event'> </p>
<script>
 document.getElementById('change').onclick = () => {
 var dropObject =
 document.getElementById("employee").ej2_instances[0];

```

```

 dropObject.value = 'Andrew Fuller';
 };
 function onChange(args) {
 let element = document.createElement('p');
 document.getElementById("event").innerHTML = "";
 if (args.isInteracted) {
 element.innerText = 'Changes happened by Interaction';
 }
 else {
 element.innerText = 'Changes happened by programmatic';
 }
 document.getElementById('event').append(element);
 }
</script>

```

## EMPLOYEES.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
 public class Employees
 {
 public string Name { get; set; }
 public string Eimg { get; set; }
 public string Designation { get; set; }
 public string Country { get; set; }
 public List<Employees> EmployeesList()
 {
 List<Employees> emp = new List<Models.Employees>();
 emp.Add(new Employees { Name= "Andrew Fuller", Eimg= "7",
Designation = "Team Lead", Country= "England"});
 emp.Add(new Employees { Name= "Anne Dodsworth", Eimg= "1",
Designation = "Developer", Country= "USA"});
 emp.Add(new Employees { Name= "Janet Leverling", Eimg= "3",
Designation = "HR", Country= "USA"});
 emp.Add(new Employees { Name= "Laura Callahan", Eimg= "2",
Designation = "Product Manager", Country= "USA"});
 emp.Add(new Employees { Name= "Margaret Peacock", Eimg= "6",
Designation = "Developer", Country= "USA"});
 emp.Add(new Employees { Name= "Michael Suyama", Eimg= "9",
Designation = "Team Lead", Country= "USA"});
 emp.Add(new Employees { Name= "Nancy Davolio", Eimg= "4",
Designation = "Product Manager", Country= "USA"});
 emp.Add(new Employees { Name= "Robert King", Eimg= "8",
Designation = "Developer ", Country= "England"});
 emp.Add(new Employees { Name= "Steven Buchanan", Eimg= "10",
Designation = "CEO", Country= "England" });
 return emp;
 }
 }
}

```

Whether each list items hold unique value

Yes, the value for each list items should be unique.

### DropDownListFor

The DropDownListFor control can be rendered by passing values and data from the model. The selected values can be retrieved during form submit using the post method.

#### CSHTML

```
@using (Html.BeginForm())
{
 @Html.EJS().DropDownListFor(model => model.Value).Placeholder("Select a
Country").DataSource((IEnumerable<object>)ViewBag.data).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "Name"
}).Render()
 <div id="submitButton">
 @Html.EJS().Button("btn").Content("Post").Render()
 </div>
}
```

#### FOR.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class AutoCompleteController : Controller
 {
 Countries model = new Countries();
 public ActionResult Index()
 {
 ViewBag.data = new Countries().CountriesList();
 model.Value = "Cameroon";
 return View(model);
 }
 [HttpPost]
 public ActionResult Index(Countries model)
 {
 ViewBag.data = new Countries().CountriesList();
 model.Value = model.Value;
 return View(model);
 }
 }
}
```

### Data Annotation

Data Annotations help us to define the rules to the model classes or properties for data validation and displaying suitable messages to end users.

Data Annotations includes built-in validation attributes for different validation rules, which can be applied to the properties of model class. ASP.NET Framework will automatically enforce these validation rules and display validation messages in the view.

Using **value** property gets or sets the value of the selected item in the control.

### C#HTML

```
@using (Html.BeginForm())
{
 @Html.EJS().DropDownListFor(model =>
model.EnquiringAboutSelect).Placeholder("Select a
Country").DataSource(Model?.EnquiringAboutSelectListItems).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListBoxFieldSettings { Value = "Text"
}).Placeholder("Please Select Enquiring About").Render()
 <div>
 @Html.ValidationMessageFor(model => model.EnquiringAboutSelect)
 </div>
 <div id="submitButton">
 @Html.EJS().Button("btn").Content("Post").Render()
 </div>
}
```

### FOR.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public class AutoCompleteController : Controller
 {
 public ActionResult Index()
 {
 DataModel model = new DataModel();
 model.EnquiringAboutSelectListItems = new
ListItems().getListItems();
 model.EnquiringAboutSelect = "104";
 return View(model);
 }
 [HttpPost]
 public ActionResult Index(DataModel model)
 {
 model.EnquiringAboutSelectListItems = new
ListItems().getListItems();
 model.EnquiringAboutSelect = model.EnquiringAboutSelect;
 return View(model);
 }
 }
 public class DataModel
 {
 [Required(ErrorMessage = "The value is Required")]
 public string EnquiringAboutSelect { get; set; }
 }
}
```

```

 public List<ListItems> EnquiringAboutSelectListItems { get; set; }
 }
 public class ListItems
 {
 public string Text { get; set; }
 public string Value { get; set; }
 public List<ListItems> getListItems()
 {
 List<ListItems> items = new List<ListItems>();
 items.Add(new ListItems() { Text = "Aberdeen", Value = "103" });
 items.Add(new ListItems() { Text = "Alexandria", Value = "102"
 });
 items.Add(new ListItems() { Text = "Albany", Value = "101" });
 items.Add(new ListItems() { Text = "Beacon ", Value = "104" });
 items.Add(new ListItems() { Text = "Brisbane ", Value = "105"
 });
 return items;
 }
 }
}

```

## Migration from Essential JS 1

This article describes the API migration process of DropDownList component from Essential JS 1 to Essential JS 2.

### DataBinding

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Default** | **Property:** *Datasource*

<br/>@Html.EJ().DropDownList("countryList").Datasource((IEnumerable<Countries>)ViewBag.datasource1) | **Property:** *dataSource*

<br/>@Html.EJS().DropDownList("games").DataSource((IEnumerable<object>)ViewBag.localdata).Render() |

| **Fields for mapping** | **Property:** *DropDownListFields*

<br/>@Html.EJ().DropDownList("groupsList").DropDownListFields(f => f.Value("parentId").Text("text")) | **Property:** *Fields*

<br/>@Html.EJS().DropDownList("games").Fields(new DropDownListFieldSettings { Text = "Game" }).Render() |

| **Query** | **Property:** *Query*

<br/>@Html.EJ().DropDownList("groupsList").Query("ej.Query().from('Customers').take(6)") | **Property:**

*Query*<br/>@Html.EJS().DropDownList("games").Query((string)ViewBag.query).Render() |

| **Begin event** | **Event** :*ActionBegin*

<br/>@Html.EJ().DropDownList("selectCompany").ActionBegin("onBegin") | **Event** : *actionBegin*

<br/>@Html.EJS().DropDownList("customers").ActionBegin("onBegin").Render() |

| **Complete event** | **Event:** *ActionComplete*

<br/>@Html.EJ().DropDownList("selectCompany").ActionComplete("onBegin") | **Event:**

*ActionComplete*

```

@Html.EJS().DropDownList("customers").ActionComplete("ActionComplete").Render() |
```

| **Failure event** | **Event:** *ActionFailure*

```

@Html.EJ().DropDownList("selectCompany").ActionFailure("onFailure") | Event:
ActionFailure
```

```

@Html.EJS().DropDownList("customers").ActionFailure("ActionFailure").Render() |
```

| **Success event** | **Event:** *ActionSuccess*

```

@Html.EJ().DropDownList("selectCompany").ActionSuccess("onsuccess") | Not Applicable |
```

| **Data binding event** | **Event:** *DataBound* <br/>

```
@Html.EJ().DropDownList("selectCompany").DataBound("onBound") | Event: DataBound
```

```

@Html.EJS().DropDownList("customers").DataBound("onBound").Render() |
```

*Filtering*

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Default** | **Property:** *EnableFilterSearch*

```

@Html.EJ().DropDownList("selectCompany").EnableFilterSearch(true) | Property:
```

```
AllowFiltering
@Html.EJS().DropDownList("customers").AllowFiltering(true).Render() |
```

| **Server filtering** | **Property:** *EnableServerFiltering*

```

@Html.EJ().DropDownList("selectCompany").EnableServerFiltering(true) | Property:
```

```
AllowFiltering
@Html.EJS().DropDownList("customers").AllowFiltering(true).Render() |
```

| **Filter type** | **Property:** *FilterType*

```

@Html.EJ().DropDownList("selectCompany").FilterType(SearchFilterType.StartsWith) |
```

<https://ej2.syncfusion.com/aspnetmvc/DropDownList/Filtering#/material> |

| **No Records Template** | **Not Applicable** | **Property:** *NoRecordsTemplate* <br/>

```
@Html.EJS().DropDownList("games").NoRecordsTemplate(" NO DATA
AVAILABLE").Render() |
```

| **Filter Bar watermarktext** | **Not Applicable** | **Property:** *FilterBarPlaceholder*

```

@Html.EJS().DropDownList("customers").FilterBarPlaceholder(true).Render() |
```

| **Ignore casing and diacritics** | **Not Applicable** | **Property:**

```
IgnoreAccent
@Html.EJS().DropDownList("customers").IgnoreAccent(true).Render() |
```

| **Incremental search** | **Property:**

```
EnableIncrementalSearch
@Html.EJ().DropDownList("selectCompany").EnableIncrementalSe
arch(true) | By default it is true |
```

| **Case sensitivity** | **Property:**

```
CaseSensitiveSearch
@Html.EJ().DropDownList("selectCompany").CaseSensitiveSearch(true)
```

<https://ej2.syncfusion.com/aspnetmvc/DropDownList/Filtering#/material> |

| **Search event** | **Event:** *Search*

```

@Html.EJ().DropDownList("selectCompany").Search("onSearch") | Event: Filtering
```

```

@Html.EJS().DropDownList("customers").Filtering("filtering").Render() |
```

## Template

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Default** | **Property:** *Template*

```

@Html.EJ().DropDownList("selectCompany").Template("<div><img class='imgId'
src='../Content/Employees/${Image}.png' alt='employee'/> <div class='ename'> ${Text}
</div><div class='role'> ${Role} </div><div class='cont'> ${Country} </div></div>") | Property:
ItemTemplate
@Html.EJS().DropDownList("customers").ItemTemplate("@Html.Raw("${FirstName}<span class
='city'>${City}")").Render() |
```

| **Group Template** | **Not Applicable** | **Property:** *GroupTemplate*

```

@Html.EJS().DropDownList("customers").GroupTemplate("@Html.Raw("${City}</
strong>")").Render() |
```

| **ValueTemplate** | **Not Applicable** | **Property:** *ValueTemplate*

```

@Html.EJS().DropDownList("customers").ValueTemplate("@"@Html.Raw("${FirstNa
me} - ${City}")").Render() |
```

| **Header Template** | **Property:** *HeaderTemplate*

```

@Html.EJ().DropDownList("selectCompany").HeaderTemplate("<div
class='eheader'>PHOTO DETAILS</div>") | Property:
HeaderTemplate

@Html.EJS().DropDownList("customers").HeaderTemplate("@Html.Raw("NameCity")").Render() |
```

| **FooterTemplate** | **Not applicable** | **Property:** *FooterTemplate*

```

@Html.EJS().DropDownList("customers").FooterTemplate("@Html.Raw(" Total list items: " + 8 + "")").Render() |
```

| **No records Template** | **Not applicable** | **Property:** *NoRecordsTemplate*

```

@Html.EJS().DropDownList("customers").NoRecordsTemplate("@Html.Raw(" NO DATA AVAILABLE")").Render() |
```

| **Action failure Template** | **Not applicable** | **Property:** *ActionFailureTemplate*

```

@Html.EJS().DropDownList("customers").ActionFailureTemplate("@Html.Raw(" Data fetch get fails")").Render() |
```

## Virtual Scrolling

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Default** | **Property:** *AllowVirtualScrolling*

```

@Html.EJ().DropDownList("customers").AllowVirtualScrolling(true) | Not applicable |
```

## Applying CSS

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Default** | **Property:** *CssClass*

<br/>@Html.EJ().DropDownList("customers").CssClass("customClass") | **Property:** *CssClass*

<br/>@Html.EJS().DropDownList("customers").CssClass("class").Render() |

| **showRoundedCorner** | **Property:** *ShowRoundedCorner*

<br/>@Html.EJ().DropDownList("customers").ShowRoundedCorner(true) | **Property:** *CssClass*

<br/>@Html.EJS().DropDownList("customers").CssClass("class").Render() |

## Sorting

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Default** | **Property:** *EnableSorting*

<br/>@Html.EJ().DropDownList("customers").EnableSorting(true) | **Enabled only on using sortorder** Property |

| **Order of sorting** | **Property:** *SortOrder*

<br/>@Html.EJ().DropDownList("customers").SortOrder("SortOrder.Descending") | **Property:**

*SortOrder* <br/>@Html.EJS().DropDownList("customers").SortOrder("Ascending").Render() |

## Popup

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Popup height** | **Property:** *PopupHeight*

<br/>@Html.EJ().DropDownList("customers").PopupHeight("550px") | **Property:** *PopupHeight*

<br/>@Html.EJS().DropDownList("customers").PopupHeight("220px").Render() |

| **Popup width** | **Property:** *PopupWidth*

<br/>@Html.EJ().DropDownList("customers").PopupWidth("550px") | **Property:** *PopupWidth*

<br/>@Html.EJS().DropDownList("customers").PopupWidth("300px").Render() |

| **Popup show on load** | **Property:** *ShowPopupOnLoad* <br/>

@Html.EJ().DropDownList("customers").ShowPopupOnLoad(true) | **By default, the data load on demand.** |

| **enableAnimation** | **Property:** *EnableAnimation*

<br/>@Html.EJ().DropDownList("customers").EnableAnimation(true) | **Not applicable** |

| **Popup resizing** | **Property:** *EnablePopupResize*

<br/>@Html.EJ().DropDownList("customers").EnablePopupResize(true) | **Not applicable** |

| **Maximum Popup height** | **Property:** *MaxPopupHeight*

<br/>@Html.EJ().DropDownList("customers").MaxPopupHeight("550px") | **Not applicable** |

| **Minimum Popup height** | **Property:** *min-popup-*

*height* <br/>@Html.EJ().DropDownList("customers").MinPopupHeight("550px")<br/>}); | **Not applicable** |

| **Maximum Popup width** | **Property:** *MaxPopupWidth*

<br/>@Html.EJ().DropDownList("customers").MaxPopupWidth("550px") | **Not applicable** |

| **Minimum Popup width** | **Property:** *MinPopupWidth*

<br/>@Html.EJ().DropDownList("customers").MinPopupWidth("550px") | **Not applicable** |

| **Loading data** | **Property:** *LoadOnDemand*

<br/>@Html.EJ().DropDownList("customers").LoadOnDemand(true) | **By default, it is true** |

| **Popup showing manually** | **Method:** *showPopup*

<br/>@Html.EJ().DropDownList("dropdown")<br/><br/>\$('#dropdown').ejDropDownList('showPopup') | **Method:** *showPopup*

<br/>@Html.EJS().DropDownList("dropdown").Render()<br/><br/>var ddlObj = document.getElementById('dropdown').ej2\_Instances[0];<br/><br/>ddlObj.showPopup(); |

| **Popup hiding manually** | **Method:** *hidePopup*

<br/>@Html.EJ().DropDownList("dropdown")<br/><br/>\$('#dropdown').ejDropDownList('hidePopup') | **Method:**

*HidePopup*<br/>@Html.EJS().DropDownList("dropdownlist").Render()<br/><br/>var ddlObj = document.getElementById("dropdownlist").ej2\_Instances[0];<br/><br/>ddlObj.hidePopup(); |

| **Before Popup hide event** | **Event:** *BeforePopupHide*

<br/>@Html.EJ().DropDownList("dropdown").BeforePopupHide("event") | **Not applicable** |

| **Before Popup shown event** | **Event:**

*BeforePopupShown*<br/>@Html.EJ().DropDownList("dropdown").BeforePopupShown("event") |

**Event:** *BeforeOpen* <br/>@Html.EJS().DropDownList("dropdown").BeforeOpen("event").Render() |

| **Popup hide event** | **Event:**

*PopupHide*<br/>@Html.EJ().DropDownList("dropdown").PopupHide("event") | **Event:** *Close*

<br/>@Html.EJS().DropDownList("dropdown").Close("event").Render() |

| **Popup resize event** | **Event:**

*PopupResize*<br/>@Html.EJ().DropDownList("dropdown").PopupResize("event") | **Not applicable**

|

| **Popup resize start event** | **Event:**

*PopupResizeStart*<br/>@Html.EJ().DropDownList("dropdown").PopupResizeStart("event") | **Not applicable** |

| **Popup resize stop event** | **Event:**

*popupResizeStop*<br/>@Html.EJ().DropDownList("dropdown").PopupResizeStop("event") | **Not applicable** |

| **Popup shown event** | **Event:**

*Popupshown*<br/>@Html.EJ().DropDownList("dropdown").PopupShown("event") | **Event:**

*Open*<br/>@Html.EJS().DropDownList("dropdown").Open("event").Render() |

[Placeholder](#)

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Watermark text** | **Property:** *WatermarkText*  
 <br/>@Html.EJ().DropDownList("dropdown").WatermarkText("Select") | **Property:** *Placeholder*  
 <br/>@Html.EJS().DropDownList("dropdown").Placeholder("Select").Render() |

| **Floating of waterMarkText** | **Not applicable** | **Property:** *FloatLabelType*  
 <br/>@Html.EJS().DropDownList("dropdown").FloatLabelType("Auto").Render() |

### Grouping

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Default** | **Property:** *fields.groupBy*  
 <br/>@Html.EJ().DropDownList("groupsList").DropDownListFields(f => f.GroupBy("parentId")) |  
**Property:** *fields.groupBy*<br/>@Html.EJS().DropDownList("games").Fields(new  
 DropDownListFieldSettings { GroupBy = "Game" }).Render() |

| **Group Template** | **Not applicable** | **Property:**  
*GroupTemplate*<br/>@Html.EJS().DropDownList("customers").GroupTemplate("@Html.Raw("<strong>\${City}</strong>")").Render() |

### Accessibility

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Globalization** | **Property:** *Locale*<br/>@Html.EJ().DropDownList("customers").Locale("fr-FE") |  
**Property:** *Locale*<br/>@Html.EJS().DropDownList("customers").Locale("fr-FE").Render() |

| **Rtl support** | **Property:** *EnableRtl*<br/>@Html.EJ().DropDownList("customers").EnableRtl(true) |  
**Property:** *EnableRtl*<br/>@Html.EJS().DropDownList("customers").EnableRtl(true).Render() |

### Miscellaneous

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Enable/disable** | **Property:** *Enabled*<br/>@Html.EJ().DropDownList("customers").Enabled(true) |  
**Property:** *Enabled* <br/>@Html.EJS().DropDownList("customers").Enabled(true).Render() |

| **Read only** | **Property:** *ReadOnly* <br/>@Html.EJ().DropDownList("customers").ReadOnly(true) |  
 <br/>**Property:** *ReadOnly*<br/>@Html.EJS().DropDownList("customers").ReadOnly(true).Render()  
 |

| **Persistence of data** | **Property:**  
*EnablePersistence*<br/>@Html.EJ().DropDownList("customers").EnablePersistence(true)  
**Property:**  
*EnablePersistence*<br/>@Html.EJS().DropDownList("customers").EnablePersistence(true).Render()  
 ) |

| **Disable** | **Method:** *disable*<br/>@Html.EJ().DropDownList("dropdown")<br/>  
 <br/>\$('#dropdown').ejDropDownList('disable') | **Property:**  
*Enabled*<br/>@Html.EJS().DropDownList("customers").Enabled(false).Render() |

| **Enable** | **Method:** `enable`<br/>@Html.EJ().DropDownList("dropdown")<br/>

<br/>\$('#dropdown').ejDropDownList('enable') | **Property:**

`Enabled`<br/>@Html.EJS().DropDownList("customers").Enabled(true).Render() |

| **Height** | **Property:** `Height` <br/>@Html.EJ().DropDownList("dropdown").Height("300px") |

**Property:** `Height` <br/>@Html.EJS().DropDownList("customers").Height("300px").Render() |

| **Width** | **Property:** `Width` <br/>@Html.EJ().DropDownList("dropdown").Width("300px") |

**Property:** `Width` <br/>@Html.EJS().DropDownList("customers").Width("300px").Render() |

## Selection

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Selecting particular index** | **Property:** `selected-`

`index`<br/>@Html.EJ().DropDownList("dropdown").Index(3) | **Property:**

`index`<br/>@Html.EJS().DropDownList("customers").Index(3).Render() |

| **Selecting particular value** | **Property:** `value`<br/>@Html.EJ().DropDownList("dropdown").Value(3)

| **Property:** `value`<br/>@Html.EJS().DropDownList("customers").Value(3).Render() |

| **Selecting particular text** | **Property:** `text`

<br/>@Html.EJ().DropDownList("dropdown").Text("data") | **Property:**

`text`<br/>@Html.EJS().DropDownList("customers").Text("data").Render() |

| **Target id** | **Property:** `targetId` <br/>@Html.EJ().DropDownList("dropdown").TargetId("data") |

**Not applicable** |

| **Selecting item using text** | **Method:** `selectItemByText`

<br/>@Html.EJ().DropDownList("dropdown")<br/>

<br/>\$('#dropdown').ejDropDownList('selectItemByText','car') | **Not applicable** |

| **Unselect item using text** | **Method:**

`unselectItemByText`<br/>@Html.EJ().DropDownList("dropdown")<br/>

<br/>\$('#dropdown').ejDropDownList('unselectItemByText','car') | **Not applicable** |

| **Selecting item using value** | **Method:**

`selectItemByValue`<br/>@Html.EJ().DropDownList("dropdown")<br/>

<br/>\$('#dropdown').ejDropDownList('selectItemByValue','car') | **Not applicable** |

| **Getting data by using value** | **Method:**

`getItemDataByValue`<br/>@Html.EJ().DropDownList("dropdown")<br/><br/>\$('#dropdown').ejDr  
opDownList('unselectItemByValue','car') | **Method:**

`getDataByValue`<br/>@Html.EJS().DropDownList("dropdownlist").Render()<br/><br/>var ddlObj =  
document.getElementById("dropdownlist").ej2\_Instances[0];<br/><br/>ddlObj.getItemDataByV  
alue("data"); |

| **Get selected value** | **Method:** `getSelectedItem`<br/>@Html.EJ().DropDownList("dropdown")<br/>

<br/>\$('#dropdown').ejDropDownList('getSelectedItem') | **Not applicable** |

| **Get selected text** | **Method:** `getSelectedText<br/>@Html.EJ().DropDownList("dropdown")<br/><br/>$('#dropdown').ejDropDownList('getSelectedText')` | **Property:** `text<br/>@Html.EJS().DropDownList("customers").Text("data").Render()` |

| **Select event** | **Event:** `select<br/>@Html.EJ().DropDownList("dropdown").select("onSelect")` | **Event:** `select<br/>@Html.EJS().DropDownList("customers").Select("onSelect").Render()` |

| **Addition of Html attributes** | **Property:** `html-attributes<br/>@Html.EJS().DropDownList("customers").HtmlAttributes((IDictionary<string,object>)ViewData["HtmlAttrData"])` | **Property:** `htmlAttributes<br/>@Html.EJS().DropDownList("customers").HtmlAttributes(@ViewBag.data).Render()` |

### Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| **Adding new item** | **Method :** `addItem<br/><ej-drop-down-list></ej-drop-down-list><br/><br/>$('#dropdown').ejDropDownList("addItem", {text:"India"});` | **Method:** `addItem<br/><ejs-dropdownlist><br/><br/>var ddlObj = document.getElementById(dropdownlist).ej2_Instances[0];<br/><br/>ddlObj.addItem({Id: 'game4', Game: 'Golf'}, 2);` |

| **Clearing the text** | **Method :** `clearText<br/><ej-drop-down-list></ej-drop-down-list><br/><br/>$('#dropdown').ejDropDownList('clearText')` | **Property:** `showClearButton<br/><ejs-dropdownlist showClearButton=true/>` |

| **Destroy the component** | **Method :** `destroy<br/><ej-drop-down-list></ej-drop-down-list><br/><br/>$('#dropdown').ejDropDownList('destroy')` | **Method:** `destroy<br/><ejs-dropdownlist><br/><br/>var ddlObj = document.getElementById(dropdownlist).ej2_Instances[0];<br/><br/>ddlObj.destroy;` |

| **Getting the data** | **Method :** `getListData<br/><ej-drop-down-list></ej-drop-down-list><br/><br/>$('#dropdown').ejDropDownList('getListData')` | **Method :** `getItems<br/><ejs-dropdownlist><br/><br/>var ddlObj = document.getElementById(dropdownlist).ej2_Instances[0];<br/><br/>ddlObj.getItems;` |

| **Create event** | **Event:** `create<br/><ej-drop-down-list create="onCreate"></ej-drop-down-list>` | **Event:** `created<br/><ejs-dropdownlist created ="created" />` |

| **Destroy event** | **Event:** `destroy<br/><ej-drop-down-list destroy="ondestroy"></ej-drop-down-list>` | **Event:** `destroyed<br/><ejs-dropdownlist destroyed ="destroy" />` |

| **Cascade event** | **Event:** `cascade<br/><ej-drop-down-list cascade="cascade"></ej-drop-down-list>` | <https://ej2.syncfusion.com/demos/#/material/drop-down-list/cascading.html> |

| **Change event** | **Event:** `change<br/><ej-drop-down-list create="change"></ej-drop-down-list>` | **Event:** `change<br/><ejs-dropdownlist change ="change" />` |

| **Focus out event** | **Event:** `focusOut<br/><ej-drop-down-list focus-out="focus"></ej-drop-down-list>` | **Event:** `blur<br/><ejs-dropdownlist blur ="blur" />` |

| **Focus in event** | **Event:** `focusIn<br/><br/><ej-drop-down-list focus-in="focus"></ej-drop-down-list>` | **Event:** `focus<br/><ejs-dropdownlist focus="onfocus" />` |

## DropDownTree

### Getting Started with ASP.NET MVC DropDownTree Control

This section briefly explains about how to include [ASP.NET MVC DropDownTree](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### **~/ LAYOUT.CSHTML**

```
<head>
...
```

```
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC DropDownTree control

Now, add the Syncfusion ASP.NET MVC DropDownTree control in `~/Views/Home/Index.cshtml` page.

### CSHTML

```
@Html.EJS().DropDownTree("data").Render()
```

Press `Ctrl+F5` (Windows) or `⌘+F5` (macOS) to run the app. Then, the Syncfusion ASP.NET MVC DropDownTree control will be rendered in the default web browser.

### Binding data source

The Dropdown Tree control can load data either from local data sources or remote data services. This can be done using the `dataSource` property that is a member of the [Fields](#) property. The `dataSource` property supports a nested list of data and `DataManager`. Here, a nested list of data is passed to the Dropdown Tree control.

### CSHTML

```
@model List<DropDownTreeSample.Controllers.Parent>
```

```
@{

 char[] value = { 'n', 'o', 'd', 'e', 'C', 'h', 'i', 'l', 'd' };
 string child = new string(value);
}
<div id='container' style="margin:0 auto; width:250px;">
 @Html.EJS().DropDownTree("treedata").Placeholder("Select a
 Item").Fields(field =>

 field.Value("nodeId").Child(child).Text("nodeText").DataSource(Model)).Rende
 r()
</div>
```

### HOMECONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 List<Parent> parentitem = new List<Parent>();
 List<Child> childitem = new List<Child>();
 parentitem.Add(new Parent
 {
 nodeId = "01",
 nodeText = "Music",
 nodeChild = childitem,
 });
 childitem.Add(new Child { nodeId = "01-01", nodeText = "Gouttes.mp3" });
 List<Child> childitem2 = new List<Child>();
 parentitem.Add(new Parent
 {
 nodeId = "02",
 nodeText = "Videos",
 expanded = true,
 nodeChild = childitem2,
 });
 childitem2.Add(new Child { nodeId = "02-01", nodeText = "Naturals.mp4" });
 childitem2.Add(new Child { nodeId = "02-02", nodeText = "Wild.mpeg" });
 List<Child> childitem3 = new List<Child>();
 parentitem.Add(new Parent
 {
 nodeId = "03",
 nodeText = "Documents",
 nodeChild = childitem3,
 });
 childitem3.Add(new Child { nodeId = "03-01", nodeText = "Environment
 Pollution.docx" });
 childitem3.Add(new Child { nodeId = "03-02", nodeText = "Global Water,
 Sanitation, & Hygiene.docx" });
 childitem3.Add(new Child { nodeId = "03-03", nodeText = "Global Warming.ppt"
 });
 childitem3.Add(new Child { nodeId = "03-04", nodeText = "Social Network.pdf"
 });
 childitem3.Add(new Child { nodeId = "03-05", nodeText = "Youth
 Empowerment.pdf" });
 //ViewBag.dataSource = parentitem;
 }
}
```

```
return View(parentitem);
}
....
}
public class Parent
{
 public string nodeId;
 public string nodeText;
 public string icon;
 public bool expanded;
 public bool selected;
 public List<Child> nodeChild;
}
public class Child
{
 public string nodeId;
 public string nodeText;
 public string icon;
 public bool expanded;
 public bool selected;
 public List<Child> nodeChild;
}
```

**Note:** [View Sample in GitHub.](#)

### Data Binding in Dropdown Tree Component

The Dropdown Tree control provides an option to load the data either from local data sources or from remote data services. This can be done through `dataSource` property that is a member of the `fields` property. The `dataSource` property supports list of data and `DataManager`. It also supports different

kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of **DataManager** adaptors.

Dropdown Tree has **load on demand** (Lazy load) option. It reduces the bandwidth size while consuming the huge data. By default, the **loadOnDemand** is set to false. By enabling this property, it loads first level items initially, and when parent item is expanded, it loads the child items based on the **parentValue/child** member.

#### Local data

To bind local data to the Dropdown Tree, you can assign a list of data to the **dataSource** property.

The Dropdown Tree control requires three fields (Value, text, and parentValue) to render local data source. When mapper fields are not specified, it takes the default values as the mapping fields. Local data source can also be provided as an instance of the **DataManager**. It supports two kinds of local data binding methods.

- Hierarchical data
- Self-referential data

#### Hierarchical data

Dropdown Tree can be populated with the hierarchical data source that contains nested list of data. You can directly map the hierarchical data and the field members with corresponding key values from the hierarchical data to the **fields** property.

In the following example, **code**, **name**, and **countries** columns from hierarchical data have been mapped to **value**, **text**, and **child** fields, respectively.

#### CSHTML

```
<div id='container' style="margin:0 auto; width:250px;">
 @Html.EJS().DropDownTree("treedata").Fields(field =>

 field.Value("code").Child(ViewBag.child).Text("name").DataSource(ViewBag.data)).Render()
</div>
```

#### HIERARCHICALDATA.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using DropDownTree.Models;
using Syncfusion.EJ2.DropDowns;
namespace DropDownTree.Controllers
{
 public class DropDownListController : Controller
 {
 public IActionResult HierarchicalData()
 {
 List<Continents> continents = new List<Continents>();
 List<Countries> countries = new List<Countries>();
```

```

 continents.Add(new Continents
 {
 code = "NA",
 name = "North America",
 expanded = true,
 child = countries,
 });
 countries.Add(new Countries { code = "USA", name = "United
States of America", selected = true });
 countries.Add(new Countries { code = "CUB", name = "Cuba" });
 countries.Add(new Countries { code = "MEX", name = "Mexico" });
 List<Countries> countries2 = new List<Countries>();
 continents.Add(new Continents
 {
 code = "AF",
 name = "Africa",
 child = countries2,
 });
 countries2.Add(new Countries { code = "NGA", name = "Nygeria"
});
 countries2.Add(new Countries { code = "EGY", name = "Egypt" });
 countries2.Add(new Countries { code = "ZAF", name = "South
Africa" });
 List<Countries> countries3 = new List<Countries>();
 continents.Add(new Continents
 {
 code = "AS",
 name = "Asia",
 child = countries3,
 });
 countries3.Add(new Countries { code = "CHN", name = "China" });
 countries3.Add(new Countries { code = "IND", name = "India" });
 countries3.Add(new Countries { code = "JPN", name = "Japan" });
 List<Countries> countries4 = new List<Countries>();
 continents.Add(new Continents
 {
 code = "EU",
 name = "Europe",
 child = countries4,
 });
 countries4.Add(new Countries { code = "DNK", name = "Denmark"
});
 countries4.Add(new Countries { code = "FIN", name = "Finland"
});
 countries4.Add(new Countries { code = "AUT", name = "Austria"
});
 List<Countries> countries5 = new List<Countries>();
 continents.Add(new Continents
 {
 code = "SA",
 name = "South America",
 child = countries5,
 });
 countries5.Add(new Countries { code = "BRA", name = "Brazil" });
 countries5.Add(new Countries { code = "COL", name = "Colombia"
});

```

```

 countries5.Add(new Countries { code = "ARG", name = "Argentina"
 });

 List<Countries> countries6 = new List<Countries>();
 continents.Add(new Continents
 {
 code = "OC",
 name = "Oceania",
 child = countries6,
 });
 countries6.Add(new Countries { code = "AUS", name = "Australia"
 });
 countries6.Add(new Countries { code = "NZL", name = "Newzealand"
 });
 countries6.Add(new Countries { code = "WSM", name = "Samoa" });
 List<Countries> countries7 = new List<Countries>();
 continents.Add(new Continents
 {
 code = "AN",
 name = "Antartica",
 child = countries7,
 });
 countries7.Add(new Countries { code = "BVT", name = "Bouvet
Island" });
 countries7.Add(new Countries { code = "ATF", name = "French
Southern Lands" });
 char[] value = { 'c', 'h', 'i', 'l', 'd' };
 string Child = new string(value);
 ViewBag.child = Child;
 ViewBag.data = continents;
 return View();
}

public class Continents
{
 public string code;
 public string name;
 public bool expanded;
 public bool selected;
 public List<Countries> child;
}

public class Countries
{
 public string code;
 public string name;
 public bool expanded;
 public bool selected;
}
}

```

#### Self-referential data

DropDown Tree can be populated from the self-referential data structure that contains array of JSON objects with `parentValue` mapping.

You can directly assign self-referential data and map all the field members with corresponding key values from self-referential data to the `fields` property.

To render the root level items, specify the `parentValue` as null or no need to specify the `parentValue` in the `dataSource`.

In the following example, `id`, `pid`, `hasChild`, and `name` columns from self-referential data have been mapped to `value`, `parentValue`, `hasChildren`, and `text` fields, respectively.

#### CSHTML

```
<div id='container' style="margin:0 auto; width:250px;">
 @Html.EJS().DropDownTree("treedata").Fields(field =>

 field.Value("id").ParentValue("pid").HasChildren("hasChild").Text("name").DataSource(ViewBag.dataSource).Render()
</div>
```

**LISTDATA.CS**

 pid = 14,
```

```
 name = "Latin Music"
 });
 treedata.Add(new
 {
 id = 18,
 pid = 14,
 name = "Jazz"
 });
 treedata.Add(new
 {
 id = 19,
 hasChild = true,
 name = "More in Music"
 });
 treedata.Add(new
 {
 id = 20,
 pid = 19,
 name = "Music Trade-In"
 });
 treedata.Add(new
 {
 id = 21,
 name = "Redeem a Gift Card",
 pid = 19
 });
 treedata.Add(new
 {
 id = 22,
 pid = 19,
 name = "Band T-Shirts"
 });
 ViewBag.dataSource = treedata;
 return View();
}
}
```

#### Remote data

Dropdown Tree can also be populated from a remote data service with the help of the **DataManager** control and **Query** property.

It supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of **DataManager** adaptors.

You can assign service data as an instance of **DataManager** to the **dataSource**. To interact with remote data source, you must provide the endpoint **url**.

The **DataManager** that acts as an interface between the service endpoint and the Dropdown Tree requires the following information to interact with service endpoint properly.

- **DataManager->url**: Defines the service endpoint to fetch data.
- **DataManager->adaptor**: Defines the adaptor option. By default, **ODataAdaptor** is used for remote binding.

Adaptor is responsible for processing response and request from/to the service endpoint. The **@syncfusion/ej2-data** package provides some pre-defined adaptors designed to interact with service endpoints. They are,

- **UrlAdaptor**: Used to interact with remote services. This is the base adaptor for all remote based adaptors.
- **ODataAdaptor**: Used to interact with OData endpoints.
- **ODataV4Adaptor**: Used to interact with OData V4 endpoints.
- **WebApiAdaptor**: Used to interact with Web API created under OData standards.
- **WebMethodAdaptor**: Used to interact with web methods.

In the following example, **ODataV4Adaptor** is used to fetch data from the remote services. The **EmployeeID**, **FirstName**, and **EmployeeID** columns from the Employees table has been mapped to **value**, **text**, and **hasChildren** fields respectively for first level nodes.

The **OrderID**, **EmployeeID**, and **ShipName** columns from the orders table have been mapped to **value**, **parentValue**, and **text** fields respectively for second level nodes.

### CSHTML

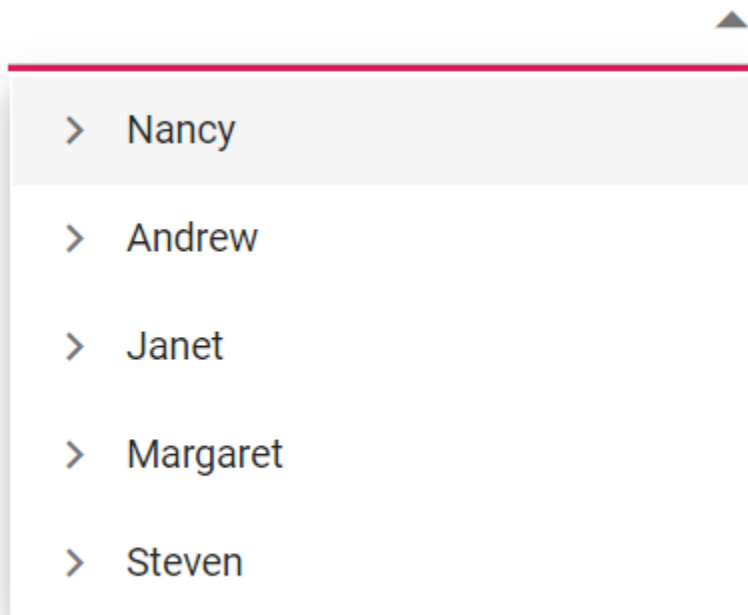

```
<div id='container' style="margin:0 auto; width:250px;">
 @Html.EJS().DropDownTree("tree").Fields(field =>
 field.Query("new
ej.data.Query().from('Employees').select('EmployeeID,FirstName,Title').take(
5)").Value("EmployeeID").ParentValue("pid").Selected("selected")
.Text("FirstName").HasChildren("EmployeeID")
.DataSource(dataSource =>
{
dataSource.Url("https://services.odata.org/V4/Northwind/Northwind.svc").Adap
tor("ODataV4Adaptor").CrossDomain(true);
}) .Child(ViewBag.child) .Render()
})
</div>
```

### REMOTEDATA.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using DropDownTree.Models;
using Syncfusion.EJ2.DropDowns;
namespace DropDownTree.Controllers
{
 public class DropDownListController : Controller
 {
 public IActionResult RemoteData()
 {
 DropDownTreeFields childData = new DropDownTreeFields();
 childData.Query = "new
ej.data.Query().from('Orders').select('OrderID,EmployeeID,ShipName').take(5)
";
 childData.Value = "OrderID";
 childData.Text = "ShipName";
 childData.ParentValue = "EmployeeID";
 childData.DataSource = new Syncfusion.EJ2.DataManager
```

```
{
 Url =
 "https://services.odata.org/V4/Northwind/Northwind.svc",
 Adaptor = "ODataV4Adaptor",
 CrossDomain = true
};
ViewBag.child = childData;
return View();
}
}
```

### Prevent Node selection

You can prevent the selection of individual tree node by using the **Selectable** property. The tree node selection is not allowed while disable this property.

The **Selectable** property is disabled and the selection is prevented for parent nodes in below sample.

### CSHTML

```
<div id='container' style="margin:0 auto; width:250px;">
 @Html.EJS().DropDownTree("treedata").Fields(field =>

 field.Value("id").ParentValue("pid").HasChildren("hasChild").Text("name").Se
 lectable("selectable").DataSource(ViewBag.dataSource)).Render()
</div>
```

### PREVENTNODE.CS

});
treedata.Add(new
{
 id = 22,
 pid = 19,
 name = "Band T-Shirts"
});
ViewBag.dataSource = treedata;
return View();
}
}
```

### Templates in Drop Down Tree Component

The Dropdown Tree provides support to customize each list item, header, and footer elements. It uses the Essential JS 2 [Template engine](#) to compile and render the elements properly.

#### Item template

The content of each list item within the Dropdown Tree can be customized with the help of `itemTemplate` property.

In the following sample, the Dropdown Tree list items are customized with employee information such as **name** and **job** using the `itemTemplate` property.

The template expression should be provided inside the `${...}` interpolation syntax.

#### CSHTML

```
<div class="control-section">
 <div style="margin: 0 auto; width:350px;">

@Html.EJS().DropDownTree("ddt").CssClass("custom").Placeholder("Select an
employee").Width("350px").PopupHeight("250px").Fields(ViewBag.templateData).
ItemTemplate("<div>${name} - ${job}</div>").Render()
 </div>
</div>
<style>
 .custom .ejob {
 opacity: .60;
 }
</style>
```

#### ITEMTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using itemtemplates.Models;
using Syncfusion.EJ2.DropDowns;
namespace itemtemplates.Controllers
{
 public class HomeController : Controller
 {
 DropDownTreeFields templateData = new DropDownTreeFields();
 public ActionResult Index()
 {
 DropDownTreeTemplate dropdownTreeTemplate = new
DropDownTreeTemplate();
 templateData.DataSource = dropdownTreeTemplate.Template();
 templateData.Value = "id";
 templateData.Text = "name";
 templateData.Expanded = "expanded";
 templateData.HasChildren = "hasChild";
 templateData.ParentValue = "pid";
 ViewBag.templateData = templateData;
 ViewBag.localData = templateData.DataSource;
 return View();
 }
 }
}

```

### DROPDOWNTREETEMPLATE.CS

```

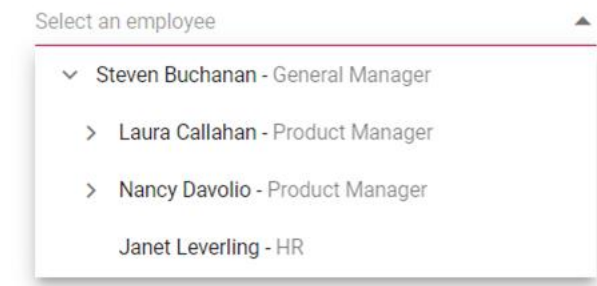

using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
namespace itemtemplates.Models
{
 public class DropDownTreeTemplate
 {
 public List<Object> Template()
 {
 List<object> localData = new List<object>();
 localData.Add(new { id = 1, name = "Steven Buchanan", hasChild =
true, expanded = true, job = "General Manager" });
 localData.Add(new { id = 2, pid = 1, name = "Laura Callahan",
job = "Product Manager", hasChild = true });
 localData.Add(new { id = 3, pid = 2, name = "Andrew Fuller",
job = "Team Lead", hasChild = true });
 localData.Add(new { id = 4, pid = 3, name = "Anne Dodsworth",
job = "Developer" });
 localData.Add(new { id = 5, pid = 3, name = "Lilly", job =
"Developer", status = "online" });
 localData.Add(new { id = 6, pid = 1, name = "Nancy Davolio",
job = "Product Manager", hasChild = true });
 localData.Add(new { id = 7, pid = 6, name = "Michael Suyama",
job = "Team Lead", hasChild = true });
 }
 }
}

```

```

 localData.Add(new { id = 8, pid = 7, name = "Robert King", job
= "Developer" });
 localData.Add(new { id = 9, pid = 7, name = "Mary", job =
"Developer" });
 localData.Add(new { id = 10, pid = 1, name = "Janet Leverling",
job = "HR" });
 return localData;
 }
}

```

### Header template

The header element is shown statically at the top of the popup list items within the Dropdown Tree. A custom element can be placed as a header element using the `headerTemplate` property.

### CSHTML

```

<div class="control-section">
 <div style="margin: 0 auto; width:350px;">

@Html.EJS().DropDownTree("ddt").CssClass("custom").Placeholder("Select an
employee").Width("350px").PopupHeight("250px").Fields(ViewBag.templateData).
ItemTemplate("<div class=\"ename\">${name}</div>").HeaderTemplate("<div
class=\"head\">Employee List</div>").Render()
 </div>
</div>
<style>
 .custom .head {
 height: 40px;
 line-height: 40px;
 font-size: 14px;
 margin: 0 auto;
 width: 100%;
 padding: 0 20px;
 font-weight: bold;
 border-bottom: 1px solid #e0e0e0;
 }
</style>

```

### HEADERTEMPLATE.CS

"Developer" });
 }
 }
}

```

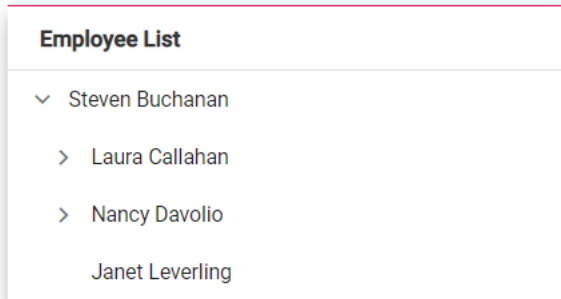

```

 localData.Add(new { id = 10, pid = 1, name = "Janet Leverling",
 job = "HR" });
 return localData;
 }
}

```

Select an employee

### Footer template

The DropDown Tree has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the `footerTemplate` property.

### CSHTML

```

<div class="control-section">
 <div style="margin: 0 auto; width:350px;">

@Html.EJS().DropDownTree("ddt").CssClass("custom").Placeholder("Select an
employee").Width("350px").PopupHeight("250px").Fields(ViewBag.templateData).
ItemTemplate("<div class=\"ename\">${name}</div>").FooterTemplate("<div
class=\"footer\"><div class=\"footer-content\">Total number of employees: 10
</div></div>").Render()
 </div>
</div>
<style>
 .custom .footer {
 height: 40px;
 line-height: 40px;
 font-size: 14px;
 margin: 0 auto;
 width: 100%;
 padding: 0 20px;
 font-weight: bold;
 }
 .custom .e-ddt-footer{
 border-top: 1px solid #e0e0e0;
 }
</style>

```

### FOOTERTEMPLATE.CS

Data fetch request fails

### Custom template to show selected items in input

In Dropdown Tree, while selecting more than one item via checkbox or multi selection support, all the selected items will be displayed in the input. Instead of displaying all the selected item text, the custom template can be displayed by setting the **mode** property as **Custom** and **customTemplate** property.

When the **mode** property is set as **Custom**, the Dropdown Tree displays the default template value (**\${value.length} item(s) selected**) like **1 item(s) selected** or **2 item(s) selected**. The default template can be customized by setting **customTemplate** property.

In the following sample, the Dropdown Tree is rendered with default value of the **customTemplate** property like **"1 item(s) selected or 2 item(s) selected"**.

### CSHTML

```
@using Syncfusion.EJ2.DropDowns
```

```
<div class="control-section">
 <div style="margin: 0 auto; width:350px;">
 @Html.EJS().DropDownTree("ddt").Placeholder("Select an
employee").Mode(Mode.Custom).CustomTemplate("${value.length} item(s)
selected").ShowCheckBox(true).PopupHeight("200px").Fields(ViewBag.templateDa
ta).Render()
 </div>
</div>
```

### CUSTOMTEMPLATEMODE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using itemtemplates.Models;
using Syncfusion.EJ2.DropDowns;
namespace itemtemplates.Controllers
{
 public class HomeController : Controller
 {
 DropDownTreeFields templateData = new DropDownTreeFields();
 public ActionResult Index()
 {
 DropDownTreeTemplate dropdownTreeTemplate = new
DropDownTreeTemplate();
 templateData.DataSource = dropdownTreeTemplate.Template();
 templateData.Value = "id";
 templateData.Text = "name";
 templateData.Expanded = "expanded";
 templateData.HasChildren = "hasChild";
 templateData.ParentValue = "pid";
 ViewBag.templateData = templateData;
 //ASP.NET Core Code Blocks
 ViewBag.localData = templateData.DataSource;
 return View();
 }
 }
}
```

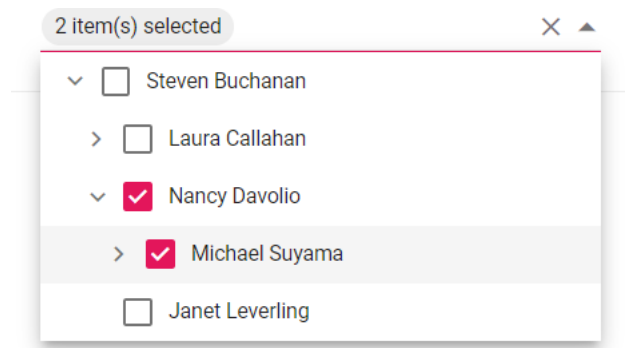

### DROPDOWNTREETEMPLATE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
namespace itemtemplates.Models
{
 public class DropDownTreeTemplate
 {
 public List<Object> Template()
 {
 List<object> localData = new List<object>();
 localData.Add(new { id = 1, name = "Steven Buchanan", hasChild =
true, expanded = true, job = "General Manager" });
 }
 }
}
```

```

 localData.Add(new { id = 2, pid = 1, name = "Laura Callahan",
job = "Product Manager", hasChild = true });
 localData.Add(new { id = 3, pid = 2, name = "Andrew Fuller",
job = "Team Lead", hasChild = true });
 localData.Add(new { id = 4, pid = 3, name = "Anne Dodsworth",
job = "Developer" });
 localData.Add(new { id = 5, pid = 3, name = "Lilly", job =
"Developer", status = "online" });
 localData.Add(new { id = 6, pid = 1, name = "Nancy Davolio",
job = "Product Manager", hasChild = true });
 localData.Add(new { id = 7, pid = 6, name = "Michael Suyama",
job = "Team Lead", hasChild = true });
 localData.Add(new { id = 8, pid = 7, name = "Robert King", job
= "Developer" });
 localData.Add(new { id = 9, pid = 7, name = "Mary", job =
"Developer" });
 localData.Add(new { id = 10, pid = 1, name = "Janet Leverling",
job = "HR" });
 return localData;
 }
}

```

In the following sample, the DropDown Tree is rendered with custom value of the **customTemplate** property like **Selected items count: 2**.

### CSHTML

```

@using Syncfusion.EJ2.DropDowns
<div class="control-section">
 <div style="margin: 0 auto; width:350px;">
 @Html.EJS().DropDownTree("ddt").Placeholder("Select an
employee").Mode(Mode.Custom).CustomTemplate("Selected item(s) count:
${value.length}").ShowCheckBox(true).PopupHeight("200px").Fields(ViewBag.tem
plateData).Render()
 </div>
</div>

```

### CUSTOMTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;

```

```

using System.Web.Mvc;
using itemtemplates.Models;
using Syncfusion.EJ2.DropDowns;
namespace itemtemplates.Controllers
{
 public class HomeController : Controller
 {
 DropDownTreeFields templateData = new DropDownTreeFields();
 public ActionResult Index()
 {
 //ASP.NET MVC Code Blocks
 DropDownTreeTemplate dropdownTreeTemplate = new
DropDownTreeTemplate();
 templateData.DataSource = dropdownTreeTemplate.Template();
 templateData.Value = "id";
 templateData.Text = "name";
 templateData.Expanded = "expanded";
 templateData.HasChildren = "hasChild";
 templateData.ParentValue = "pid";
 ViewBag.templateData = templateData;
 //ASP.NET Core Code Blocks
 ViewBag.localData = templateData.DataSource;
 return View();
 }
 }
}

```

### DROPDOWNTREETEMPLATE.CS

```

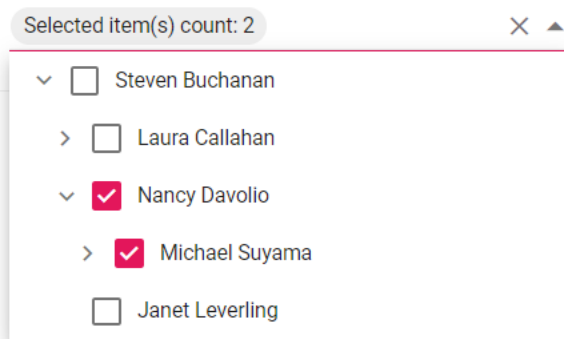

using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
namespace itemtemplates.Models
{
 public class DropDownTreeTemplate
 {
 public List<Object> Template()
 {
 List<object> localData = new List<object>();
 localData.Add(new { id = 1, name = "Steven Buchanan", hasChild =
true, expanded = true, job = "General Manager" });
 localData.Add(new { id = 2, pid = 1, name = "Laura Callahan",
job = "Product Manager", hasChild = true });
 localData.Add(new { id = 3, pid = 2, name = "Andrew Fuller",
job = "Team Lead", hasChild = true });
 localData.Add(new { id = 4, pid = 3, name = "Anne Dodsworth",
job = "Developer" });
 localData.Add(new { id = 5, pid = 3, name = "Lilly", job =
"Developer", status = "online" });
 localData.Add(new { id = 6, pid = 1, name = "Nancy Davolio",
job = "Product Manager", hasChild = true });
 localData.Add(new { id = 7, pid = 6, name = "Michael Suyama",
job = "Team Lead", hasChild = true });
 localData.Add(new { id = 8, pid = 7, name = "Robert King", job
= "Developer" });
 }
 }
}

```

```

 localData.Add(new { id = 9, pid = 7, name = "Mary", job =
"Developer" });
 localData.Add(new { id = 10, pid = 1, name = "Janet Leverling",
job = "HR" });
 return localData;
 }
}

```

## CheckBox

The Dropdown Tree control allows to check more than one item from the tree without affecting the UI's appearance by enabling the `showCheckBox` property. When this property is enabled, checkbox appears before each item text in the popup.

In the following example, the `showCheckBox` property is enabled.

### CSHTML

```

<div id='container' style="margin:0 auto; width:250px;">
 @Html.EJS().DropDownTree("treedata").ShowCheckBox(true).Fields(field =>
 field.Value("id").ParentValue("pid").HasChildren("hasChild").Text("name").Da
 taSource(ViewBag.dataSource)).Render()
</div>

```

### CHECKBOX.CS

```

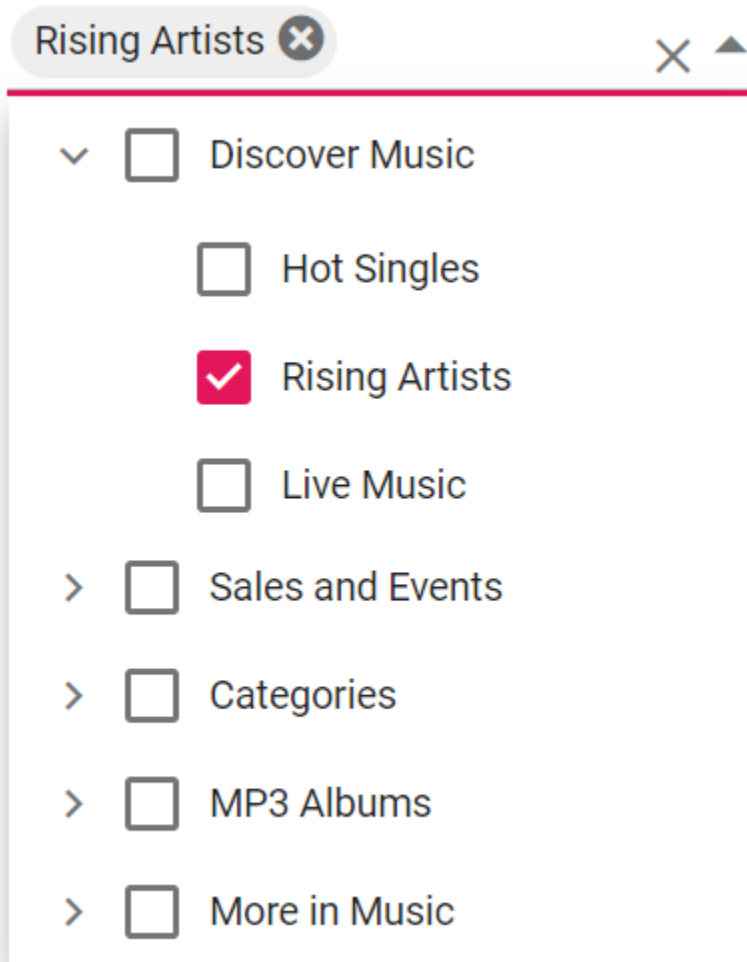

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using DropDownList.Models;
using Syncfusion.EJ2.DropDowns;
namespace DropDownList.Controllers
{
 public class DropDownListController : Controller
 {
 public IActionResult CheckBox()
 {
 List<object> treedata = new List<object>();
 treedata.Add(new

```

```
{
 id = 1,
 name = "Discover Music",
 hasChild = true,
 expanded = true
});
treedata.Add(new
{
 id = 2,
 pid = 1,
 name = "Hot Singles",
});
treedata.Add(new
{
 id = 3,
 pid = 1,
 name = "Rising Artists"
});
treedata.Add(new
{
 id = 4,
 pid = 1,
 name = "Live Music"
});
treedata.Add(new
{
 id = 5,
 hasChild = true,
 name = "Sales and Events",
});
treedata.Add(new
{
 id = 6,
 pid = 5,
 name = "100 Albums - $5 Each",
});
treedata.Add(new
{
 id = 7,
 pid = 5,
 name = "Hip-Hop and R&B Sale"
});
treedata.Add(new
{
 id = 8,
 pid = 5,
 name = "CD Deals"
});
treedata.Add(new
{
 id = 10,
 hasChild = true,
 name = "Categories"
});
treedata.Add(new
{
 id = 11,
```

```
 pid = 10,
 name = "Bestselling Albums",
 });
 treedata.Add(new
 {
 id = 12,
 pid = 10,
 name = "New Releases"
 });
 treedata.Add(new
 {
 id = 13,
 pid = 10,
 name = "Bestselling Songs"
 });
 treedata.Add(new
 {
 id = 14,
 hasChild = true,
 name = "MP3 Albums"
 });
 treedata.Add(new
 {
 id = 15,
 pid = 14,
 name = "Rock"
 });
 treedata.Add(new
 {
 id = 16,
 name = "Gospel",
 pid = 14,
 });
 treedata.Add(new
 {
 id = 17,
 pid = 14,
 name = "Latin Music"
 });
 treedata.Add(new
 {
 id = 18,
 pid = 14,
 name = "Jazz"
 });
 treedata.Add(new
 {
 id = 19,
 hasChild = true,
 name = "More in Music"
 });
 treedata.Add(new
 {
 id = 20,
 pid = 19,
 name = "Music Trade-In"
 });
});
```

```
 treedata.Add(new
 {
 id = 21,
 name = "Redeem a Gift Card",
 pid = 19
 });
 treedata.Add(new
 {
 id = 22,
 pid = 19,
 name = "Band T-Shirts"
 });
 ViewBag.dataSource = treedata;
 return View();
 }
}
```

### Auto Check

By default, the checkbox state of the parent and child items in the Dropdown Tree will not be dependent over each other. If you need dependent checked state, then enable the `autoCheck` property which is a member of `treeSettings` property.

- If one or more child items are not in the checked state, then the parent item will be in the intermediate state.
- If all the child items are checked, then the parent item will also be in the checked state.
- If a parent item is checked, then all the child items will also be changed to checked state.

In the following example, the `autoCheck` property is enabled.

### CSHTML

```
<div id='container' style="margin:0 auto; width:250px;">
 @Html.EJS().DropDownTree("treedata").ShowCheckBox(true).Fields(field =>
 field.Value("id").ParentValue("pid").HasChildren("hasChild").Text("name").DataSource(ViewBag.dataSource)).TreeSettings(treeSettings =>
 treeSettings.AutoCheck(true)).Render()
</div>
```

### AUTOCHECK.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using DropDownTree.Models;
using Syncfusion.EJ2.DropDowns;
namespace DropDownTree.Controllers
{
 public class DropDownListController : Controller
 {
 public IActionResult AutoCheck()
 {
 List<object> treedata = new List<object>();
 treedata.Add(new
 {
 id = 1,
 name = "Discover Music",
 hasChild = true,
 expanded = true
 });
 treedata.Add(new
 {
 id = 2,
 pid = 1,
 name = "Hot Singles",
 });
 treedata.Add(new
 {
```

```
 id = 3,
 pid = 1,
 name = "Rising Artists"
 });
 treedata.Add(new
 {
 id = 4,
 pid = 1,
 name = "Live Music"
 });
 treedata.Add(new
 {
 id = 5,
 hasChild = true,
 name = "Sales and Events",
 });
 treedata.Add(new
 {
 id = 6,
 pid = 5,
 name = "100 Albums - $5 Each",
 });
 treedata.Add(new
 {
 id = 7,
 pid = 5,
 name = "Hip-Hop and R&B Sale"
 });
 treedata.Add(new
 {
 id = 8,
 pid = 5,
 name = "CD Deals"
 });
 treedata.Add(new
 {
 id = 10,
 hasChild = true,
 name = "Categories"
 });
 treedata.Add(new
 {
 id = 11,
 pid = 10,
 name = "Bestselling Albums",
 });
 treedata.Add(new
 {
 id = 12,
 pid = 10,
 name = "New Releases"
 });
 treedata.Add(new
 {
 id = 13,
 pid = 10,
 name = "Bestselling Songs"
```

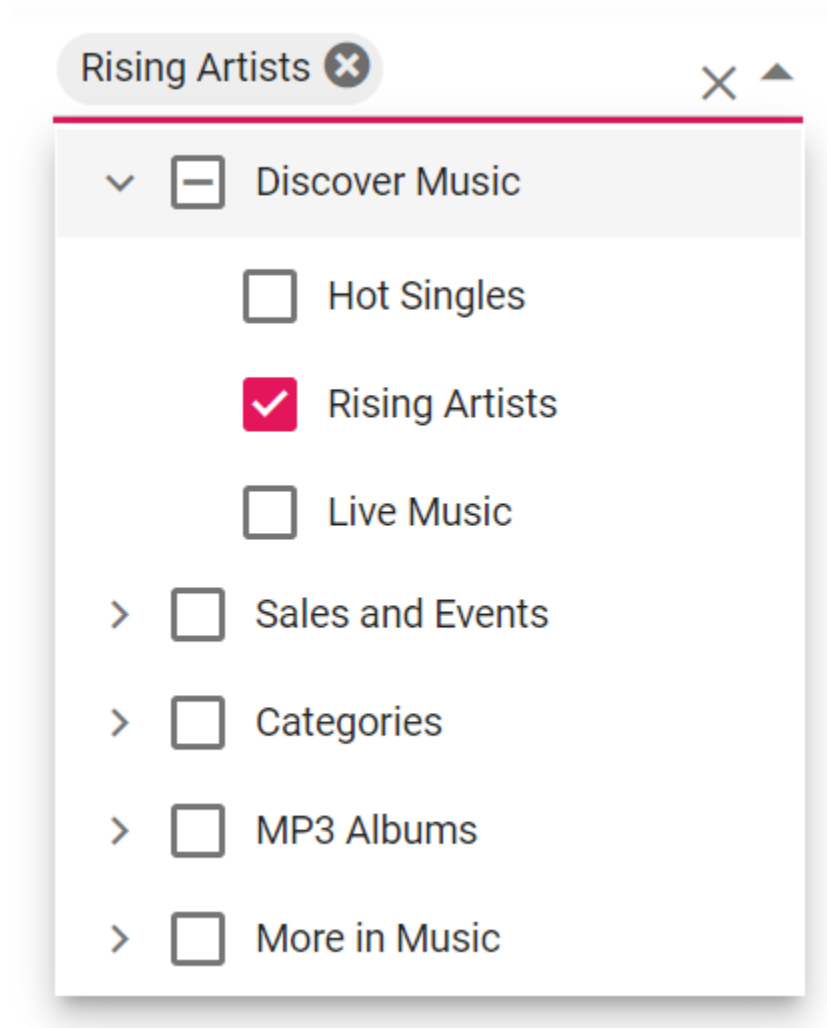

```
});
treedata.Add(new
{
 id = 14,
 hasChild = true,
 name = "MP3 Albums"
});
treedata.Add(new
{
 id = 15,
 pid = 14,
 name = "Rock"
});
treedata.Add(new
{
 id = 16,
 name = "Gospel",
 pid = 14,
});
treedata.Add(new
{
 id = 17,
 pid = 14,
 name = "Latin Music"
});
treedata.Add(new
{
 id = 18,
 pid = 14,
 name = "Jazz"
});
treedata.Add(new
{
 id = 19,
 hasChild = true,
 name = "More in Music"
});
treedata.Add(new
{
 id = 20,
 pid = 19,
 name = "Music Trade-In"
});
treedata.Add(new
{
 id = 21,
 name = "Redeem a Gift Card",
 pid = 19
});
treedata.Add(new
{
 id = 22,
 pid = 19,
 name = "Band T-Shirts"
});
ViewBag.dataSource = treedata;
return View();
```

```

 }
}
}

```

### Select All

The Dropdown Tree control has in-built support to select all the tree items using Select All options in the header.

When the `showSelectAll` property is set to true, a checkbox will be displayed in the popup header that allows to select or deselect all the tree items in the popup.

By default, `Select All` and `unSelect All` text values will be showcased along with the checkbox in the popup header to indicate the action to be performed on checking or unchecking the checkbox. You can customize these name attributes by using `selectAllText` and `unSelectAllText` properties respectively.

### CSHTML

```

<div id='container' style="margin:0 auto; width:250px;">

@Html.EJS().DropDownTree("treedata").ShowCheckBox(true).ShowSelectAll(true).
SelectAllText("Check All").UnSelectAllText("UnCheck All").Fields(field =>

```

```
field.Value("id").ParentValue("pid").HasChildren("hasChild").Text("name").DataSource(ViewBag.dataSource)).Render()
</div>
```

### SELECTALL.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using DropDownTree.Models;
using Syncfusion.EJ2.DropDowns;
namespace DropDownTree.Controllers
{
 public class DropDownListController : Controller
 {
 public IActionResult SelectAll()
 {
 List<object> treedata = new List<object>();
 treedata.Add(new
 {
 id = 1,
 name = "Discover Music",
 hasChild = true,
 expanded = true
 });
 treedata.Add(new
 {
 id = 2,
 pid = 1,
 name = "Hot Singles",
 });
 treedata.Add(new
 {
 id = 3,
 pid = 1,
 name = "Rising Artists"
 });
 treedata.Add(new
 {
 id = 4,
 pid = 1,
 name = "Live Music"
 });
 treedata.Add(new
 {
 id = 5,
 hasChild = true,
 name = "Sales and Events",
 });
 treedata.Add(new
 {
 id = 6,
```

```
 pid = 5,
 name = "100 Albums - $5 Each",
 });
 treedata.Add(new
 {
 id = 7,
 pid = 5,
 name = "Hip-Hop and R&B Sale"
 });
 treedata.Add(new
 {
 id = 8,
 pid = 5,
 name = "CD Deals"
 });
 treedata.Add(new
 {
 id = 10,
 hasChild = true,
 name = "Categories"
 });
 treedata.Add(new
 {
 id = 11,
 pid = 10,
 name = "Bestselling Albums",
 });
 treedata.Add(new
 {
 id = 12,
 pid = 10,
 name = "New Releases"
 });
 treedata.Add(new
 {
 id = 13,
 pid = 10,
 name = "Bestselling Songs"
 });
 treedata.Add(new
 {
 id = 14,
 hasChild = true,
 name = "MP3 Albums"
 });
 treedata.Add(new
 {
 id = 15,
 pid = 14,
 name = "Rock"
 });
 treedata.Add(new
 {
 id = 16,
 name = "Gospel",
 pid = 14,
 });
 });
```

```
 treedata.Add(new
 {
 id = 17,
 pid = 14,
 name = "Latin Music"
 });
 treedata.Add(new
 {
 id = 18,
 pid = 14,
 name = "Jazz"
 });
 treedata.Add(new
 {
 id = 19,
 hasChild = true,
 name = "More in Music"
 });
 treedata.Add(new
 {
 id = 20,
 pid = 19,
 name = "Music Trade-In"
 });
 treedata.Add(new
 {
 id = 21,
 name = "Redeem a Gift Card",
 pid = 19
 });
 treedata.Add(new
 {
 id = 22,
 pid = 19,
 name = "Band T-Shirts"
 });
 ViewBag.dataSource = treedata;
 return View();
 }
}
```

### Accessibility in ASP.NET MVC Dropdown Tree component

The Dropdown Tree component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Dropdown Tree component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Dropdown Tree component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Dropdown Tree component:

| Attributes | Purpose |

| --- | --- |

| **role=listbox** | All list items are contained within the element. |

| **aria-disabled** | Indicates element is perceivable but disabled. |

| **aria-owns** | This attribute contains the ID of the popup list to indicate popup as a child element. |

| **aria-haspopup** | Indicates whether the Dropdown Tree input element has a popup list or not. |

| **aria-expanded** | Indicates the state of the popup list for Dropdown Tree and the parent node's expansion status for TreeView. |

| **aria-activedescendent** | This attribute holds the ID of the active list item to focus its descendant child element. |

| **aria-labelledby** | This attribute points to the element(s) labeling the element it's applied to. |

- | **aria-decribedby** | This attribute points to the element(s) describing the one it's set on. |
- | **role=tree** | All tree nodes are contained within the element. |
- | **role=treeitem** | Specifies the role of each tree node in a selectable TreeView and its containment within the tree. |
- | **role=group** | Specifies the role of each parent node container in the TreeView. |
- | **role=checkbox** | Indicates checkbox control along with treeitem element. |
- | **aria-multiselectable** | Indicates whether the TreeView enables multiple selection or not. |
- | **aria-selected** | Indicates the selected node. |
- | **aria-level** | Indicates the level of node in TreeView. |
- | **aria-checked** | Indicates the current checked state of TreeView checkbox. |
- | **aria-label** | Indicates the contextual message for the TreeView checkbox and Dropdown Tree. |
- | **aria-activedescendant** | Identifies the currently active element when focusing on the TreeView. |

#### Keyboard interaction

The Dropdown Tree component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Dropdown Tree component.

| Interaction Keys | Description |

|-----|-----|

| **Alt + Down** | Opens the popup. |

| **Alt + Up** | Closes the popup. |

| **Esc(Escape)** | Closes the popup when it is in an open state. |

| **Arrow Up** | Goes to the previous item in the popup. |

| **Arrow Down** | Goes to the next item in the popup. |

| **Arrow Right** | Expands the current item in the popup. |

| **Arrow Left** | Collapses the current item in the popup. |

| **Home** | Goes to the first item in the popup. |

| **End** | Goes to the last item in the popup. |

| **Enter** | Selects the focused item in the popup. |

| **Space** | Checks the current item in the popup. |

#### Ensuring accessibility

The Dropdown Tree component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Dropdown Tree component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Dropdown Tree component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET MVC components](#)

## Localization in Dropdown Tree Component

The Dropdown Tree component can be localized to any culture by defining the texts and messages of the Dropdown Tree in the corresponding culture. The default locale of the Dropdown Tree is **en** (English). The following table represents the default texts and messages of the Dropdown Tree in **en** culture.

KEY Text/Message
---- ----
noRecordsTemplate No records found
actionFailureTemplate Request failed
overflowCountTemplate +\${count} more..
totalCountTemplate \${count} selected

## File Manager

### Getting Started with ASP.NET MVC FileManager Control

This section briefly explains about how to include [ASP.NET MVC FileManager](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

##### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

##### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC FileManager Control

Now, add the Syncfusion ASP.NET MVC FileManager control in **~/Views/Home/Index.cshtml** page.

##### CSHTML

```
<div class="control-section">
 <div class="sample-container">
```

```

 <!-- Filemanager element declaration -->
 @Html.EJS().FileManager("file").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations"
 }).NavigationPaneSettings(ls =>
ls.Visible(false)).ContextMenuSettings(ls =>
ls.Visible(false)).ToolbarSettings(ls => ls.Visible(false)).Render()
 <!-- end of filemanager element -->
 </div>
</div>

```

## HOMECONTROLLER.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Mvc;
//File Manager's base functions are available in the below package
using Syncfusion.EJ2.FileManager.Base;
//File Manager's operations are available in the below package
using Syncfusion.EJ2.FileManager.PhysicalFileProvider;
using Newtonsoft.Json;
// Use the package for hosting
using System.Web.Hosting;
namespace WebApplication.Controllers
{
 public class HomeController : Controller
 {
 // Accessing the File Operations from File Manager package
 PhysicalFileProvider operation = new PhysicalFileProvider();
 public HomeController()
 {
 // Map the path of the files to be accessed with the host
 var path = HostingEnvironment.MapPath("~/Content/Files");
 // Assign the mapped path as root folder
 operation.RootFolder(path);
 }
 public ActionResult FileOperations(FileManagerDirectoryContent args)
 {
 // Processing the File Manager operations
 switch (args.Action)
 {
 case "read":
 // Path - Current path; ShowHiddenItems - Boolean value
 // to show/hide hidden items
 return
 Json(operation.ToCamelCase(operation.GetFiles(args.Path,
 args.ShowHiddenItems)));
 case "delete":
 // Path - Current path where of the folder to be
 // deleted; Names - Name of the files to be deleted
 return
 Json(operation.ToCamelCase(operation.Delete(args.Path, args.Names)));
 case "copy":

```

```

 // Path - Path from where the file was copied;
 TargetPath - Path where the file/folder is to be copied; RenameFiles - Files
 with same name in the copied location that is confirmed for renaming;
 TargetData - Data of the copied file
 return
 Json(operation.ToCamelCase(operation.Copy(args.Path, args.TargetPath,
 args.Names, args.RenameFiles, args.TargetData)));
 case "move":
 // Path - Path from where the file was cut; TargetPath -
 Path where the file/folder is to be moved; RenameFiles - Files with same
 name in the moved location that is confirmed for renaming; TargetData - Data
 of the moved file
 return
 Json(operation.ToCamelCase(operation.Move(args.Path, args.TargetPath,
 args.Names, args.RenameFiles, args.TargetData)));
 case "details":
 if (args.Names == null)
 {
 args.Names = new string[] { };
 }
 // Path - Current path where details of file/folder is
 requested; Name - Names of the requested folders
 return
 Json(operation.ToCamelCase(operation.Details(args.Path, args.Names)));
 case "create":
 // Path - Current path where the folder is to be
 created; Name - Name of the new folder
 return
 Json(operation.ToCamelCase(operation.Create(args.Path, args.Name)));
 case "search":
 // Path - Current path where the search is performed;
 SearchString - String typed in the searchbox; CaseSensitive - Boolean value
 which specifies whether the search must be casesensitive
 return
 Json(operation.ToCamelCase(operation.Search(args.Path, args.SearchString,
 args.ShowHiddenItems, args.CaseSensitive)));
 case "rename":
 // Path - Current path of the renamed file; Name - Old
 file name; NewName - New file name
 return
 Json(operation.ToCamelCase(operation.Rename(args.Path, args.Name,
 args.NewName)));
 }
 return null;
 }
 // Processing the Upload operation
 public ActionResult Upload(string path,
 IList<System.Web.HttpPostedFileBase> uploadFiles, string action)
 {
 FileManagerResponse uploadResponse;
 //Invoking upload operation with the required paramaters
 // path - Current path where the file is to uploaded;
 uploadFiles - Files to be uploaded; action - name of the operation(upload)
 uploadResponse = operation.Upload(path, uploadFiles, action,
 null);
 return Content("");
 }

```

```
// Processing the Download operation
public ActionResult Download(string downloadInput)
{
 FileManagerDirectoryContent args =
 JsonConvert.DeserializeObject<FileManagerDirectoryContent>(downloadInput);
 //Invoking download operation with the required paramaters
 // path - Current path where the file is downloaded; Names -
 Files to be downloaded;
 return operation.Download(args.Path, args.Names);
}
// Processing the GetImage operation
public ActionResult GetImage(FileManagerDirectoryContent args)
{
 //Invoking GetImage operation with the required paramaters
 // path - Current path of the image file; Id - Image file id;
 return operation.GetImage(args.Path, args.Id, false, null,
null);
}
public ActionResult Index()
{
 return View();
}
}
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC FileManager control will be rendered in the default web browser.

**Note:** The File Manager can be rendered with **local service** for sending ajax request. Ajax request will be sent to the server which then processes the request and sends back the response. Refer Controller file for file manager service.

### File Download support

To perform the download operation, initialize the **DownloadUrl** property in a [AjaxSettings](#) of File Manager component.

#### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 DownloadUrl = "/Home/Download"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### File Upload support

To perform the upload operation, initialize the **UploadUrl** property in a [AjaxSettings](#) of File Manager Component.

#### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 UploadUrl = "/Home/Upload"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

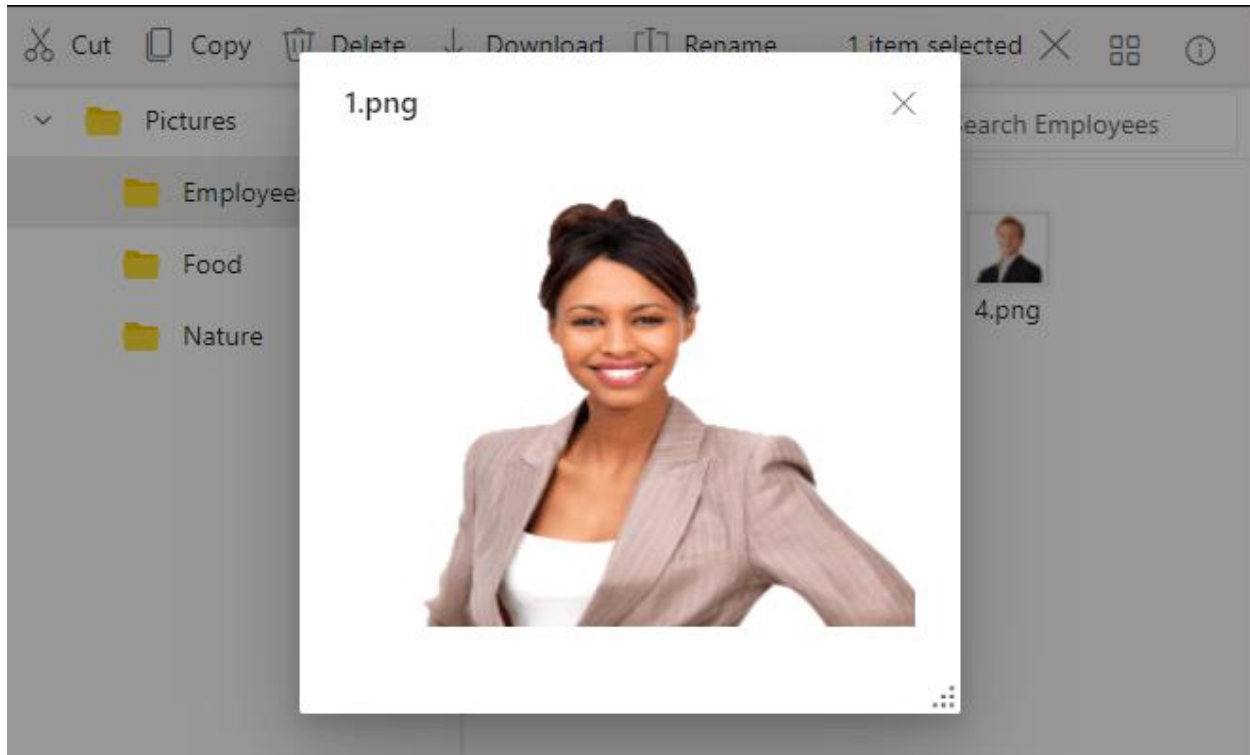

### Image Preview support

To perform the image preview support in the File Manager component, need to initialize the [GetImageUrl](#) property in a [AjaxSettings](#) of File Manager component.

#### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
```

```
 GetImageUrl = "/Home/GetImage"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### File Manager Overview

By default, the File Manager component having extra module like [NavigationPane](#), [Toolbar](#), [ContextMenu](#) module.

In this sample demonstrates the full features of the File Manager that includes toolbar, navigation pane and details view.

}
}
}

```

**Note:** The appearance of the File Manager can be customized by using [cssClass](#) property. This adds a css class to the root of the File Manager which can be used to add new styles or override existing styles to the File Manager.

#### Switching initial view of the File Manager

The initial view of the File Manager can be changed to details or largeicons view with the help of [View](#) property. By default, the File Manager will be rendered in large icons view. When the File Manager is initially rendered, [Created](#) will be triggered. This event can be utilized for performing operations once the File Manager has been successfully created.

#### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).View(Syncfusion.EJ2.FileManager.ViewType.Details).Created("onCreated").Render()
 <!-- end of filemanager element -->
 </div>
</div>
<script>
 // File Manager's created event function
 function onCreated() {
```

```
 console.log("File Manager has been created successfully");
 }
</script>
```

 return View();
 }
}
}

```

#### Maintaining component state on page reload

The File Manager supports maintaining the component state on page reload. This can be achieved by enabling [EnablePersistence](#) property which maintains the following,

- Previous view of the File Manager - [View](#)
- Previous path of the File Manager - [Path](#)
- Previous selected items of the File Manager - [SelectedItems](#)

For every operation in File Manager, ajax request will be sent to the server which then processes the request and sends back the response. When the ajax request is success, [Success](#) event will be triggered and [Failure](#) event will be triggered if the request gets failed.

**CSHTML**

```

<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).EnablePersistence(true).Success("onSuccess").Failure("onFailure").Render(
)
 <!-- end of filemanager element -->
 </div>
</div>
<script>
 // File Manager's file onSuccess function
 function onSuccess() {
 console.log("Ajax request successful");
 }
 // File Manager's file onError function
 function onFailure() {
 console.log("Ajax request has failed");
 }
</script>

```

**HOMECONTROLLER.CS**

{
 return View();
}
}
}

```

**Note:** The files of the current folder opened in the File Manager can be refreshed programmatically by calling `refreshFiles` method

Rendering component in right-to-left direction

It is possible to render the File Manager in right-to-left direction by setting the [EnableRtl](#) API to true.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).EnableRtl(true).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### HOMECONTROLLER.CS

```

### Specifying the current path of the File Manager

The current path of the File Manager can be specified initially or dynamically using the [Path](#) property.

#### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).Path("/Pictures/Employees").Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

#### HOMECONTROLLER.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Mvc;
//File Manager's base functions are available in the below package
using Syncfusion.EJ2.FileManager.Base;
//File Manager's operations are available in the below package
```

```

using Syncfusion.EJ2.FileManager.PhysicalFileProvider;
using Newtonsoft.Json;
// Use the package for hosting
using System.Web.Hosting;
namespace WebApplication.Controllers
{
 public class HomeController : Controller
 {
 // Accessing the File Operations from File Manager package
 PhysicalFileProvider operation = new PhysicalFileProvider();
 public HomeController()
 {
 // Map the path of the files to be accessed with the host
 var path = HostingEnvironment.MapPath("~/Content/Files");
 // Assign the mapped path as root folder
 operation.RootFolder(path);
 }
 public ActionResult FileOperations(FileManagerDirectoryContent args)
 {
 // Processing the File Manager operations
 switch (args.Action)
 {
 case "read":
 // Path - Current path; ShowHiddenItems - Boolean value
 // to show/hide hidden items

**Note:** [View Sample in GitHub.](#)

### User Interface Structure

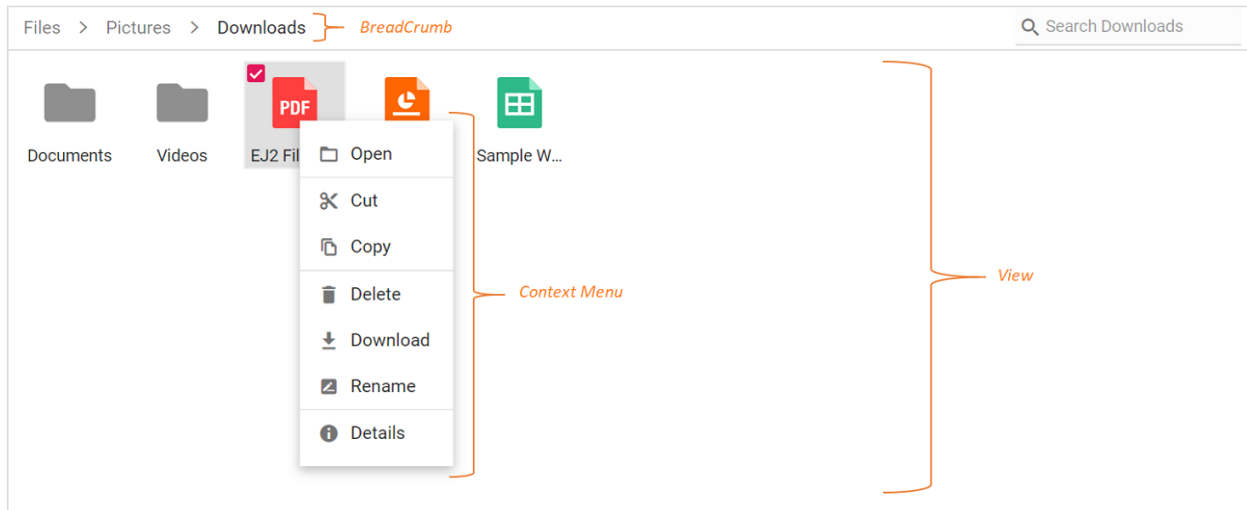

The file manager UI is comprised of several sections like view, toolbar, breadcrumb, context menu, and so on. The UI of the file manager is enhanced with injectable modules like **Details View** for browsing files and folders in a grid, **Navigation Pane** for folder navigation, and **Toolbar** for file operations. The file manager with all feature modules have the following sections in its UI.

- [Toolbar](#) (For direct access to file operations)
- [Navigation Pane](#) (For easy navigation between folders)
- [Breadcrumb](#) (For parent folder navigations)
- [View](#) (For browsing files and folders using large icon view or details view)
- [Context Menu](#) (For accessing file operations)

The basic file manager is a light weight component with all the basic functions. The basic file manager have the following sections in its UI to browse files and folders and manage them with file operations.

- [Breadcrumb](#) (For parent folder navigations)
- [View](#) (Large Icons view for browsing files and folders)
- [Context Menu](#) (For accessing file operations)

### Toolbar

The **Toolbar** provides easy access to the file operations using different buttons and it is presented at the top of the file manager.

If the toolbar items exceed the size of the toolbar, then the exceeding toolbar size will be moved to toolbar popup with a dropdown button at the end of toolbar.

*\*Refer [Toolbar](#) section in file operations to know more about the buttons present in toolbar\*.*

### Files and folders navigation

The file manager provides navigation between files and folders using the following two options.

- [Navigation Pane](#)
- [Breadcrumb](#)

#### Navigation pane

FileManager provides navigation pane, it displays the folder hierarchy of the file system and provides easy navigation to the desired folder. Using `navigationPaneSettings` minimum and maximum width of the navigation pane can be changed. The navigation pane can be shown or hidden using the `visible` option in the `navigationPaneSettings`.

#### BreadCrumb

The file manager provides breadcrumb for navigating to the parent folders. The breadcrumb the in file manager is responsible for resizing. Whenever the path length exceeds the breadcrumb length, a dropdown button will be added at the starting of the breadcrumb to hold the parent folders adjacent to root.

### View

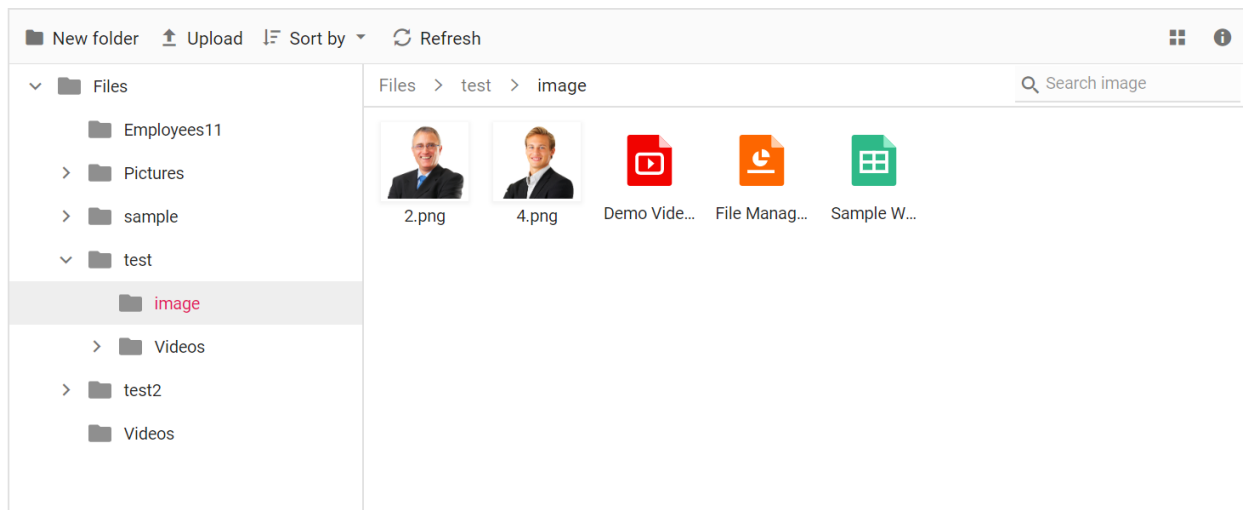

View is the section where the files and folders are displayed for the user to browse. The file manager has two types of views to display the files and folders.

- [Large Icons View](#)
- [Details View](#)

The **large icons view** is the default starting view in the file manager. The view can be changed by using the **toolbar** view button or by using the view menu in **context menu**. The **view** API can also be used to change the initial view of the file manager.

#### Large icons view

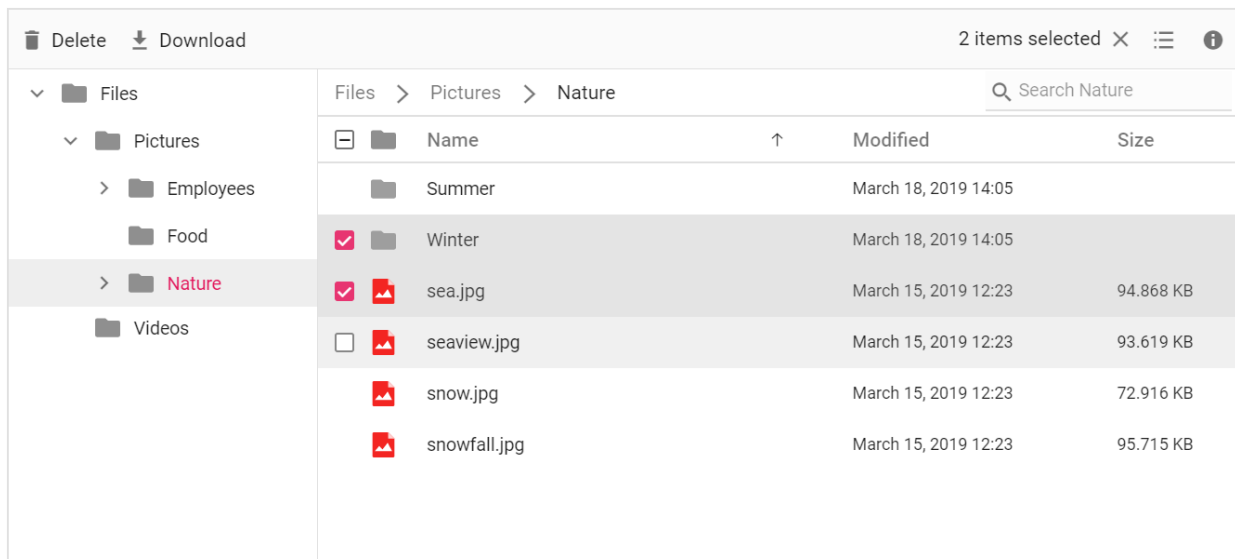

In the large icons view, the thumbnail icons will be shown in a larger size, which displays the data in a form that best suits their content. For image and video type files, a **preview** will be displayed. Extension thumbnails will be displayed for other type files.

#### Details view

FileManager can be changed from large icon to details view by using **View** property. In the details view, the files are displayed in a sorted list order. This file list comprises of several columns of information

about the files such as **Name**, **Date Modified**, **Type**, and **Size**. Each file has its own small icon representing the file type. Additional columns can be added using `detailsViewSettings` API. The details view allows you to perform sorting using column header.

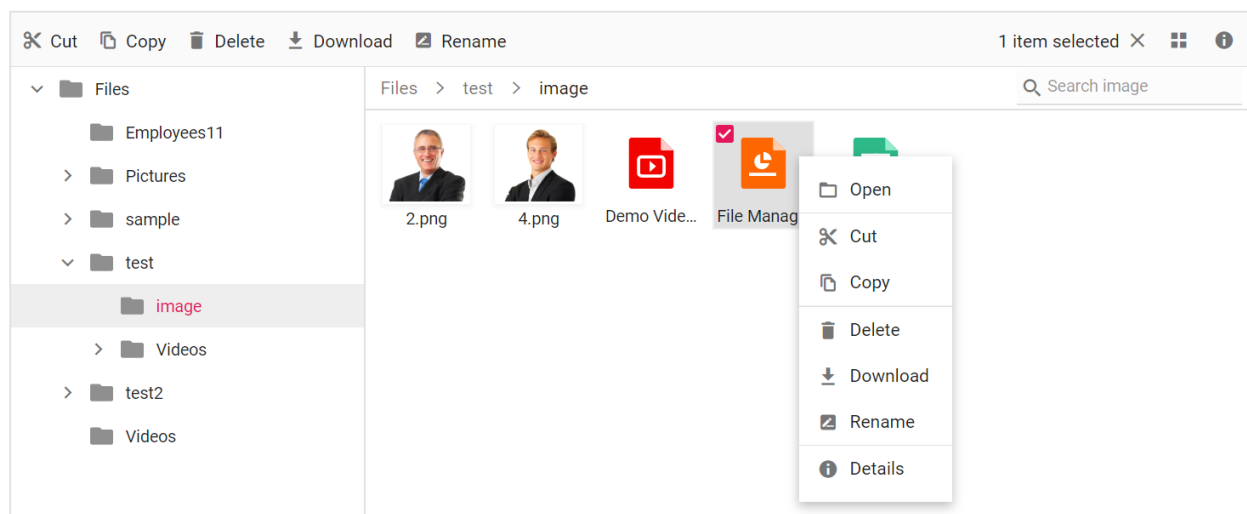

### Context menu

The context menu appears on user interaction such as right-click. The file manager is provided with context menu support to perform list of file operations with the files and folders. Context menu appears with varying menu items based on the targets such as file, folder (including navigation pane folders), and layout (empty area in view).

Context menu can be customized using the `contextMenuSettings`, `menuOpen`, and `menuClick` events.

*\*Refer [Context Menu](#) section in file operations to know more about the menu items present in context menu\*.*

### File Operations in FileManager Component

The file manager component is used to browse, manage, and organize the files and folders in a file system through a web application. All basic file operations like creating a new folder, uploading and downloading of files in the file system, and deleting and renaming of existing files and folders are available in the file manager component. Additionally, previewing of image files is also provided in the file manager component.

The following table represents the basic operations available in the file manager and their corresponding functions.

Operation Name	Function
----------------	----------

----	----
------	------

read	Read the details of files or folders available in the given path from the file system, to display the files for the user to browse the content.
------	-------------------------------------------------------------------------------------------------------------------------------------------------

create	Creates a new folder in the current path of the file system.
--------	--------------------------------------------------------------

delete	Removes the file or folder from the file server.
--------	--------------------------------------------------

rename	Rename the selected file or folder in the file system.
--------	--------------------------------------------------------

search	Searches for items matching the search string in the current and child directories.
--------	-------------------------------------------------------------------------------------

details	Gets the detail of the selected item(s) from the file server.
---------	---------------------------------------------------------------

copy	Copy the selected file or folder in the file system.
------	------------------------------------------------------

move	Cut the selected file or folder in the file server.
------	-----------------------------------------------------

upload	Upload files to the current path or directory in the file system.
--------	-------------------------------------------------------------------

download	Downloads the file from the server and the multiple files can be downloaded as ZIP files.
----------	-------------------------------------------------------------------------------------------

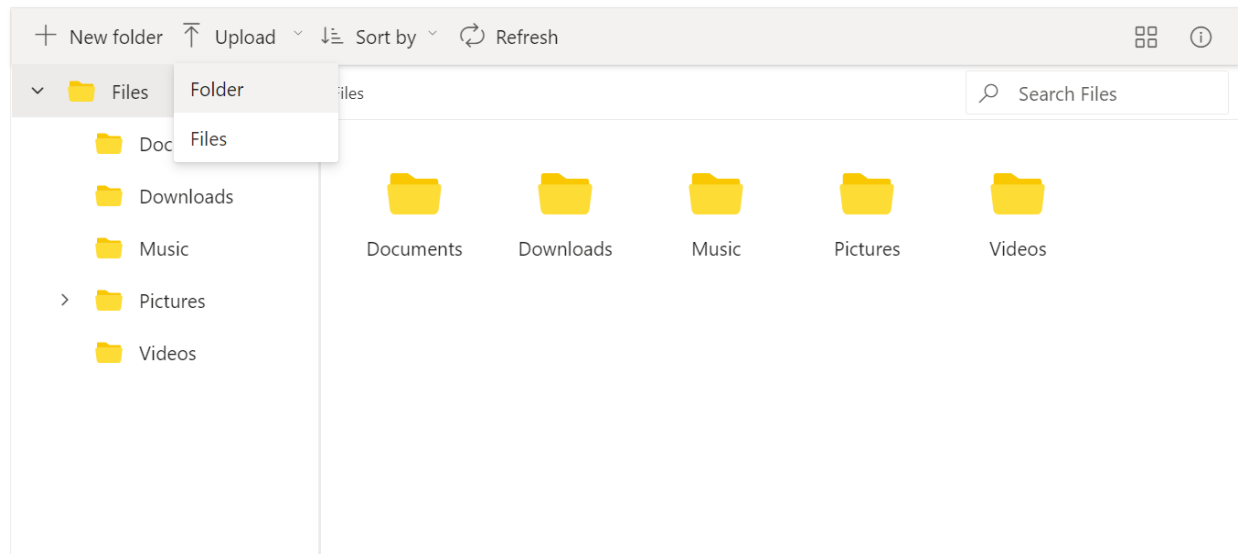

---

**Note:** The *CreateFolder*, *Remove*, and *Rename* actions will be reflected in the file manager only after the successful response from the server.

---

## Folder Upload support

To perform the directory(folder) upload in File Manager, set

`directoryUpload` property as true within the `uploadSettings` property. The directory upload feature is supported for the following file service providers:

- Physical file service provider.
- Azure file service provider.
- NodeJS file service provider.
- Amazon file service provider.

In the following example, directory upload is enabled/disabled on `DropDownButton` selection.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Filemanager element declaration -->
 @Html.EJS().FileManager("file").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).AllowDragAndDrop(true).FileDragStart("onFileDragStart").FileDragStop("onF
 ileDragStop").FileDragging("onFileDragging").FileDropped("onFileDropped").Re
 nder()
 <!-- end of filemanager element -->
 </div>
</div>
<script>
```

```

function onFileDragStart() {
 console.log("Drag start");
}
function onFileDragStop() {
 console.log("Drag stop");
}
function onFileDragging() {
 console.log("File Dragging");
}
function onFileDropped() {
 console.log("File Dropped");
}
</script>

```

### HOMECONTROLLER MVC.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Mvc;
//File Manager's base functions are available in the below package
using Syncfusion.EJ2.FileManager.Base;
//File Manager's operations are available in the below package
using Syncfusion.EJ2.FileManager.PhysicalFileProvider;
using Newtonsoft.Json;
// Use the package for hosting
using System.Web.Hosting;
namespace WebApplication.Controllers
{
 public class HomeController : Controller
 {
 // Accessing the File Operations from File Manager package
 PhysicalFileProvider operation = new PhysicalFileProvider();
 public HomeController()
 {
 // Map the path of the files to be accessed with the host
 var path = HostingEnvironment.MapPath("~/Content/Files");
 // Assign the mapped path as root folder
 operation.RootFolder(path);
 }
 public ActionResult FileOperations(FileManagerDirectoryContent args)
 {
 // Processing the File Manager operations
 switch (args.Action)
 {
 case "read":
 // Path - Current path; ShowHiddenItems - Boolean value
 // to show/hide hidden items
 return
 Json(operation.ToCamelCase(operation.GetFiles(args.Path,
 args.ShowHiddenItems)));
 case "delete":
 // Path - Current path where of the folder to be
 // deleted; Names - Name of the files to be deleted
 return
 Json(operation.ToCamelCase(operation.Delete(args.Path, args.Names)));
 }
 }
 }
}

```

```

 case "copy":
 // Path - Path from where the file was copied;
 TargetPath - Path where the file/folder is to be copied; RenameFiles - Files
 with same name in the copied location that is confirmed for renaming;
 TargetData - Data of the copied file
 return
 Json(operation.ToCamelCase(operation.Copy(args.Path, args.TargetPath,
 args.Names, args.RenameFiles, args.TargetData)));
 case "move":
 // Path - Path from where the file was cut; TargetPath -
 Path where the file/folder is to be moved; RenameFiles - Files with same
 name in the moved location that is confirmed for renaming; TargetData - Data
 of the moved file
 return
 Json(operation.ToCamelCase(operation.Move(args.Path, args.TargetPath,
 args.Names, args.RenameFiles, args.TargetData)));
 case "details":
 if (args.Names == null)
 {
 args.Names = new string[] { };
 }
 // Path - Current path where details of file/folder is
 requested; Name - Names of the requested folders
 return
 Json(operation.ToCamelCase(operation.Details(args.Path, args.Names)));
 case "create":
 // Path - Current path where the folder is to be
 created; Name - Name of the new folder
 return
 Json(operation.ToCamelCase(operation.Create(args.Path, args.Name)));
 case "search":
 // Path - Current path where the search is performed;
 SearchString - String typed in the searchbox; CaseSensitive - Boolean value
 which specifies whether the search must be casesensitive
 return
 Json(operation.ToCamelCase(operation.Search(args.Path, args.SearchString,
 args.ShowHiddenItems, args.CaseSensitive)));
 case "rename":
 // Path - Current path of the renamed file; Name - Old
 file name; NewName - New file name
 return
 Json(operation.ToCamelCase(operation.Rename(args.Path, args.Name,
 args.NewName)));
 }
 return null;
}
// Processing the Upload operation
public ActionResult Upload(string path,
IList<System.Web.HttpPostedFileBase> uploadFiles, string action)
{
 FileManagerResponse uploadResponse;
 //Invoking upload operation with the required paramaters
 // path - Current path where the file is to uploaded;
 uploadFiles - Files to be uploaded; action - name of the operation(upload)
 uploadResponse = operation.Upload(path, uploadFiles, action,
 null);
 return Content("");
}

```

```

 }
 // Processing the Download operation
 public ActionResult Download(string downloadInput)
 {
 FileManagerDirectoryContent args =
 JsonConvert.DeserializeObject<FileManagerDirectoryContent>(downloadInput);
 //Invoking download operation with the required paramaters
 // path - Current path where the file is downloaded; Names -
 Files to be downloaded;
 return operation.Download(args.Path, args.Names);
 }
 // Processing the GetImage operation
 public ActionResult GetImage(FileManagerDirectoryContent args)
 {
 //Invoking GetImage operation with the required paramaters
 // path - Current path of the image file; Id - Image file id;
 return operation.GetImage(args.Path, args.Id, false, null,
null);
 }
 public ActionResult Index()
 {
 return View();
 }
}
}

```

Output be like the below.

![[Directory upload](./images/directory-upload.png)]

#### Physical file service provider

To achieve the directory upload in the physical file service provider, use the below code snippet in `IActionResult Upload` method in the `Controllers/FileManagerController.cs` file.

```

`typescript
[Route("Upload")]
public IActionResult Upload(string path, IList<IFormFile> uploadFiles, string action)
{
 FileManagerResponse uploadResponse;
 foreach (var file in uploadFiles)
 {
 var folders = (file.FileName).Split('/');
 // checking the folder upload
 if (folders.Length > 1)
 {
 for (var i = 0; i < folders.Length - 1; i++)
 {

```

```
string newDirectoryPath = Path.Combine(this.basePath + path, folders[i]);
if (!Directory.Exists(newDirectoryPath))
{
 this.operation.ToCamelCase(this.operation.Create(path, folders[i]));
}
path += folders[i] + "/";
}
}
}

uploadResponse = operation.Upload(path, uploadFiles, action, null);
if (uploadResponse.Error != null)
{
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusCode = Convert.ToInt32(uploadResponse.Error.Code);
 Response.HttpContext.Features.Get<IHttpResponseFeature>().ReasonPhrase =
 uploadResponse.Error.Message;
}
return Content("");
}
`
```

Refer to the [GitHub](#) for more details

And also add the below code snippet in `FileManagerResponse Upload` method in `Models/PhysicalFileProvider.cs` file.

```
`typescript
string[] folders = name.Split('/');
string fileName = folders[folders.Length - 1];
var fullName = Path.Combine((this.contentRootPath + path), fileName);
`
```

Refer to the [GitHub](#) for more details.

#### *Azure file service provider*

For Azure file service provider, no customizations are needed for directory upload with server side and this will work with the below default upload method code.

Refer to the [GitHub](#) for more details.

*NodeJS file service provider*

To perform the directory upload in the NodeJS file service provider, use the below code snippet in `app.post` method in the `filesystem-server.js` file.

```
`typescript
var folders = (req.body.filename).split('/');
var filepath = req.body.path;
var uploadedFileName = folders[folders.length - 1];
// checking the folder upload
if (folders.length > 1)
{
for (var i = 0; i < folders.length - 1; i++)
{
var newDirectoryPath = path.join(contentRootPath + filepath, folders[i]);
if (!fs.existsSync(newDirectoryPath)) {
fs.mkdirSync(newDirectoryPath);
(async () => {
await FileManagerDirectoryContent(req, res, newDirectoryPath).then(data => {
response = { files: data };
response = JSON.stringify(response);
});
})();
}
filepath += folders[i] + "/";
}
fs.rename('./' + uploadedFileName, path.join(contentRootPath, filepath + uploadedFileName), function
(err) {
if (err) {
if (err.code !== 'EBUSY') {
errorValue.message = err.message;
errorValue.code = err.code;
}
}
});
}
```

`

Refer to the [GitHub](#) for more details.

#### *Amazon file service provider*

To perform the directory upload in the Amazon file service provider, use the below code snippet in `IActionResult AmazonS3Upload` method in the `Controllers/AmazonS3ProviderController.cs` file.

```
`typescript
foreach (var file in uploadFiles)
{
 var folders = (file.FileName).Split('/');
 // checking the folder upload
 if (folders.Length > 1)
 {
 for (var i = 0; i < folders.Length - 1; i++)
 {
 if (!this.operation.checkFileExist(path, folders[i]))
 {
 this.operation.ToCamelCase(this.operation.Create(path, folders[i], dataObject));
 }
 path += folders[i] + "/";
 }
 }
}
```

`

Refer to the [GitHub](#) for more details.

And also add the below code snippet in `AsyncUpload` method in `Models/AmazonS3FileProvider.cs` file.

```
`typescript
string[] folders = file.FileName.Split('/');
string name = folders[folders.Length - 1];
`
```

Refer to the [GitHub](#) for more details.

#### *File operation request and response Parameters*

The default parameters available in file operation request from the file manager and the corresponding response parameters required by the file manager are listed as follows.

### Read

The following table represents the request parameters of *read* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	read	Name of the file operation.
path	String	-	Relative path from which the data has to be read.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

*\*Refer [File request and response contents](#) for the contents of data\*.*

*Example:*

```
`typescript
{
 action: "read",
 path: "/",
 showHiddenItems: false,
 data: []
}
```

The following table represents the response parameters of *read* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent	-	Details of files and folders present in given path or directory.
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of cwd, files, and error\*.*

*Example:*

```
`typescript
{
 cwd:
 {
 name:"Download",
 size:0,
 dateModified:"2019-02-28T03:48:19.8319708+00:00",
```

```
dateCreated:"2019-02-27T17:36:15.812193+00:00",
hasChild:false,
isFile:false,
type:"",
filterPath:"\\Download\\"
},
files:[
{
name:"Sample Work Sheet.xlsx",
size:6172,
dateModified:"2019-02-27T17:23:50.9651206+00:00",
dateCreated:"2019-02-27T17:36:15.8151955+00:00",
hasChild:false,
isFile:true,
type:".xlsx",
filterPath:"\\Download\\"
}
],
error:null,
details:null
}
`
```

### Create

The following table represents the request parameters of *create* operations.

Parameter	Type	Default	Explanation
action	String	create	Name of the file operation.
path	String	-	Relative path in which the folder has to be created.
name	String	-	Name of the folder to be created.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

\*Refer [File request and response contents](#) for the contents of data\*

Example:

```
`typescript
```

```
{
 action: "create",
 data: [
 {
 dateCreated: "2019-02-27T17:36:15.6571949+00:00",
 dateModified: "2019-03-12T10:17:31.8505975+00:00",
 filterPath: "\",
 hasChild: true,
 isFile: false,
 name: files,
 nodeId: "fe_tree",
 size: 0,
 type: ""
 }
],
 name: "Hello",
 path: "/"
}
```

The following table represents the response parameters of *create* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the created folder
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of files and error\*.*

*Example:*

```
`typescript
{
 cwd: null,
 files: [
 {
 dateCreated: "2019-03-15T10:25:05.3596171+00:00",
 dateModified: "2019-03-15T10:25:05.3596171+00:00",
```

```
filterPath: null,
hasChild: false,
isFile: false,
name: "New",
size: 0,
type: ""
},
details: null,
error: null
},
`
```

### Rename

The following table represents the request parameters of *rename* operations.

Parameter	Type	Default	Explanation
action	String	rename	Name of the file operation.
path	String	-	Relative path in which the item is located.
name	String	-	Current name of the item to be renamed.
newname	String	-	New name for the item.
data	FileManagerDirectoryContent	-	Details of the item to be renamed.

*\*Refer [File request and response contents](#) for the contents of data\*.*

### Example:

```
`typescript
{
 action: "rename",
 data: [
 {
 dateCreated: "2019-03-20T05:22:34.621Z",
 dateModified: "2019-03-20T08:45:56.000Z",
 filterPath: "\\Pictures\\Nature\\",
 hasChild: false,
 iconClass: "e-fe-image",
```

```
isFile: true,
name: "seaviews.jpg",
size: 95866,
type: ".jpg"
},
newname: "seaview.jpg",
name: "seaviews.jpg",
path: "/Pictures/Nature/"
},
,
```

The following table represents the response parameters of *rename* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the renamed item.
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of files and error\*.*

*Example:*

```
`typescript
{
 cwd:null,
 files:[
 {
 name:"seaview.jpg",
 size:95866,
 dateModified:"2019-03-20T08:45:56+00:00",
 dateCreated:"2019-03-20T05:22:34.6214847+00:00",
 hasChild:false,
 isFile:true,
 type:".jpg",
 filterPath:"\\Pictures\\Nature\\seaview.jpg"
 }
],
}
```

```
error:null,
details:null
}
`
```

### Delete

The following table represents the request parameters of *delete* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	delete	Name of the file operation.
path	String	-	Relative path where the items to be deleted are located.
names	String[]	-	List of the items to be deleted.
data	FileManagerDirectoryContent	-	Details of the item to be deleted.

*\*Refer [File request and response contents](#) for the contents of data\*.*

*Example:*

```
`typescript
{
 action: "delete",
 path: "/Hello/",
 names: ["New"],
 data: []
}
`
```

The following table represents the response parameters of *delete* operations.

Parameter	Type	Default	Explanation
----	----	----	----
files	FileManagerDirectoryContent[]	-	Details about the deleted item(s).
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of files and error\*.*

*Example:*

```
`typescript
{
 cwd: null,
 details: null,
}
```

```
error: null,
files: [
{
 dateCreated: "2019-03-15T10:13:30.346309+00:00",
 dateModified: "2019-03-15T10:13:30.346309+00:00",
 filterPath: "\\Hello\\folder",
 hasChild: true,
 isFile: false,
 name: "folder",
 size: 0,
 type: ""
}
]
}
```

#### Details

The following table represents the request parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	details	Name of the file operation.
path	String	-	Relative path where the items are located.
names	String[]	-	List of the items to get details.
data	FileManagerDirectoryContent	-	Details of the selected item.

*\*Refer [File request and response contents](#) for the contents of data\*.*

*Example:*

```
`typescript
{
 action: "details",
 path: "/FileContents/",
 names: ["All Files"],
 data: []
}
```

The following table represents the response parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
details	FileManagerDirectoryContent	-	Details of the requested item(s).
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of details and error\*.*

*Example:*

```
`typescript
{
 cwd:null,
 files:null,
 error:null,
 details:
 {
 name:"All Files",
 location:"\\Files\\FileContents\\All Files",
 isFile:false,
 size:"679.8 KB",
 created:"3/8/2019 10:18:37 AM",
 modified:"3/8/2019 10:18:39 AM",
 multipleFiles:false
 }
}
```

### *Search*

The following table represents the request parameters of *search* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	search	Name of the file operation.
path	String	-	Relative path to the directory where the files should be searched.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
caseSensitive	Boolean	-	Defines search is case sensitive or not.
searchString	String	-	String to be searched in the directory.

|data|FileManagerDirectoryContent|-|Details of the searched item.|

*Example:*

```
`typescript
{
 action: "search",
 path: "/",
 searchString: "nature",
 showHiddenItems: false,
 caseSensitive: false,
 data: []
}
```

The following table represents the response parameters of *search* operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

----	----	----	----
------	------	------	------

cwd FileManagerDirectoryContent - Path (Current Working Directory) details.
-----------------------------------------------------------------------------

files FileManagerDirectoryContent[] - Files and folders in the searched directory that matches the search input.
------------------------------------------------------------------------------------------------------------------

error ErrorDetails - Error Details
------------------------------------

*\*Refer [File request and response contents](#) for the contents of cwd, files and error.\**

*Example:*

```
`typescript
{
 cwd:
 {
 name:files,
 size:0,
 dateModified:"2019-03-15T10:07:00.8658158+00:00",
 dateCreated:"2019-02-27T17:36:15.6571949+00:00",
 hasChild:true,
 isFile:false,
 type:"",
 filterPath:"\\"
 }
}
```

```
},
files:[
{
name:"Nature",
size:0,
dateModified:"2019-03-08T10:18:42.9937708+00:00",
dateCreated:"2019-03-08T10:18:42.5907729+00:00",
hasChild:true,
isFile:false,
type:"",
filterPath:"\\FileContents\\Nature"
}
],
error:null,
details:null
}
`
```

### Copy

The following table represents the request parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	copy	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be copied.
targetPath	String	-	Relative path where the items to be pasted are located.
data	FileManagerDirectoryContent	-	Details of the copied item.
renameFiles	String[]	-	Details of the renamed item.

### Example:

```
`typescript
{
action: "copy",
path: "/",
names: ["6.png"],
```

```
renameFiles: ["6.png"],
targetPath: "/Videos/"
},
,
```

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of copied files or folders
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of cwd, files and error.\**

*Example:*

```
`typescript
{
 cwd:null,
 files:[
 {
 path:null,
 action:null,
 newName:null,
 names:null,
 name:"justin.mp4",
 size:0,
 previousName:"album.mp4",
 dateModified:"2019-06-21T06:58:32+00:00",
 dateCreated:"2019-06-24T04:22:14.6245618+00:00",
 hasChild:false,
 isFile:true,
 type:".mp4",
 id:null,
 filterPath:"\\"
 }
],
```

```
error:null,
details:null
}
`
```

### Move

The following table represents the request parameters of *move* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	move	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be moved.
targetPath	String	-	Relative path where the items to be pasted are located.
data	FileManagerDirectoryContent	-	Details of the moved item.
renameFiles	String[]	-	Details of the renamed item.

*Example:*

```
`typescript
{
 action: "move",
 path: "/",
 names: ["6.png"],
 renameFiles: ["6.png"],
 targetPath: "/Videos/"
}
`
```

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of cut files or folders
error	ErrorDetails	-	Error Details

\*Refer [File request and response contents](#) for the contents of *cwd*, *files* and *error*.\*

*Example:*

```
`typescript
```

```
{
 cwd:null,
 files:[
 {
 path:null,
 action:null,
 newName:null,
 names:null,
 name:"justin biber.mp4",
 size:0,
 previousName:"justin biber.mp4",
 dateModified:"2019-06-21T06:58:32+00:00",
 dateCreated:"2019-06-24T04:26:49.2690476+00:00",
 hasChild:false,
 isFile:true,
 type:".mp4",
 id:null,
 filterPath:"\\Videos\\"
 }
],
 error:null,
 details:null
}
```

### Upload

The following table represents the request parameters of *Upload* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	Save	Name of the file operation.
path	String	-	Relative path to the location where the file has to be uploaded.
uploadFiles	IList<IFormFile>	-	File that are uploaded.

*Example:*

```
`typescript
```

```
uploadFiles: (binary),
path: /,
action: Save,
data: {
 path:null,
 action:null,
 newName:null,
 names:null,
 name:"Downloads",
 size:0,
 previousName:null,
 dateModified:"2019-07-22T11:23:46.7153977 00:00",
 dateCreated:"2019-07-22T11:26:13.9047229 00:00",
 hasChild:false,
 isFile:false,
 type:"",
 id:null,
 filterPath:"\\",
 targetPath:null,
 renameFiles:null,
 uploadFiles:null,
 caseSensitive:false,
 searchString:null,
 showHiddenItems:false,
 fmiconClass:null,
 fmid:"fetree1",
 fmpId:null,
 fmselected:false,
 fmicon:null,
 data:null,
 targetData:null,
 permission:null
}
```

,

The upload response is an empty string.

Download

The following table represents the request parameters of *download* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	download	Name of the file operation
path	String	-	Relative path to location where the files to download are present.
names	String[]	-	Name list of the items to be downloaded.
data	FileManagerDirectoryContent	-	Details of the download item.

Example:

```
`typescript
{
 action:"download",
 path:"/",
 names:["1.png"],
 data:[
 {
 path:null,
 action:null,
 newName:null,
 names:null,
 name:"1.png",
 size:49792,
 previousName:null,
 dateModified:"2019-07-22T12:15:45.0972405+00:00",
 dateCreated:"2019-07-22T12:15:45.0816042+00:00",
 hasChild:false,
 isFile:true,
 type:".png",
 id:null,
 filterPath:"\\",
 targetPath:null,
```

```
renameFiles:null,
uploadFiles:null,
caseSensitive:false,
searchString:null,
showHiddenItems:false,
fmiconClass:"e-fe-image",
fmid:null,
fmpld:null,
fmselected:false,
fmicon:null,
data:null,
targetData:null,
permission:null,
fmcreated:"2019-07-22T12:15:45.081Z",
fmmodified:"2019-07-22T12:15:45.097Z",
fmimageUrl:"https://ej2-aspcore-service.azurewebsites.net/api/FileManager/GetImage?path=/1.png",
fmimageAttr:
{
 alt:"1.png"
},
fmhtmlAttr:
{
 class:"e-large-icon",
 title:"Employee.png"
}
]
}
```

Downloads the requested items from the file server in response.

#### [GetImage](#)

The following table represents the request parameters of *GetImage* operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

```
|----|----|----|----|
```

```
|path|String|-|Relative path to the image file|
```

Return the image as a file stream in response.

The request from the file manager can be customized using the `beforeSend` event. Additional information can be passed to the file manager in file operation response and can be used in customization.

#### File request and response contents

The following table represents the contents of *data*, *cwd*, and *files* in the file manager request and response.

```
|Parameter|Type|Default|Explanation|
```

```
|----|----|----|----|
```

```
|name|String|-|File name|
```

```
|dateCreated|String|-|Date in which file was created (UTC Date string).|
```

```
|dateModified|String|-|Date in which file was last modified (UTC Date string).|
```

```
|filterPath|String|-|Relative path to the file or folder.|
```

```
|hasChild|Boolean|-|Defines this folder has any child folder or not.|
```

```
|isFile|Boolean|-|Say whether the item is file or folder.|
```

```
|size|Number|-|File size|
```

```
|type|String|-|File extension|
```

The following table represents the contents of *error* in the file manager request and response.

```
|Parameter|Type|Default|Explanation|
```

```
|----|----|----|----|
```

```
|code|String|-|Error code|
```

```
|message|String|-|Error message|
```

```
|fileExists|String[]|-|List of duplicate file names|
```

The following table represents the contents of *details* in the file manager request and response.

```
|Parameter|Type|Default|Explanation|
```

```
|----|----|----|----|
```

```
|name|String|-|File name|
```

```
|dateCreated|String|-|Date in which file was created (UTC Date string).|
```

```
|dateModified|String|-|Date in which file was last modified (UTC Date string).|
```

```
|filterPath|String|-|Relative path to the file or folder.|
```

```
|hasChild|Boolean|-|Defines this folder has any child folder or not.|
```

```
|isFile|Boolean|-|Say whether the item is file or folder.|
```

|size|Number|-|File size|

|type|String|-|File extension|

|multipleFiles|Boolean|-|Say whether the details are about single file or multiple files.|

### Action Buttons

The file manager has several menu buttons to access the file operations. The list of menu buttons available in the file manager is given in the following table.

|Menu Button|Behaviour|

|----|----|

|SortBy| Opens the sub menu to choose the sorting order and sorting parameter. |

|View| Opens the sub menu to choose the View. |

|Open| Navigates to the selected folder. Opens the preview for image files. |

|Refresh| Initiates the read operation for the current directory and displays the updated directory content. |

|NewFolder| Opens the new folder dialog box to receive the name for the new folder. |

|Rename| Opens the rename dialog box to receive the new name for the selected item. |

|Delete| Opens the delete dialog box to confirm the removal of the selected items from the file system. |

|Upload| Opens the upload box to select the items to upload to the file system. |

|Download| Downloads the selected item(s). |

|Details| Get details about the selected items and display them in details dialog box. |

|SelectAll| Selects all the files and folders displayed in the view section. |

The action menu buttons are present in the toolbar and context menu. The toolbar contains the buttons based on the selected items count, while the context menu will appear with a list based on the target.

### Toolbar

The toolbar can be divided into two sections as right and left. Whenever the toolbar buttons exceed the size, the buttons present in the left section of the toolbar will be moved to the toolbar popup.

The following table provides the toolbar buttons that appear based on the selection.

<!-- markdownlint-disable MD033 -->

Selected Items Count	Left section	Right section
0 (none of the item )	<i>SortBy</i> Refresh <i>NewFolder</i> Upload	<i>View</i> Details
1 (single item selected)	<i>Delete</i> Download* Rename	<i>Selected items count</i> View* Details
>1 (multiple selection)	<i>Delete</i> Download	<i>Selected items count</i> View* Details

### Context menu

The following table provides the default context menu item and the corresponding target areas.

<!-- markdownlint-disable MD033 -->

Menu Name	Menu Items	Target
Layout	<i>SortBy View Refresh NewFolder Upload</i> Details* Select all	<i>Empty space in the view section (details view and large icon view area). Empty folder content.</i>
Folders	<i>Open Delete Rename</i> Downloads* Details	* Folders in treeview, details view, and large icon view.
Files	<i>Open Delete Rename</i> Downloads* Details	* Files in details view and large icon view.

## Views

View is the section where the files and folders are displayed for the user to browse. The [view](#) API can also be used to change the initial view of the file manager.

The file manager has two types of [views](#) to display the files and folders.

- [Largelcons View](#)
- [Details View](#)

## Largelcons View

By Default, File Manager is rendered with largeicons view. The following example demonstrate this.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### HOMECONTROLLER MVC.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Mvc;
//File Manager's base functions are available in the below package
using Syncfusion.EJ2.FileManager.Base;
//File Manager's operations are available in the below package
using Syncfusion.EJ2.FileManager.PhysicalFileProvider;
using Newtonsoft.Json;
```

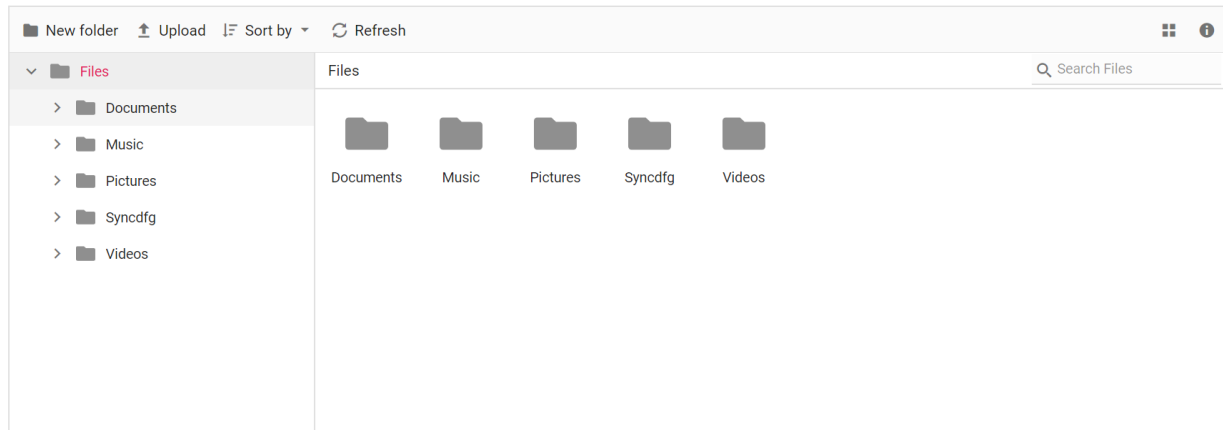

```
// Use the package for hosting
using System.Web.Hosting;
namespace WebApplication.Controllers
{
 public class HomeController : Controller
 {
 // Accessing the File Operations from File Manager package
 PhysicalFileProvider operation = new PhysicalFileProvider();
 public HomeController()
 {
 // Map the path of the files to be accessed with the host
 var path = HostingEnvironment.MapPath("~/Content/Files");
 // Assign the mapped path as root folder
 operation.RootFolder(path);
 }
 public ActionResult FileOperations(FileManagerDirectoryContent args)
 {
 // Processing the File Manager operations
 switch (args.Action)
 {
 case "read":
 // Path - Current path; ShowHiddenItems - Boolean value
 // to show/hide hidden items
 return
 Json(operation.ToCamelCase(operation.GetFiles(args.Path,
 args.ShowHiddenItems)));
 case "delete":
 // Path - Current path where of the folder to be
 // deleted; Names - Name of the files to be deleted
 return
 Json(operation.ToCamelCase(operation.Delete(args.Path, args.Names)));
 case "copy":
 // Path - Path from where the file was copied;
 // TargetPath - Path where the file/folder is to be copied; RenameFiles - Files
 // with same name in the copied location that is confirmed for renaming;
 // TargetData - Data of the copied file
 return
 Json(operation.ToCamelCase(operation.Copy(args.Path, args.TargetPath,
 args.Names, args.RenameFiles, args.TargetData)));
 case "move":
 // Path - Path from where the file was cut; TargetPath -
 // Path where the file/folder is to be moved; RenameFiles - Files with same
 // name in the moved location that is confirmed for renaming; TargetData - Data
 // of the moved file
 return
 Json(operation.ToCamelCase(operation.Move(args.Path, args.TargetPath,
 args.Names, args.RenameFiles, args.TargetData)));
 case "details":
 if (args.Names == null)
 {
 args.Names = new string[] { };
 }
 // Path - Current path where details of file/folder is
 // requested; Name - Names of the requested folders
 return
 Json(operation.ToCamelCase(operation.Details(args.Path, args.Names)));
 case "create":
 }
 }
 }
}
```

```

 // Path - Current path where the folder is to be
 created; Name - Name of the new folder
 return
 }
 JsonResult(operation.ToCamelCase(operation.Create(args.Path, args.Name)));
 case "search":
 // Path - Current path where the search is performed;
 SearchString - String typed in the searchbox; CaseSensitive - Boolean value
 which specifies whether the search must be casesensitive
 return
 }
 JsonResult(operation.ToCamelCase(operation.Search(args.Path, args.SearchString,
 args.ShowHiddenItems, args.CaseSensitive)));
 case "rename":
 // Path - Current path of the renamed file; Name - Old
 file name; NewName - New file name
 return
 }
 JsonResult(operation.ToCamelCase(operation.Rename(args.Path, args.Name,
 args.NewName)));
 }
 return null;
}
// Processing the Upload operation
public ActionResult Upload(string path,
IList<System.Web.HttpPostedFileBase> uploadFiles, string action)
{
 FileManagerResponse uploadResponse;
 //Invoking upload operation with the required paramaters
 // path - Current path where the file is to uploaded;
 uploadFiles - Files to be uploaded; action - name of the operation(upload)
 uploadResponse = operation.Upload(path, uploadFiles, action,
 null);
 return Content("");
}
// Processing the Download operation
public ActionResult Download(string downloadInput)
{
 FileManagerDirectoryContent args =
 JsonConvert.DeserializeObject<FileManagerDirectoryContent>(downloadInput);
 //Invoking download operation with the required paramaters
 // path - Current path where the file is downloaded; Names -
 Files to be downloaded;
 return operation.Download(args.Path, args.Names);
}
// Processing the GetImage operation
public ActionResult GetImage(FileManagerDirectoryContent args)
{
 //Invoking GetImage operation with the required paramaters
 // path - Current path of the image file; Id - Image file id;
 return operation.GetImage(args.Path, args.Id, false, null,
 null);
}
public ActionResult Index()
{
 return View();
}
}
}

```

Output be like the below.

### Details View

The default appearance of the file manager can be changed from largeicons to details view by using [view](#) property. In the Details view, the files are displayed in a sorted list order. This file list comprises of several columns of information about the files such as **Name**, **Date Modified**, **Type**, and **Size**. The following example demonstrate the file manager with details view.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).View(Syncfusion.EJ2.FileManager.ViewType.Details).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### HOMECONTROLLER MVC.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Mvc;
//File Manager's base functions are available in the below package
using Syncfusion.EJ2.FileManager.Base;
//File Manager's operations are available in the below package
using Syncfusion.EJ2.FileManager.PhysicalFileProvider;
using Newtonsoft.Json;

IList<System.Web.HttpPostedFileBase> uploadFiles, string action)
{
 FileManagerResponse uploadResponse;
 //Invoking upload operation with the required paramaters
 // path - Current path where the file is to uploaded;
 uploadFiles - Files to be uploaded; action - name of the operation(upload)
 uploadResponse = operation.Upload(path, uploadFiles, action,
 null);
 return Content("");
}
// Processing the Download operation
public ActionResult Download(string downloadInput)
{
 FileManagerDirectoryContent args =
 JsonConvert.DeserializeObject<FileManagerDirectoryContent>(downloadInput);
 //Invoking download operation with the required paramaters
 // path - Current path where the file is downloaded; Names -
 Files to be downloaded;
 return operation.Download(args.Path, args.Names);
}
// Processing the GetImage operation
public ActionResult GetImage(FileManagerDirectoryContent args)
{
 //Invoking GetImage operation with the required paramaters
 // path - Current path of the image file; Id - Image file id;
 return operation.GetImage(args.Path, args.Id, false, null,
 null);
}
public ActionResult Index()
{
 return View();
}
}
}

```

Output be like the below.

### Customizing File Manager functionalities

The file manager component allows customizing its functionalities like, context menu, searching, uploading, toolbar using APIs. Given below are some of the functionalities that can be customized in the File Manager,

- [Context menu customization](#)
- [Details view customization](#)
- [Navigation pane customization](#)
- [Show/Hide file extension](#)
- [Show/Hide hidden items](#)
- [Show/Hide thumbnail images in large icons view](#)
- [Toolbar customization](#)
- [Upload customization](#)
- [Tooltip customization](#)

#### Context menu customization

The context menu settings like, items to be displayed on files, folders and layout click and visibility can be customized using [contextMenuSettings](#) property.

#### CSHTML

```
@{
 string[] files = new string[] { "Open", "|", "Details" };
 string[] folder = new string[] { "Open", "|", "Details" };
 string[] layout = new string[] { "SortBy", "View", "Refresh", "|",
 "Details" };
}
<div class="control-section">
```

```

<div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).ContextMenuSettings(new
Syncfusion.EJ2.FileManager.FileManagerContextMenuSettings()
 {
 File = files,
 Folder = folder,
 Layout = layout
 }).Render()
 <!-- end of filemanager element -->
</div>
</div>

```

### HOMECONTROLLER\_MVC.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Mvc;
//File Manager's base functions are available in the below package
using Syncfusion.EJ2.FileManager.Base;
//File Manager's operations are available in the below package
using Syncfusion.EJ2.FileManager.PhysicalFileProvider;
using Newtonsoft.Json;
// Use the package for hosting
using System.Web.Hosting;

 return operation.Download(args.Path, args.Names);
 }
 // Processing the GetImage operation
 public ActionResult GetImage(FileManagerDirectoryContent args)
 {
 //Invoking GetImage operation with the required paramaters
 // path - Current path of the image file; Id - Image file id;
 return operation.GetImage(args.Path, args.Id, false, null,
 null);
 }
 public ActionResult Index()
 {
 return View();
 }
}
}

```

Output be like the below.

### Details view customization

The details view settings like, column width, header text, template for each field can be customized using [detailsViewSettings](#) property.

**CSHTML**

```

<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->

@Html.EJS().FileManager("filemanager").View(Syncfusion.EJ2.FileManager.ViewType.Details).AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).DetailsViewSettings(new
Syncfusion.EJ2.FileManager.FileManagerDetailsViewSettings()
 {
 Columns = new List<Syncfusion.EJ2.FileManager.FileManagerColumn>
 {
 new Syncfusion.EJ2.FileManager.FileManagerColumn
 {
 Field = "name",
 HeaderText = "File Name",
 Width = "auto",
 Template = "${name}",
 CustomAttributes = new Dictionary<string, string>
 {
 { "class", "e-fe-grid-name" }
 }
 },
 new Syncfusion.EJ2.FileManager.FileManagerColumn
 {
 Field = "size",
 HeaderText = "File Size",
 Template = "${size}"
 },
 new Syncfusion.EJ2.FileManager.FileManagerColumn
 {
 Field = "_fm_modified",
 HeaderText = "Date Modified",
 }
 }
 }).Render()

```

Output be like the below.

### Show/Hide file extension

The file extensions are displayed in the File Manager by default. This can be hidden by disabling the [showFileExtension](#) property.

In File Manager [fileLoad](#) and [fileOpen](#) events are triggered before the file/folder is rendered and before the file/folder is opened respectively. These events can be utilized to perform operations before a file/folder is rendered or opened.

### CSHTML

```

### Upload customization

The upload settings like, minimum and maximum file size and enabling auto upload can be customized using [uploadSettings](#) property.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).UploadSettings(new
Syncfusion.EJ2.FileManager.FileManagerUploadSettings()
 {
 MaxFileSize = 233332,
 MinFileSize = 250,
 AutoUpload = true
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

}
public ActionResult Index()
{
 return View();
}
}
}

```

Output be like the below.

## Multiple Selection

The file manager allows you to select multiple files by enabling the [allowMultiSelection](#) property (enabled by default). The multiple selection can be done by pressing the **Ctrl** key or **Shift** key and selecting the files. The check box can also be used to do multiple selection. **Ctrl + A** can be used to select all files in the current directory. The [fileSelect](#) event will be triggered when the items of file manager control is selected or unselected.

The below example shows File manager allows you to select multiple files using [allowMultiSelection](#) property.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Filemanager element declaration -->
 @Html.EJS().FileManager("file").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).AllowMultiSelection(true).View(Syncfusion.EJ2.FileManager.ViewType.Detail
s).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### HOMECONTROLLER MVC.CS

}
public ActionResult Index()
{
 return View();
}
}
}

```

Output be like the below.

## Drag And Drop

The file manager allows files or folders to be moved from one folder to another by using the [allowDragAndDrop](#) property. It also supports uploading a file by dragging it from Windows Explorer to File Manager control. You can enable or disable this support by using the [allowDragAndDrop](#) property of file manager.

The event triggered in drag and drop support are,

- [fileDragStart](#) - Triggers when the file/folder dragging is started.
- [fileDragging](#) - Triggers while dragging the file/folder.
- [fileDragStop](#) - Triggers when the file/folder is about to be dropped at the target.
- [fileDropped](#) - Triggers when the file/folder is dropped.

## CSHTML

## File system provider

The file system provider allows the File Manager component to manage the files and folders in a physical or cloud-based file system. It provides the methods for performing various file actions like creating a new folder, copying and moving of files or folders, deleting, uploading, and downloading the files or folders in the file system.

The following file providers are added in Syncfusion EJ2 File Manager component.

- [ASP.NET Core file system provider](#)
- [ASP.NET MVC 5 file system provider](#)
- [ASP.NET Core Azure cloud file system Provider](#)
- [ASP.NET MVC 5 Azure cloud file system Provider](#)
- [Amazon S3 cloud file system provider](#)
- [File Transfer Protocol file system provider](#)
- [SQL database file system provider](#)
- [NodeJS file system provider](#)
- [Google Drive file system provider](#)
- [Firebase Realtime Database file system provider](#)
- [IBM Cloud Object Storage provider](#)

### ASP.NET Core file system provider

The ASP.NET Core file system provider allows the users to access and manage the physical file system. To get started, clone the [ej2-aspcore-file-provider](#) using the following command.

```
`typescript
```

```
git clone https://github.com/SyncfusionExamples/ej2-aspcore-file-provider ej2-aspcore-file-provider
cd ej2-aspcore-file-provider
`
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, set the root directory of the physical file system in the FileManager controller.

After setting the root directory of the file system, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the files in the physical file system.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with ASP.NET Core service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "http://localhost:{port}/api/FileManager/FileOperations",
 GetImageUrl =
"http://localhost:{port}/api/FileManager/GetImage",
 UploadUrl = "http://localhost:{port}/api/FileManager/Upload",
 DownloadUrl = "http://localhost:{port}/api/FileManager/Download"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### FILE-SYSTEM-PROVIDER.CS

---

**Note:** To learn more about file actions that can be performed with ASP.NET Core file system provider, refer to this [link](#)

---

### ASP.NET MVC 5 file system provider

The ASP.NET MVC5 file system provider allows the users to access and manage the physical file system. To get started, clone the [ej2-aspmvc-file-provider](#) using the following command.

```
`typescript
git clone https://github.com/SyncfusionExamples/ej2-aspmvc-file-provider ej2-aspmvc-file-provider
cd ej2-aspmvc-file-provider
`
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, set the root directory of the physical file system in the FileManager controller using the Root Folder method.

After setting the root directory of the file system, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the files in the physical file system.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with ASP.NET MVC service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "http://localhost:{port}/FileManager/FileOperations",
 GetImageUrl = "http://localhost:{port}/FileManager/GetImage",
 UploadUrl = "http://localhost:{port}/FileManager/Upload",
 DownloadUrl = "http://localhost:{port}/FileManager/Download"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### FILE-SYSTEM-MVC.CS

---

**Note:** To learn more about file actions that can be performed with ASP.NET MVC 5 file system provider, refer to this [link](#).

---

### ASP.NET Core Azure cloud file system Provider

In ASP.NET Core, Azure file system provider allows the users to access and manage the blobs in the Azure blob storage. To get started, clone the [azure-aspcore-file-provider](#) using the following command.

```
`typescript
git clone https://github.com/SyncfusionExamples/azure-aspcore-file-provider azure-aspcore-file-provider
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, register the Azure storage by passing details like name, password, and blob name to the Register Azure method in the FileManager controller.

```
`typescript
void RegisterAzure(string accountName, string accountKey, string blobName)
```

Then, set the blob container and the root blob directory by passing the corresponding URLs as parameters in the setBlobContainer method as follows.

```
`typescript
void setBlobContainer(string blobPath, string filePath)
```

---

**Note:** Also, assign the same *blobPath* URL and *filePath* URL in [AzureFileOperations](#) and [AzureUpload](#) methods in the FileManager controller to determine the original path of the Azure blob.

---

After setting the blob container references, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Azure blob storage.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with Azure service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url =
 "http://localhost:{port}/api/AzureProvider/AzureFileOperations",
 GetImageUrl =
 "http://localhost:{port}/api/AzureProvider/AzureGetImage",
 UploadUrl =
 "http://localhost:{port}/api/AzureProvider/AzureUpload",
 DownloadUrl =
 "http://localhost:{port}/api/AzureProvider/AzureDownload"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### AZURE-FILE-SYSTEM.CS

---

**Note:** To learn more about file actions that can be performed with ASP.NET Core Azure cloud file system provider, refer to this [link](#)

---

### ASP.NET MVC 5 Azure cloud file system Provider

In ASP.NET MVC, Azure file system provider allows the users to access and manage the blobs in the Azure blob storage. To get started, clone the [ej2-azure-aspmvc-file-provider](https://github.com/SyncfusionExamples/ej2-azure-aspmvc-file-provider) using the following command.

```
`typescript
git clone https://github.com/SyncfusionExamples/ej2-azure-aspmvc-file-provider ej2-azure-aspmvc-file-provider
`
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, register the Azure storage by passing details like name, password, and blob name to the Register Azure method in the FileManager controller.

```
`typescript
void RegisterAzure(string accountName, string accountKey, string blobName)
`
```

Then, set the blob container and the root blob directory by passing the corresponding URLs as parameters in the **setBlobContainer** method as follows.

```
`typescript
void setBlobContainer(string blobPath, string filePath)
`
```

---

**Note:** Also, assign the same *blobPath* URL and *filePath* URL in [AzureFileOperations](#) and [AzureUpload](#) methods in the FileManager controller to determine the original path of the Azure blob.

---

After setting the blob container references, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Azure blob storage.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with Azure service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url =
 "http://localhost:{port}/AzureProvider/AzureFileOperations",
 GetImageUrl =
 "http://localhost:{port}/AzureProvider/AzureGetImage",
 UploadUrl = "http://localhost:{port}/AzureProvider/AzureUpload",
 DownloadUrl =
 "http://localhost:{port}/AzureProvider/AzureDownload"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

## MVC-AZURE-FILE-SYSTEM.CS

**Note:** To learn more about file actions that can be performed with ASP.NET MVC 5 Azure cloud file system provider, refer to this [link](#).

### Amazon S3 cloud file system provider

In ASP.NET Core, Amazon **S3** (*Simple Storage Service*) cloud file system provider allows the users to access and manage a server hosted file system as collection of objects stored in the Amazon S3 Bucket. To get started, clone the [amazon-s3-aspcore-file-provider](#) using the following command.

```
`typescript
git clone https://github.com/SyncfusionExamples/amazon-s3-aspcore-file-provider.git amazon-s3-
aspcore-file-provider.git
`
```

**Note:** To learn more about creating and configuring an Amazon S3 bucket, refer to this [link](#).

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register Amazon S3 client account details like *awsAccessKeyId*, *awsSecretKeyId* and *awsRegion* details in **RegisterAmazonS3** method in the FileManager controller to perform the file operations.

```
`typescript
void RegisterAmazonS3(string bucketName, string awsAccessKeyId, string awsSecretAccessKey, string
bucketRegion)
`
```

After registering the Amazon client account details, just build and run the project. Now, the project will be hosted in <http://localhost:{port}> and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Amazon **S3** (*Simple Storage Service*) bucket's objects storage.

## CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with Amazon service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url =
"http://localhost:{port}/api/AmazonS3Provider/AmazonS3FileOperations",
 DownloadUrl =
"http://localhost:{port}/api/AmazonS3Provider/AmazonS3Download",
 UploadUrl =
"http://localhost:{port}/api/AmazonS3Provider/AmazonS3Upload",
 GetImageUrl =
"http://localhost:{port}/api/AmazonS3Provider/AmazonS3GetImage"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

```
</div>
</div>
```

## AMAZON-FILE-SYSTEM.CS

**Note:** To learn more about the file actions that can be performed with Amazon S3 Cloud File System provider, refer to this [link](#).

### File Transfer Protocol file system provider

In ASP.NET Core, File Transfer Protocol file system provider allows the users to access to the hosted file system as collection of objects stored in the file storage using File Transfer Protocol. To get started, clone the [ftp-aspcore-file-provider](#) using the following command.

```
`typescript
git clone https://github.com/SyncfusionExamples/ftp-aspcore-file-provider.git ftp-aspcore-file-
provider.git
`
```

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register File Transfer Protocol details like *hostName*, *userName* and *password* in **SetFTPConnection** method in the FileManager controller to perform the file operations.

```
`typescript
void SetFTPConnection(string hostName, string userName, string password)
`
```

After registering the File Transfer Protocol details, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows you to manage the FTP's objects storage.

## CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with FTP service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url =
"http://localhost:{port}/api/FTPProvider/FTPFileOperations",
 DownloadUrl =
"http://localhost:{port}/api/FTPProvider/FTPDownload",
 UploadUrl = "http://localhost:{port}/api/FTPProvider/FTPUUpload",
 GetImageUrl =
"http://localhost:{port}/api/FTPProvider/FTPGetImage"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

## FTP-FILE-SYSTEM.CS

**Note:** To learn more about the file actions that can be performed with File Transfer Protocol file system provider, refer to this [link](#).

### SQL database file system provider

In ASP.NET Core, SQL database file system provider allows the users to manage the file system being maintained in a SQL database table. Unlike the other file system providers, the SQL database file system provider works on ID basis. Here, each file and folder have a unique ID based on which all the file operations will be performed. To get started, clone the [sql-server-database-aspcore-file-provider](#) using the following command.

```
`typescript
<add name="FileExplorerConnection" connectionString="Data
Source=(LocalDB)\v11.0;AttachDbFilename=|DataDirectory|\FileManager.mdf;Integrated
Security=True;Trusted_Connection=true" />
`
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. To establish the SQL server connection with the database file (for eg: FileManager.mdf), specify the connection string in the web config file as follows.

```
`typescript
<add name="FileExplorerConnection" connectionString="Data
Source=(LocalDB)\v11.0;AttachDbFilename=|DataDirectory|\FileManager.mdf;Integrated
Security=True;Trusted_Connection=true" />
`
```

Then, make an entry for the connection string in `appsettings.json` file as follows.

```
`typescript
"ConnectionStrings": {
 "FileManagerConnection": "Data
Source=(LocalDB)\\MSSQLLocalDB;AttachDbFilename=|DataDirectory|\\App_Data\\FileManager.mdf;In
tegrated Security=True;Connect Timeout=30"
}
`
```

Now, to configure the database connection, set the connection name, table name and root folder ID value by passing these values to the SetSQLConnection method.

```
`typescript
void SetSQLConnection(string name, string tableName, string tableID)
`
```

---

**Note:** Refer to this [FileManager.mdf](#), to learn about the pre-defined file system SQL database for the EJ2 File Manager.

---

After configuring the connection, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the files in the SQL database table.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with ASP.NET Core service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url =
"http://localhost:{port}/api/SQLProvider/SQLFileOperations",
 GetImageUrl =
"http://localhost:{port}/api/SQLProvider/SQLGetImage",
 UploadUrl = "http://localhost:{port}/api/SQLProvider/SQLUpload",
 DownloadUrl =
"http://localhost:{port}/api/SQLProvider/SQLDownload"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### SQL-FILE-SYSTEM.CS

---

**Note:** To learn more about file actions that can be performed with SQL database file system provider, refer to this [link](#).

---

#### NodeJS file system provider

In ASP.NET Core, NodeJS file system provider allows the users to manage the files and folders in a physical file system. It provides methods for performing all basic file operations like creating a folder, copy, move, delete, and download files and folders in the file system. We can use of the NodeJS file system provider either by installing the [ej2-filemanager-node-filessystem](#) package or by cloning the [file system provider](#) from the GitHub.

#### Using ej2-filemanager-node-filessystem package

- Install the ej2-filemanager-node-filessystem package by running the below command.

```
`typescript
```

```
npm install @syncfusion/ej2-filemanager-node-filessystem
```

```
`
```

- After installing the package, navigate to the ej2-filemanager-node-filesystem package folder within the node-modules.
- Run the command **npm install** command.

#### Cloning the ej2-filemanager-node-filesystem from GitHub

- Clone the ej2-filemanager-node-filesystem using the following command.

```
`typescript
```

```
git clone https://github.com/SyncfusionExamples/ej2-filemanager-node-filesystem.git node-filesystem-provider
```

```
`
```

- After cloning, open the root folder and run the command **npm install** command.

After installing the packages, set the root folder directory of the physical file system in the package JSON under scripts sections as follows.

```
`typescript
```

```
"start": "node filesystem-server.js -d D:/Projects"
```

```
`
```

---

**Note:** By default, the root directory will be configured to set C:/Users as the root directory.

---

To set the port in which the project to be hosted and the root directory of the file system. Run the following command.

```
`typescript
```

```
set PORT=3000 && node filesystem-server.js -d D:/Projects
```

```
`
```

---

**Note:** By default, the service will run 8090 port.

---

Now, just mapping the **ajaxSettings** property of the FileManager component to the appropriate file operation methods in the filesystem-server.js file will allow to manage the physical file system with NodeJS file system provider.

#### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with NodeJS service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "http://localhost:{port}",
 GetImageUrl = "http://localhost:{port}/GetImage",
 UploadUrl = "http://localhost:{port}/Upload",
 DownloadUrl = "http://localhost:{port}/Download"
 }).Render()
```

```
<!-- end of filemanager element -->
</div>
</div>
```

## NODE-JS.CS

**Note:** To learn more about file actions that can be performed with NodeJS file system provider, refer to this [link](#).

### Google Drive file system provider

In ASP.NET Core, Google Drive file system provider allows the users to manage the files and folders in a Google Drive account. The Google Drive file system provider works on ID basis where each file and folder have a unique ID. To get started, clone the [google-drive-aspcore-file-provider](#) using the following command.

```
`typescript
git clone https://github.com/SyncfusionExamples/google-drive-aspcore-file-provider google-drive-aspcore-file-provider
cd google-drive-aspcore-file-provider
`
```

Google Drive file system provider use the [Google Drive APIs](#) to read the file in the file system and uses the [OAuth 2.0](#) protocol for authentication and authorization. To authenticate from the client end, obtain OAuth 2.0 client credentials from the [Google API Console](#). To learn more about generating the client credentials from the from Google API Console, refer to this [link](#).

After generating the client secret data, copy the JSON data to the following specified JSON files in the cloned location.

- EJ2GoogleDriveFileProvider > credentials > client\_secret.json
- GoogleOAuth2.0Base > credentials > client\_secret.json

After updating the credentials, just build and run the project. Now, the project will be hosted in `http://localhost:{port}`, and it will ask to log on to the Gmail account created the client secret credentials. Then, provide permission to access the Google Drive files by clicking the allow access button in the page. Now, just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods will allows to manage the files from the Google Drive.

## CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with ASP.NET Core service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
```

```
 Url =
 "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveFileOperations",
 GetImageUrl =
 "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveGetImage",
 UploadUrl =
 "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveUpload",
 DownloadUrl =
 "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveDownload"
 }).Render()
 <!-- end of filemanager element -->
</div>
</div>
```

### GOOGLE-DRIVE-FILE-SYSTEM.CS

**Note:** To learn more about file actions that can be performed with Google Drive file system provider, refer to this [link](#).

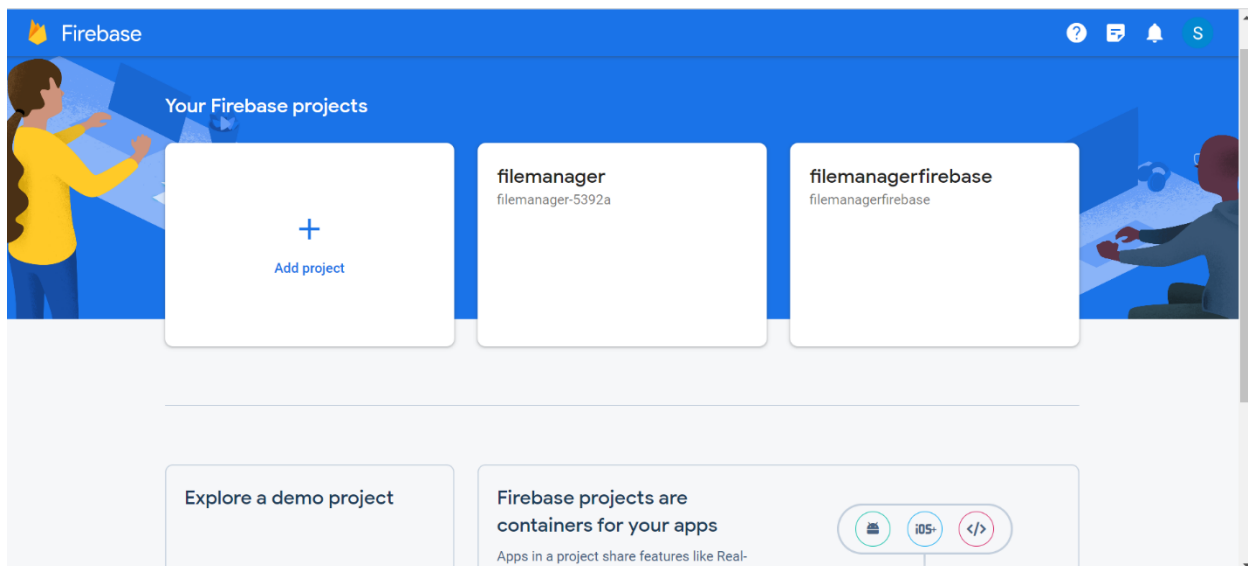

#### Firebase Realtime Database file system provider

The [Firebase Realtime Database](#) file system provider in **ASP.NET Core** provides the efficient way to store the File Manager file system in a cloud database as JSON representation.

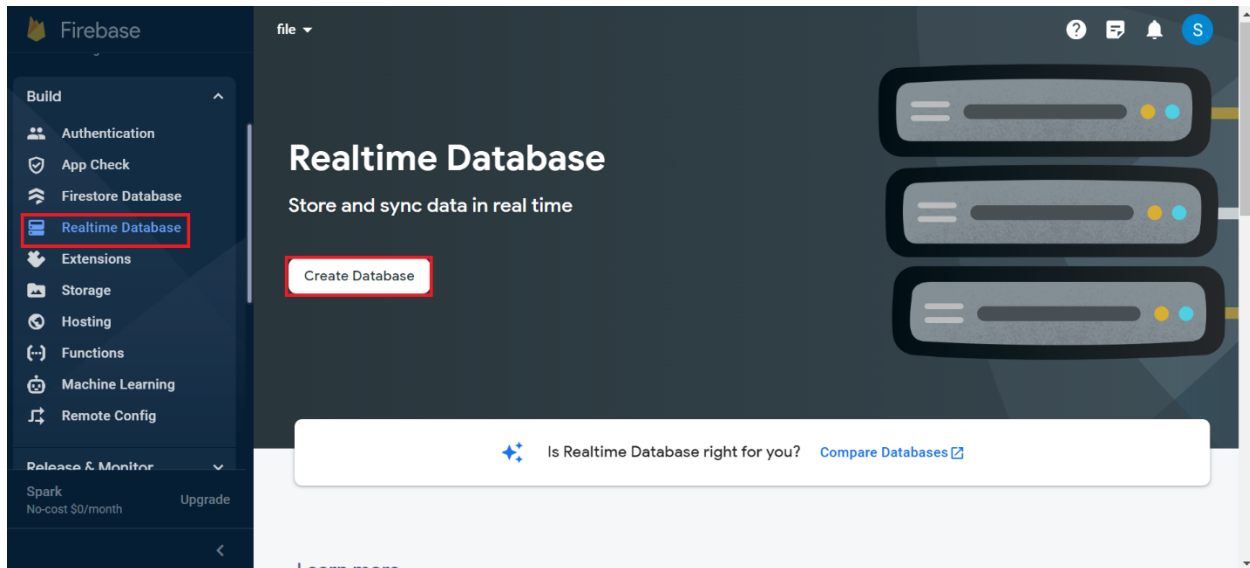

#### *Generate Secret access key from service account*

Follow the given steps to generate the secret access key:

- To access the Firebase console, please click on this [link](#). Once you have accessed the console, you can create a new project by filling in the necessary fields and clicking on the relevant buttons.

- Within the Firebase console, navigate to the **Build** tab. Under this tab, select the option for **Realtime Database**. From there, you can create a new database by clicking on the **Create Database** button.

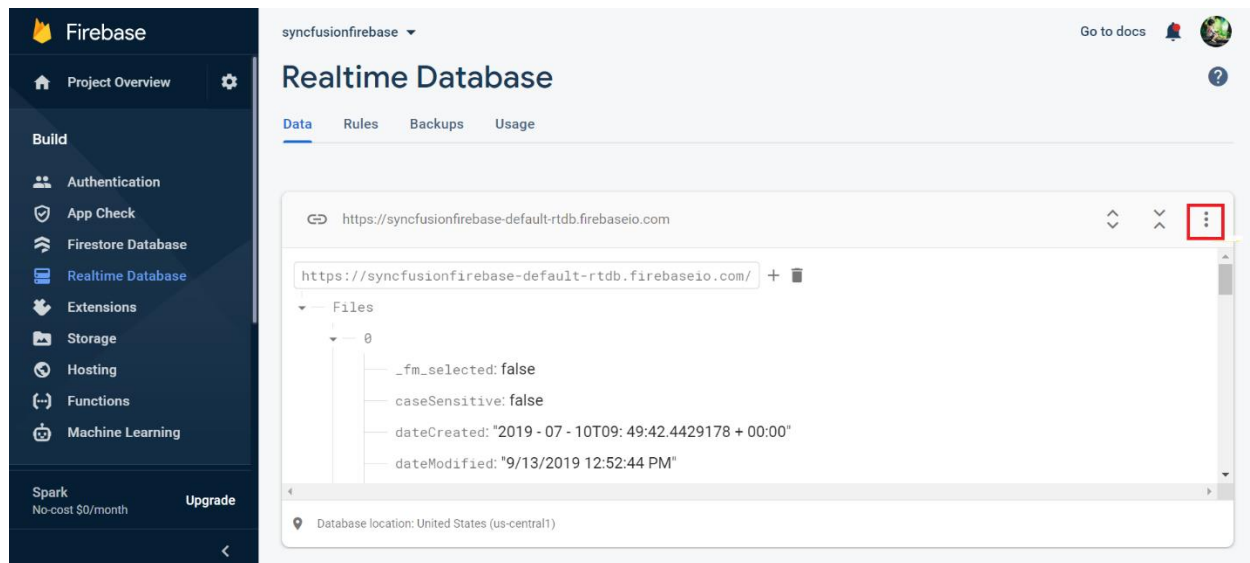

- To get started, create a root node and add any desired children to it. Please refer to the following code snippet for guidance on the structure of the JSON:

```
`typescript
{
 "Files" : [{
 "caseSensitive" : false,
 "dateCreated" : "8/22/2019 5:17:55 PM",
 "dateModified" : "8/22/2019 5:17:55 PM",
 "filterId" : "0/",
 "filterPath" : "/",
 "hasChild" : false,
 "id" : "5",
 "isFile" : false,
 "isRoot" : true,
 "name" : "Music",
 "parentId" : "0",
 "selected" : false,
 "showHiddenItems" : false,
 "size" : 0,
```

```
"type" : "folder"
},
{
 "caseSensitive" : false,
 "dateCreated" : "8/22/2019 5:18:03 PM",
 "dateModified" : "8/22/2019 5:18:03 PM",
 "filterId" : "0/",
 "filterPath" : "/",
 "hasChild" : false,
 "id" : "6",
 "isFile" : false,
 "isRoot" : true,
 "name" : "videos",
 "parentId" : "0",
 "selected" : false,
 "showHiddenItems" : false,
 "size" : 0,
 "type" : ""
}]
}
```

Here, the `Files` denotes the `rootNode` and the subsequent object refers to the children of the root node. `rootNode` will be taken as the root folder of the file system loaded which will be loaded in File Manager component.

- To import a JSON file into the Firebase Realtime Database, navigate to the **Data** tab and click on the action icon shown in the accompanying image. From there, select the **Import JSON** option and upload the JSON file that was created using the code provided above.

- To interact with the Firebase Realtime Database through your application, it is necessary to grant read and write permissions by defining appropriate rules in the Firebase project's **Rules tab**, as shown in the following code snippet. Once you have specified the rules, you can publish them by clicking the **Publish** button to enable the necessary authentication.

```
`typescript
{
/ Visit https://firebase.google.com/docs/database/security to learn more about security rules. /
"rules": {
".read": "auth!=null",
".write": "auth!=null"
}
}
`
```

---

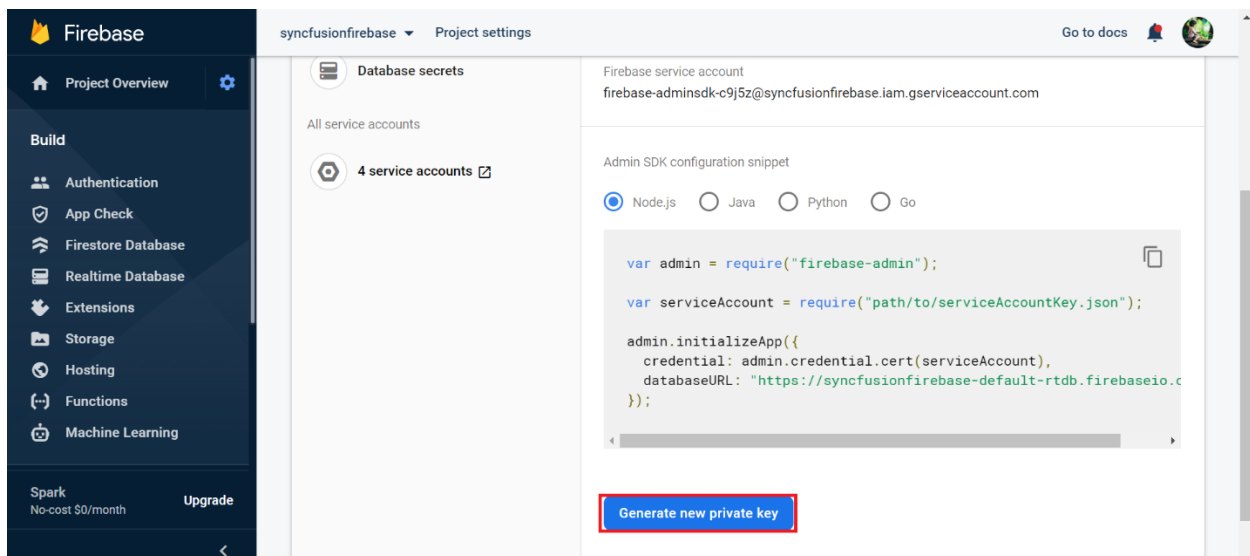

**Note:** By default, rules of a Firebase project will be **false**. To read and write the data, configure the **Rules** as given in the following code snippet in the *Rules* tab in the Firebase Realtime Database project.

---

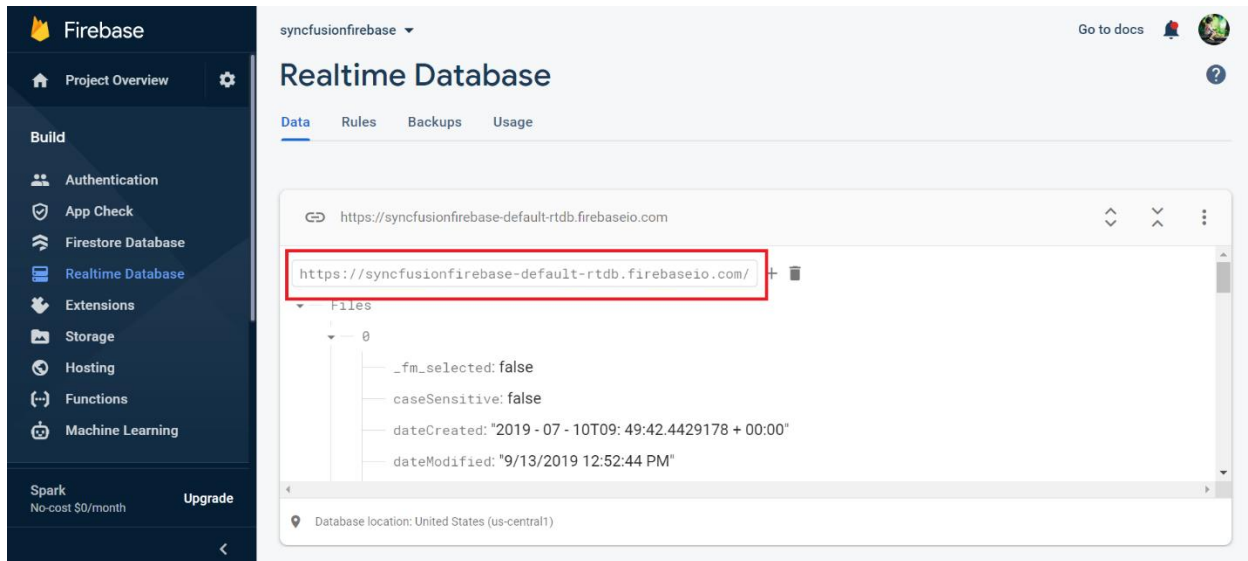

- Navigate to the project settings as instructed and then click on the **Service Account** tab.

- To obtain the access key JSON file, simply click on the **Generate new private key** button and then confirm by clicking the **Generate key** button in the pop-up window that appears.

- Next, you will need to clone the [firebase-realtime-database-apscore-file-provider](#) repository. Once cloned, simply open the project in Visual Studio and restore the NuGet package.
- Once you have generated the secret key, you will need to replace the JSON in the `access_key.json` file in the Firebase Realtime Database provider project with the newly generated key. This will enable authentication and allow you to perform read and write operations.
- In the **Data** tab, locate the project API URL and then paste it into the below mentioned section.

Register the Firebase Realtime Database by assigning *Firebase Realtime Database REST API link*, *rootNode*, and *serviceAccountKeyPath* parameters in the `RegisterFirebaseRealtimeDB` method of class `FirebaseRealtimeDBFileProvider` in the controller part of the ASP.NET Core application.

```
`typescript
```

```
this.operation.RegisterFirebaseRealtimeDB(string apiUrl, string rootNode, string serviceAccountKeyPath)
```

```
,
```

**Example:**

```
`typescript
```

```
this.operation.RegisterFirebaseRealtimeDB("{copy your API URL here}", "Files",
hostingEnvironment.ContentRootPath + "\\FirebaseRealtimeDBHelper\\access_key.json");
```

```
,
```

In the above code,

- `{copy your API URL here}` denotes Firebase Realtime Database REST API link.
- `Files` denotes newly created root node in Firebase Realtime Database.
- `hostingEnvironment.ContentRootPath + "\\FirebaseRealtimeDBHelper\\access_key.json` denotes service account key path which has authentication key for the Firebase Realtime Database data.

After configuring the Firebase Realtime Database service link, build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the `ajaxSettings` property of the File Manager component to the appropriate controller methods allows to manage the files in the Firebase Realtime Database.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with Firebase service-->
```

```
<!--Replace the hosted port number in the place of "{port}"-->
@Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
{
 Url =
"http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeFileOperations
",
 GetImageUrl =
"http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeGetImage",
 UploadUrl =
"http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeUpload",
 DownloadUrl =
"http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeDownload"
}).Render()
<!-- end of filemanager element -->
</div>
</div>
```

### **FIRE-BASE.CS**

**Note:** To learn more about the file actions that can be performed with Firebase Realtime Database file system provider, refer to this [link](#).

#### IBM Cloud Object Storage file provider

The IBM Cloud Object Storage file provider module allows you work with the IBM Cloud Object Storage. It also provides the methods for performing various file actions such as creating a new folder, renaming files, and deleting files. The IBM Cloud Object Storage file provider serves the file provider support for the File Manager component with the IBM Cloud Object Storage. We can make use of IBM Cloud Object Storage file provider by installing the [ej2-filemanager-ibm-cos-node-file-provider](#) npm package or by cloning the [file provider](#) from the GitHub.

#### *Using ej2-filemanager-ibm-cos-node-file-provider npm package*

- Install the ej2-filemanager-ibm-cos-node-file-provider npm package by running the below command.

```
`typescript
```

```
npm install @syncfusion/ej2-filemanager-ibm-cos-node-file-provider
```

```
,
```

- After installing the package, navigate to the ej2-filemanager-ibm-cos-node-file-provider package folder within the node-modules.
- Run the **npm install** command to install the dependent packages for file provider.

#### *Cloning the filemanager-ibm-cos-node-file-provider from GitHub*

- Clone the filemanager-ibm-cos-node-file-provider using the following command.

```
`typescript
```

```
git clone https://github.com/SyncfusionExamples/filemanager-ibm-cos-node-file-provider.git
```

```
,
```

- After cloning, open the root folder and run the command **npm install** command.

To set the port in which the project to be hosted. Run the following command.

```
`typescript
```

```
set PORT=3000 && node index.js
```

```
,
```

---

**Note:** By default, the service will run 8090 port.

---

Now, just mapping the **ajaxSettings** property of the FileManager component to the appropriate file operation methods in the index.js file will allow to manage the IBM Cloud Object Storage.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Initialize file manager component with IBM COS service-->
 <!--Replace the hosted port number in the place of "{port}"-->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "http://localhost:{port}",
 GetImageUrl = "http://localhost:{port}/GetImage",
 UploadUrl = "http://localhost:{port}/Upload",
 DownloadUrl = "http://localhost:{port}/Download"
 }).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

### IBM-JS.CS

---

**Note:** To learn more about the file actions that can be performed with IBM Cloud Object Storage file provider, refer to this [link](#).

---

### Localization

The file manager can be localized to any culture by defining the texts and messages of the file manager in the corresponding culture. The default locale of the file manager is **en**(English). The following table represents the default texts and messages of the file manager in **en** culture.

KEY	Text/Message
-----	--------------

 return operation.GetImage(args.Path, args.Id, false, null,
null);
 }
 public ActionResult Index()
 {
 return View();
 }
}

```

Output be like the below.

## Virtualization in File Manager Component

File Manager's UI virtualization allows you for the dynamic loading of a large number of directories and files in both the detailsView and largeIconsView without degrading its performance.

### Enable Virtualization

The virtualization of the File Manager component is based on the height and width of the viewport. The items will be loaded in both [largeIconsView](#) and [detailsView](#) based on the viewport size.

In order to enable [virtualization](#), you must set the [EnableVirtualization](#) property to true.

In the instance below, a sizable collection of files can be found in the folders **Documents** and **Text Documents**.

### CSHTML

```
<div class="control-section">
<div class="sample-container">
 <!-- File Manager virtualization feature sample -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(
 new Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
 DownloadUrl = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download",
 UploadUrl = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
 GetImageUrl = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage"
 }).EnableVirtualization(true).Render()
</div>
</div>
```

### HOMECONTROLLER\_MVC.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Mvc;
//File Manager's base functions are available in the below package
using Syncfusion.EJ2.FileManager.Base;
//File Manager's operations are available in the below package
using Syncfusion.EJ2.FileManager.PhysicalFileProvider;
using Newtonsoft.Json;
// Use the package for hosting
using System.Web.Hosting;
namespace WebApplication.Controllers
{
 public class HomeController : Controller
 {
 // Accessing the File Operations from File Manager package
 PhysicalFileProvider operation = new PhysicalFileProvider();
 public HomeController()
 {
 // Map the path of the files to be accessed with the host
 var path = HostingEnvironment.MapPath("~/Content/Files");
 // Assign the mapped path as root folder
 operation.RootFolder(path);
 }
 public ActionResult FileOperations(FileManagerDirectoryContent args)
 {
 // Processing the File Manager operations
 switch (args.Action)
 {
 case "read":
```

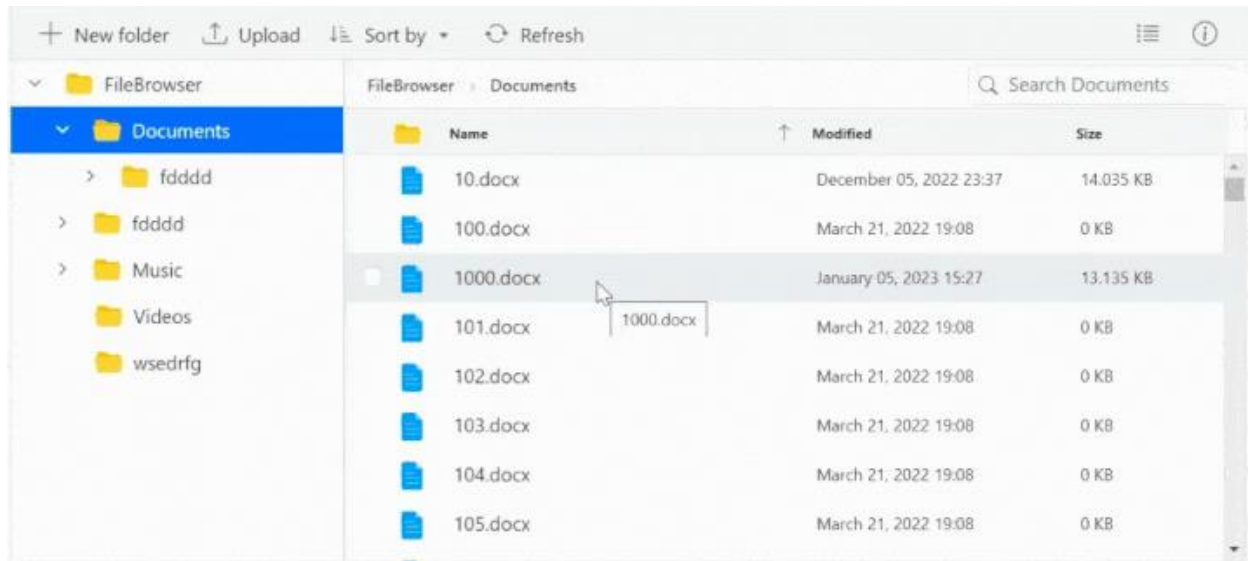

```

 // Path - Current path; ShowHiddenItems - Boolean value
 to show/hide hidden items
 return
 Json(operation.ToCamelCase(operation.GetFiles(args.Path,
args.ShowHiddenItems)));
 case "delete":
 // Path - Current path where of the folder to be
 deleted; Names - Name of the files to be deleted
 return
 Json(operation.ToCamelCase(operation.Delete(args.Path, args.Names)));
 case "copy":
 // Path - Path from where the file was copied;
 TargetPath - Path where the file/folder is to be copied; RenameFiles - Files
 with same name in the copied location that is confirmed for renaming;
 TargetData - Data of the copied file
 return
 Json(operation.ToCamelCase(operation.Copy(args.Path, args.TargetPath,
args.Names, args.RenameFiles, args.TargetData)));
 case "move":
 // Path - Path from where the file was cut; TargetPath -
 Path where the file/folder is to be moved; RenameFiles - Files with same
 name in the moved location that is confirmed for renaming; TargetData - Data
 of the moved file
 return
 Json(operation.ToCamelCase(operation.Move(args.Path, args.TargetPath,
args.Names, args.RenameFiles, args.TargetData)));
 case "details":
 if (args.Names == null)
 {
 args.Names = new string[] { };
 }
 // Path - Current path where details of file/folder is
 requested; Name - Names of the requested folders
 return
 Json(operation.ToCamelCase(operation.Details(args.Path, args.Names)));
 case "create":
 // Path - Current path where the folder is to be
 created; Name - Name of the new folder
 return
 Json(operation.ToCamelCase(operation.Create(args.Path, args.Name)));
 case "search":
 // Path - Current path where the search is performed;
 SearchString - String typed in the searchbox; CaseSensitive - Boolean value
 which specifies whether the search must be casesensitive
 return
 Json(operation.ToCamelCase(operation.Search(args.Path, args.SearchString,
args.ShowHiddenItems, args.CaseSensitive)));
 case "rename":
 // Path - Current path of the renamed file; Name - Old
 file name; NewName - New file name
 return
 Json(operation.ToCamelCase(operation.Rename(args.Path, args.Name,
args.NewName)));
 }
 return null;
}
// Processing the Upload operation

```

```
public ActionResult Upload(string path,
IList<System.Web.HttpPostedFileBase> uploadFiles, string action)
{
 FileManagerResponse uploadResponse;
 //Invoking upload operation with the required paramaters
 // path - Current path where the file is to uploaded;
 uploadFiles - Files to be uploaded; action - name of the operation(upload)
 uploadResponse = operation.Upload(path, uploadFiles, action,
null);
 return Content("");
}
// Processing the Download operation
public ActionResult Download(string downloadInput)
{
 FileManagerDirectoryContent args =
JsonConvert.DeserializeObject<FileManagerDirectoryContent>(downloadInput);
 //Invoking download operation with the required paramaters
 // path - Current path where the file is downloaded; Names -
Files to be downloaded;
 return operation.Download(args.Path, args.Names);
}
// Processing the GetImage operation
public ActionResult GetImage(FileManagerDirectoryContent args)
{
 //Invoking GetImage operation with the required paramaters
 // path - Current path of the image file; Id - Image file id;
 return operation.GetImage(args.Path, args.Id, false, null,
null);
}
public ActionResult Index()
{
 return View();
}
}
```

Output be like the below.

### Limitations for Virtualization

- Programmatic selection using the **selectAll** method is not supported with virtual scrolling.
- The keyboard shortcut **CTRL+A** will only select the files and directories that are currently visible within the viewport, rather than selecting all files and directories in the entire directory tree.
- Selected file items are not maintained while scrolling, considering the performance of the component.

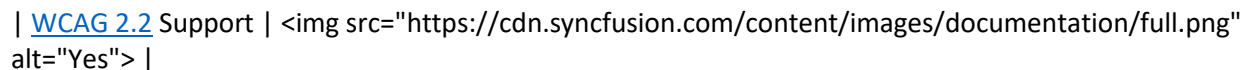

### Accessibility in ASP.NET MVC File Manager component

The File Manager component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the File Manager component is outlined below.

| Accessibility Criteria | Compatibility |

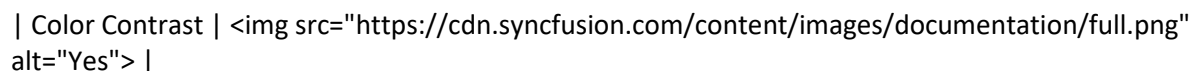

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" > |

| [Section 508](#) Support |  alt="Yes" > |

| Screen Reader Support |  alt="Yes" > |

| Right-To-Left Support |  alt="Yes" > |

| Color Contrast |  alt="Yes" > |

| Mobile Device Support |  alt="Yes" > |

```
| Keyboard Navigation Support | |

| Accessibility Checker Validation | |

| Axe-core Accessibility Validation | |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

#### WAI-ARIA attributes

The File Manager component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the File Manager component:

Attributes	Purpose
role	Used to convey a significant and contextual message to the user.
aria-disabled	Indicates whether the File Manager component is in disabled state.
aria-haspopup	Indicates whether the toolbar item has a popup list or not.
aria-orientation	Indicates whether the File Manager element is oriented horizontally or vertically.
aria-expanded	Indicates whether the Treeview node has been expanded.
aria-owns	Contains the ID of the suggestion list to indicate popup as a child element.
aria-activedescendent	Holds the ID of the active list item to focus its descendant child element.
aria-level	Specifies the level of the element in Treeview Structure.
aria-selected	Indicates whether a particular node is in selected state.
aria-placeholder	Represents a hint (word or phrase) to the user about what to enter in the text field.
aria-label	Provides an accessible name for the element.

- | **aria-checked** | Indicates whether the checkbox is in checked state. |
- | **aria-labelledby** | Provides a label for the dialog. Typically, the "aria-labelledby" attribute will contain the id of the element used as the dialog's title. |
- | **aria-describedby** | This attribute points to the Dialog element describing the one it's set on. |
- | **aria-modal** | Indicates whether an element is a modal when display. |
- | **aria-colcount** | Specifies the number of columns in full table. |
- | **aria-colindexnt** | Defines the number of columns within a table in details view. |
- | **aria-rowspan** | Defines the number of rows a cell spanned within a table in details view. |
- | **aria-colspan** | Defines the number of columns a cell spanned within a table in details view. |
- | **aria-sort** | Indicates whether items in the table are sorted in ascending or descending order. |
- | **aria-grabbed** | When the folder/file item is chosen for dragging, the aria-grabbed attribute is set to "true." If it's set to "false," the element can be grabbed for drag-and-drop, but it won't be actively held. |
- | **aria-busy** | This attribute is set to false when table content is loaded. |
- | **aria-multiselectable** | Defines more than one item has been selected. |

#### Keyboard interaction

The File Manager component followed the **keyboard interaction** guidelines, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the File Manager component.

| **Press** | **To do this** |

| --- | --- |

| **Page Down** | Scrolls down to the next folder or file and selects the first item when files are loaded. |

| **Page Up** | Scrolls up to previous folder and select the first item when files are loaded. |

| **Enter** | Selects the focused item and navigate through the child elements. |

| **Tab** | Focuses on the first element of toolbar and navigates through the next tab indexed element. |

| **Esc(Escape)** | Closes the image when it is in open state. |

| **Alt+N** | Creates a new folder dialog. |

| **F5** | Refresh the file manager element. |

| **Home** | Navigate through the first element of details view or large icons view. |

| **End** | Navigate through the last element of details view or large icons view. |

| **Move Left** | Scrolls left to the previous folder and select the first item when files are loaded |

Move Right	Scrolls right to the previous folder and select the first item when files are loaded	
Alt+Enter	Shows the get details info for selected folder.	
Shift+Right	Allows multiselection. Select the file or folder at the right of the previously selected folder.	
Shift+Left	Allows multiselection. Select the file or folder at the left of the previously selected folder.	
Shift+Down	Allows multiselection. Select the file or folder till the focused index.	
Shift+Delete	Permanently deletes the selected file or folder in the file manager element.	
Delete	Deletes the selected file or folder in the file manager element.	
Shift+Up	Allows multiselection. Select the file or folder till the focused index.	
Ctrl+C	Copies the selected file or folder in the file manager element.	
Ctrl+V	Pastes the copied/cut file or folder in the file manager element.	
Ctrl+X	Cuts the selected file or folder in the file manager element.	
Ctrl+A	Select all the files or folders in the details view or large icons view.	
F2	Creates a rename dialog for a selected file or folder in the file manager element.	
Shift+F10	Opens the context menu for the selected file or folder in the file manager element.	
Ctrl+D	Downloads the list of selected files or folders in the file manager element.	
Ctrl+Shift+1	Changes the file manager layout to details view.	
Ctrl+Shift+2	Changes the file manager layout to details view.	

### Ensuring accessibility

The File Manager component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the File Manager component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the File Manager component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET MVC components](#)

### Access Control in File Manager component

The FileManager allows you to define access permissions for folders and files using a set of access rules to user(s).

- [Access Rules](#)
- [Permissions](#)

### Access Rules

The FileAccessController allows you to define security permissions for folders and files using a set of folder or file access rules.

To set up access rules for folders (including their files and sub-folders) and individual files, use the SetRules() method. The following table represents the AccessRule properties available for file and folder:

Properties	Applicable for file	Applicable for folder	Description
Copy	Yes	Yes	Allows access to copy a file or folder.
Read	Yes	Yes	Allows access to read a file or folder.
Write	Yes	Yes	Allows permission to write a file or folder.
WriteContents	No	Yes	Allows permission to write the content of folder.
Download	Yes	Yes	Allows permission to download a file or folder.
Upload	No	Yes	Allows permission to upload to the folder.
Path	Yes	Yes	Specifies the path to apply the rules, which are defined.
Role	Yes	Yes	Specifies the role to which the rule is applied.
IsFile	Yes	Yes	Specifies whether the rule is specified for folder or file.

The following syntax represents the access Rules for Administrator using file or folder.

```
`typescript
//Administrator
//Access Rules for File
new AccessRule { Path = "/", Role = "Administrator", Read = Permission.Allow, Write =
Permission.Allow, Copy = Permission.Allow, Download = Permission.Allow, IsFile = true },
// Access Rules for folder
new AccessRule { Path = "*", Role = "Administrator", Read = Permission.Allow, Write = Permission.Allow,
Copy = Permission.Allow, WriteContents = Permission.Allow, Upload = Permission.Allow, Download =
Permission.Deny, IsFile = false },
`
```

The following syntax represent the access Rules for Default user using file or folder.

```
`typescript
//Default User
//Access Rules for File
new AccessRule { Path = "/", Role = "Default User", Read = Permission.Deny, Write = Permission.Deny,
Copy = Permission.Deny, Download = Permission.Deny, IsFile = true },
// Access Rules for folder
```

```
new AccessRule { Path = "*", Role = "Default User", Read = Permission.Deny, Write = Permission.Deny,
Copy = Permission.Deny, WriteContents = Permission.Deny, Upload = Permission.Deny, Download =
Permission.Deny, IsFile = false },
```

,

### Permissions

It helps to explain how to apply security permission to file manager file or folder using access rules. The following table represent the value that determines the permission.

Value	Description
-------	-------------

---	---
-----	-----

Allow	Allows you to do read, write, copy, and download operations.
-------	--------------------------------------------------------------

Deny	Denies you to do read, write, copy, and download operations.
------	--------------------------------------------------------------

Use the **Role** property to apply created roles to the file manager. After that, the file manager displays folder or file and allow permission based on assigned roles.

The following syntax represent how to apply permission based on assigned roles.

- Permission denied for administrator to write a file or folder.

```
`typescript
```

```
// For file
```

```
new AccessRule { Path = "/", Role = "Administrator", Read = Permission.Allow, Write = Permission.Deny,
IsFile = true},
```

```
// For folder
```

```
new AccessRule { Path = "*", Role = "Administrator", Read = Permission.Allow, Write = Permission.Deny,
IsFile = false},
```

,

The following syntax represent how to allow or deny permission based on file or folder access rule.

- Permission denied for writing except for particular file or folder.

```
`typescript
```

```
// Deny writing for particular folder
```

```
new AccessRule { Path = "/Documents", Role = "Document Manager", Read = Permission.Allow, Write =
Permission.Deny, Copy = Permission.Allow, WriteContents = Permission.Deny, Upload =
Permission.Deny, Download = Permission.Deny, IsFile = false },
```

```
// Deny writing for particular file
```

```
new AccessRule { Path = "/Pictures/Employees/Adam.png", Role = "Document Manager", Read =
Permission.Allow, Write = Permission.Deny, Copy = Permission.Deny, Download = Permission.Deny,
IsFile = true },
```

,

- Permission denied for writing and uploading in root folder.

```
` typescript
```

```
// Folder Rule
```

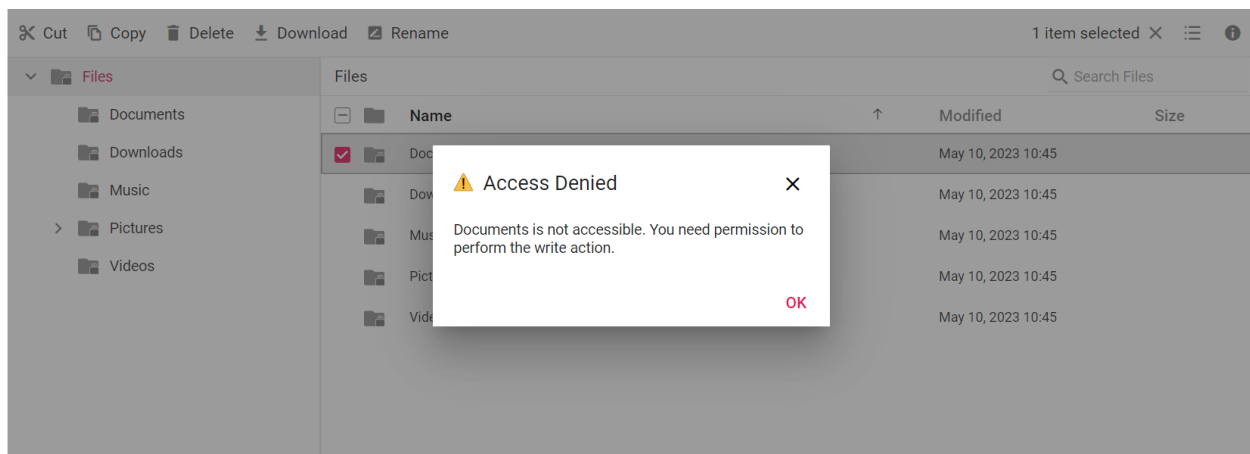

```
new AccessRule { Path = "/", Role = "Document Manager", Read = Permission.Allow, Write =
Permission.Deny, Copy = Permission.Deny, WriteContents = Permission.Deny, Upload =
Permission.Deny, Download = Permission.Deny, IsFile = false },
`
```

The following example demonstrate the file manager rendered with access control support.

### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManagerAccess/FileOperations",
 GetImageUrl = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManagerAccess/GetImage",
 UploadUrl = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManagerAccess/Upload",
 DownloadUrl = "https://ej2-aspcore-
service.azurewebsites.net/api/FileManagerAccess/Download"
 }).View(Syncfusion.EJ2.FileManager.ViewType.Details).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

Output be like the below, when write the documents folder.

### How To

How to add custom menu item in context menu

The context menu can be customized using the [contextMenuSettings](#), [menuOpen](#), and [menuClick](#) events.

The following example shows adding a custom item in the context menu.

The [menuOpen](#) event is used to add the new menu item. The [menuClick](#) event is used to add event handler to the new menu item.

### CSHTML

```
@{
 string[] files = new string[] { "Custom", "Open", "|", "Delete",
 "Download", "Rename", "|", "Details" };
 string[] folder = new string[] { "Custom", "Open", "|", "Delete",
 "Download", "Rename", "|", "Details" };
 string[] layout = new string[] { "Custom", "SortBy", "View", "Refresh",
 "|", "NewFolder", "Upload", "|", "Details", "|", "SelectAll" };
}
<div class="control-section">
 <div class="sample-container">
 <!-- Filemanager element declaration -->
 @Html.EJS().FileManager("file").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings()
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).ContextMenuSettings(new
 Syncfusion.EJ2.FileManager.FileManagerContextMenuSettings()
 {
 File = files,
 Folder = folder,
 Layout = layout
 }).MenuOpen("menuOpen").MenuClick("menuClick").Render()
 <!-- end of filemanager element -->
 </div>
</div>
<script>
// Icon added to custom menu item
function menuOpen(args) {
 for (var i = 0; i < args.items.length; i++) {
 if (args.items[i].id === this.element.id + '_cm_custom') {
 args.items[i].iconCss = 'e-icons e-fe-tick';
 }
 }
}
// event for custom menu item
function menuClick(args) {
 if (args.item.text === 'Custom') {
 alert('You have clicked custom menu item')
 }
}
</script>
```

```

 {
 return View();
 }
}

```

Output be like the below.

### How to add custom button in toolbar

You can modify the items displayed in the toolbar by utilizing the [toolbarItems](#) API. To display both default and customized items, it's essential to assign a unique **name** to each item. Additionally, you have the flexibility to alter the default items by adjusting properties such as **tooltipText**, **iconCss**, **Text**, **suffixIcon** and more. This level of customization allows you to tailor the toolbar to your specific requirements and design preferences. The names used in the code example below serve as unique identifiers for default toolbar items, while custom items can be assigned any unique name value to distinguish them from the defaults.

For instance, here's an example of how to add a custom checkbox to the toolbar using the **template** property. Here we have modified the default **New Folder** item and added a custom toolbar item for selection.

### CSHTML

```

@{
 string[] items = new string[] { "NewFolder", "Upload", "Delete",
 "Download", "Rename", "SortBy", "Refresh", "Selection", "View", "Details",
 "Custom" };
}
<div class="control-section">
 <div class="sample-container">
 <!-- Filemanager element declaration -->
 @Html.EJS().FileManager("file").AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings()
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"

```

```

 }).ToolBarSettings(new
Syncfusion.EJ2.FileManager.FileManagerToolBarSettings()
 {
 Items = items
 }).ToolBarClick("toolbarClick").ToolBarCreate("onCreate").Render()
 <!-- end of filemanager element -->
</div>
</div>
<script>
 // event for custom toolbar item
 function toolbarClick(args) {
 if (args.item.text === 'Custom') {
 alert('You have clicked custom toolbar item')
 }
 }
 function onCreate(args) {
 for (var i = 0; i < args.items.length; i++) {
 if (args.items[i].id === this.element.id + '_tb_custom') {
 args.items[i].prefixIcon = 'e-icons e-fe-tick';
 }
 }
 }
</script>
<style>

```

Output be like the below.

### How to enable/disable toolbar item/items

The toolbar items can be enabled/disabled by specifying the items in `enableToolBarItems` or `disableToolBarItems` methods respectively.

The following example shows enabling and disabling toolbar items on button click.

### CSHTML

```
<div>
 <!-- Declare button element -->
 @Html.EJS().Button("enable").Content("Enable New Folder toolbar
item").CssClass("e-success").Render()
 @Html.EJS().Button("disable").Content("Disable New Folder toolbar
item").CssClass("e-danger").Render()
 <!-- end of button element -->
</div>
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).View(Syncfusion.EJ2.FileManager.ViewType.Details).Render()
 <!-- end of filemanager element -->
 </div>
</div>
```

```

</div>
<script>
 document.addEventListener('DOMContentLoaded', function () {
 var filemanagerInstance =
document.getElementById("filemanager").ej2_instances[0];
 // Click event for enable button
 document.getElementById("enable").onclick = function (args) {
 // Enable new folder toolbar item
 filemanagerInstance.enableToolbarItems(["newfolder"]);
 }
 // Click event for enable button
 document.getElementById("disable").onclick = function (args) {
 // Disable new folder toolbar item
 filemanagerInstance.disableToolbarItems(["newfolder"]);
 }
 });
</script>
<style>
 /*sample level styles*/
 #enable {
 margin: 10px;
 }
 #disable {
 margin: 10px;
 }
</style>

```

### How to add custom thumbnail in file manager

The default appearance of the file manager can customize with your own icon by using [showThumbnail](#) property.

The following example demonstrate how to add a custom icon in largeicons view.

#### CSHTML

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->

 @Html.EJS().FileManager("filemanager").ShowThumbnail(false).AjaxSettings(new
 Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
```

```
UploadUrl = "/Home/Upload",
DownloadUrl = "/Home/Download"
}).Render()
<!-- end of filemanager element -->
</div>
</div>
<style>
.e-filemanager .e-large-icons .e-fe-image {

Output be like the below.

### Nested FileManager

FileManager can be rendered inside the other components like Tab, Dialog, and more.

- [Adding file manager inside the dialog](#)
- [Adding file manager inside the tab](#)

#### *Adding file manager inside the dialog*

The following example shows the file manager component rendered inside the dialog. Click the browse button in the Uploader element to open the File Manager inside the Dialog control.

#### **CSHTML**

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Popups
<div class="control-section">
 <div class="sample-container">
 <div id='container' class="fileupload">
 @Html.EJS().Uploader("UploadFile").Render()
 @Html.EJS().Button("openBtn").Content("Browse...").Render()
 </div>
 <div id='target' class="control-section">
 @*Dialog*@
 @Html.EJS().Dialog("dialog").AnimationSettings(new
DialogAnimationSettings() { Effect = DialogEffect.None
}).Created("onDialogLoad").Close("dialogClose").Open("dialogOpen").Header("O
pen").Visible(false).ShowCloseIcon(true).Width("850px").Target("#target").Co
ntentTemplate(@<div class='dialogContent'>
 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).FileOpen("onFileOpen").Render()
 </div>).Render()
 </div>
 </div>
</div>
</script>
```

```

function onDialogLoad() {
 document.getElementById("openBtn").addEventListener('click',
function () {

Initially output be like the below.

After clicking the file browser button, file manager is rendered with dialog. Output be like the below.

#### *Adding file manager inside the tab*

The following example demonstrate that the file manager component is placed inside the content area of tab element.

#### **CSHTML**

```
@using Syncfusion.EJ2.Navigations;
<div class="e-tab-section">
 <div class="col-lg-8 content-wrapper control-section">
 <div class="e-sample-resize-container">
 <div id="overview" style="display: none">
 <div class="content-title">
 <div class="cnt-text">Overview</div>
 </div>
 The file manager component contains a context menu for
 performing file operations, large-icons view for displaying the files and
 folders, and a breadcrumb for navigation. However, these basic
 functionalities can be extended by using the additional feature modules like
 toolbar, navigation pane, and details view to simplify the navigation and
 file operations within the file system.
 </div>
 </div>
 </div>
</div>
```

```

 </div>
 <div id="filemanager" style="display: none">
 <div class="content-title">
 <div class="cnt-text">Filemanager with default
functionalities</div>
 </div>
 <div>
 @Html.EJS().FileManager("file").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).Render()
 </div>
 </div>
 @ (Html.EJS().Tab("orientationTab")
 .Items(new List<TabBarItem> {
 new TabBarItem { Header = ViewBag.headerText1, Content =

 return
 }
 Json(operation.ToCamelCase(operation.Search(args.Path, args.SearchString,
args.ShowHiddenItems, args.CaseSensitive)));
 case "rename":
 // Path - Current path of the renamed file; Name - Old
 file name; NewName - New file name
 return
 }
 Json(operation.ToCamelCase(operation.Rename(args.Path, args.Name,
args.NewName)));
 }
 return null;
}

// Processing the Upload operation
public ActionResult Upload(string path,
IList<System.Web.HttpPostedFileBase> uploadFiles, string action)
{
 FileManagerResponse uploadResponse;
 //Invoking upload operation with the required paramaters
 // path - Current path where the file is to uploaded;
 uploadFiles - Files to be uploaded; action - name of the operation(upload)
 uploadResponse = operation.Upload(path, uploadFiles, action,
null);
 return Content("");
}

// Processing the Download operation
public ActionResult Download(string downloadInput)
{
 FileManagerDirectoryContent args =
JsonConvert.DeserializeObject<FileManagerDirectoryContent>(downloadInput);
 //Invoking download operation with the required paramaters
 // path - Current path where the file is downloaded; Names -
 Files to be downloaded;
 return operation.Download(args.Path, args.Names);
}

// Processing the GetImage operation

```

```
public ActionResult GetImage(FileManagerDirectoryContent args)
{
 //Invoking GetImage operation with the required paramaters
 // path - Current path of the image file; Id - Image file id;
 return operation.GetImage(args.Path, args.Id, false, null,
null);
}
public ActionResult Index()
{
 List<TabTabItem> orientationItems = new List<TabTabItem>
 {
 new TabTabItem { Header = new TabHeader { Text = "Overview"
}, Content = "#overview" },
 new TabTabItem { Header = new TabHeader { Text =
"Filemanager" }, Content = "#filemanager" }
 };
 ViewBag.orientationItems = orientationItems;
 return View();
}
}
```

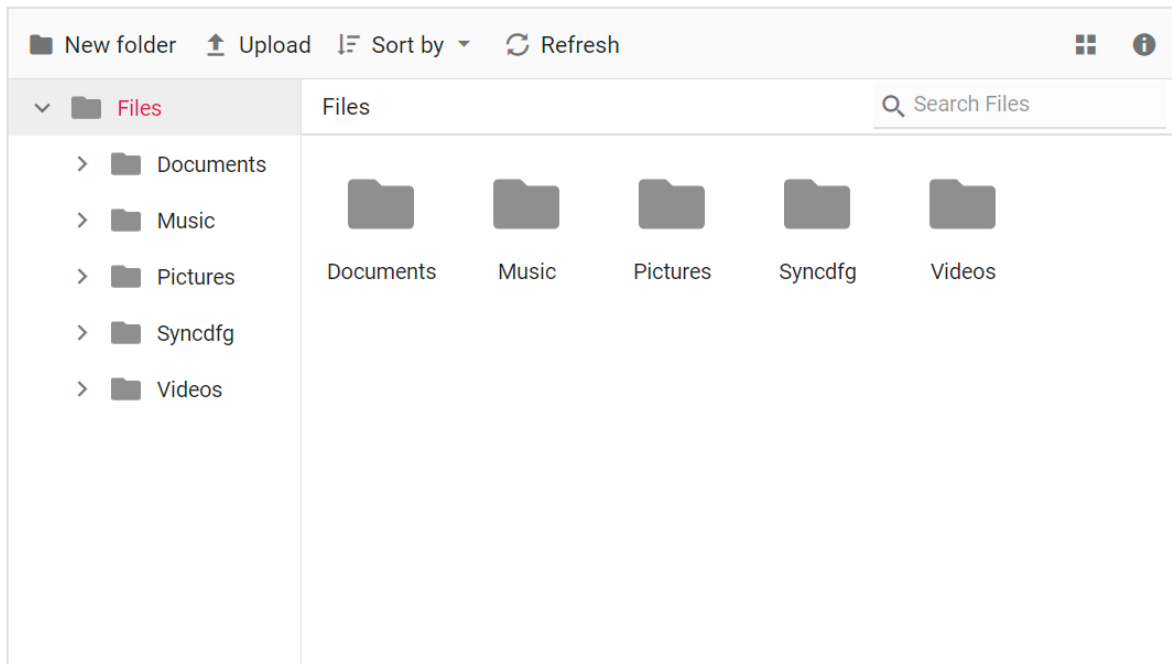

Output be like the below for initial view.

OVERVIEW × FILEMANAGER ×

## Overview

The file manager component contains a context menu for performing file operations, large-icons view for displaying the files and folders, and a breadcrumb for navigation. However, these basic functionalities can be extended by using the additional feature modules like toolbar, navigation pane, and details view to simplify the navigation and file operations within the file system.

Output be like the below, when file manager is placed inside the tab

OVERVIEW × **FILEMANAGER** ×**Filemanager with Default Functionalities****Render FileManager in Internet Explorer**

In the Internet Explorer browser, ES6 promise polyfills are required to run the file manager component. Click this [link](#) to learn more about the EJ2 components browser compatibility.

To render the file manager component in Internet Explorer browser, add the ES6 promise polyfill script above the Syncfusion Essential JS 2 Scripts in **layout** page.

```
`html
<head>
<!-- ES6 Promise polyfill -->
<script src="https://cdn.polyfill.io/v2/polyfill.min.js"></script>
<!-- Syncfusion Essential JS 2 Scripts -->
<script src="https://cdn.syncfusion.com/ej2/dist/ej2.min.js"></script>
</head>
`
```

After adding the script file in **layout** page, render the file manager component. The following example shows how to render the file manager in IE browser.

**CSHTML**

```
<div class="control-section">
 <div class="sample-container">
 <!-- Declare filemanager element -->
```

```

 @Html.EJS().FileManager("filemanager").AjaxSettings(new
Syncfusion.EJ2.FileManager.FileManagerAjaxSettings
 {
 Url = "/Home/FileOperations",
 GetImageUrl = "/Home/GetImage",
 UploadUrl = "/Home/Upload",
 DownloadUrl = "/Home/Download"
 }).Render()
 <!-- end of filemanager element -->
</div>
</div>

```

## LAYOUT MVC.CSHTML

```

<!DOCTYPE html>
<html>
<head>
 <meta charset="utf-8" />
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <title>@ViewBag.Title - My ASP.NET Application</title>
 <!-- Syncfusion Essential JS 2 Styles -->
 <link rel="stylesheet"
href="https://cdn.syncfusion.com/ej2/material.css" />
 <!-- ES6 Promise polyfill -->
 <script src="https://cdn.polyfill.io/v2/polyfill.min.js"></script>
 <!-- Syncfusion Essential JS 2 Scripts -->
 <script src="https://cdn.syncfusion.com/ej2/dist/ej2.min.js"></script>
 @Styles.Render("~/Content/css")
 @Scripts.Render("~/bundles/modernizr")
</head>
<body>
 <div class="navbar navbar-inverse navbar-fixed-top">
 <div class="container">
 <div class="navbar-header">
 <button type="button" class="navbar-toggle" data-
toggle="collapse" data-target=".navbar-collapse">

 </button>
 @Html.ActionLink("Application name", "Index", "Home", new {
area = "" }, new { @class = "navbar-brand" })
 </div>
 <div class="navbar-collapse collapse">
 <ul class="nav navbar-nav">
 @Html.ActionLink("Home", "Index", "Home")
 @Html.ActionLink("About", "About", "Home")
 @Html.ActionLink("Contact", "Contact", "Home")

 </div>
 </div>
 </div>
 <div class="container body-content">
 @RenderBody()
 <hr />
 <footer>

```

```
<p>© @DateTime.Now.Year - My ASP.NET Application</p>
</footer>
</div>
@Html.EJS().ScriptManager()
@Scripts.Render("~/bundles/jquery")
@Scripts.Render("~/bundles/bootstrap")
@RenderSection("scripts", required: false)
</body>
</html>
```

Output be like the below.

### Create the custom file provider using NodeJS

Here we manipulate the Azure Blob Storage to supply the necessary data for the File Manager. We achieve this by utilizing NodeJS to fetch the required data from the Azure blob storage.

NodeJS acts as the bridge between the File Manager component and Azure Blob Storage, allowing seamless communication and data retrieval. Through this integration, the File Manager can access and interact with the data stored in Azure Blob Storage, enabling smooth file management operations.

#### Prerequisites

- Valid Azure blob storage account. ( accountName, accountKey, endpointSuffix)
- Node version 14 above.

#### Introduction to Azure Blob Storage

Azure Blob Storage is a cloud-based object storage service provided by Microsoft Azure. It is designed to store and manage unstructured data, also known as "blobs" in the cloud. Blobs can be any type of data, such as images, videos, documents, backups, logs, and more.

#### Key concepts of Azure Blob Storage

**Containers:** In Azure Blob Storage, data is organized into containers. Containers are logical units that can hold one or more blobs. Think of them as directories or folders that help organize the data.

**Blobs:** Blobs are the actual data objects stored in Azure Blob Storage.

By understanding the fundamental concepts and use cases of Azure Blob Storage, you will be well-prepared to proceed with setting up and interacting with it using NodeJS in the custom File Provider.

### Create NodeJS project

Following the steps to create the NodeJS project.

Create a new directory for your project and run the following command to initialize a new NodeJS project. This will create a package.json file.

```
`ts
npm init
`
```

Install the following packages.

- express
- @azure/storage-blob
- archiver
- body-parser
- cors
- esm
- multer

Open your text editor or integrated development environment (IDE) and create the index.js file start writing your NodeJS code. This file will serve as the entry point of your application.

```
`ts
const express = require('express');
const app = express();
const port = 3000;
app.get('/', (req, res) => {
res.send('Hello, NodeJS!');
});
app.listen(port, () => {
console.log(Server running on http://localhost:${port});
});
`
```

To start your NodeJS application, simply run the following command in your terminal, pointing to the entry point file:

```
`ts
node index.js
`
```

### Initialize container client

We need to first get the BlobServiceClient. By using the connection string, we can obtain the BlobServiceClient. So, format the connection string as shown below.

```
`ts
```

```
Const connectionString =
DefaultEndpointsProtocol=https;AccountName=${accountName};AccountKey=${accountKey};E
ndpointSuffix=${EndpointSuffix};
`
```

We can obtain the `BlobServiceClient` and the **containerClient** using this connection String and the `BlobServiceClient`. the **containerName** is the container from your Azure blob storage account that you need to access.

```
`ts
```

```
import { BlobServiceClient } from "@azure/storage-blob";
const blobServiceClient = BlobServiceClient.fromConnectionString(connectionString);
const containerClient = blobServiceClient.getContainerClient(containerName);
`
```

#### File actions

Need to provide the following action to creating a new folder, copying and moving of files or folders, deleting, uploading, and downloading the files or folders in the file system

#### Read

Specify the directory name that needs to be accessed.

```
`ts
```

```
const directoryName = 'Files';
`
```

Create the **app.post** method with URL **‘/fileManager’**.

To identify the action by use this condition **req.body.action === ‘read’**

The following table represents the request parameters of **read** operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	read	Name of the file operation.
path	String	-	Relative path from which the data has to be read.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details about the current path (directory).

*Example for request:*

```
`ts
```

```
{
 action: "read",
 path: "/Videos/",
}
```

```
showHiddenItems: false,
data: [
0:{
name:"Videos",
size:0,
dateModified:"2023-09-14T14:28:27.000Z",
dateCreated: "2023-09-14T11:16:57.000Z",
hasChild:true,
isFile:false,
type:"Directory",
filterPath:"/",
fmicon: "e-fe-folder",
fmiconClass: "e-fe-folder",
fmid: "fetree0",
fmmodified: "September 14, 2023 19:58"
}
]
}
,
```

The following table represents the response parameters of **read** operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	<a href="#">FileManagerDirectoryContent</a>	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of files and folders present in given path or directory.
error	<a href="#">ErrorDetails</a>	-	Error Details

<a id="file-manager-directory-content"></a>

The following table represents the contents of **FileManagerDirectoryContent** in the file manager request and response.

Parameter	Type	Default	Explanation	Is required
----	----	----	----	----
name	String	-	File name	Yes
dateCreated	String	-	Date in which file was created (UTC Date string).	Yes
dateModified	String	-	Date in which file was last modified (UTC Date string).	Yes

filterPath	String	-	Relative path to the file or folder.	Yes
hasChild	Boolean	-	Defines this folder has any child folder or not.	Yes
isFile	Boolean	-	Say whether the item is file or folder.	Yes
size	Number	-	File size	Yes
type	String	-	File extension	Yes
permission	[AccessRules](#)	-	File extension	Optional
caseSensitive	Boolean	-	Defines search is case sensitive or not.	Optional
action	String	read	Name of the file operation.	Optional
names	String[]	-	Name list of the items to be downloaded.	Optional
data	FileManagerDirectoryContent	-	Details of the download item.	Optional
uploadFiles	IList<IFormFile>	-	File that are uploaded.	Optional
newName	String	-	New name for the item.	Optional
searchString	String	-	String to be searched in the directory.	Optional
targetPath	String	-	Relative path where the items to be pasted are located.	Optional
targetData	FileManagerDirectoryContent	-	Details of the copied item.	Optional
renameFiles	String[]	-	Details of the renamed item.	Optional
<a id="access-rules"></a>

The following table represents the **AccessRules** properties available for file and folder:

Properties	Applicable for file	Applicable for folder	Description
---	---	---	---
Copy	Yes	Yes	Allows access to copy a file or folder.
Read	Yes	Yes	Allows access to read a file or folder.
Write	Yes	Yes	Allows permission to write a file or folder.
WriteContents	No	Yes	Allows permission to write the content of folder.
Download	Yes	Yes	Allows permission to download a file or folder.
Upload	No	Yes	Allows permission to upload to the folder.
Path	Yes	Yes	Specifies the path to apply the rules, which are defined.
Role	Yes	Yes	Specifies the role to which the rule is applied.
IsFile	Yes	Yes	Specifies whether the rule is specified for folder or file.

*Example for response:*

```
`ts
{
 cwd:
```

```
{
 filterPath: "/",
 hasChild: true,
 name: "Videos",
 size: 0,
 type: "File Folder"
},
files:[
 0:{
 dateCreated: "2023-09-14T11:16:57.000Z"
 dateModified: "2023-09-14T11:16:57.000Z"
 filterPath: "/Videos/"
 hasChild: false
 isFile: true
 name: "about.txt"
 size: 29
 type: ".txt"
 }
],
error:null
}
```

#### Get image

Create the **app.get** method with URL **'/fileManager/GetImage'**.

The following table represents the request parameters of **GetImage** operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

path	String	-	Relative path to the image file
------	--------	---	---------------------------------

The req.query.path contains the exact path of the images. For example: **"/Jack.png"**.

Download the blob (image) from Azure Blob Storage using the blobClient and stores the result in the downloadResponse variable.

Pipe the readableStreamBody from the blob to the res response. It means the image data will be streamed from the Azure Blob Storage directly to the client's browser when the image URL is accessed.

Handle the exception if the image is not available in the given path.

### Download

Create the **app.post** method with URL **‘/fileManager/Download’**.

The following table represents the request parameters of *download* operations.

Parameter	Type	Default	Explanation
action	String	download	Name of the file operation
path	String	-	Relative path to location where the files to download are present.
names	String[]	-	Name list of the items to be downloaded.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the download item.

*Example for request:*

```
`ts
{
 action: 'download',
 path: '/Downloads/Testing/',
 names: ['About.txt'],
 data: [
 0:{
 name: 'About.txt',
 type: '.txt',
 isFile: true,
 size: 29,
 dateModified: '2023-09-14T06:03:52.000Z',
 hasChild: false,
 filterPath: '/Downloads/Testing/',
 fmcreated: null,
 fmmodified: 'September 14, 2023 11:33',
 fmiconClass: 'e-fe-txt',
 fmicon: 'e-fe-txt'
 }
]
}
```

The **req.body.downloadInput** must be parsed to get the **downloadObj**. Download the blob from Azure Blob Storage using the blobClient.

Download the blob from Azure Blob Storage using the blobClient and Pipe the readableStreamBody to the response object.

Create the archive file to download the multiple Files, Folders and single folders, then pipe the archive to the response.

### Upload

Create the **app.post** method with URL **'/fileManager/Upload'**.

The following table represents the request parameters of *Upload* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	Save	Name of the file operation.
path	String	-	Relative path to the location where the file has to be uploaded.
uploadFiles	IList<IFormFile>	-	File that are uploaded.

*Example for request:*

```
`ts
{
 path: '/Pictures/',
 action: 'save',
 data: [
 0:{
 name: 'Pictures',
 type: 'File Folder',
 isFile: true,
 size: 0,
 dateModified: '2023-09-14T06:03:52.000Z',
 hasChild: true,
 filterPath: '',
 fmid: 'fetree1',
 }
],
 filename: 'bird (2).jpg'
}
```

Multer is a popular middleware used to handle file uploads in Express-based web applications. Create the Multer config to store the upload files in buffer.

```
`ts
const multerConfig = {
storage: memoryStorage()
};
`
```

Need to handle the 3 cases here.

- Save
- Keep Both (action name will be **keepboth**)
- Replace (action name will be **replace**)

Create the **getBlockBlobClient** with the **req.body.filename**. If the blob does not exist, then upload the data to that blob. If the blob already exists, then create an error message containing "File Already Exists" and send the response.

#### Create a new folder

The following table represents the request parameters of *create* operations.

Parameter	Type	Default	Explanation
action	String	create	Name of the file operation.
path	String	-	Relative path in which the folder has to be created.
name	String	-	Name of the folder to be created.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details about the current path (directory).

*Example for request:*

```
`ts
action: "create",
data: [
0:{
filterPath: "/",
hasChild: true,
isFile: false,
name: "files",
nodeId: "fe_tree",
size: 0,
type: ""
}
],
```

```
name: "Hello",
path: "/test/"
,
```

Check the existence of the folder, If the folder exists then send the error message containing “Folder already exists”. If it does not exist, then create the folder. Create the folder by creating the file in that folder’s path.

The following table represents the response parameters of *create* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the created folder
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example for response:*

```
`ts
{
 cwd: null,
 files: [
 0:{
 dateCreated: "2023-09-14T10:52:25.000Z",
 dateModified: "2023-09-14T10:52:25.000Z",
 filterPath: null,
 hasChild: false,
 isFile: false,
 name: "New",
 size: 0,
 type: "Directory"
 }
],
 details: null,
 error: null
}
```

### [Rename](#)

The following table represents the request parameters of *rename* operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

action	String	rename	Name of the file operation.	
path	String	-	Relative path in which the item is located.	
name	String	-	Current name of the item to be renamed.	
newName	String	-	New name for the item.	
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the item to be renamed.	

*Example for request:*

```
`ts
{
 action: "rename",
 data: [
 0:{
 dateCreated: "2023-09-14T10:41:17.000Z",
 filterPath: "/Pictures/Nature/",
 hasChild: false,
 iconClass: "e-fe-image",
 isFile: true,
 name: "seaviews.jpg",
 size: 95866,
 type: ".jpg"
 }
],
 newName: "seaview.jpg",
 name: "seaviews.jpg",
 path: "/Pictures/Nature/"
}
```

Renaming can be done by copy the folder or file from the source blob instance to target blob instance. If the file exists, then send the error message as response.

The following table represents the response parameters of *rename* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the renamed item.

|error| [ErrorDetails](#) | - |Error Details|

*Example for response:*

```
`ts
{
 cwd:null,
 files:[
 0:{
 name:"seaview.jpg",
 size:95866,
 dateModified:"2023-09-14T11:16:57.000Z",
 dateCreated:"2023-09-14T10:41:17.000Z",
 hasChild:false,
 isFile:true,
 type:".jpg",
 filterPath:"/Pictures/Nature/"
 }
],
 error:null,
 details:null
}
```

### Delete

The following table represents the request parameters of *delete* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	delete	Name of the file operation.
path	String	-	Relative path where the items to be deleted are located.
names	String[]	-	List of the items to be deleted.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the item to be deleted.

*Example for request:*

```
`ts
{
 action: "delete",
```

```
path: "/",
names: ["bird.jpg"],
data: [
 0:{
 dateModified: "2023-09-14T09:12:53.000Z",
 filterPath: "/",
 hasChild: false,
 iconClass: "e-fe-image",
 isFile: true,
 name: "bird.jpg",
 size: 102182,
 type: ".jpg"
 }
]
}
```

To delete the file, directly get the file instance and delete the file. To delete the folder, we need to get all files inside that folder and delete all those files.

Handle the null exception if file or folder is not available.

The following table represents the response parameters of *delete* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details about the deleted item(s).
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example for response:*

```
`ts
{
 cwd: null,
 details: null,
 error: null,
 files: [
 0:{
 dateModified: "2023-09-14T09:12:53.000Z",
```

```
filterPath: "/",
hasChild: false,
iconClass: "e-fe-image",
isFile: true,
name: "bird.jpg",
size: 102182,
type: ".jpg"
}
]
}
,
```

### Details

The following table represents the request parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	details	Name of the file operation.
path	String	-	Relative path where the items are located.
names	String[]	-	List of the items to get details.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the selected item.

*Example:*

```
`ts
{
 action: "details",
 path: "/FileContents/",
 names: ["bird.jpg"],
 data: [
 0:{
 dateModified: "2023-09-14T09:12:53.000Z",
 filterPath: "/",
 hasChild: false,
 iconClass: "e-fe-image",
 isFile: true,
 name: "bird.jpg",
```

```
size: 102182,
type: ".jpg"
}
]
}
,
```

To get the file and folder details, iterate the **req.body.names** to get the details of files and folders. If the data is file, then get the file instance and get the properties using the **getProperties** method. If the data is Folder, then get the blobs details under that folder using **listBlobsFlat** method. Get the required properties and send final response. Handled the null exception if the file or folder is not available.

The following table represents the response parameters of *details* operations.

Parameter	Type	Default	Explanation
details	<a href="#">FileManagerDirectoryContent</a>	-	Details of the requested item(s).
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example:*

```
`ts
{
 cwd:null,
 files:null,
 error:null,
 details:
 {
 created: "2023-09-15T06:04:12.000Z"
 isFile: true
 location: "Files/bird.jpg"
 modified: "2023-09-15T06:04:12.000Z"
 multipleFiles: false
 name: "bird.jpg"
 size: "100.0 KB"
 }
}
,
```

### Search

The following table represents the request parameters of *search* operations.

Parameter	Type	Default	Explanation
	----	----	----
action	String	search	Name of the file operation.
path	String	-	Relative path to the directory where the files should be searched.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
caseSensitive	Boolean	-	Defines search is case sensitive or not.
searchString	String	-	String to be searched in the directory.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the searched item.

*Example for request:*

```
`ts
{
 action: "search",
 path: "/asia/",
 searchString: "nature",
 showHiddenItems: false,
 caseSensitive: false,
 data: [
 0:{
 filterPath: "/",
 hasChild: true,
 name: "asia",
 size: 0,
 type: "File Folder",
 fmid: "fetree1"
 }
]
}
```

Replace the '\*' in the **req.body.searchString** and assign the result to new variable. Get all blobs under this directory and check that path contains the search string

The following table represents the response parameters of *search* operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

|----|----|----|----|

|cwd|[FileManagerDirectoryContent](#)|-|Path (Current Working Directory) details.|

|files|FileManagerDirectoryContent[]|-|Files and folders in the searched directory that matches the search input.|

|error|[ErrorDetails](#)|-|Error Details|

*Example for response:*

```
`ts
{
 cwd:
 {
 name:"asia",
 size:0,
 dateModified:"2023-09-14T14:28:27.000Z",
 dateCreated:"2023-09-14T11:16:57.000Z",
 hasChild:true,
 isFile:false,
 type:"File Folder",
 filterPath:"/"
 },
 files:[
 0: {
 dateModified: "2023-09-15T06:22:00.000Z",
 filterPath: "/asia/",
 hasChild: false,
 isFile: true,
 name: "about.txt",
 size: 42,
 type: ".txt"
 }
],
 error:null,
 details:null
}
```

### Copy and move

The following table represents the request parameters of *copy* operations.

Parameter	Type	Default	Explanation
action	String	copy	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be copied.
targetPath	String	-	Relative path where the items to be pasted are located.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the copied item.
targetData	<a href="#">FileManagerDirectoryContent</a>	-	Details of the copied item.
renameFiles	String[]	-	Details of the renamed item.

*Example for request:*

```
`ts
{
 action: "copy",
 path: "/",
 names: ["bird.jpg"],
 renameFiles: [],
 targetPath: "/asia/",
 targetData: {
 filterPath: "/",
 hasChild: true,
 name: "asia",
 size: 0,
 type: "File Folder",
 fmid: "fetree1",
 },
 data: [
 0:{
 dateCreated: "2023-09-15T06:04:12.000Z",
 dateModified: "2023-09-15T06:04:12.000Z",
 filterPath: "/",
```

```
hasChild: false,
isFile: true,
name: "bird.jpg",
size: 102182,
type: ".jpg",
fmcreated: "September 15, 2023 11:34",
fmhtmlAttr: {class: "e-large-icon", title: "bird.jpg"},
fmiconClass: "e-fe-image",
fmimageAttr: {alt: "bird.jpg"},
fmimageUrl: "http://localhost:3000/GetImage?path=%2Fbird.jpg&time=1694760243307",
fmmodified: "September 15, 2023 11:34",
}
]
}
,
```

Action name will be **move** for move action.

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	<a href="#">FileManagerDirectoryContent</a>	-	Path (Current Working Directory) details.
files	<a href="#">FileManagerDirectoryContent[]</a>	-	Details of copied files or folders
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example for response:*

```
`ts
{
 cwd:null,
 files:[
 0:{
 dateCreated: "2023-09-15T06:55:03.000Z"
 dateModified: "2023-09-15T06:55:03.000Z"
 filterPath: "/asia/"
 hasChild: false
 isFile: true
```

```
name: "bird.jpg"
previousName: null
size: 102182
type: ".jpg"
}
],
error:null,
details:null
}
`
```

Need to handle two cases.

- Directory copy and move.
- File copy and move.

Create the **isRename** variable to store the is request is rename or not. If the **isRename** is false then check the existence of the folders, and if folder is existing, then send the error message. If **isRename** is true, then don't check the existence of the folder.

To move or copy the folders you need to get all the blobs from that folder and create the new path for each blob and copy the data from the old path to the new path. To move or copy the files copy the data from the source blob client to target client. If the action is move then delete the old blob.

---

**Note:** To get the complete project, refer to this [link](#)

---

## Floating Action Button

### Getting Started with ASP.NET MVC Floating Action Button Control

This section briefly explains about how to include [ASP.NET MVC Floating Action Button] control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

##### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

##### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

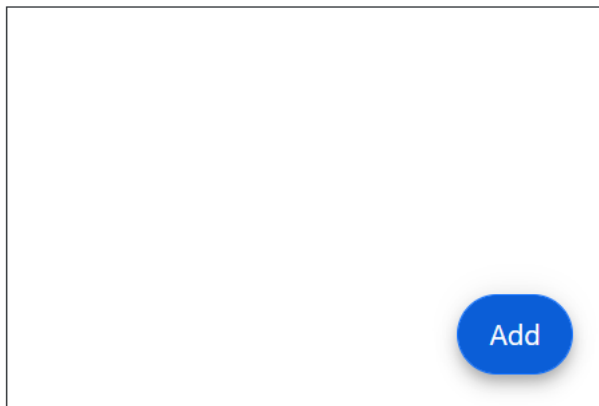

### Add ASP.NET MVC Floating Action Button control

Now, add the Syncfusion ASP.NET MVC Floating Action Button control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
<div id="target" style="min-height:200px; position:relative; width:300px; border:1px solid;">
 @Html.EJS().Fab("fab").Target("#target").Content("Add").Render()
</div>
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Floating Action Button control will be rendered in the default web browser.

### Event Click In Floating Action Button

The floating action button control triggers the `onclick` event when you click on the floating action button. You can use this event to perform the required action.

#### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").IconCss("e-icons e-edit").Content("Edit").Render()
<script>
 document.getElementById("fab").addEventListener('click', function () {
 alert("Edit is clicked!");
 });
</script>
```

#### ONCLICKEVENT.CS

```
public ActionResult OnClickEvent()
{
 return View();
}
```

### Icons in Asp.Net MVC Floating Action Button Control

You can customize the icon and text of Asp.Net MVC Floating Action Button(FAB) using [IconCss](#) and [Content](#) properties.

## FAB with icon

You can show icon only in Floating Action Button by setting [IconCss](#) property. You can show tooltip on hover to show additional details to end-user by setting [Title](#) attribute.

## CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").IconCss("fab-icons fab-icon-people").Render()

<style>

```

## ICONPOSITION.CS

```

public ActionResult IconPosition()
{
 return View();
}

```

## Styles in ASP.NET MVC Floating Action Button Control

This section explains the different styles of Floating Action Button.

### FAB styles

The ASP.NET MVC Floating Action Button supports the following predefined styles that can be defined using the [CssClass](#) property. You can customize by replacing the [CssClass](#) property with the below defined class.

Class	Description
-----	-----
e-success	Used to represent a positive action.
e-outline	Used to represent an appearance of button with outline.
e-info	Used to represent an informative action.
e-warning	Used to represent an action with caution.
e-danger	Used to represent a negative action.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").IconCss("e-icons e-edit").CssClass("e-
warning").Render()
```

### FABSTYLES.CS

```
public ActionResult FabStyles()
{
 return View();
}
```

**Note:** Predefined Floating Action Button styles provide only the visual indication. So, Floating Action Button [Content](#) property should define the Floating Action Button style for the users of assistive technologies such as screen readers.

### Styles customization

To modify the Floating Action Button appearance, you need to override the default CSS of Floating Action Button component. Find the list of CSS classes and its corresponding section in Floating Action Button component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

| CSS Class | Purpose of Class |

|-----|-----|

|.e-fab.e-btn|To customize the FAB.|

|.e-fab.e-btn:hover|To customize the FAB on hover.|

|.e-fab.e-btn:focus|To customize the FAB on focus.|

|.e-fab.e-btn:active|To customize the FAB on active.|

|.e-fab.e-btn-icon|To customize the style of FAB icon.|

### Show text on hover

By using [CssClass](#), you can customize the Floating Action Button to show text on hover with applied transition effect.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").IconCss("e-icons e-edit").CssClass("fab-
hover").Content("Edit").Render()
<style>
 .e-fab.e-btn.fab-hover {
 padding: 6px 2px 8px 10px;
 }
 .fab-hover .text-container {
 overflow: hidden;
 width: 0;
 margin: 0;
 transition: width .5s linear 0s, margin .2s linear .5s;
```

```
}
.fab-hover:hover .text-container {
 width: 25px;
 margin-right:10px;
 transition: width .5s linear .2s, margin .2s linear 0s;
}
</style>
```

#### **FABHOVER.CS**

```
public ActionResult FabHover()
{
 return View();
}
```

#### Positions in Asp.Net MVC Floating Action Button Control

The floating action button can be positioned anywhere on the [Target](#) using the [Position](#) property. If the [Target](#) is not defined, then FAB is positioned based on the browser viewport.

The position values of Floating Action Button are as follows:

- TopLeft
- TopCenter
- TopRight
- MiddleLeft
- MiddleCenter
- MiddleRight
- BottomLeft
- BottomCenter
- BottomRight

Below example demonstrates Bottom Left position of FAB.

#### **CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").IconCss("fab-icons fab-icon-
people").Position(FabPosition.BottomLeft).Render()
<style>
```

```

 content: "\e70a";
}
</style>
```

### **FABPOSITION.CS**

```
public ActionResult FabPositions()
{
 return View();
}
```

### Custom position

You can define the custom position of the Floating Action Button by override the **top**, **left**, **right**, and **bottom** CSS properties using [CssClass](#).

### **CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").IconCss("e-icons e-edit").CssClass("custom-
position").Render()
<style>
 .e-fab.e-btn.custom-position {
 left: 40px;
 top: 40px;
 bottom: unset;
 right: unset;
 }
</style>
```

### **CUSTOMPOSITION.CS**

```
public ActionResult CustomPosition()
{
 return View();
}
```

## Events in Floating Action Button Control

This section explains the available events in Floating Action Button Control.

### Created

Event triggers after the creation of Floating Action Button.

#### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").Created("CreatedEvent()").IconCss("e-icons e-edit").Content("Edit").Render()
<script>
 function CreatedEvent() {
 // Your required action here
 }
</script>
```

#### CREATEDEVENT.CS

```
public ActionResult CreatedEvent()
{
 return View();
}
```

### OnClick

Event triggers when the Floating Action Button is clicked. Below example shows the Click event of the Floating Action Button.

#### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().Fab("fab").IconCss("e-icons e-edit").Content("Edit").Render()
<script>
 document.getElementById("fab").addEventListener('click', function () {
 alert("Edit is clicked!");
 });
</script>
```

#### ONCLICKEVENT.CS

```
public ActionResult OnClickEvent()
{
 return View();
}
```

## Gantt

### Getting Started with ASP.NET MVC Gantt Control

This section briefly explains about how to include [ASP.NET MVC Gantt](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

<namespaces>

<add namespace="Syncfusion.EJ2"/>

</namespaces>

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

**~/ LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

**Register Syncfusion script manager**

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

**~/ LAYOUT.CSHTML**

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

**Add ASP.NET MVC Gantt Control**

Now, add the Syncfusion ASP.NET MVC Gantt control in `~/Views/Home/Index.cshtml` page.

Bind the data with Gantt control by using the [DataSource](#) property. It accepts an array of JavaScript object or the DataManager instance. The data source fields that are required to render the tasks are mapped to the Gantt control using the [TaskFields](#) property.

**CSHTML**

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)Model).Height("45
0px").TaskFields(ts => ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
rogress("Progress").Child("SubTasks")).Render()
```

**HOMECONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View(ganttData());
 }
}
```

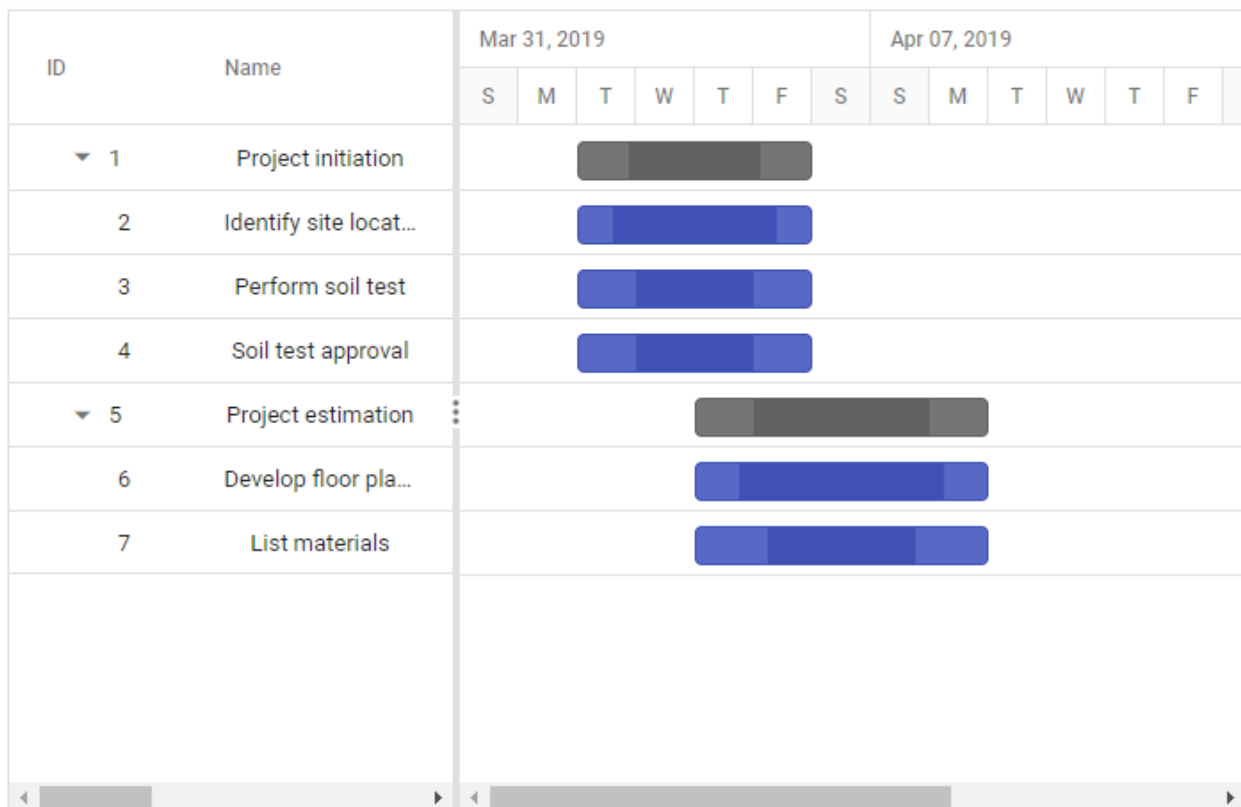

```
public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
 List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
```

```

TaskId = 7,
TaskName = "List materials",
StartDate = new DateTime(2019, 04, 04),
Duration = 3,
Progress = 50
};
Record2.SubTasks.Add(Child4);
Record2.SubTasks.Add(Child5);
GanttDataSourceCollection.Add(Record1);
GanttDataSourceCollection.Add(Record2);
return GanttDataSourceCollection;
}
}
public class GanttDataSource
{
public int TaskId { get; set; }
public string TaskName { get; set; }
public DateTime StartDate { get; set; }
public DateTime EndDate { get; set; }
public int? Duration { get; set; }
public int Progress { get; set; }
public List<GanttDataSource> SubTasks { get; set; }
}

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Gantt control will be rendered in the default web browser.

### Defining columns

Gantt has an option to define columns as an array. You can customize the Gantt columns using the following properties:

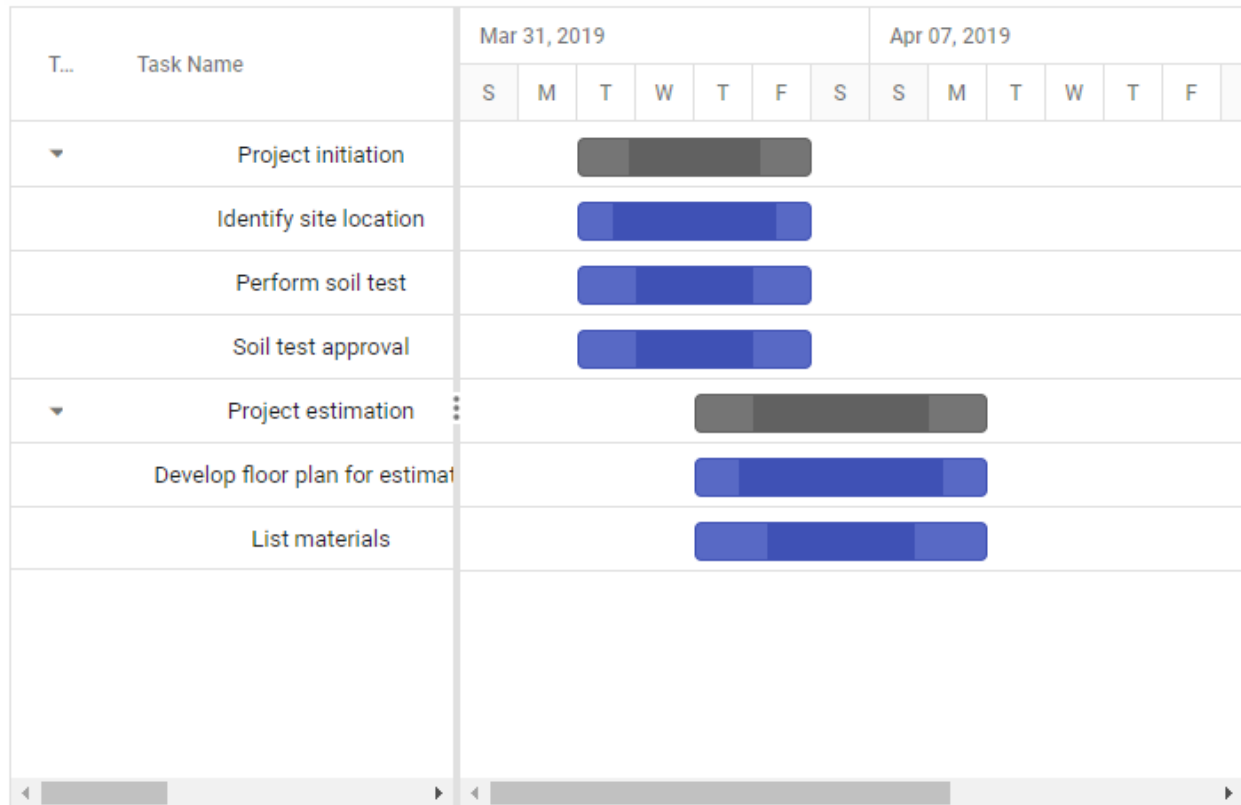

- [Field](#) : Maps the data source fields to the columns.
- [HeaderText](#) : Changes the title of columns.
- [TextAlign](#) : Changes the alignment of columns. By default, columns will be left aligned. To change the columns to right align, set [TextAlign](#) to right.
- [Format](#) : Formats the number and date values to standard or custom formats. Here, it is defined for the conversion of numeric values to currency.

### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)Model).Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Columns(col =>
{
 col.Field("TaskId").HeaderText("Task ID").Width(50).Add();
 col.Field("TaskName").HeaderText("Task Name").Width(250).Add();
 col.Field("StartDate").HeaderText("Start Date").Add();
 col.Field("Duration").HeaderText("Duration").Add();
 col.Field("Progress").HeaderText("Progress").Format("C").Add();
}).Render()
```

### Enable editing

The editing feature enables you to edit the tasks in the Gantt control. It can be enabled by using the [EditSettings.AllowEditing](#) and [EditSettings.AllowTaskbarEditing](#) properties.

The following editing options are available to update the tasks in Gantt:

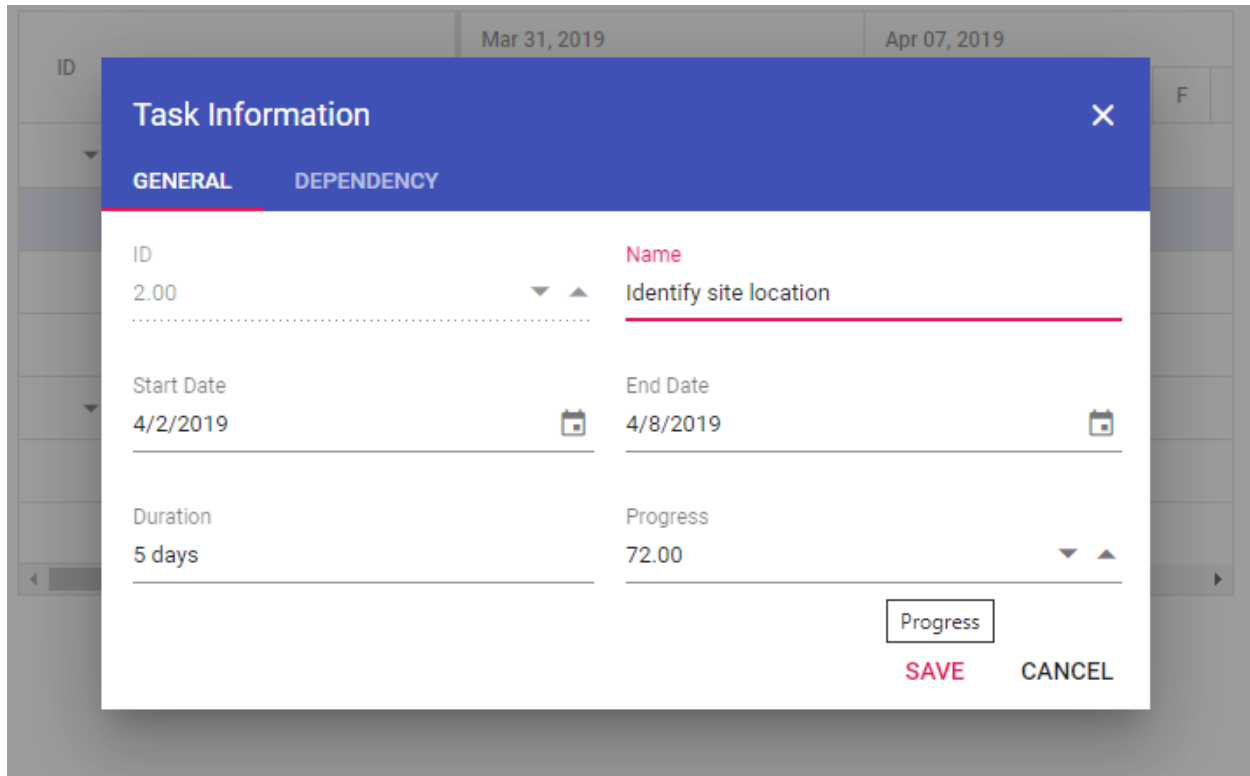

- Cell
- Dialog
- Taskbar
- Connector line

### Cell editing

Modify the task details through cell editing by setting the edit mode to **Auto**.

### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Editing").DataSource((IEnumerable<object>)Model).TaskFields(
 ts => ts.Id("TaskId").Name(
 "TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks")
).EditSettings(es =>
 es.AllowEditing(true).Mode(Syncfusion.EJ2.Gantt.EditMode.Auto)).Render()
```

**Note:** When the edit mode is set to **Auto**, you can change the cells to editable mode by double-clicking anywhere at the TreeGrid and edit the task details in the edit dialog by double-clicking anywhere at the chart.

#### Dialog editing

Modify the task details through dialog by setting the edit mode to **Dialog**.

#### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Editing").DataSource((IEnumerable<object>)Model).TaskFields(
 ts => ts.Id("TaskId").Name("TaskName").StartDate(
 "StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency(
 "Predecessor").Child("SubTasks").EditSettings(es =>
 es.AllowEditing(true).Mode(Syncfusion.EJ2.Gantt.EditMode.Dialog)).Render()
```

**Note:** In dialog editing mode, the edit dialog will appear while performing double-click action in both TreeGrid and chart sides.

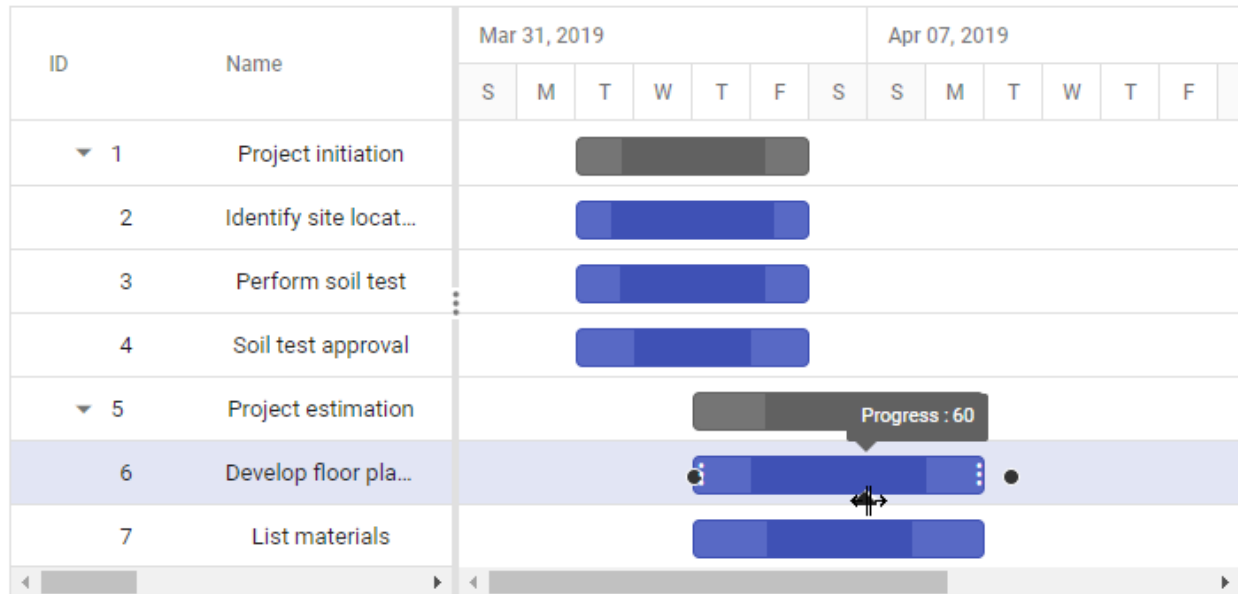

#### Taskbar editing

Modify the task details through user interaction such as resizing and dragging the taskbar by enabling the [AllowTaskbarEditing](#) property.

#### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Editing").DataSource((IEnumerable<object>)Model).TaskFields(
 ts => ts.Id("TaskId").Name("TaskName").StartDate(
```

```
"StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks").EditSettings(es =>
 es.AllowTaskbarEditing(true)).Render()
```

#### Dependency editing

Modify the task dependencies using mouse interactions by enabling the [AllowTaskbarEditing](#) property along with mapping the task dependency data source field to the [Dependency](#) property.

#### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Editing").DataSource((IEnumerable<object>)Model).TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate(
 "StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks").EditSettings(es =>
 es.AllowTaskbarEditing(true)).Render()
```

#### DEPENDENCYEDITING.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View(ganttData());
 }
 public static List<GanttDataSource> ganttData()
 {
 List<GanttDataSource> GanttDataSourceCollection = new
 List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
```

```
StartDate = new DateTime(2019, 04, 02),
EndDate = new DateTime(2019, 04, 21),
SubTasks = new List<GanttDataSource>(),
};
GanttDataSource Child1 = new GanttDataSource()
{
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
};
GanttDataSource Child2 = new GanttDataSource()
{
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 Predecessor = "2FS"
};
GanttDataSource Child3 = new GanttDataSource()
{
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 Predecessor = "3FS"
};
Record1.SubTasks.Add(Child1);
Record1.SubTasks.Add(Child2);
Record1.SubTasks.Add(Child3);
GanttDataSource Record2 = new GanttDataSource()
{
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
};
GanttDataSource Child4 = new GanttDataSource()
{
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70
};
GanttDataSource Child5 = new GanttDataSource()
{
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 Predecessor = "6SS"
```

```

};
Record2.SubTasks.Add(Child4);
Record2.SubTasks.Add(Child5);
GanttDataSourceCollection.Add(Record1);
GanttDataSourceCollection.Add(Record2);
return GanttDataSourceCollection;
}
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public string Predecessor { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

### Enable filtering

The filtering feature enables you to view the reduced amount of records based on filter criteria. Gantt provides the menu filtering support for each column. It can be enabled by setting the [AllowFiltering](#) property to **true**. Filtering feature can also be customized using the [FilterSettings](#) property.

### CSHTML

```

@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Editing").DataSource((IEnumerable<object>)Model).AllowFiltering(true).TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks")).Render()

```

### Enable sorting

The sorting feature enables you to order the records. It can be enabled by setting the [AllowSorting](#) property to `true`. The sorting feature can be customized using the [SortSettings](#) property.

#### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Editing").DataSource((IEnumerable<object>)ViewBag.DataSource).AllowSorting(true).TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks")).Render()
```

### Sorting in ASP.NET MVC Gantt Control

#### Enabling predecessors or task relationships

Predecessor or task dependency in the Gantt control is used to depict the relationship between the tasks.

- Start to Start (SS): You cannot start a task until the dependent task starts.
- Start to Finish (SF): You cannot finish a task until the dependent task finishes.
- Finish to Start (FS): You cannot start a task until the dependent task completes.
- Finish to Finish (FF): You cannot finish a task until the dependent task completes.

You can show the relationship in tasks by using the [Dependency](#) property as shown in the following code example.

#### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)Model).Height("450px").TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks")).Render()
```

### Assigning Resources

You can display and assign the resource for each task in the Gantt control. Create a collection of JSON object, which contains id, name, unit and group of the resources and assign it to the [Resources](#) property. Map these fields to the Gantt control using the [ResourceFields](#) property.

#### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)Model).AllowFiltering(true).AllowSorting(true).Height("450px").TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks").ResourceInfo("ResourceId").LabelSettings(ls =>
 ls.RightLabel($"{if(ResourceId)} {ResourceId} {/if}"))
```

```
).ResourceFields(rf =>
rf.Id("ResourceId").Name("ResourceName")).Resources((IEnumerable<object>)ViewBag.projectResources).Render()
```

## HOMECONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.projectResources = projectResources();
 return View(ganttData());
 }
 public static List<GanttResources> projectResources()
 {
 List<GanttResources> GanttResourcesCollection = new List<GanttResources>();
 GanttResources Record1 = new GanttResources()
 {
 ResourceId = 1,
 ResourceName = "Martin Tamer"
 };
 GanttResources Record2 = new GanttResources()
 {
 ResourceId = 2,
 ResourceName = "Rose Fuller"
 };
 GanttResources Record3 = new GanttResources()
 {
 ResourceId = 3,
 ResourceName = "Margaret Buchanan"
 };
 GanttResources Record4 = new GanttResources()
 {
 ResourceId = 4,
 ResourceName = "Fuller King"
 };
 GanttResources Record5 = new GanttResources()
 {

 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
 public int[] ResourceId { get; set; }
}

```

**Note:** [View Sample in GitHub.](#)

### Data Binding in Gantt

The Gantt control uses **DataManager** for binding the data source, which supports both RESTful JSON data services and local JavaScript object array. The **DataSource** property can be assigned either with the instance of **DataManager** or JavaScript object array collection. The Gantt control supports binding two types of data:

- Local data
- Remote data

### Local data

To bind local data to Gantt, you can assign a JavaScript object array to the [DataSource](#) property. The local data source can also be provided as an instance of the [DataManager](#).

In local data binding, the data source for rendering the Gantt control is retrieved from the same application locally.

The following are the two types of data binding possible with the Gantt control:

- Hierarchical data binding.
- Self-referential data binding (Flat data).

### Hierarchical data binding

The [Child](#) property is used to map the child records in hierarchical data.

The following code example shows how to bind the hierarchical local data into the Gantt control.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id(
 "TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration(
 "Duration").Progress("Progress").Child("SubTasks")
).Render()
```

#### HIERARCHYDATA.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}
public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
 List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
 };
 GanttDataSource Child2 = new GanttDataSource()
```

```

 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
 }

 public class GanttDataSource
 {
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 }

```

```

 public List<GanttDataSource> SubTasks { get; set; }
 }

```

### Self-referential data binding (Flat data)

The Gantt control can be bound with self-referential data by mapping the data source field values to the [Id](#) and [ParentID](#) properties.

- **ID field:** This field contains unique values used to identify each individual task and it is mapped to the [Id](#) property.
- **Parent ID field:** This field contains values that indicate parent tasks and it is mapped to the [ParentID](#) property.

### CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id(
 "TaskId").ParentId("ParentId").Name("TaskName").StartDate("StartDate").EndDa
te("EndDate").Duration("Duration").Progress("Progress")
).Render()

```

### SELFREFERENCE.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSourceCollection.Add(new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 ParentId = null
 });
 GanttDataSourceCollection.Add(new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
 ParentId = 1
 });
 GanttDataSourceCollection.Add(new GanttDataSource()
 {
 TaskId = 3,

```

```
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 ParentId = 1
 });
 GanttDataSourceCollection.Add(new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 ParentId = 1
 });
 GanttDataSourceCollection.Add(new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 ParentId = null
 });
 GanttDataSourceCollection.Add(new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70,
 ParentId = 5
 });
 GanttDataSourceCollection.Add(new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 ParentId = 5
 });
 return GanttDataSourceCollection;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public int? ParentId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
}
```

### Remote data

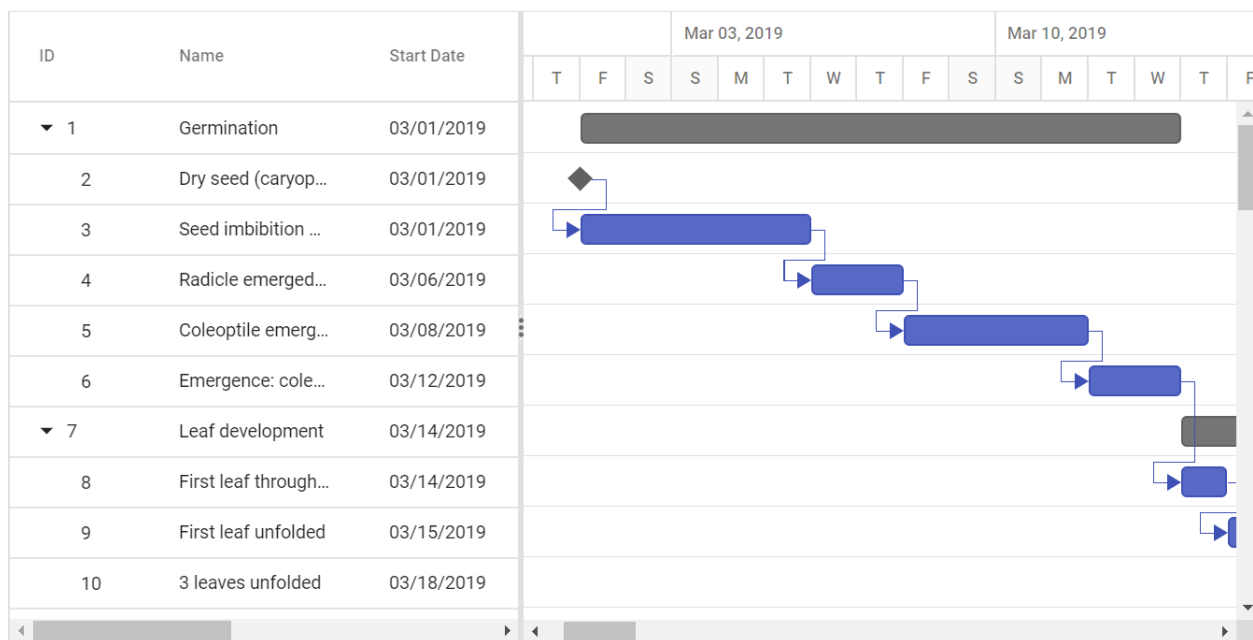

To bind remote data to the Gantt component, assign service data as an instance of **DataManager** to the [DataSource](#) property.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource(dataManger =>
{
 dataManger.Url("https://ej2services.syncfusion.com/production/web-services/api/GanttData").CrossDomain(true).Adaptor("WebApiAdaptor");
 }).Height("450px").TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").Progress("Progress").Duration("Duration")
).Dependency("Predecessor").Child("SubTasks").Render()
```

### REMOTEDATA.CS

```
public IActionResult Index()
{
 return View();
}
```

### URL Adaptor

In Gantt, we can fetch data from SQL database using **ADO.NET** Entity Data Model and update the changes on CRUD action to the server by using **DataManager** support. To communicate with the remote data we are using **UrlAdaptor** of **DataManager** property to call the server method and get back resultant data in JSON format. We can know more about **UrlAdaptor** from [here](#).

**Note:** Refer the [link](#) to create the **ADO.NET** Entity Data Model in Visual Studio,

We can define data source for Gantt as instance of DataManager using **url** property of DataManager. Check the below code snippet to assign data source to Gantt.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource(dataManager =>
{
 dataManager.Url("/Home/UrlDatasource").Adaptor("UrlAdaptor")
}).TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Render()
```

### URLADAPTOR.CS

```
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult UrlDatasource(DataManagerRequest dm)
{

 List<GanttData>DataList = db.GanttDatas.ToList();
 var count = DataList.Count();
 return Json(new { result = DataList, count = count });
}
```

### *Remote Save Adaptor*

You may need to perform all Gantt Actions on the client-side except the CRUD operations, which should be interacted with the server-side to persist data. It can be achieved in Gantt by using

### **RemoteSaveAdaptor.**

Datasource must be set to the **json** property and set **RemoteSaveAdaptor** to the **adaptor** property of DataManager. CRUD operations can be mapped to the server-side using the **batchUrl** properties.

You can use the following code example to use **RemoteSaveAdaptor** in Gantt.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource(dataManager =>
{
 dataManager.Url("/Home/BatchUpdate").Adaptor("remoteSaveAdaptor")
}).TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Render()
```

### REMOTESAVEADAPTOR.CS

```
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult BatchUpdate(DataManagerRequest dm)
{

 List<GanttData>DataList = db.GanttDatas.ToList();
 var count = DataList.Count();
 return Json(new { result = DataList, count = count });
}
```

```
}

```

The following code example describes the CRUD operations handled at server-side.

```
`json
public IActionResult BatchUpdate([FromBody] CRUDModel batchmodel)
{
 public class CRUDModel
 {
 public List<GanttDataSource> added { get; set; }
 public List<GanttDataSource> changed { get; set; }
 public List<GanttDataSource> deleted { get; set; }
 public object key { get; set; }
 public string action { get; set; }
 public string table { get; set; }
 }

 public IActionResult BatchUpdate([FromBody] CRUDModel batchmodel)
 {
 if (batchmodel.changed != null)
 {
 for (var i = 0; i < batchmodel.changed.Count(); i++)
 {
 var value = batchmodel.changed[i];
 GanttDataSource result = DataList.Where(or => or.taskId == value.taskId).FirstOrDefault();
 result.taskId = value.taskId;
 result.taskName = value.taskName;
 result.startDate = value.startDate;
 result.endDate = value.endDate;
 result.duration = value.duration;
 result.progress = value.progress;
 result.parentID = value.parentID;
 }
 }
 if (batchmodel.deleted != null)
 {

```

```

for (var i = 0; i < batchmodel.deleted.Count(); i++)
{
 DataList.Remove(DataList.Where(or => or.taskId.Equals(batchmodel.deleted[i].taskId)).FirstOrDefault());
 RemoveChildRecords(batchmodel.deleted[i].taskId);
}
}

if (batchmodel.added != null)
{
 for (var i = 0; i < batchmodel.added.Count(); i++)
 {
 DataList.Add(batchmodel.added[i]);
 }
}

return Json(new { addedRecords = batchmodel.added, changedRecords = batchmodel.changed,
 deletedRecords = batchmodel.deleted });
}

public void RemoveChildRecords(int key)
{
 var childList = DataList.Where(x => x.parentID == key).ToList();
 foreach (var item in childList)
 {
 DataList.Remove(item);
 RemoveChildRecords(item.taskId);
 }
}

return Json(new { addedRecords = batchmodel.added, changedRecords = batchmodel.changed,
 deletedRecords = batchmodel.deleted });
}

```

#### *Load child on demand*

To render child records on demand, assign a remote service URL in the instance of DataManager to the Url property. To interact with the remote data source, provide the endpoint URL and also define the [HasChildMapping](#) property in taskFields of Gantt Chart.

The `hasChildMapping` property maps the field name in the data source, which denotes whether the current record holds any child records. This is useful internally to show expand icon while binding child data on demand.

When [LoadChildOnDemand](#) is disabled, all the root nodes are rendered in a collapsed state at initial load. On expanding the root node, the child nodes will be loaded from the remote server.

When `EnableVirtualization` is enabled and `LoadChildOnDemand` is disabled, only the current viewport root nodes are rendered in a collapsed state.

When a root node is expanded, its child nodes are rendered and maintained in a collection locally, such that on consecutive expand/collapse actions on the root node, the child nodes are loaded locally instead of from the remote server.

When the `LoadChildOnDemand` is enabled, parent records are rendered in an expanded state.

### **CSHTML**

```
@Html.EJS().Gantt("DefaultFunctionalities").DataSource(dataManger =>
{
 dataManger.Url("https://services.syncfusion.com/aspnet/development/api/GanttLoadOnDemand").CrossDomain(true).Adaptor("WebApiAdaptor");
})

.Height("460px").EnableVirtualization(true).LoadChildOnDemand(false)
.TaskFields(ts =>
ts.Id("taskId").Name("taskName").StartDate("startDate").Progress("progress")

.Duration("duration").ParentID("parentID").EndDate("endDate").HasChildMapping("isParent"))

.Columns(col =>
{
 col.Field("taskId").Add();
 col.Field("taskName").Add();
 col.Field("startDate").Add();
 col.Field("duration").Add();
})
.TreeColumnIndex(1)
.AllowSelection(true)
.HighlightWeekends(true)
.IncludeWeekend(true)
.ProjectStartDate("01/02/2000")
.ProjectEndDate("12/01/2002")
.Render()
```

### **LOADCHILDONDEMAND.CS**

```
public IActionResult Index()
{
 return View();
}
```

The following code example describes handling of Load on demand at server end.

```
`json
public object Get()
{
 DataOperations operation = new DataOperations();
 var queryString = Request.Query;
 if (tree.Count == 0)
 tree = TreeData.GetTree();
 if (queryString.Keys.Contains("$filter") && !queryString.Keys.Contains("$stop"))
 {
 StringValues filter;
 queryString.TryGetValue("$filter", out filter);
 int? fltr;

}
}
,

```

### Limitations

- Filtering, sorting and searching are not supported in load on demand.
- Only Self-Referential type data is supported with remote data binding in Gantt Chart.
- Load-on-demand supports only the validated data source

### Sending additional parameters to the server

We can pass additional parameters using [addParams](#) method of [Query](#) class. In server side we have inherited and shown the additional parameter value in Syncfusion DataManager class itself. We pass an additional parameter in load time using [load](#) event. We can also pass additional parameter to the CRUD model. Check the below code snippet to send additional parameter to Gantt.

### CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource(dataManager =>
{
 dataManager.Url("http://localhost:50039/Home/UrlDatasource").Adaptor("UrlAdaptor").BatchUrl("http://localhost:50039/Home/BatchSave");
}).Toolbar(new List<string>()
{ "Add", "Cancel", "CollapseAll", "Delete", "Edit", "ExpandAll", "Update"
}).TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").ParentId("ParentId")

).EditSettings(es=>es.AllowEditing(true).AllowAdding(true).AllowDeleting(true)).Load("load").Render()
<script>
function load(args) {
 var ganttObj = document.getElementById("Gantt").ej2_instances[0];
 ganttObj.query = new Query().addParams('ej2Gantt', "test");
}
</script>

```

### SERVERPARAMETERS.CS

```

namespace URLAdaptor.Controllers
{
 public class HomeController : Controller
 {
 ...///
 //inherit the class to show age as property of DataManager
 public class Test : DataManagerRequest
 {
 public string ej2Gantt { get; set; }
 }
 public ActionResult UrlDatasource([FromBody]Test dm)
 {
 if (DataList == null)
 {
 ProjectData datasource = new ProjectData();
 DataList = datasource.GetUrlDataSource();
 }
 var count = DataList.Count();
 return Json(new { result = DataList, count = count },
 JsonRequestBehavior.AllowGet);
 }
 ...///
 public class ICRUDModel<T> where T : class
 {
 public object key { get; set; }
 public T value { get; set; }
 public List<T> added { get; set; }
 public List<T> changed { get; set; }
 public List<T> deleted { get; set; }
 public IDictionary<string, object> @params { get; set; }
 }
 ...///
 }
}

```

### Handling HTTP error

During server interaction from the Gantt, some server-side exceptions may occur, and you can acquire those error messages or exception details in client-side using the [actionFailure](#) event.

The argument passed to the `actionFailure` event contains the error details returned from the server.

### CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource(dataManager =>
{
 dataManager.Url("http://some.com/invalidUrl")).TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress").ParentId("ParentId")
).ActionFailure("actionFailure").Render()
<script>
function actionFailure(args) {
 var ganttObj = document.getElementById("Gantt").ej2_instances[0];
 let span: HTMLElement = document.createElement('span');
 ganttObj.element.parentNode.insertBefore(span, ganttObj.element);
 span.style.color = '#FF0000'
}

```

```
span.innerHTML = 'Server exception: 404 Not found';
</script>
```

### HTTPERROR.CS

```
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult UrlDatasource(DataManagerRequest dm)
{
 List<GanttData>DataList = db.GanttDatas.ToList();
 var count = DataList.Count();
 return Json(new { result = DataList, count = count });
}
```

### Binding with Fetch

You can use Gantt [dataSource](#) property to bind the data source to Gantt from external Fetch request. In the below code we have fetched the data source from the server with the help of Fetch request and provided that to [dataSource](#) property by using [onSuccess](#) event of the Fetch.

### CSHTML

```
@Html.EJS().Button("dataBind").Content("Bind Data").CssClass("e-
primary").Render()
@Html.EJS().Gantt("Gantt").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress").Child("SubTasks")
).Render()
<script>
 document.getElementById('dataBind').addEventListener('click',
function (args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 var fetch = new
Fetch("https://ej2services.syncfusion.com/production/web-
services/api/GanttData", "GET");
 ganttObj.showSpinner();
 fetch.send();
 fetch.onSuccess = function (data: any) {
 ganttObj.hideSpinner();
 ganttObj.dataSource = data.Items;
 ganttObj.refresh();

 };
 });
</script>
```

### AJAXBINDING.CS

```
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult UrlDatasource(DataManagerRequest dm)
{
 List<GanttData>DataList = db.GanttDatas.ToList();
 var count = DataList.Count();
 return Json(new { result = DataList, count = count });
}
```

```
}
```

**Note:** If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server side crud actions.

### Split task

The **Split-task** feature allows you to split a task or interrupt the work during planned or unforeseen circumstances. We can split the task either in load time or dynamically, by defining the segments either in hierarchical or self-referential way.

### Hierarchical

To split a task at load time in hierarchical way, we need to define the segment details in datasource and this field should be mapped by using the [taskFields.Segments](#) property.

```
`html
```

```
GanttDataSource Record2Child1 = new GanttDataSource()
{
 TaskId = 3,
 TaskName = "Plan timeline",
 StartDate = new DateTime(2019, 02, 04),
 EndDate = new DateTime(2019, 02, 10),
 Duration = 10,
 Progress = 60,
 Segments = new List<GanttSegment>
 {
 new GanttSegment {StartDate = new DateTime(2019,02,04), Duration = 2},
 new GanttSegment {StartDate = new DateTime(2019,02,05), Duration = 5},
 new GanttSegment {StartDate = new DateTime(2019,02,08), Duration = 3}
 }
};
```

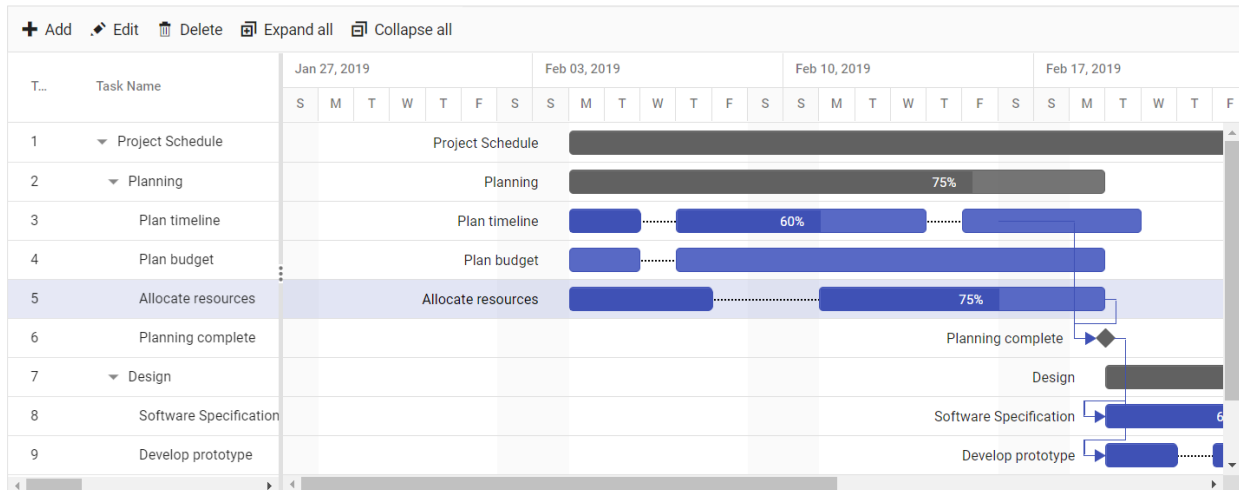

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
 "TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
 rogress("Progress").Child("SubTasks").Segments("Segments")
).Render()
```

### SPLIT-TASK.CS

```
public ActionResult SplitTasks()
```

```
{
 ViewBag.DataSource = GanttData.SplitTasksData();
 return View();
}
```

### Self-referential

We can also define segment details as a flat data and this collection can be mapped by using [segmentData](#) property. The segment id field of this collection is mapped by using the [taskFields.SegmentId](#) property.

```
`html
```

```
GanttSegment Record1 = new GanttSegment()
```

```
{
```

```
segmentId = 2,
```

```
Duration = 2,
```

```
StartDate = new DateTime(2019, 04, 02),
```

```
};
```

```
,
```

### CSHTML

```
@(Html.EJS().Gantt("SplitTasks").DataSource((IEnumerable<object>)ViewBag.DataSource).SegmentData((IEnumerable<object>)ViewBag.Segment)
 .TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
)
 .Dependency("Predecessor").SegmentId("segmentId").Child("SubTasks"))
 .Render())
```

### SPLIT-SELFREFERENCE.CS

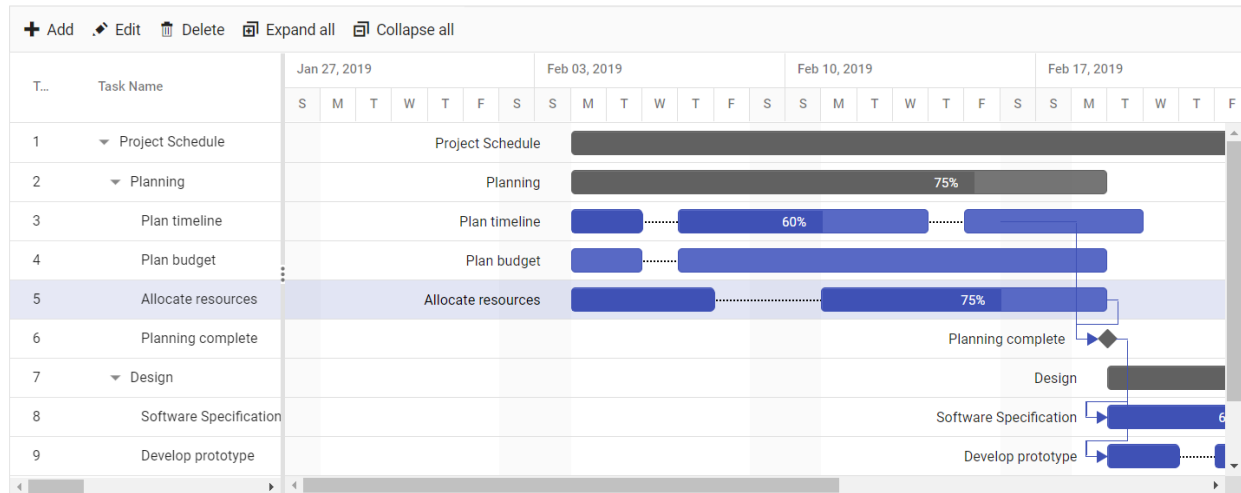

```
public ActionResult SplitTasks()
```

```

{
 ViewBag.DataSource = GanttData.SplitTasksData();
 ViewBag.Segment = GanttData.SegmentData();
 return View();
}

```

**Note:** Segment id field contains id of a task which should be split at load time.

### Improve performance by disabling validations

The [autoCalculateDateScheduling](#) property can help you reduce the time taken for the Gantt chart to render on the initial load. When this API is enabled, parent-child validation, data validation, and predecessor validation are restricted, allowing the Gantt chart to load more quickly. Since we are disabling the validations, data source provided to gantt should have all data such as start date, end date, duration, as proper data.

### CSHTML

```

@(Html.EJS().Gantt("VirtualScroll").DataSource((IEnumerable<object>)ViewBag.
DataSource).Height("450px").EnableVirtualization(true).HighlightWeekends(tru
e).AllowSelection(true)
 .TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress")
 .Child("SubTasks").ParentID("ParentID"))
 .LabelSettings(ls=>ls.TaskLabel("Progress")) .EditSettings(es =>
es.AllowAdding(true).AllowEditing(true).AllowDeleting(true).AllowTaskbarEdit
ing(true).ShowDeleteConfirmDialog(true))
 .AutoCalculateDateScheduling(false).Toolbar(new List<string>()
{ "Add", "Edit", "Update", "Delete", "Cancel", "ExpandAll", "CollapseAll",
"Indent", "Outdent" }).Columns(col =>
{
 col.Field("TaskId").Width(140).Add();
 col.Field("TaskName").Width(250).Add();
 col.Field("StartDate").Add();
 col.Field("EndDate").Add();
 col.Field("Duration").Add();
 col.Field("Progress").Add();
}).SplitterSettings(ss => ss.ColumnIndex(2))

```

```

 .Render()
)

```

### **VIRTUAL-SCROLL.CS**

```

public IActionResult Index()
{
 ViewBag.dataSource = GanttData.VirtualData();
 return View();
}

```

### Limitations

Gantt has the support for both Hierarchical and Self-Referential data binding. When rendering the Gantt control with SQL database, we suggest you use the Self-Referential data binding to maintain the parent-child relation. Because the complex json structure is very difficult to manage in SQL tables, we need to write complex queries, and we have to write a complex algorithm to find out the proper record details while updating/deleting the inner level task in the Gantt data source. We cannot implement both data binding for Gantt control, and this is not a recommended way. If both child and parentID are mapped, the records will not render properly because when the task id of a record defined in the hierarchy structure is assigned to the parent id of another record, in such case, the records will not properly render. As the self-referential will search the record with a particular id in flat data only, not in the inner level of records. If we map the parentID field, it will be prioritized and Gantt will be rendered based on the parentID values.

### Columns in in gantt control

The column displays information from a bound data source, and you can edit the values of column to update the task details through TreeGrid. The operations such as sorting, filtering, and searching can be performed based on column definitions. To display a Gantt column, the [Field](#) property should be mapped from the data source to the column.

---

**Note:** If the column [Field](#) is not specified in the data source, the column values will be empty.

---

The [TreeColumnIndex](#) property is used to define the expander column in the Gantt control to expand and collapse the child rows.

### Defining columns

Using the [Columns](#) property, you can define the columns in Gantt. If the columns are not defined, then the default columns will be rendered based on the mapped data source fields in the [TaskFields](#) property. Refer to the following code example for defining the columns in Gantt along with their widths.

### **CSHTML**

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration")
.Progress("Progress").Child("SubTasks")
).Columns(col =>
{
 col.Field("TaskId").Width(150).Add();
 col.Field("TaskName").HeaderText("Job Name").Width(250).Add();
}
)

```

```
}).Render()
```

## DEFININGCOLUMNS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}
public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
```

```

};
GanttDataSource Child4 = new GanttDataSource()
{
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50
};
GanttDataSource Child5 = new GanttDataSource()
{
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50
};
Record2.SubTasks.Add(Child4);
Record2.SubTasks.Add(Child5);
GanttDataSourceCollection.Add(Record1);
GanttDataSourceCollection.Add(Record2);
return GanttDataSourceCollection;
}
public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

![Alt text](images/definingColumns.png)

### Custom column header

The column header text can be defined using the [HeaderText](#) property, and you can customize the column headers using the [HeaderTemplate](#) property.

### CSHTML

```

@ (Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress(
 "Progress").Child("SubTasks")).Columns(col =>
 {

col.Field("TaskName").HeaderTemplate("#projectName").Width(150).Add();

col.Field("StartDate").HeaderTemplate("#dateTemplate").Width(150).Add();

col.Field("Duration").HeaderTemplate("#durationTemplate").Width(150).Add();

```

```

col.Field("Progress").HeaderTemplate("#progressTemplate").Width(150).Add();
 }).Render()

 <script type="text/x-template" id="projectName">
 <div>
 <div>
 Task Name
 </div>
 </div>
 </script>

 <script type="text/x-template" id="dateTemplate">
 <div>
 <div>
 Start Date
 </div>
 </div>
 </script>

 <script type="text/x-template" id="durationTemplate">
 <div>
 <div>
 Duration
 </div>
 </div>
 </script>

 <script type="text/x-template" id="progressTemplate">
 <div>
 <div>
 Progress
 </div>
 </div>
 </script>

```

### HEADERTEMPLATE.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

![Alt text](images/headerTemplate.png)

### Format

To format the cell values based on a specific culture, use the [Columns.Format](#) property. The Gantt control uses the [Internationalization](#) library to format [number](#) and [date](#) values.

**CSHTML**

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress(
 "Progress").Child("SubTasks").Columns(col =>
 {
 col.Field("TaskId").Width(150).Add();
 col.Field("Progress").Format("C").Width(150).Add();
 }).Render()
```

**FORMATCOLUMN.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![[Alt text]](images/formatColumn.png)

**Note:** By default, the [number](#) and [date](#) values are formatted in **en-US** culture.

*Number formatting*

The number or integer values can be formatted using the following format strings.

Format	Description	Remarks
----- ----- ----		
N	Denotes numeric type.   The numeric format is followed by an integer value like N2 or N3, which denotes the number of precisions to be allowed.	
C	Denotes currency type.   The currency format is followed by an integer value like C2 or C3, which denotes the number of precisions to be allowed.	
P	Denotes percentage type   The percentage format expects the input value to be in the range of 0 to 100. For example, the cell value 0.2 is formatted as 20%. The percentage format is followed by an integer value like P2, P3, which denotes the number of precisions to be allowed.	

*Date formatting*

You can format date values either using the built-in date format string or a custom format string.

For the built-in date format, you can specify the [Columns.Format](#) property as string (example: **yMd**).

You can also use the custom format string to format the date values. Some of the custom formats and the formatted date values are given in the following table.

Format	Formatted value
----- -----	
{ type:'date', format:'dd/MM/yyyy' }	04/07/2019

```
|{ type:'date', format:'dd.MM.yyyy' } | 04.07.2019|
```

```
|{ type:'date', skeleton:'short' } | 7/4/19|
```

```
|{ type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' } | 04/07/2019 12:00 AM|
```

```
|{ type: 'dateTime', format: 'MM/dd/yyyy hh:mm:ss a' } | 07/04/2019 12:00:00 AM|
```

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Columns(col =>
{
 col.Field("TaskId").Width(50).Add();
 col.Field("TaskName").Add();
 col.Field("StartDate").Format("yMd").Add();
 col.Field("Duration").Add();
 col.Field("Progress").Format("C").Add();
})
.Render()
```

### FORMATCOLUMNS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Change tree/expander column

The tree/expander column is a column in the Gantt control, that has icons to expand or collapse the parent records. You can define the tree column index in the Gantt control by using the [TreeColumnIndex](#) property and the default value of this property is 0. The following code example shows how to use this property.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TreeColumnIndex(2).TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).Render()
```

### TREECOLUMNINDEX.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![Alt text](images/treeColumnIndex.png)

### Show or hide columns dynamically

You can show or hide gantt columns dynamically using external buttons by invoking the `showColumn` or `hideColumn` method. The **Progress** column is hidden and shown on button clicking.

#### CSHTML

```
@Html.EJS().Button("show").Content("Show").CssClass("e-primary").Render()
@Html.EJS().Button("hide").Content("Hide").CssClass("e-primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
.StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
.Child("SubTasks")).EditSettings(es =>
 es.AllowEditing(true)
 .Columns(col =>
 {
 col.Field("TaskId").Add();
 col.Field("TaskName").HeaderText("TaskName").Width(180).Add();
 col.Field("EndDate").HeaderText("EndDate").Width(160).Add();
 col.Field("Duration").Width(100).Add();
 col.Field("Progress").HeaderText("Progress").Add();
 })
 .Render()

<script>
 document.getElementById('show').addEventListener('click', function
(args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.showColumn(["Progress"]);
 });
 document.getElementById('hide').addEventListener('click', function
(args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.hideColumn(["Progress"]);
 });
</script>
```

#### SHOWHIDE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![Alt text](images/showhidecol.png)

### Controlling gantt column actions

You can enable or disable gantt action for a particular column by setting the `allowFiltering`, `allowSorting`, `allowReordering`, and [allowEditing](#) properties.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
 .StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
 .Child("SubTasks")).EditSettings(es =>
 {
 es.AllowEditing(true)
 .AllowFiltering(true).AllowSorting(true).AllowReordering(true)
 .Columns(col =>
 {
 col.Field("TaskId").Add();
 col.Field("TaskName").HeaderText("TaskName")
 .AllowSorting(false).Width(180).Add();

 col.Field("StartDate").HeaderText("StartDate").AllowEditing(false).Width(160)
 .Add();
 col.Field("Duration").AllowFiltering(false).Width(100).Add();
 col.Field("Progress").AllowReordering(false).Width(100).Add();
 })
 }).Render()
```

#### GRIDACTIONS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Column type

Column type can be specified using the `columns.type` property. It specifies the type of data the column binds.

If the `format` is defined for a column, the column uses `type` to select the appropriate format option **number** or **date**.

Gantt column supports the following types:

- string
- number
- boolean
- date
- date-time

**Note:** If the `type` is not defined, it will be determined from the first record of the `dataSource`. In case if the first record of the `dataSource` is null/blank value for a column then it is necessary to define the `type` for that column.

## Timeline

In the Gantt control, timeline is used to represent the project duration as individual cells with defined unit and formats.

### Timeline view modes

Gantt contains the following in-built timeline view modes:

- Hour
- Week
- Month
- Year

Timescale mode in Gantt can be defined by using [TimelineViewMode](#) property and also we can define timescale mode of top tier and bottom tier by using [TopTier.Unit](#) and [BottomTier.Unit](#) properties.

### Week timeline mode

In the **Week** timeline mode, the upper part of the schedule header displays the weeks, whereas the bottom half of the header displays the days. Refer to the following code example.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
rogress("Progress").Child("SubTasks")).TimelineSettings(ts=>
ts.TimelineViewMode(Syncfusion.EJ2.Gantt.TimelineViewMode.Week)).Render()
```

#### WEEKMODE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![Alt text](images/weekMode.png)

### Month timeline mode

In the **Month** timeline mode, the upper part of the schedule header displays the months, whereas the bottom header of the schedule displays its corresponding weeks. Refer to the following code example.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
rogress("Progress").Child("SubTasks")).TimelineSettings(ts=>
```

```
ts.TimelineViewMode(Syncfusion.EJ2.Gantt.TimelineViewMode.Month)).Render()
```

### **MONTHMODE.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![Alt text](images/monthMode.png)

#### *Year timeline mode*

In the **Year** timeline mode, the upper schedule header displays the years whereas, the bottom header displays its corresponding months. Refer to the following code example.

### **CSHTML**

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate")
.EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks"))
.TimelineSettings(ts=>ts.TimelineViewMode(Syncfusion.EJ2.Gantt.TimelineViewMode.Year)).Render()
```

### **YEARMODE.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![Alt text](images/yearMode.png)

#### *Day timeline mode*

In the **Day** timeline mode, the upper part of the header displays the days whereas, the bottom schedule header displays its corresponding hours. Refer to the following code example.

### **CSHTML**

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").DateFormat("M/d/yyyy hh:mm:ss tt").DurationUnit(Syncfusion.EJ2.Gantt.DurationUnit.Hour)
.TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate")
.Duration("Duration").Progress("Progress").Child("SubTasks")).TimelineSettings(ts=>
```

```
ts.TimelineViewMode(Syncfusion.EJ2.Gantt.TimelineViewMode.Day)).Render()
```

### DAYMODE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 5,
 Progress = 70,
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 5,
 Progress = 50,
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 5,
 Progress = 50
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
```

```

 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 02, 10, 10, 0),
 Duration = 5,
 Progress = 70,
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 02, 10, 10, 0),
 Duration = 5,
 Progress = 50,
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}
public class GanttDataSource
{

 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

![Alt text](images/dayMode.png)

#### Hour timeline mode

An **Hour** timeline mode tracks the tasks in minutes scale. In this mode, the upper schedule header displays hour scale and the lower schedule header displays its corresponding minutes.

#### CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Height("450px").DateFormat("M/d/yyyy hh:mm:ss tt").DurationUnit(Syncfusion.EJ2.Gantt.DurationUnit.Minute)
 .TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate")
 .Duration("Duration").Progress("Progress").Child("SubTasks"))
 .TimelineSettings(ts => ts.TimelineViewMode(Syncfusion.EJ2.Gantt.TimelineViewMode.Hour))
 .Render()

```

**HOURLMODE.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",

```

![[Alt text](images/hourMode.png)]

### Timeline cells tooltip

In the Gantt control, you can enable or disable the mouse hover tooltip of timeline cells using the [TimelineSettings.ShowTooltip](#) property. The default value of this property is true. The following code example shows how to enable the timeline cells tooltip in Gantt.

### CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
.StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
.Child("SubTasks")).TimelineSettings(tl => tl.ShowTooltip(true)).Render()

```

### TIMELINECELLTOOLTIP.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

![Alt text](images/timelinecellTooltip.png)

## Splitter in ASP.NET MVC Gantt component

### Splitter

In the Gantt control, the Splitter separates the TreeGrid section from the Chart section. You can change the position of the Splitter when loading the Gantt control using the [SplitterSettings](#) property. By splitting the TreeGrid from the chart, the width of the TreeGrid and chart sections will vary in the control. The [SplitterSettings.Position](#) property denotes the percentage of the TreeGrid section's width to be rendered and this property supports both pixels and percentage values. You can define the splitter position as column index value using the [SplitterSettings.ColumnIndex](#) property. You can also define the splitter position with built-in splitter view modes by using the [SplitterSettings.View](#) property. The following list is the possible values for this property:

- **Default**: Shows Grid side and Gantt side.
- **Grid**: Shows Grid side alone in Gantt.
- **Chart**: Shows chart side alone in Gantt.

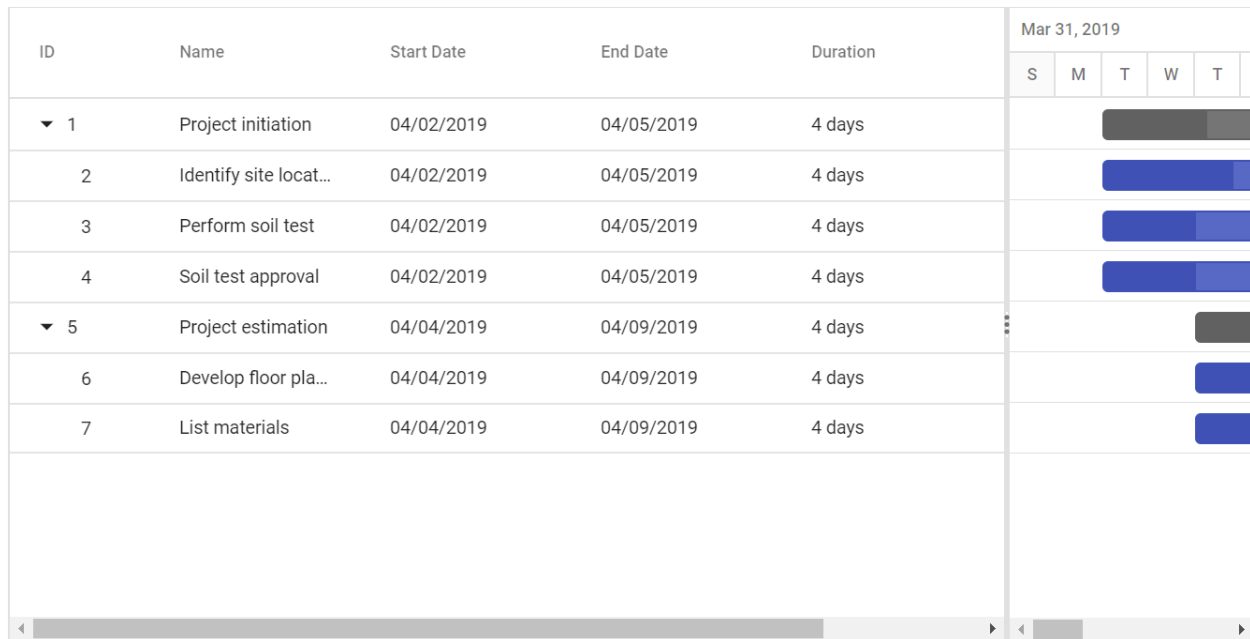

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource).Height("450px").TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).SplitterSettings(ss=>ss.Position("80%")).Render()
```

### CHANGESPLITTER.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Change splitter position dynamically

In Gantt, we can change the splitter position dynamically by using `setSplitterPosition` method. We can change the splitter position by passing value and type parameter to `setSplitterPosition` method. Type parameter will accept one of the following values 'position', 'columnIndex', 'viewType'. The following code example shows how to use this method.

### CSHTML

```
@Html.EJS().DropDownList("SplitterView").DataSource((IEnumerable<object>)ViewBag.dropdata).Width("250px").Value("Default").Fields(new Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "id", Value = "view" }).Change("onViewChange").Render()
 @Html.EJS().Button("changeByPosition").Content("Change Splitter By Position").CssClass("e-primary").Render()
 @Html.EJS().Button("changeByIndex").Content("Change Splitter By ColumnIndex").CssClass("e-primary").Render()

@(Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts =>

 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Render())

<script>
 function onViewChange(e) {
 var viewType = e.value;
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.setSplitterPosition(viewType, 'view');
 }
}
```

```

document.getElementById("changeByPosition").addEventListener('click', () =>
{
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.setSplitterPosition('50%', 'position');
});
document.getElementById("changeByIndex").addEventListener('click',
() => {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.setSplitterPosition(0, 'columnIndex');
});
</script>

```

### SETSPLITTERPOSITION.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 ViewBag.dropdata = new List<object>() {
 new { id= "Default", view= "Default" },
 new { id= "Grid", view= "Grid" },
 new { id= "Chart", view= "Chart" }
 };
 return View();
}

```

### Task Scheduling

The Gantt provides support for automatic and manual task scheduling modes. It is used to indicate whether the start date and end date of all the tasks will be automatically validated or not. [taskMode](#) is the property used to change the schedule mode of a task.

The Gantt control supports three types of mode. They are:

- **Auto**: All the tasks are automatically validate.
- **Manual**: All the tasks are manually validate by the user.
- **Custom**: Both Auto and Manual tasks are render by mapped from data source.

---

**Note:** The default value of [taskMode](#) is **Auto**.

---

#### Automatically scheduled tasks

When the [taskMode](#) property is set as **Auto**, the start date and end date of all the tasks in the project will be automatically validated. That is, dates are validated based on various factors such as working time, holidays, weekends and predecessors.

### CSHTML

```

@(Html.EJS().Gantt("ResourceAllocation").DataSource((IEnumerable<object>
)ViewBag.DataSource).Height("450px").HighlightWeekends(true).AllowSelection(
true)

```

```

 .TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
 .Dependency("Predecessor").Child("SubTasks"))
 .TreeColumnIndex(1).TaskMode(Syncfusion.EJ2.Gantt.ScheduleMode.Auto)
 .EditSettings(es =>
es.AllowEditing(true).AllowDeleting(true).AllowTaskbarEditing(true).ShowDeleteConfirmDialog(true))
 .Toolbar(new List<string>
() { "Add", "Edit", "Update", "Delete", "Cancel", "ExpandAll", "CollapseAll" })
 .Render()
)

```

### AUTO-TASKS.CS

}

```

### Manually scheduled tasks

When the [taskMode](#) property is set as **Manual**, the start date and end date of all the tasks in the project will be same as given in the data source. That is, dates are not validated based on various factors such as dependencies between tasks, holidays, weekends, working time. We can restrict this mode in

predecessor validation alone. That is, we can automatically validate the dates based on predecessor values by enabling the [validateManualTasksOnLinking](#) property.

### CSHTML

```
@ (Html.EJS () .Gantt ("ResourceAllocation") .DataSource ((IEnumerable<object>
) ViewBag.DataSource) .Height ("450px") .HighlightWeekends (true) .AllowSelection (
true)
 .TaskFields (ts =>
ts.Id ("TaskId") .Name ("TaskName") .StartDate ("StartDate") .EndDate ("EndDate") .D
uration ("Duration") .Progress ("Progress")
 .Dependency ("Predecessor") .Child ("SubTasks"))
 .TreeColumnIndex (1) .TaskMode (Syncfusion.EJ2.Gantt.ScheduleMode.Manual)
 .EditSettings (es =>
es.AllowEditing (true) .AllowDeleting (true) .AllowTaskbarEditing (true) .ShowDele
teConfirmDialog (true))
 .Toolbar (new List<string>
() { "Add", "Edit", "Update", "Delete", "Cancel", "ExpandAll",
"CollapseAll" })
 .Render ()
)
```

 public int ParentID { get; set; }
 }
}

```

### Unscheduled tasks

Unscheduled tasks are planned for a project without any definite schedule dates. The Gantt control supports rendering the unscheduled tasks. You can create or update the tasks with anyone of start date, end date, and duration values or none. You can enable or disable the unscheduled tasks by using the [allowUnscheduledTasks](#) property. The following images represent the various types of unscheduled tasks in Gantt.

|Taskbar state |Auto |Manual|

|-----|-----|-----|

---

**Note:** A milestone is a task that has no start and end dates, but it has a duration value of zero.

---

[Define unscheduled tasks in data source](#)

You can define the various types of unscheduled tasks in the data source as follows

**CSHTML**

```
@(Html.EJS().Gantt("UnscehduledTask").DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Height("450px")
 .HighlightWeekends(true)
 .TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress"))
 .EditSettings(es =>
es.AllowEditing(true).AllowTaskbarEditing(true))
 .AllowUnscheduledTasks(true)
 .Render()
)
</div>
```

**UNSCHEDULED-TASKS.CS**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
namespace WebApplication8.Controllers
{
 public class HomeController : Controller
 {
 public ActionResult Index()
 {
 ViewBag.DataSource = UnscheduledData();
 return View();
 }
 public static List<GanttDataSource> UnscheduledData()
 {
 List<GanttDataSource> ganttData = new List<GanttDataSource>();
 GanttDataSource record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Task 1",
 StartDate = new DateTime(2019, 01, 03),
 EndDate = new DateTime(2019, 01, 08),
 Duration = 5,
 TaskType = "",
 };
 GanttDataSource record2 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Task 2",
 Duration = 5,
 TaskType = "Task with duration only",
 };
 GanttDataSource record3 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Task 3",
 StartDate = new DateTime(2019, 01, 03),
```

```

 TaskType = "Task with start date only",
 };
 GanttDataSource record4 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Task 4",
 EndDate = new DateTime(2019, 01, 08),
 TaskType = "Task with end date only",
 };
 ganttData.Add(record1);
 ganttData.Add(record2);
 ganttData.Add(record3);
 ganttData.Add(record4);
 return ganttData;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public string TaskType { get; set; }
 public DateTime? StartDate { get; set; }
 public DateTime? EndDate { get; set; }
 public DateTime BaselineStartDate { get; set; }
 public DateTime BaselineEndDate { get; set; }
 public int? Duration { get; set; }
 public bool IsManual { get; set; }
 public int Progress { get; set; }
 public string Predecessor { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
 public int[] ResourceId { get; set; }
 public string Notes { get; set; }
 public int? Work { get; set; }
 public int ParentID { get; set; }
}
}

```

**Note:** If the [allowUnscheduledTasks](#) property is set to false, then the Gantt control automatically calculates the scheduled date values with a default value of duration 1 and the project start date is considered as the start date for the task.

### Working time range

In the Gantt control, working hours in a day for a project can be defined by using the [dayWorkingTime](#) property. Based on the working hours, automatic date scheduling and duration validations for a task are performed.

The following code snippet explains how to define the working time range for the project in Gantt.

### CSHTML

```
<div class="col-lg-9 control-section">
 <div class="content-wrapper">

@ (Html.EJS().Gantt("WorkingTimeRange").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px")
 .TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").Duration("Duration")
 .Progress("Progress").Child("SubTasks"))
 .TimelineSettings(ts => ts.TopTier(tt =>
tt.Unit(Syncfusion.EJ2.Gantt.TimelineViewMode.Day)).BottomTier(bt =>
bt.Unit(Syncfusion.EJ2.Gantt.TimelineViewMode.Hour)))
 .Render()
)
 </div>
</div>
<div class="col-lg-3 property-section">
 <table id="property" title="Properties" style="width: 100%;">
 <colgroup>
 <col style="width:55%" />
 <col style="width:45%" />
 </colgroup>
 <tr>
 <td style="width:55%">
 <div>Work Start Time</div>
 </td>
 <td style="width:45%">
 <div style="padding-top: 0px">

@ (Html.EJS().NumericTextBox("WorkStartTime").Min(0).Max(24).Value(8).Change("UpdateTime").ShowSpinButton(true).Step(0.5)
 .Render()
)
 </div>
 </td>
 </tr>
 <tr>
 <td style="width:55%">
 <div>Work End Time</div>
 </td>
 <td style="width:45%">
 <div style="padding-top: 0px">

@ (Html.EJS().NumericTextBox("WorkEndTime").Min(0).Max(24).Value(17).Change("UpdateTime").ShowSpinButton(true).Step(0.5)
 .Render()
)
 </div>
 </td>
 </tr>
 </table>
 </div>
```

```

 .Render()
)
 </div>
</td>
</tr>
</table>
</div>
<script>
 var isTimeUpdated = false;
 function UpdateTime() {
 var ganttChart =
document.getElementById("WorkingTimeRange").ej2_instances[0];
 var defaultDate = "08/08/2016", startDate = new Date(defaultDate),
endDate = new Date(defaultDate);
 var decPlace = WorkStartTime.value -
Math.floor(WorkStartTime.value);
 startDate.setHours(WorkStartTime.value);
 startDate.setMinutes(decPlace * 60);

**Note:** \* Individual tasks can lie between any time within the defined working time range of the project.

<br/>\* The [dayWorkingTime](#) property is used to define the working time for the whole project.

#### Weekend/Non-working days

Non-working days/weekend are used to represent the non-productive days in a project. You can define the non-working days in a week using the [workWeek](#) property in Gantt.

#### CSHTML

```
@(Html.EJS().Gantt("WorkWeek").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").HighlightWeekends(true)
 .TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").Duration("Duration")
 .Progress("Progress").Child("SubTasks"))
 .WorkWeek(new string[] { "Sunday", "Monday", "Tuesday",
 "Wednesday", "Thursday", "Friday" })
 .Render()
)
```

#### WORKING-DAYS.CS

 public string date { get; set; }
 public string iconClass { get; set; }
 public string name { get; set; }
 public string tooltip { get; set; }
 }
 public class CheckList
 {
 public string id { get; set; }
 public string day { get; set; }
 public static List<CheckList> Days()
 {
 List<CheckList> Data = new List<CheckList>();
 Data.Add(new CheckList { id = "Sunday", day = "Sunday" });
 Data.Add(new CheckList { id = "Monday", day = "Monday" });
 Data.Add(new CheckList { id = "Tuesday", day = "Tuesday" });
 Data.Add(new CheckList { id = "Wednesday", day = "Wednesday" });

 Data.Add(new CheckList { id = "Thursday", day = "Thursday" });

 Data.Add(new CheckList { id = "Friday", day = "Friday" });
 Data.Add(new CheckList { id = "Saturday", day = "Saturday" });

 return Data;
 }
 }
}

```

```
}

```

**Note:** By default, Saturdays and Sundays are considered as non-working days/weekend in a project.

In the Gantt control, you can make weekend as working day by setting the [includeWeekend](#) property to **true**.

### Duration units

In Gantt, the task's duration value can be measured by the following duration units,

- Day
- Hour
- Minute

In Gantt, we can define duration unit for whole project by using [durationUnit](#) property, when we defines the value for this property, this unit will be applied for all task which don't has duration unit value. And each task in the project can be defined with different duration units and the duration unit of a task can be defined by the following ways,

- Using [taskFields.durationUnit](#) property, to map the duration unit data source field.
- Defining the duration unit value along with the duration field in the data source.

### Mapping the duration unit field

The below code snippet explains the mapping of duration unit data source field to the Gantt control using the [taskFields.durationUnit](#) property.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
 .StartDate("StartDate").EndDate("EndDate").Duration("Duration").DurationUnit("DurationUnit")
 .Progress("Progress").Child("SubTasks")).Render()
```

**DURATIONUNITS.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
 DurationUnit="day"
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 16,
 Progress = 50,
 DurationUnit = "hour"
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 480,
 Progress = 50,
 DurationUnit = "minute"
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
```

```
 SubTasks = new List<GanttDataSource>()
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 24,
 Progress = 70,
 DurationUnit = "hour"
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 DurationUnit = "day"
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public string DurationUnit { get; set; }

 public List<GanttDataSource> SubTasks { get; set; }
}
```

**Note:** The default value of the [durationUnit](#) property is day.

#### Defining duration unit along with duration field

Duration units for the tasks can also be defined along with the duration values, the below code snippet explains the duration unit for a task along with duration value,

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
rogress("Progress").Child("SubTasks").Render()
```

#### DURATIONUNITSWITHDURATION.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
}
```

```
GanttDataSource Child1 = new GanttDataSource()
{
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = "3days",
 Progress = 70,
};
GanttDataSource Child2 = new GanttDataSource()
{
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = "12hours",
 Progress = 50
};
GanttDataSource Child3 = new GanttDataSource()
{
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = "1800minutes",
 Progress = 50
};
Record1.SubTasks.Add(Child1);
Record1.SubTasks.Add(Child2);
Record1.SubTasks.Add(Child3);
GanttDataSource Record2 = new GanttDataSource()
{
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
};
GanttDataSource Child4 = new GanttDataSource()
{
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = "480minutes",
 Progress = 70
};
GanttDataSource Child5 = new GanttDataSource()
{
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = "3days",
 Progress = 50
};
Record2.SubTasks.Add(Child4);
Record2.SubTasks.Add(Child5);
GanttDataSourceCollection.Add(Record1);
GanttDataSourceCollection.Add(Record2);
```

```

 return GanttDataSourceCollection;
 }

 public class GanttDataSource
 {
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public string Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
 }

```

**Note:** The edit type of the duration column in Gantt is string, to support editing the duration field along with duration units.

## Taskbar in ASP.NET MVC Gantt Chart Component

### Taskbar template

You can design your own taskbars to view the tasks in Gantt by using [TaskbarTemplate](#) property. And it is possible to map the template script element's ID value to this property. It is also possible to customize the parent taskbars and milestones with custom templates by using [ParentTaskbarTemplate](#) and [MilestoneTemplate](#) properties.

### CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").RowHeight(60).TaskbarTemplate(
 "#TaskbarTemplate").ParentTaskbarTemplate("#ParentTaskbarTemplate").MilestoneTemplate(
 "#MilestoneTemplate").TaskFields(ts =>

```

```

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Render()

<script type="text/x-jsrender" id="TaskbarTemplate">
 <div class="e-gantt-child-taskbar-inner-div e-gantt-child-taskbar"
style="height:100%">
 <div class="e-gantt-child-progressbar-inner-div e-gantt-child-progressbar" style="width:${ganttProperties.progressWidth}px;height:100%">
 ${taskData.TaskName}
 </div>
 </div>
</script>
<script type="text/x-jsrender" id="ParentTaskbarTemplate">
 <div class="e-gantt-parent-taskbar-inner-div e-gantt-parent-taskbar"
style="height:100%">
 <div class="e-gantt-parent-progressbar-inner-div e-gantt-parent-progressbar" style="width:${ganttProperties.progressWidth}px;height:100%">
 ${taskData.TaskName}
 </div>
 </div>
</script>
<script type="text/x-jsrender" id="MilestoneTemplate">
 <div class="e-gantt-milestone" style="position:absolute;">
 <div class="e-milestone-top" style="border-right-width:15px;border-left-width:15px;border-bottom-width:15px;"></div>
 <div class="e-milestone-bottom" style="top:15px;border-right-width:15px; border-left-width:15px; border-top-width:15px;">
 </div>
 </div>
</script>

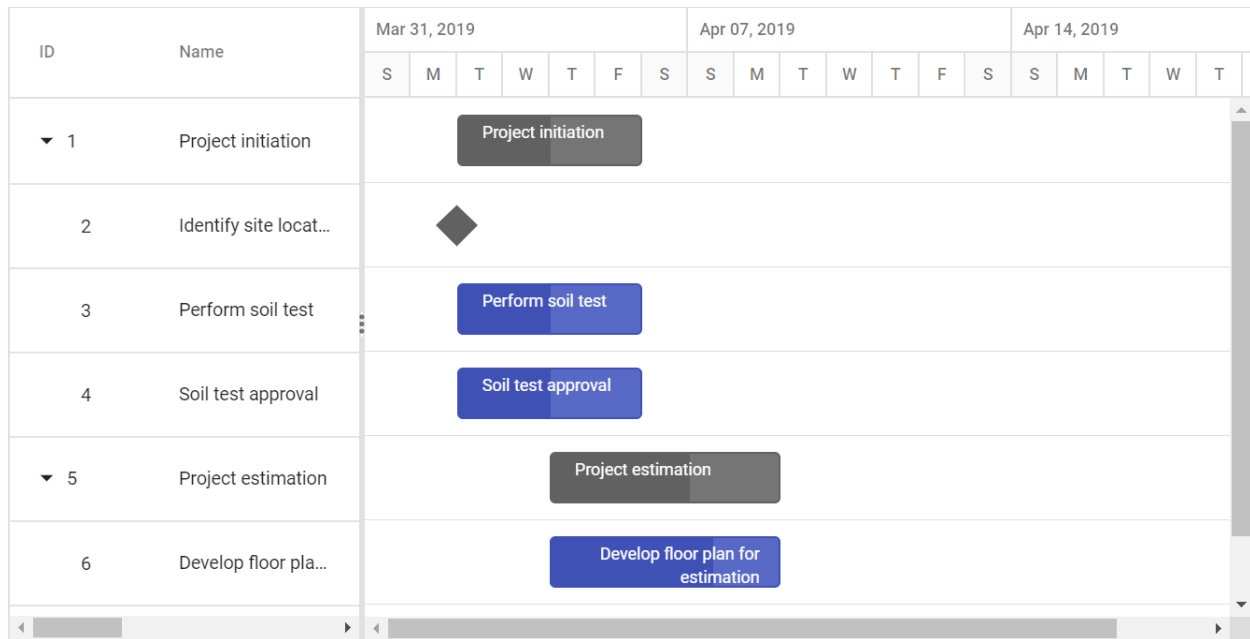

```

### TASKBARTEMPLATE.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

### Taskbar customization

#### Taskbar Height

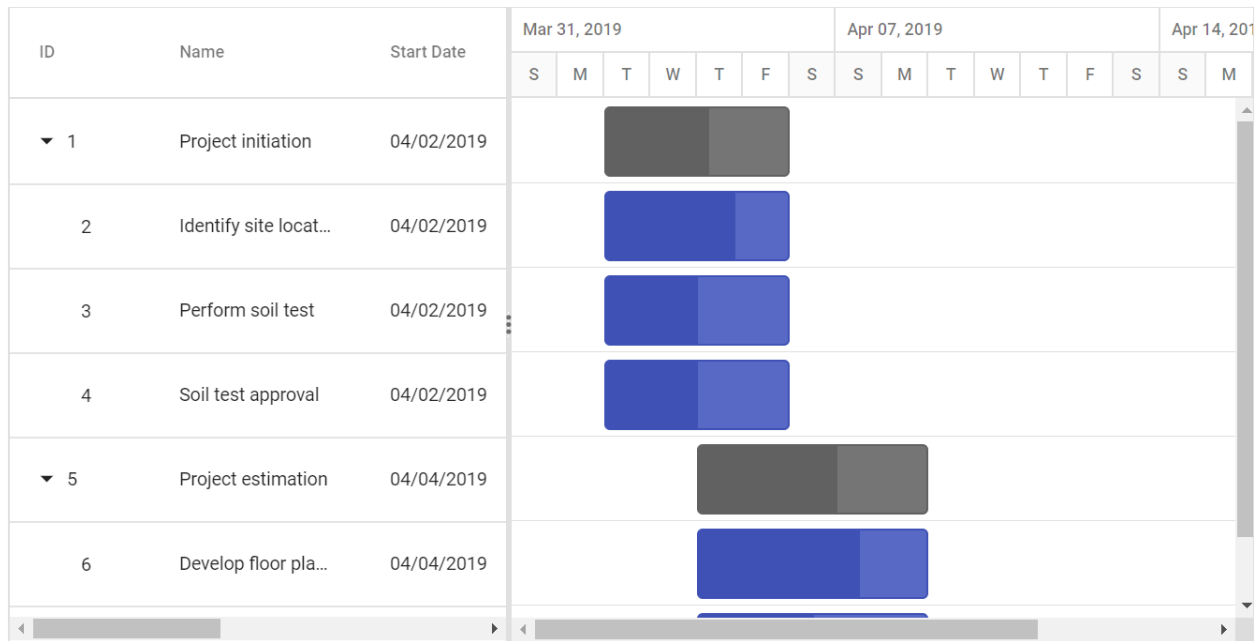

Height of child taskbars and parent taskbars can be customized by using [TaskbarHeight](#) property. The following code example shows how to use the property.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").RowHeight(60).TaskbarHeight(50).TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration(
 "Duration").Progress("Progress").Child("SubTasks")).Render()
```

#### TASKBARHEIGHT.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

**Note:** The [TaskbarHeight](#) value should be lower than the [RowHeight](#) property value and these properties accept only pixel values.

#### Conditional formatting

The default taskbar UI can be replaced with custom templates using the [QueryTaskbarInfo](#) event. The following code example shows customizing the taskbar UI based on task progress values in the Gantt control.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").QueryTaskbarInfo("queryTaskbarInfo").TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).Render()

<script>
 function queryTaskbarInfo(args) {
 if (args.data.Progress == 50) {
 args.progressBarBgColor = "red";
 } else if (args.data.Progress == 70) {
 args.progressBarBgColor = "yellow";
 } else if (args.data.Progress == 80) {
 args.progressBarBgColor = "lightgreen";
 }
 }
</script>
```

#### CONDITIONALFORMATTING.CS

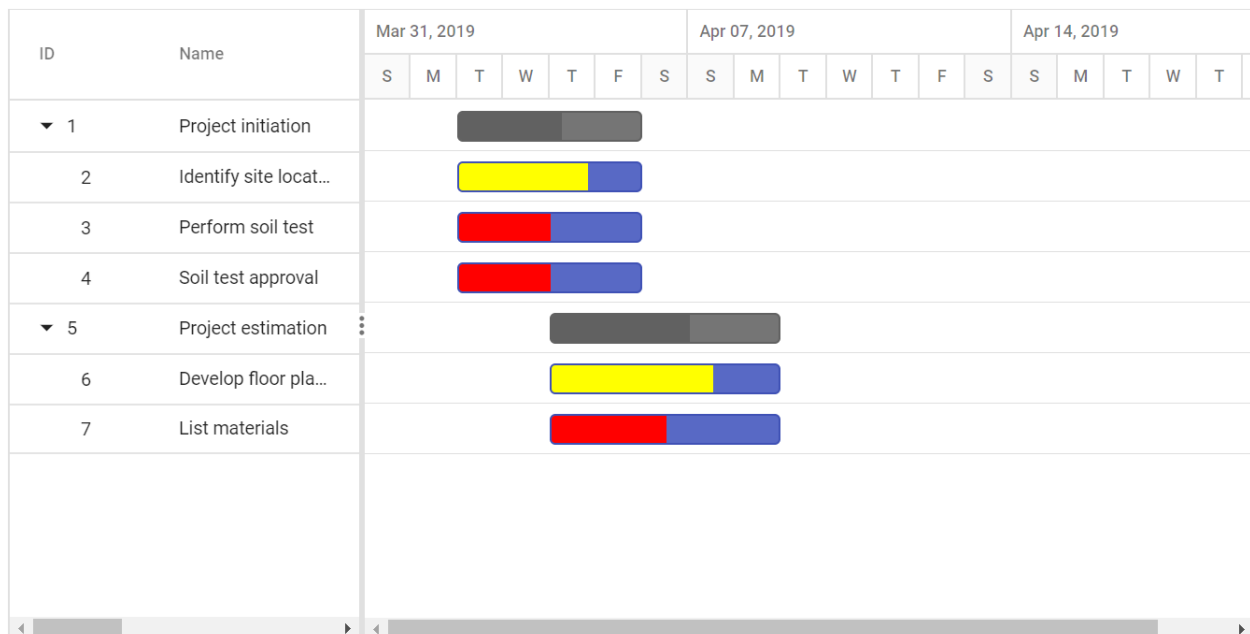

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}
```

```
public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
```

```

 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}
public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

#### Change gripper icon in taskbar

You can change the gripper icon in the taskbar by applying styles to their respective class elements.

#### CSHTML

```

@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Editing").DataSource((IEnumerable<object>)Model).TaskFields(
 ts => ts.Id("TaskId").Name("TaskName").StartDate(
 "StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency(
 "Predecessor").Child("SubTasks").EditSettings(es => es.AllowTaskbarEditing(true)).Render()
)

```

```

<style>
/* change gripper icon */
.e-gantt .e-left-resize-gripper::before, .e-gantt .e-right-resize-
gripper::before {
 content: '\e934';
}
.e-gantt .e-left-resize-gripper, .e-gantt .e-right-resize-gripper {
 transform: rotate(90deg);
}
</style>

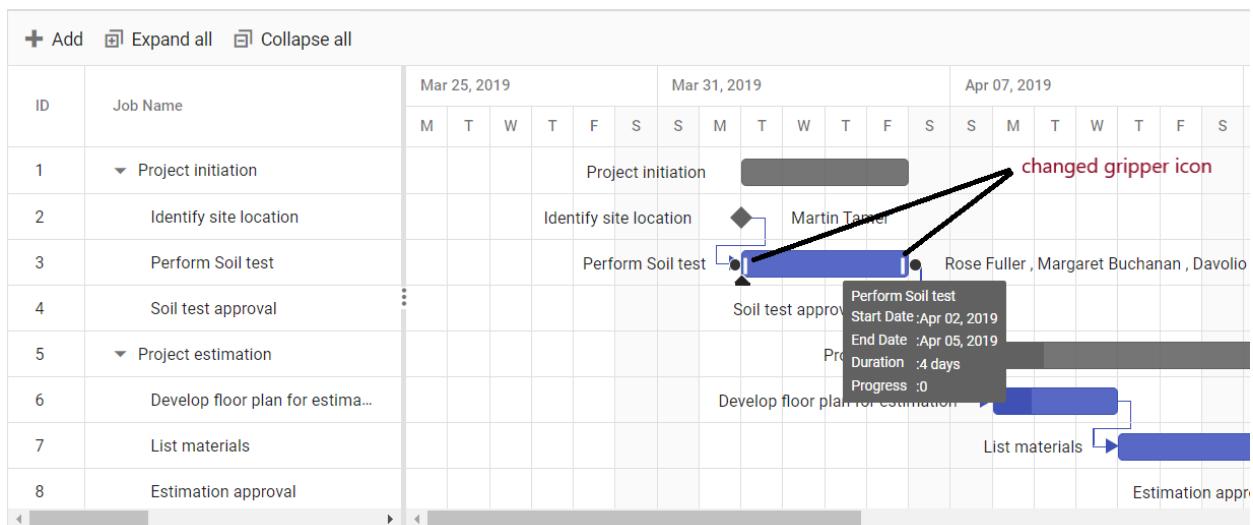

```

## DATA.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

## Connector lines

The width and background color of connector lines in Gantt can be customized using the [ConnectorLineWidth](#) and [ConnectorLineBackground](#) properties. The following code example shows how to use these properties.

## CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").ConnectorLineWidth(3).ConnectorLineBackground("red").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks").Dependency("Dependency")).Render()

```

**DEPENDENCYFORMATTING.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

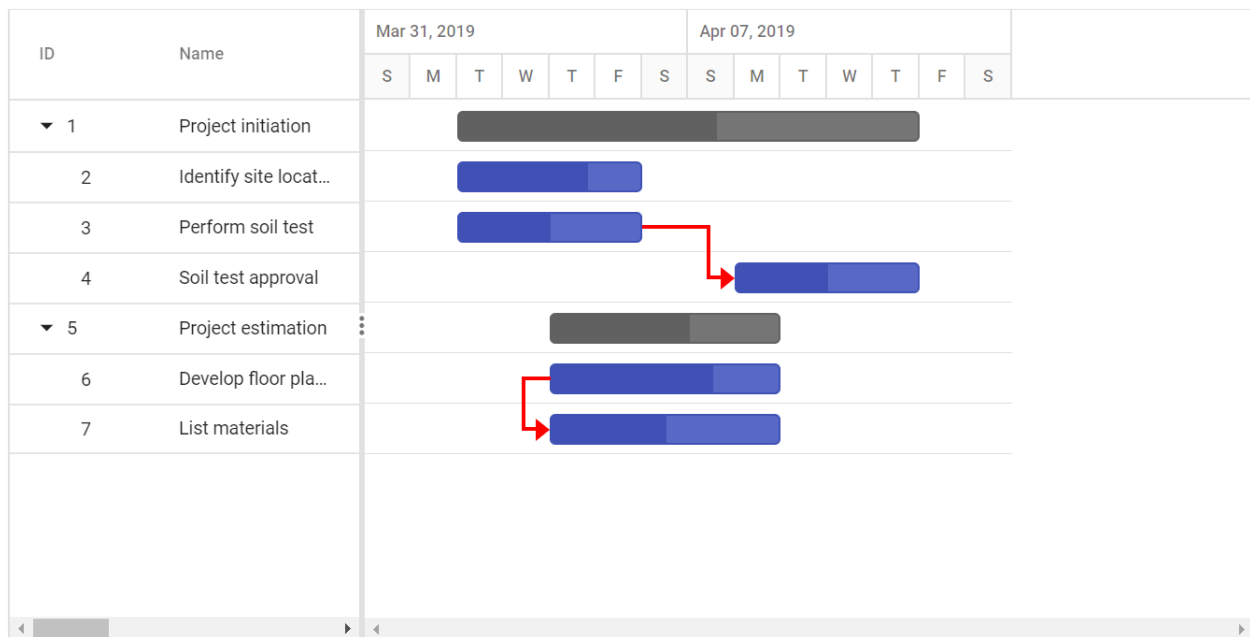

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {

}

```

## Tooltip

In the Gantt control, you can enable or disable the mouse hover tooltip for the following UI elements using the [TooltipSettings.ShowTooltip](#) property:

- Taskbar
- Connector line
- Baseline
- Event marker

## CSHTML

```
<style>
 .e-gantt .e-gantt-chart .e-custom-event-marker {
 width: 1px;
 border-left: 2px green dotted;
 }
</style>

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.D
ataSource).Height("450px").RenderBaseline(
 true).BaselineColor("red").TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").Dependency("Predecessor").StartDate(
"StartDate").BaselineStartDate("BaselineStartDate").BaselineEndDate("Baselin
eEndDate").Duration("Duration"
).Progress("Progress").EndDate("EndDate").Child("SubTasks")).EventMarkers(em
=>
 {
 em.Day("04/10/2019").Label("Project approval and
kick-off").CssClass("e-custom-event-marker").Add();
 }).Render()
```

## ENABLETOOLTIP.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}
public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
```

```

 {

 public string Predecessor { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

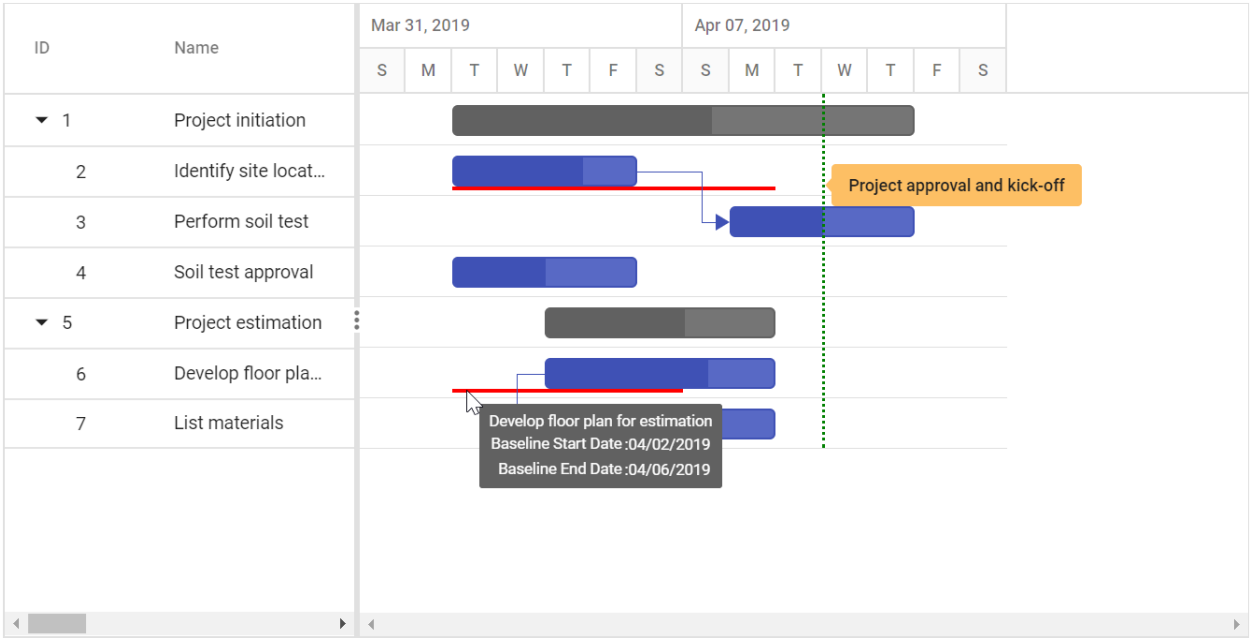

```

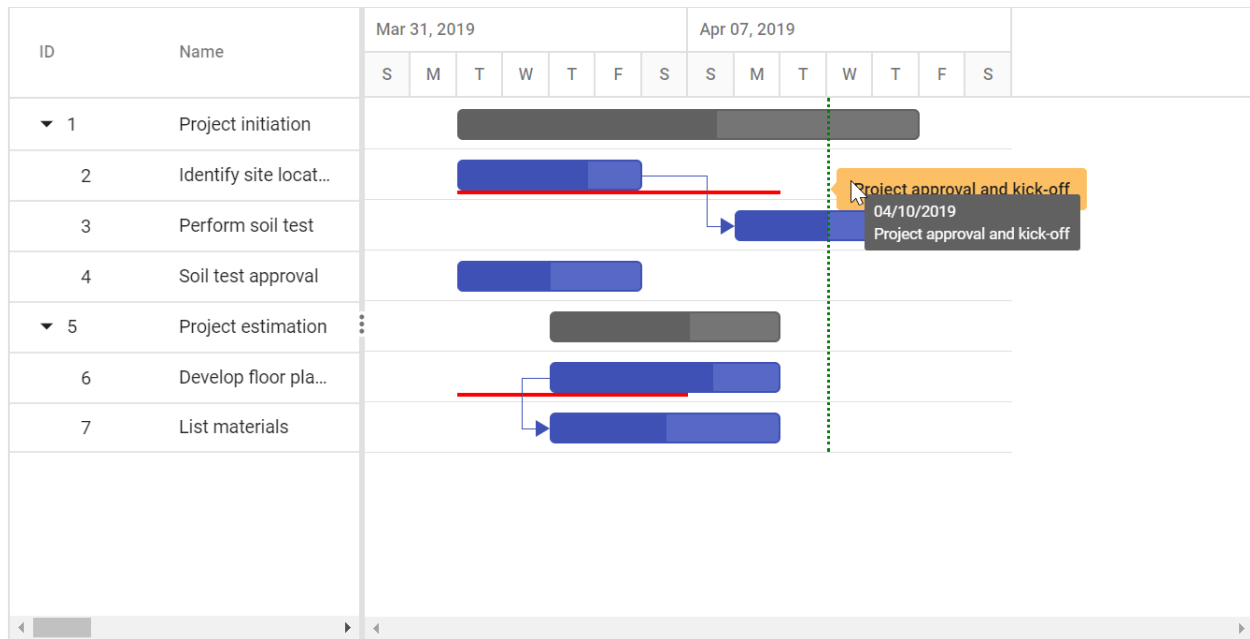

Taskbar Tooltip

Dependency Tooltip

Baseline Tooltip

### Event Marker Tooltip

**Note:** The default value of the [TooltipSettings.ShowTooltip](#) property is true.

### Tooltip template

#### Taskbar tooltip

The default tooltip in the Gantt control can be customized using the [TooltipSettings.Taskbar](#) property. You can map the template script element's ID value or template string directly to this property.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Child("SubTasks").Duration("Duration").Progress(
 "Progress")).TooltipSettings(ts =>
ts.Taskbar("#taskbarTooltip")).Render()

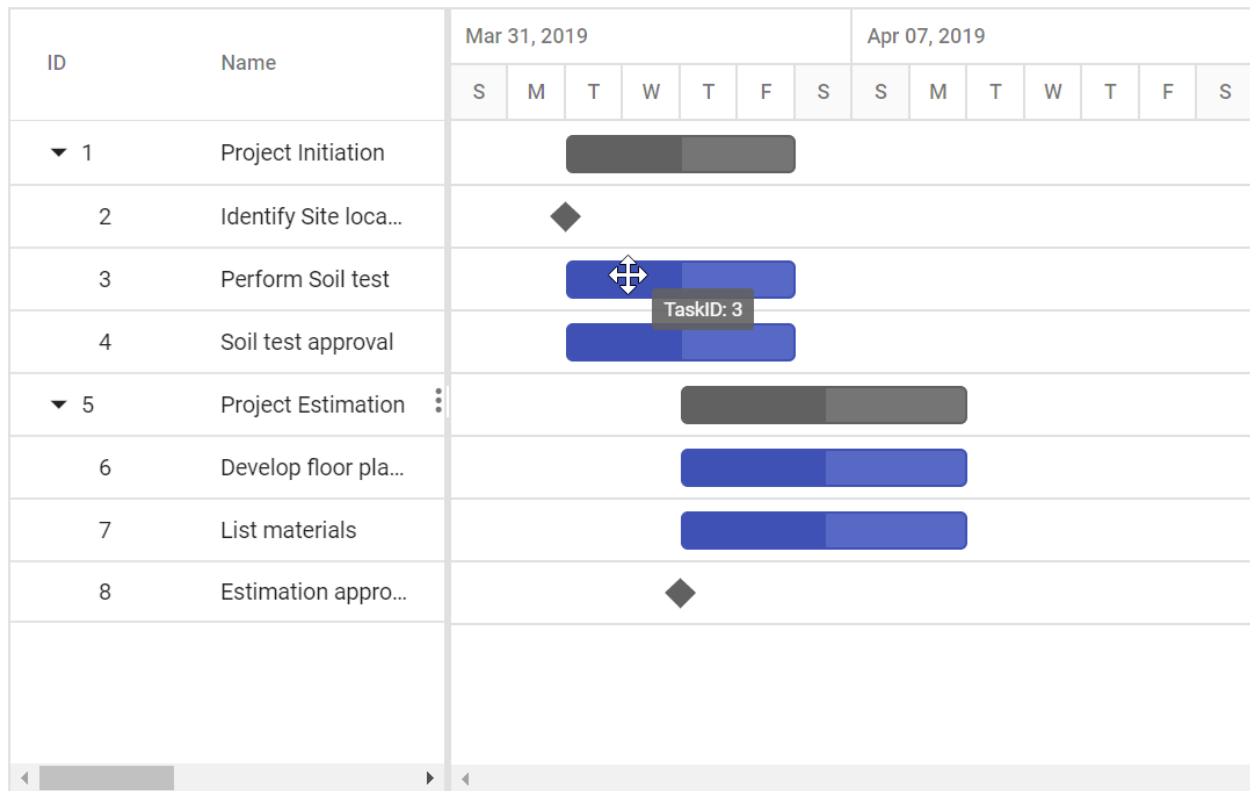

<script type="text/x-jsrender" id="taskbarTooltip">
 <div>TaskID: ${TaskId}</div>
</script>
```

### TASKBARTEMPLATE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

The below screenshot shows the output of above code example.

### Baseline tooltip

A baseline tooltip can be customized using the [TooltipSettings.Baseline](#) property. The following code example shows how to customize the baseline tooltip in Gantt.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").RenderBaseline(true).BaselineColor("red")
 .TaskFields(ts =>
 ts.Id("TaskId").BaselineStartDate("BaselineStartDate").BaselineEndDate("BaselineEndDate").Name("TaskName").StartDate(
 "StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks"))
 .TooltipSettings(ts =>
 ts.Baseline("#baselineTemplate")).Render()

<script type="text/x-jsrender" id="baselineTemplate">
 <div>Baseline StartDate :
 ${this.getFormattedDate(BaselineStartDate)}</div>
</script>
```

### BASELINETEMPLATE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
 public static List<GanttDataSource> ganttData()
 {
```

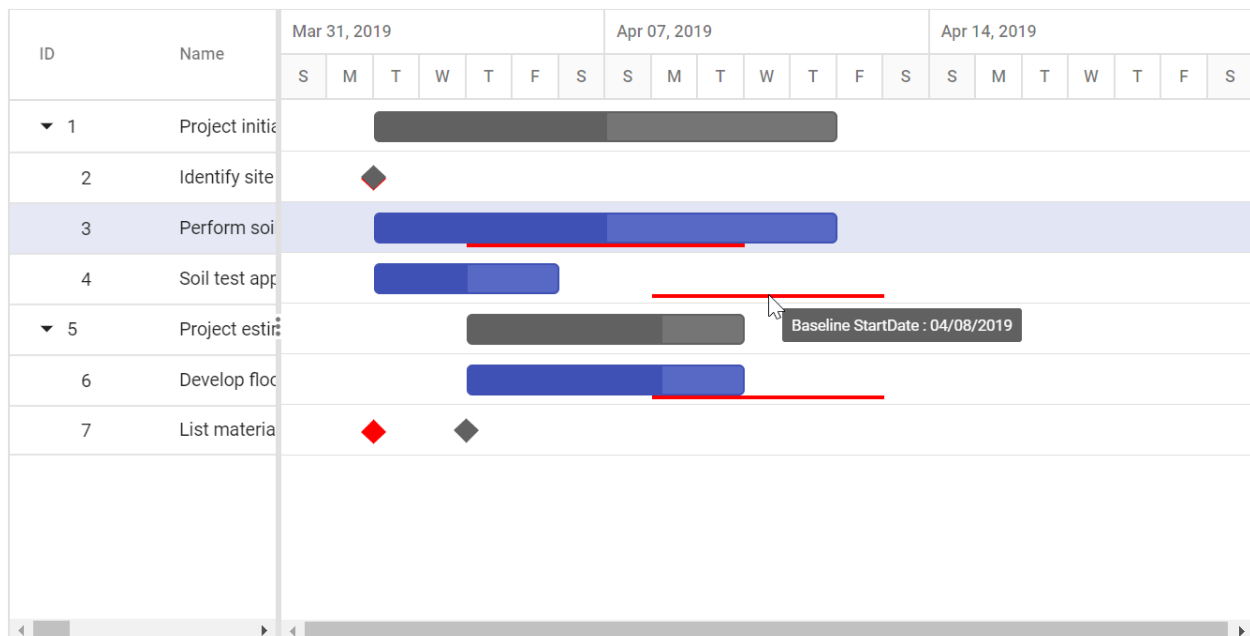

```
List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
GanttDataSource Record1 = new GanttDataSource()
{
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
};
GanttDataSource Child1 = new GanttDataSource()
{
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 BaselineStartDate = new DateTime(2019, 04, 02),
 BaselineEndDate = new DateTime(2019, 04, 02),
 Duration = 0,
 Progress = 70,
};
GanttDataSource Child2 = new GanttDataSource()
{
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 BaselineStartDate = new DateTime(2019, 04, 04),
 BaselineEndDate = new DateTime(2019, 04, 09),
 Duration = 8,
 Progress = 50
};
GanttDataSource Child3 = new GanttDataSource()
{
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 BaselineStartDate = new DateTime(2019, 04, 08),
 BaselineEndDate = new DateTime(2019, 04, 12),
 Duration = 4,
 Progress = 50
};
Record1.SubTasks.Add(Child1);
Record1.SubTasks.Add(Child2);
Record1.SubTasks.Add(Child3);
GanttDataSource Record2 = new GanttDataSource()
{
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
};
GanttDataSource Child4 = new GanttDataSource()
{
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 BaselineStartDate = new DateTime(2019, 04, 08),
```

```

 BaselineEndDate = new DateTime(2019, 04, 12),
 Duration = 4,
 Progress = 70
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 BaselineStartDate = new DateTime(2019, 04, 02),
 BaselineEndDate = new DateTime(2019, 04, 02),
 Duration = 0,
 Progress = 50
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}
public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public DateTime? BaselineStartDate { get; set; }
 public DateTime? BaselineEndDate { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

The following screenshot shows the template for baseline in Gantt.

### Connector line tooltip

The default connector line tooltip in the Gantt control can be customized using the [TooltipSettings.ConnectorLine](#) property. You can map the value to this property as template script element ID or template string format. The following code example shows how to use the [TooltipSettings.ConnectorLine](#) property.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").Duration("Duration")
 .Progress("Progress").Child("SubTasks"
).Dependency("Predecessor")).TooltipSettings(ts =>
ts.ConnectorLine("#dependencyLineTooltip").Render()

<script type="text/x-jsrender" id="dependencyLineTooltip">
 <div>Offset : ${offsetString}</div>
</script>
```

### DEPENDENCYLINETEMPLATE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 Predecessor = "2FS"
```

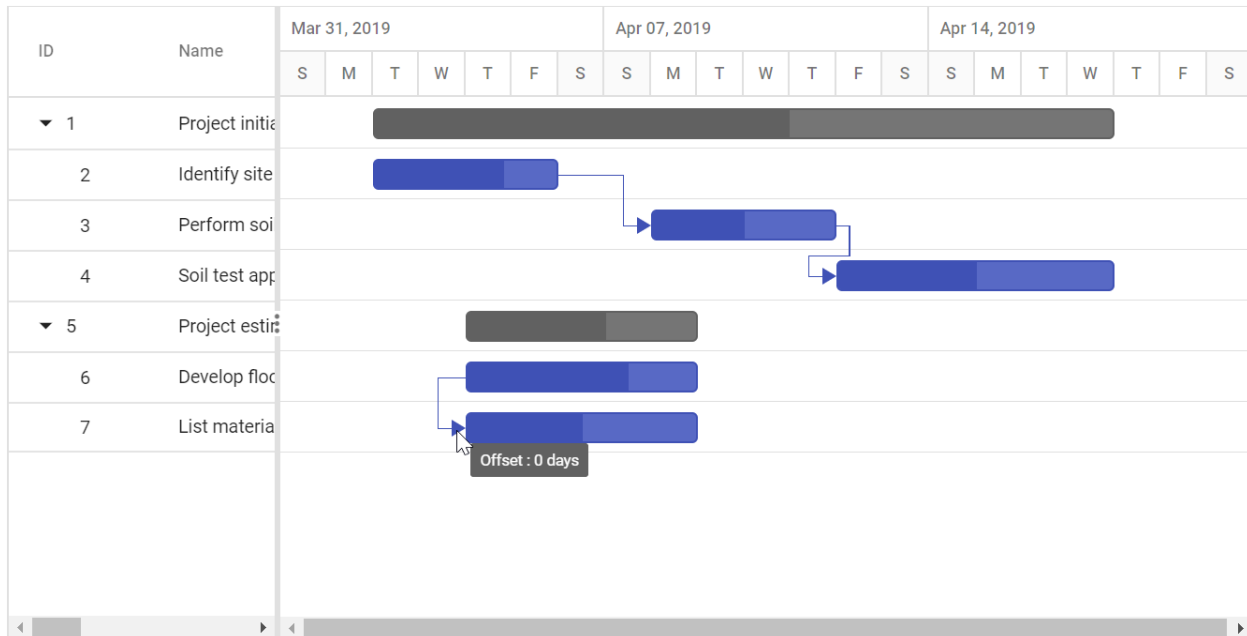

```

 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 Predecessor = "3FS"
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 Predecessor = "6SS"
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public string Predecessor { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

The below screenshot shows the output of above code example.

### Critical Path feature

The critical path in a project is indicated by a single task or a series of tasks. If a task in critical path is delayed, the entire project will be delayed. A task is considered to be critical if any delay to this task would affect the project end date.

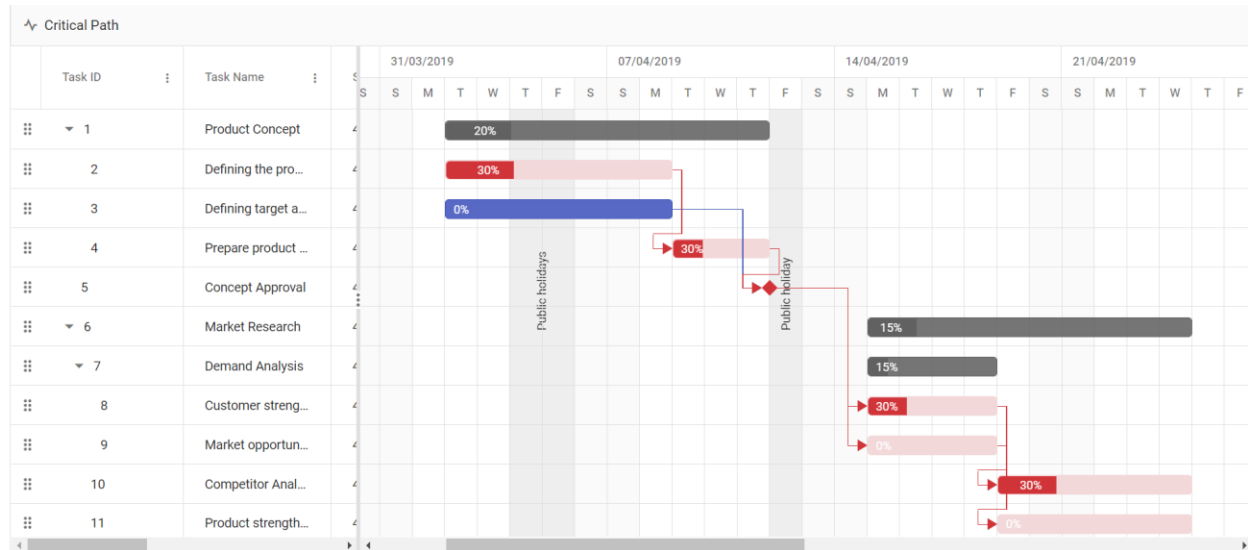

The critical path can be enabled in Gantt by using the built-in toolbar button or `enableCriticalPath` to true.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
).StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
 .Child("SubTasks")
).EnableCriticalPath(true).EditSettings(es =>
 es.AllowAdding(true).AllowEditing(true).AllowDeleting(true)
).Toolbar(new List<string>() { "CriticalPath" }).Render()
```

### CRITICALPATH.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.EditingData();
 return View();
}
```

### Customize taskbar in critical path

The taskbar in critical path can be customized by using `queryTaskbarInfo` event and `isCritical` property of row `data` in the event argument.

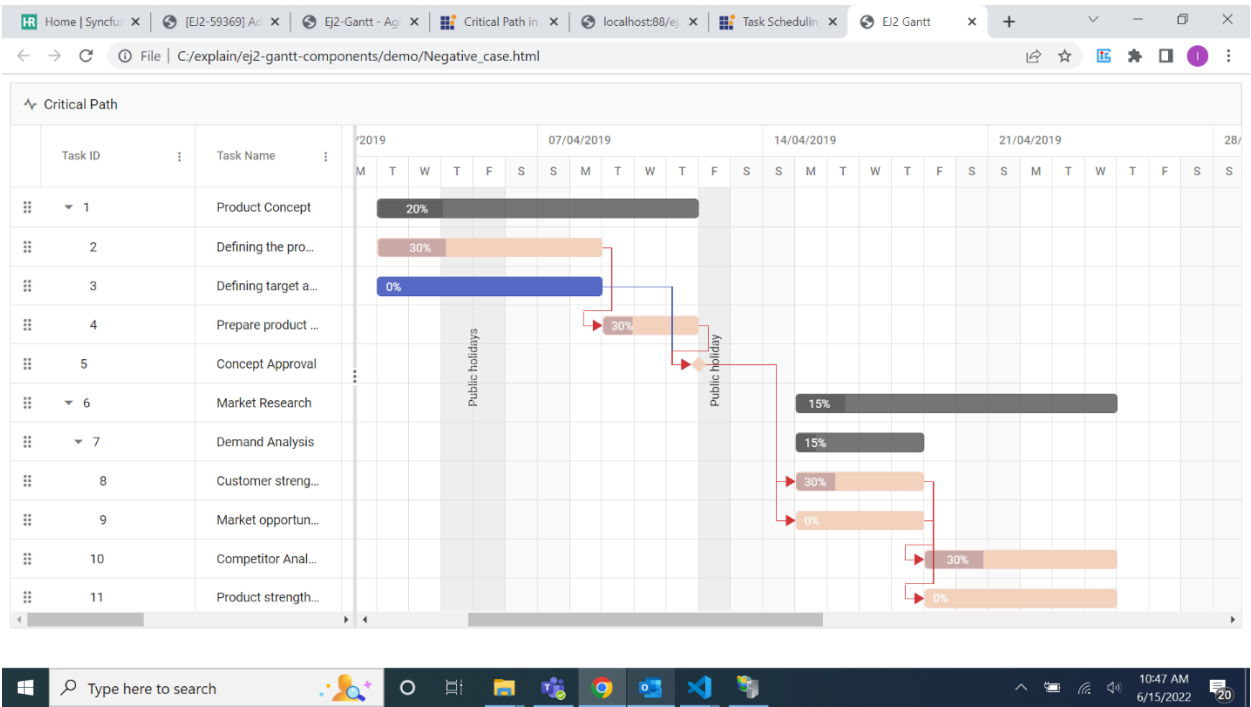

The following code example shows how to customize the critical path taskbar in the Gantt control:

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
 .StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
 .Child("SubTasks")
).EnableCriticalPath(true).EditSettings(es =>
 es.AllowAdding(true).AllowEditing(true).AllowDeleting(true)
).QueryTaskbarInfo("queryTaskbarInfo").Render()
<script>
 function queryTaskbarInfo(args) {
 if ((args.data.isCritical || args.data.slack === '0 day') &&
 !args.data.hasChildRecords) {
 args.taskbarBgColor = 'rgb(242, 210, 189)';
 args.progressBarBgColor = 'rgb(201, 169, 166)';
 }
 }
</script>
```

#### CUSTOMCRITICALPATH.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.EditingData();
 return View();
}
```

Toolbar in Gantt control

The Gantt control provides toolbar support to handle Gantt actions. The [Toolbar](#) property accepts the collection of built-in toolbar items and [ItemModel](#) objects for custom toolbar items.

Built-in toolbar items

Built-in toolbar items execute standard actions of the Gantt control, and these items can be added to toolbar by defining the [Toolbar](#) as a collection of built-in items. It renders the button with icon and text.

The following table shows built-in toolbar items and its actions.

Built-in Toolbar Items	Actions
----- -----	
Add	Adds a new record.
Cancel	Cancels the edit state.
CollapseAll	Collapses all the rows.
Delete	Deletes the selected record.
Edit	Edits the selected record.
Indent	Indent the selected record to one level.
Outdent	Outdent the elected record to one level.
ExpandAll	Expands all the rows.
NextTimeSpan	Navigate the Gantt timeline to next time span.
PrevTimeSpan	Navigate the Gantt timeline to previous time span.
Search	Searches the records by the given key.

| Update | Updates the edited record. |

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").Toolbar(new List<string>()
{ "Add", "Cancel", "CollapseAll", "Delete", "Edit", "ExpandAll",
"NextTimeSpan", "PrevTimeSpan", "Search", "Update" }).TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress").Child("SubTasks")
).EditSettings(es=>es.AllowEditing(true).AllowAdding(true).AllowDeleting(tru
e)).Render()
```

### DEFAULTITEMS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

**Note:** The [Toolbar](#) has options to define both built-in and custom toolbar items.

#### Custom toolbar items

Custom toolbar items can be added to the toolbar by defining the [Toolbar](#) property as a collection of [ItemModels](#). Actions for this customized toolbar items are defined in the [ToolbarClick](#) event.

By default, the custom toolbar items are at left position. You can change the position by using the [Align](#) property. In the following sample, the **Quick Filter** toolbar item is positioned at right.

### CSHTML

```
@{
 List<object> toolbarItems = new List<object>();
 toolbarItems.Add(new { text = "Quick Filter", tooltipText = "Quick
Filter", id = "toolbarfilter", align = "Right", prefixIcon: "e-quickfilter"
});
}

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.D
ataSource).Height("450px").ToolbarClick(
 "toolbarClick").Toolbar(toolbarItems).TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate"
).EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTas
ks")).Render()

<script>
function toolbarClick(args) {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.filterByColumn("TaskName", "startswith", "Perform");
}
```

```
};
</script>
```

### CUSTOMITEMS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

**Note:** \* The [Toolbar](#) has options to define both built-in and custom toolbar items.

\* If a toolbar item does not match the built-in items, it will be treated as a custom toolbar item.

#### Built-in and custom items in toolbar

The Gantt control has an option to use both built-in and custom toolbar items at the same time.

In the following example, the **ExpandAll** and **CollapseAll** are built-in toolbar items and **Test** is the custom toolbar item.

### CSHTML

```
@{
 List<object> toolbarItems = new List<object>();
 toolbarItems.Add("ExpandAll");
 toolbarItems.Add("CollapseAll");
 toolbarItems.Add(new { text = "Test", tooltipText = "Test", id =
 "Test" });
}

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").ToolbarClick(
 "onToolbarClick").Toolbar(toolbarItems).TaskFields(ts
=> ts.Id("TaskId").Name("TaskName").StartDate("StartDate"
).EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTas
ks")).Render()

<script>
 function onToolbarClick(args) {
 if (args.item.text === 'Test') {
 alert("Custom toolbar click...");
 }
 }
</script>
```

### DEFAULTANDCUSTOMITEMS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Enable/disable toolbar items

You can enable or disable the toolbar items by using the `enableItems` method.

#### CSHTML

```
@{
 List<object> toolbarItems = new List<object>();
 toolbarItems.Add("QuickFilter");
 toolbarItems.Add("ClearFilter");
}

@Html.EJS().Button("enable").Content("Enable").Render()
@Html.EJS().Button("disable").Content("Disable").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").ToolbarClick("onToolbarClick")
).Toolbar(toolbarItems).TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration")
).Progress("Progress").Child("SubTasks")).Render()

<script>

 document.getElementById("enable").addEventListener('click', () => {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.toolbarModule.enableItems([ganttObj.element.id +
'_QuickFilter', ganttObj.element.id + '_ClearFilter'], true); // enable
toolbar items.
 });
 document.getElementById("disable").addEventListener('click', () => {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.toolbarModule.enableItems([ganttObj.element.id +
'_QuickFilter', ganttObj.element.id + '_ClearFilter'], false); // disable
toolbar items.
 });
 function onToolbarClick(args) {
 if (args.item.text === 'QuickFilter') {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.filterByColumn("TaskName", "startswith",
"Perform");
 }
 if (args.item.text === 'ClearFilter') {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.clearFiltering();
 }
 }
}

</script>
```

#### ENABLE-DISABLETOOLBARITEMS.CS

```
public IActionResult Index()
```

```
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Add input elements to toolbar

In the Gantt toolbar, you can add EJ2 editor elements like a numeric text box, a drop-down list, and date picker controls. The following code snippets demonstrate how to add EJ2 editors to the Gantt toolbar:

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").Toolbar(new List<string>()
{
 "Add", "Cancel", "CollapseAll", "Delete", "Edit", "ExpandAll",
 "NextTimeSpan", "PrevTimeSpan", "Search", "Update", {type:'Input', template:
 new NumericTextBox({ format: 'c2', value:1, width:150 })} })
.TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")

).EditSettings(es=>es.AllowEditing(true).AllowAdding(true).AllowDeleting(true)).Render()
```

#### INPUT-ELEMENTS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Managing Tasks in ASP.NET MVC Gantt Component

The Gantt component has options to dynamically insert, delete, and update tasks in the project. The primary key column is necessary to manage the tasks and perform CRUD operations in Gantt. To define the primary key, set the [Columns.IsPrimaryKey](#) property to `true` in the particular column.

The following code example shows you how to enable the cell editing in Gantt control.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name(

"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")

).EditSettings(es=>es.AllowEditing(true).Mode(Syncfusion.EJ2.Gantt.EditMode.Auto)).Render()
```

#### ENABLECELLEDITING.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Cell edit type and its params

The [columns.editType](#) is used to define the edit type for any particular column. You can set the [columns.editType](#) based on data type of the column.

- numeric edit - [NumericTextBox](#) component for integers, double, and decimal data types.
- default edit - [TextBox](#) component for string data type.
- dropdown edit - [DropDownList](#) component to show all unique values related to that field.
- boolean edit - [CheckBox](#) component for boolean data type.
- date picker edit - [DatePicker](#) component for date data type.
- date time picker edit - [DateTimePicker](#) component for date time data type.

Also, you can customize the behavior of the editor component through the [columns.edit.params](#).

The following table describes cell edit type component and their corresponding edit params of the column.

Edit Type	Component	Example
numericedit	<a href="#">NumericTextBox</a>	params: { decimals: 2, value: 5 }
dropdownedit	<a href="#">DropDownList</a>	params: { value: 'Germany' }
booleanedit	<a href="#">Checkbox</a>	params: { checked: true }
datepickeredit	<a href="#">DatePicker</a>	params: { format: 'dd.MM.yyyy' }
datetimepickeredit	<a href="#">DateTimePicker</a>	params: { value: new Date() }

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Columns(col =>
 {
 col.Field("TaskId").Add();
 col.Field("TaskName").HeaderText("Task Name").Add();
 col.Field("StartDate").Add();
 col.Field("Duration").EditType("numericedit").Edit(new {
@params = new { min = 1 } }).ValueAccessor("durationFormat").Add();
 col.Field("Progress").EditType("numericedit").Edit(new {
@params = new Syncfusion.EJ2.Inputs.NumericTextBox() { ShowSpinButton=false }
 }).Add();
 }) .EditSettings(es=>es.AllowEditing(true)).Render()

<script>
```

```
function durationFormat(field, data, column) {
 return data[field];
}
</script>
```

### EDITPARAMS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![Alt text](images/editParams.png)

### Cell edit template

The cell edit template is used to create a custom component for a particular column by invoking the following functions:

- **create** - It is used to create the element at the time of initialization.
- **write** - It is used to create the custom component or assign default value at the time of editing.
- **read** - It is used to read the value from the component at the time of save.
- **destroy** - It is used to destroy the component.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Columns(col =>
{
 col.Field("TaskId").Add();
 col.Field("TaskName").HeaderText("Task Name").Edit(new {
create = "create", read = "read", destroy = "destroy", write = "write"
}).Add();

 col.Field("StartDate").Add();
 col.Field("Duration").Add();
 col.Field("Progress").Add();
}).EditSettings(es=>es.AllowEditing(true)).Render()

<script>
var elem;
var dropdownlistObj;
function create(args) {
 elem = document.createElement('input');
 return elem;
}
function write(args) {
 var gantt = document.getElementById("Gantt").ej2_instances[0];
 dropdownlistObj = new ej.dropdowns.DropDownList({
 dataSource: gantt.treeGrid.grid.dataSource,
 fields: { value: 'TaskName' },
 value: args.rowData[args.column.field],
```

```

 floatLabelType: 'Auto',
 });
 dropdownlistObj.appendTo(elem);
}
function destroy() {
 dropdownlistObj.destroy();
}
function read(args) {
 return dropdownlistObj.value;
}
</script>

```

### EDITTEMPLATE.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

![[Alt text]](images/editTemplate.png)

Disable editing for particular column

You can disable editing for particular columns, by using the [columns.allowEditing](#) property.

In the following demo, editing is disabled for the **TaskName** column.

### CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Columns(col =>
{
 col.Field("TaskId").Add();
 col.Field("TaskName").HeaderText("TaskName").AllowEditing(false).Add();
 col.Field("StartDate").Add();
 col.Field("Duration").Add();
 col.Field("Progress").Add();
}).EditSettings(es=>es.AllowEditing(true)).Render()

```

### DISABLEEDITING.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

### Read-only gantt

In Gantt, all create, update, delete operations can be disabled by setting `readOnly` property as `true`. The following sample demonstrates, render Gantt chart as read only.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").Toolbar(new List<string>()
{ "Add", "Cancel", "CollapseAll", "Delete", "Edit", "ExpandAll",
"NextTimeSpan", "PrevTimeSpan", "Search", "Update" }).TaskFields(ts =>
ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).EnableContextMenu(true).AllowSorting(true).AllowResizing(true).ReadOnly(true).EditSettings(es=>
es.AllowEditing(true).AllowAdding(true).AllowDeleting(true).AllowTaskbarEditing(true)).Render()
```

#### READONLY.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

![Alt text](images/readOnly.PNG)

![Alt text](images/readOnlyEdit.png)

### Open new task dialog with default values

You can set default values when new task dialog opens using `actionBegin` event when `requestType` is `beforeOpenAddDialog`.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts => ts.Id("TaskId")
).Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).EditSettings(es=>
es.AllowAdding(true)).Toolbar(new List<string>() { "Add"
}).ActionBegin("onActionBegin").Render()
<script>
function onActionBegin(args) {
 if (args.requestType == 'beforeOpenAddDialog') {
 args.rowData.TaskName = 'Gantt';
 args.rowData.Progress = 70;
 args.rowData.ganttProperties.taskName = 'Gantt';
 args.rowData.ganttProperties.progress = 70;
 }
}
</script>
```

**TASK-DIALOG-DEFAULT-VALUE.CS**

```
public IActionResult Index()

![Gantt new task dialog with default values](images/task-dialog-with-default-values.png)

Troubleshoot: Editing works only when primary key column is defined

Editing feature requires a primary key column for CRUD operations. While defining columns in Gantt using the [columns](#) property, it is mandatory that any one of the columns, must be a primary column. By default, the [id](#) column will be the primary key column. If [id](#) column is not defined, we need to enable [isPrimaryKey](#) for any one of the columns defined in the [columns](#) property.

Touch interaction

The Gantt control editing actions can be achieved using the double tap and tap and drag actions on a element.

The following table describes different types of editing modes available in Gantt.

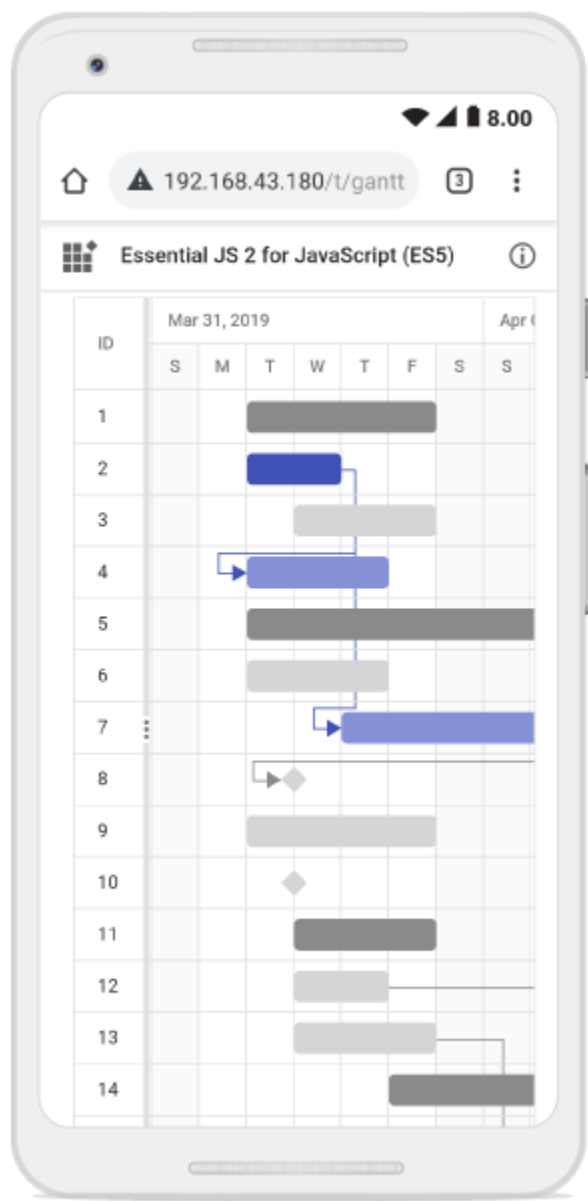

Action	Description
----- -----	
<a href="#">Cell editing</a>	To perform <b>double tap</b> on a specific cell, initiate the cell to be in edit state.
<a href="#">Dialog editing</a>	To perform <b>double tap</b> on a specific row, initiate the edit dialog to be opened.
<a href="#">Taskbar editing</a>	Taskbar editing action is initiated using the <b>tap</b> action on the taskbar.   <b>Parent taskbar</b> : Once you tap on the parent taskbar, it will be changed to editing state. Perform only dragging
	action on parent taskbar editing.  
	: Once you tap the child taskbar, it will be changed to editing state.  
	 <b>Dragging taskbar</b> : To drag a taskbar to the
	left or right in editing state.     <b>Resizing taskbar</b> : To resize a taskbar, drag the left/right resize
	icon.     <b>Progress resizing</b> : To change the progress, drag the progress resize icon to the left or
	right direction.

Task dependency editing

You can tap the left/right connector point to initiate [task dependencies](#) edit mode and again tap another taskbar to establish the dependency line between two taskbars.

The following table explains the taskbar state in dependency edit mode.

Taskbar state	Description
----- -----	
Parent taskbar	You cannot create dependency relationship to parent tasks.  

|

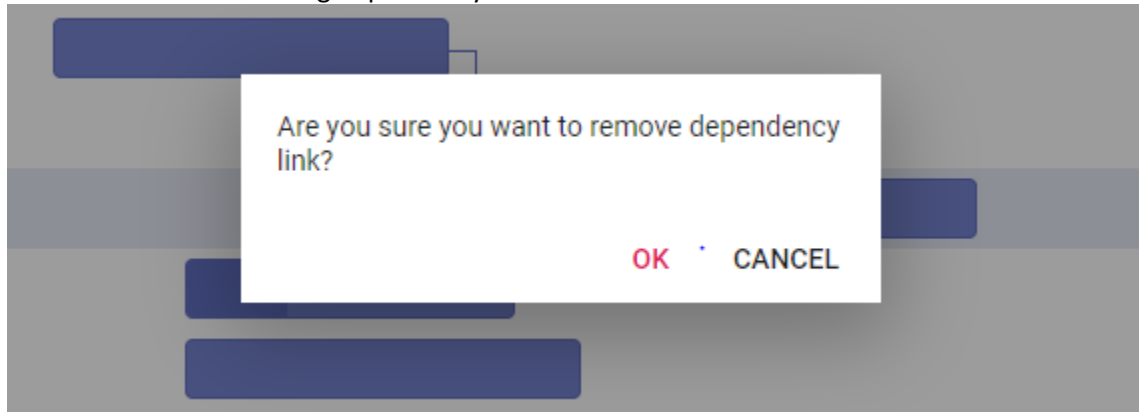

**|Taskbar without dependency |** If you tap a valid child taskbar, it will create FS type dependency line between tasks, otherwise exits from task dependency edit mode. <br>

**|Taskbar with dependency |** If you tap the second taskbar, which has already been directly connected, it will ask to remove it. <br>

**|Removing dependency |** Once you tap the taskbar with direct dependency, then confirmation dialog will be shown for removing dependency. <br>

**Note:** In mobile device, you cannot create dependency other than FS by taskbar editing. By using cell/dialog editing, you can add all type of dependencies.

### Taskbar editing tooltip

The taskbar editing tooltip can be customized using the [TooltipSettings.Editing](#) property. The following code example shows how to customize the taskbar editing tooltip in Gantt.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName").StartDate("StartDate")
).EndDate("EndDate").Child("SubTasks").Duration("Duration").Progress("Progress")
).TooltipSettings(ts => ts.Editing("#editingTooltip")
).EditSettings(es=>es.AllowTaskbarEditing(true)).Render()

<script type="text/x-jsrender" id="editingTooltip">
 <div>Duration : ${duration}</div>
</script>
```

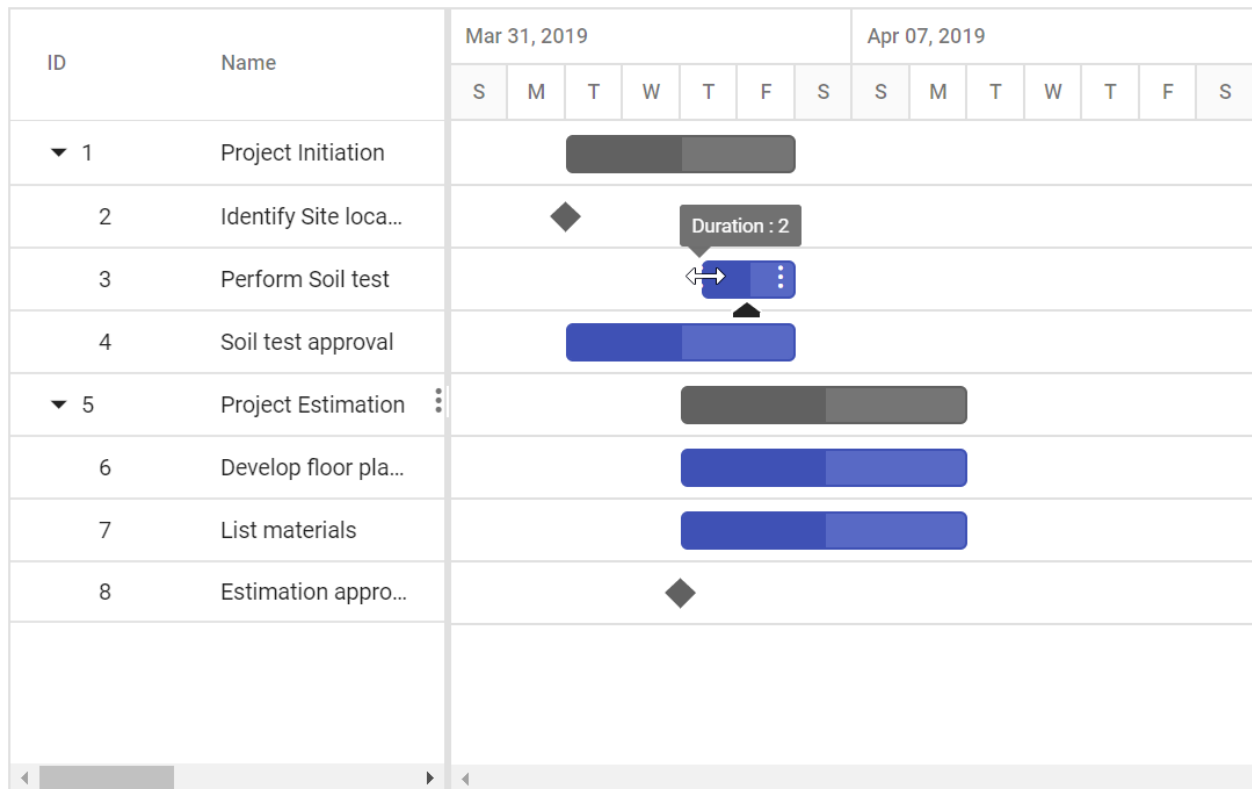

### EDITINGTEMPLATE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

```
}

```

The below screenshot shows the output of above code example.

### Scrolling in Gantt Control

The scrollbar will be displayed in the gantt when content exceeds the element [width](#) or [height](#). The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the gantt exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the grid pane size.
- The [height](#) and [width](#) are used to set the gantt height and width, respectively.

**Note:** The default value for [height](#) and [width](#) is auto.

### Set width and height

To specify the [width](#) and [height](#) of the scroller in the pixel, set the pixel value to a number.

The following code example shows how to set height and width in the Gantt control:

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").Width("600px").TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName")

```

```

).StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).EditSettings(es =>
es.AllowAdding(true).AllowEditing(true).AllowDeleting(true)
).Render()

```

### **WIDTH-HEIGHT.CS**

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.EditingData();
 return View();
}

```

Responsive with the parent container

Specify the [width](#) and [height](#) as **100%** to make the gantt element fill its parent container.

Setting the [height](#) to **100%** requires the gantt parent element to have explicit height.

The following code example shows how to set height and width in the Gantt control:

### **CSHTML**

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("100%").Width("100%").TaskFields(ts =>
ts.Id("TaskId").Name("TaskName")

).StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).EditSettings(es =>
es.AllowAdding(true).AllowEditing(true).AllowDeleting(true)
).Render()

```

### **RESPONSIVE.CS**

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.EditingData();
 return View();
}

```

Scroll To Date method

In the Gantt control, When We use the [scrollToDate](#) method, it will scroll the timeline horizontally to the date that we specified in the method's argument.

The following code examples show how the scroll To Date method works in Gantt:

### **CSHTML**

```

@Html.EJS().Button("scrollToDate").Content("Change Scroll Position").CssClass("e-primary").Render()

```

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Render()

<script>
 document.getElementById('scrollToDate').addEventListener('click',
function (args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.scrollToDate('05/20/2019');
});
</script>
```

### **SCROLLTODATE.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Set the vertical scroll position

In the Gantt control, you can set the vertical scroller position dynamically by clicking the custom button using the `setScrollTop` method.

### **CSHTML**

```
@Html.EJS().Button("setScrollTop").Content("Change Scroll
Position").CssClass("e-primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).Render()

<script>
 document.getElementById('setScrollTop').addEventListener('click',
function (args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.ganttChartModule.scrollObject.setScrollTop(300);
});
</script>
```

### **SETSCROLLTOP.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
}
```

```
return View();
}
```

## Virtual Scrolling in Gantt

Virtual Scroll support in Gantt allows you to load large amount of data without performance degradation. To enable Virtual Scrolling, you need to inject `VirtualScroll` module in Gantt.

### Row virtualization

Row virtualization allows you to load and render a large number of tasks in Gantt with effective performance. In this mode, all tasks are fetched initially from the datasource and rendered in the DOM within a compact viewport area.

The number of records displayed in the Gantt is determined by the height.

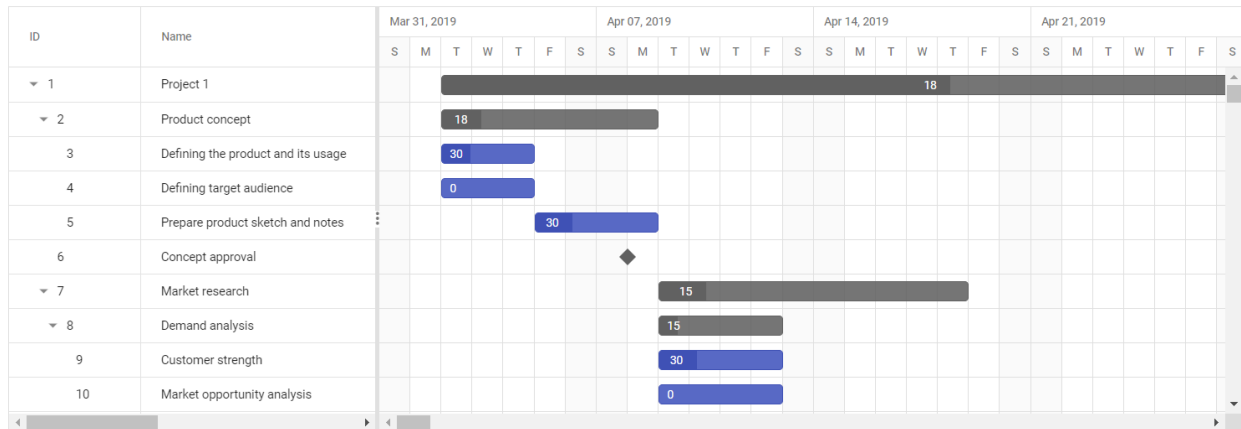

This mode can be enable by setting the `EnableVirtualization` property to `true`.

### CSHTML

```
@(Html.EJS().Gantt("VirtualScroll").DataSource((IEnumerable<object>)ViewBag.
DataSource).Height("450px").EnableVirtualization(true).HighlightWeekends(true)
.AllowSelection(true)
 .TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress")
 .Child("SubTasks").ParentID("ParentID"))
 .LabelSettings(ls=>ls.TaskLabel("Progress")).Columns(col =>
 {
 col.Field("TaskId").Width(140).Add();
 col.Field("TaskName").Width(250).Add();
 col.Field("StartDate").Add();
 col.Field("EndDate").Add();
 col.Field("Duration").Add();
 col.Field("Progress").Add();
 }).SplitterSettings(ss => ss.ColumnIndex(2))
 .Render()
)
```

### VIRTUAL-SCROLL.CS

```
public IActionResult Index()
{
 ViewBag.dataSource = GanttData.VirtualData();
 return View();
}
```

### Timeline virtualization

Timeline virtualization allows you to load a data source having large timespan with high performance. Initially, it renders the timeline with thrice the width of the gantt element, while other timeline cells render on-demand during horizontal scrolling.

This mode can be enable by setting the [EnableTimelineVirtualization](#) property to `true`.

### CSHTML

```
@(Html.EJS().Gantt("VirtualScroll").DataSource((IEnumerable<object>)ViewBag.
DataSource).Height("450px").EnableVirtualization(true).EnableTimelineVirtual
ization(true).HighlightWeekends(true).AllowSelection(true)
.TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress")
.Child("SubTasks").ParentID("ParentID"))
.LabelSettings(ls=>ls.TaskLabel("Progress")).EditSettings(es =>
es.AllowAdding(true).AllowEditing(true).AllowDeleting(true).AllowTaskbarEdit
ing(true).ShowDeleteConfirmDialog(true))
.AutoCalculateDateScheduling(false).Toolbar(new List<string>()
{ "Add", "Edit", "Update", "Delete", "Cancel", "ExpandAll", "CollapseAll",
"Indent", "Outdent" }).Columns(col =>
{
col.Field("TaskId").Width(140).Add();
col.Field("TaskName").Width(250).Add();
col.Field("StartDate").Add();
col.Field("EndDate").Add();
col.Field("Duration").Add();
col.Field("Progress").Add();
}).SplitterSettings(ss => ss.ColumnIndex(2))
.Render()
)
```

### TIMELINE-VIRTUAL-SCROLL.CS

```
public IActionResult Index()
{
 ViewBag.dataSource = GanttData.VirtualData();
 return View();
}
```

### Limitations for virtual scroll

- Due to the element height limitation in browsers, the maximum number of records loaded is limited by the browser capacity.
- Cell selection will not be persisted.
- The number of records rendered will be determined by the `Height` property.
- It is necessary to mention the height of the Gantt in pixels when enabling Virtual Scrolling.

### Resources in Syncfusion ASP.NET MVC Gantt Component

In Gantt, the resources are represented by staff, equipment and materials etc. In Gantt control you can show or allocate the resources (human resources) for each task.

#### Resource collection

The resource collection contains details about resources that are used in the project. Resources are JSON object that contains id, name, unit and group of the resources and this collection is mapped to the Gantt control using the [resources](#) property. These resource fields are mapped to the Gantt control using the [resourceFields](#) property.

|Resource fields | Description|

|----|----|

|[id](#) | This field is used to assign resources to the tasks.|

|[name](#) | This field is used to map the resource names. These names are displayed as one of Gantt columns and also can display as labels using the [labelSettings](#) property.|

|[unit](#) | It indicates the amount of work that can be done by a resource for the task in a day.|

|[group](#) | This field is used to group the resources and the tasks assigned to that particular resource into category.|

The following code snippets shows resource collection and how it assigned to Gantt control.

#### CSHTML

```
@model List<GanttSample.Controllers.GanttDataSource>
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)Model).AllowFiltering(true).AllowSorting(true).Height("450px").TaskFields(ts =>
ts.Id("TaskId")

).Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks").ResourceInfo(
 "ResourceId").LabelSettings(ls =>
ls.RightLabel("${if(ResourceId)} ${ResourceId} ${/if}")
).ResourceFields(rf =>
rf.Id("ResourceId").Name("ResourceName")).Resources((IEnumerable<object>)ViewBag.projectResources).Render()
```

#### ASSIGNRESOURCE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
}
```

```
ViewBag.projectResources = projectResources();
return View();
}
public static List<GanttResources> projectResources()
{
 List<GanttResources> GanttResourcesCollection = new
List<GanttResources>();
 GanttResources Record1 = new GanttResources()
 {
 ResourceId = 1,
 ResourceName = "Martin Tamer"
 };
 GanttResources Record2 = new GanttResources()
 {
 ResourceId = 2,
 ResourceName = "Rose Fuller"
 };
 GanttResources Record3 = new GanttResources()
 {
 ResourceId = 3,

 Progress = 50,
 ResourceId = new int[] { 2, 3, 5 },
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
```

```

 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 ResourceId = new int[] { 4 },
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 ResourceId = new int[] { 4, 8 },
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}

public class GanttResources
{
 public int ResourceId { get; set; }
 public string ResourceName { get; set; }
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
 public int[] ResourceId { get; set; }
}

```

```
}
```

### Assign resource

We can assign resources for a task at initial load, using the resource id value of the resources as a collection. This collection is mapped from the dataSource to the Gantt control using the [resourceInfo](#) property.

Resources are assigned to tasks in following ways.

#### Assign resource alone

If the unit is not specified for specific resource, the amount of work done will be consider as 100% by default. In such cases, the resource unit will not be displayed in Gantt UI.

```
`html
```

```
GanttDataSource Child1 = new GanttDataSource()
{
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 ResourceId = new int[] { 1 },
};
`
```

#### Assign resources with unit

We can assign the quantity of work done by the resources for the specific task as like below code snippet.

```
`html
```

```
GanttDataSource Record1Child1 = new GanttDataSource()
{
 TaskId = 2,
 TaskName = "Identify Site location",
 StartDate = new DateTime(2019, 03, 29),
 Duration = 2,
 Progress = 30,
 Work = 10,
 Resources = new List<ResourceModel>
{

```

```
new ResourceModel{ ResourceId = 1, Unit = 50 }
}
};
`
```

When resource unit is defined in resource collection, the amount of work done by that particular resource will be same for all the tasks.

The following code snippet shows how to assign the resource for each task and map to Gantt control.

### CSHTML

```
@ (Html.EJS().Gantt("ResourceAllocation").DataSource((IEnumerable<object>
) ViewBag.DataSource)
.TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress")
.ResourceInfo("Resources").Child("SubTasks"))
.ResourceFields(rf =>
rf.Id("ResourceId").Name("ResourceName").Unit("ResourceUnit"))
.Resources((IEnumerable<object>) ViewBag.projectResources)
.Columns(col =>
{
col.Field("TaskId").Visible(false).Add();
col.Field("TaskName").HeaderText("Task Name").Width(180).Add();
col.Field("Resources").HeaderText("Resources").Width(160).Add();
col.Field("Duration").Width(100).Add();
})
.LabelSettings(ls => ls.RightLabel("Resources"))
.Render()
)
```

### RESOURCEUNIT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication8Core.Models;
using Syncfusion.EJ2.Gantt;

{
 public int ResourceId { get; set; }
 public Nullable<int> Unit { get; set; }
}
}

```

### Add/Edit resource collection

By using cell/ dialog edit option, we can add/remove the multiple resources for a particular task.

Resource Unit can be change for a each task on resource tab in edit dialog by double click on the unit cell.

### Resource View in ASP.NET MVC Gantt Component

The resource breakdown view is used to visualize the tasks assigned to each resource in hierarchy manner. Resources are displayed as parents and all the tasks assigned to each resource are displayed as its child records. It can be initialized by setting the [viewType](#) property to `ResourceView`.

#### Resource task

A task assigned to one or more resources are termed as resource task and it is added as child task to the respective resource. Already assigned task can also be shared or moved with other resources by adding a resource name to the task or removing resource name from the task by cell or dialog editing.

**Note:** Currently there is no support for unscheduled task in Resource view Gantt.

#### CSHTML

```
@(Html.EJS().Gantt("ResourceView").DataSource((IEnumerable<object>
) ViewBag.DataSource).Height("450px").ViewType(Syncfusion.EJ2.Gantt.ViewType.
ResourceView).HighlightWeekends(true).AllowSelection(true).AllowResizing(true)
)
.TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").Work("Work").StartDate("StartDate").EndDate(
"EndDate").Duration("Duration").Progress("Progress")
.ResourceInfo("Resources").Child("SubTasks"))
.TreeColumnIndex(1).ResourceFields(rf =>
rf.Id("ResourceId").Name("ResourceName").Unit("ResourceUnit").Group("Resourc
eGroup"))
.EditSettings(es =>
es.AllowAdding(true).AllowEditing(true).AllowDeleting(true).AllowTaskbarEdit
ing(true).ShowDeleteConfirmDialog(true))
.Toolbar(new List<string>() { "Add", "Edit", "Update", "Delete",
"Cancel", "ExpandAll", "CollapseAll" })
.Resources((IEnumerable<object>) ViewBag.Resources)
```

```

 .Columns(col =>
 {
 col.Field("TaskId").Visible(false).Add();
 col.Field("TaskName").HeaderText("Name").Width(250).Add();
 col.Field("Work").HeaderText("Work").Add();
 col.Field("Progress").Add();
 col.Field("ResourceGroup").HeaderText("Group").Add();
 col.Field("StartDate").Width(100).Add();
 col.Field("Duration").Width(100).Add();
 })
 .LabelSettings(ls =>
ls.RightLabel("Resources")).SplitterSettings(sp => sp.ColumnIndex(3))
 .ProjectStartDate("03/28/2019").ProjectEndDate("05/18/2019")
 .Render()
)

```

### Resource OverAllocation

When a resource is assigned too much of work to complete within a day of resource's available time then it is called as overallocation.

The available working time of resources for completing the task in a day will be calculated based on the `dayWorkingTime` property and `resource unit`.

The range of overallocation dates can be highlighted by a square bracket. It can be enabled by setting the `showOverallocation` property as `true`. The following code example demonstrates how to hide or show the over allocation by clicking the custom button.

**Note:** By default, the `showOverAllocation` property value is `false`.

### CSHTML

```

@ {

### Unassigned task

A task not assigned to any one of the resource are termed as unassigned tasks. The unassigned tasks are grouped with a name as **Unassigned Task** and displayed at the bottom of Gantt data collection . It is validated at load time during Gantt record creation by default based on a task [resourceInfo](#) mapping property in the Gantt chart data source. If the resource is assigned to the unassigned grouped tasks, the task will be moved as child to the respective resource.

### Enable taskbar drag and drop

In Gantt, you can enable taskbar drag and drop between resources by using the [AllowTaskbarDragAndDrop](#) property. This allows you to move a taskbar from one resource to another vertically, making it easier to schedule tasks and manage resources.

**Note:** By default, the [AllowTaskbarDragAndDrop](#) property value is false.

### CSHTML

### Filtering in gantt control

Filtering allows you to view specific or related records based on filter criteria. This can be done in the Gantt control by using the filter menu support and toolbar search support. To enable filtering in the Gantt control, set the [AllowFiltering](#) to **true**. Menu filtering support can be configured using the [FilterSettings](#) property and toolbar searching can be configured using the [SearchSettings](#) property.

### Filter hierarchy modes

The Gantt supports a set of filtering modes with the [FilterSettings.HierarchyMode](#) property. The following are the types of filter hierarchy modes available in the Gantt control:

- **Parent:** This is the default filter hierarchy mode in Gantt. The filtered records are displayed with its parent records. If the filtered records do not have any parent record, then only the filtered records will be displayed.
- **Child:** Displays the filtered records with its child record. If the filtered records do not have any child record, then only the filtered records will be displayed.
- **Both:** Displays the filtered records with its both parent and child records. If the filtered records do not have any parent and child records, then only the filtered records will be displayed.
- **None:** Displays only the filtered records.

### CSHTML

```

@Html.EJS().DropDownList("FilterMode").DataSource((IEnumerable<object>)ViewBag.dropdata).Width("250px").Value("Parent").Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Text = "id", Value =
"mode" }).Change("onChange").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).AllowFiltering(true).Render()

<script>
 function onChange(e) {
 var mode = e.value;
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 ganttObj.filterSettings.hierarchyMode = mode;
 ganttObj.clearFiltering();
 }
</script>

```

**FILTERHIERARCHYMODE.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 ViewBag.dropdata = new List<object>() {
 new { id= "Parent", mode= "Parent" },
 new { id= "Child", mode= "Child" },
 new { id= "Both", mode= "Both" },
 new { id= "None", mode= "None" },
 };
 return View();
}
```

*Initial filter*

To apply the filter at initial rendering, set the filter to **predicate** object in the [FilterSettings.Columns](#) property.

**CSHTML**

```
@{
 List<object> filterColumns = new List<object>();
 filterColumns.Add(new { field = "TaskName", matchCase = false,
@operator = "startswith", predicate = "and", value = "Identify" });
 filterColumns.Add(new { field = "TaskId", matchCase = false,
@operator = "equal", predicate = "and", value = 2 });
}

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
rogress("Progress").Child("SubTasks")
).AllowFiltering(true).FilterSettings(filter =>
filter.Columns(filterColumns)).Render()
```

**INITIALFILTER.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

*Filter operators*

The filter operator for a column can be defined in the **FilterSettings.Columns.Operator** property.

The available operators and its supported data types are:

Operator	Description	Supported Types
----------	-------------	-----------------

startswith	Checks whether the value begins with the specified value.	String
------------	-----------------------------------------------------------	--------

endswith	Checks whether the value ends with the specified value.	String
----------	---------------------------------------------------------	--------

contains | Checks whether the value contains the specified value. |String

equal | Checks whether the value is equal to the specified value. |String &#124; Number &#124; Boolean &#124; Date

notequal | Checks for the values that are not equal to the specified value. |String &#124; Number &#124; Boolean &#124; Date

greaterthan | Checks whether the value is greater than the specified value. |Number &#124; Date

greaterthanorequal | Checks whether the value is greater than or equal to the specified value. |Number &#124; Date

lessthan | Checks whether the value is less than the specified value. |Number &#124; Date

lessthanorequal | Checks whether the value is less than or equal to the specified value. |Number &#124; Date

---

**Note:** By default, the `FilterSettings.Columns.Operator` value is `equal`

---

### *Diacritics*

By default, the Gantt control ignores the diacritic characters while filtering. To include diacritic characters, set the [FilterSettings.IgnoreAccent](#) to true.

In the following sample, type **Perform** in the **TaskName** column to filter diacritic characters.

### **CSHTML**

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).AllowFiltering(
 true).FilterSettings(filter =>
 filter.IgnoreAccent(true)).Render()
```

### **DIACRITICSFILTER.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
```

```

 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 ResourceId = new int[] { 1 },
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 ResourceId = new int[] { 2, 3, 5 },
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 ResourceId = new int[] { 4 },
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 ResourceId = new int[] { 4, 8 },
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);

```

```

 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
 }

 public class GanttDataSource
 {
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
 public int[] ResourceId { get; set; }
 }

```

### Filtering a specific column by method

You can filter the columns dynamically by using the `filterByColumn` method.

#### CSHTML

```

@Html.EJS().Button("filter").Content("Filter TaskName column").CssClass("e-
primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSourc
e).Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress").Child("SubTasks")
).AllowFiltering(true).Render()

<script>
 document.getElementById('filter').addEventListener('click', function
(args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.filterByColumn('TaskName', 'startswith', 'Iden');
 });
</script>

```

#### FILTERBYCOLUMN.CS

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

### Clear filtered columns

You can clear all the filtering condition done in the Gantt control by using the `clearFiltering` method. The following code snippet explains the above behaviour.

### CSHTML

```
@Html.EJS().Button("clearFilter").Content("Clear Filter").CssClass("e-primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
).AllowFiltering(true).Render()

<script>
 document.getElementById('clearFilter').addEventListener('click',
function (args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.clearFiltering();
});
</script>
```

### CLEARFILTER.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

## Sorting in ASP.NET MVC Gantt Chart Component

Sorting enables you to sort data in the ascending or descending order. To sort a column, click the column header.

To sort multiple columns, press and hold the CTRL key and click the column header. You can clear sorting of any one of the multi-sorted columns by pressing and holding the SHIFT key and clicking the specific column header.

To enable sorting in the Gantt control, set the [AllowSorting](#) property to true. Sorting options can be configured through the [SortSettings](#) property.

### CSHTML

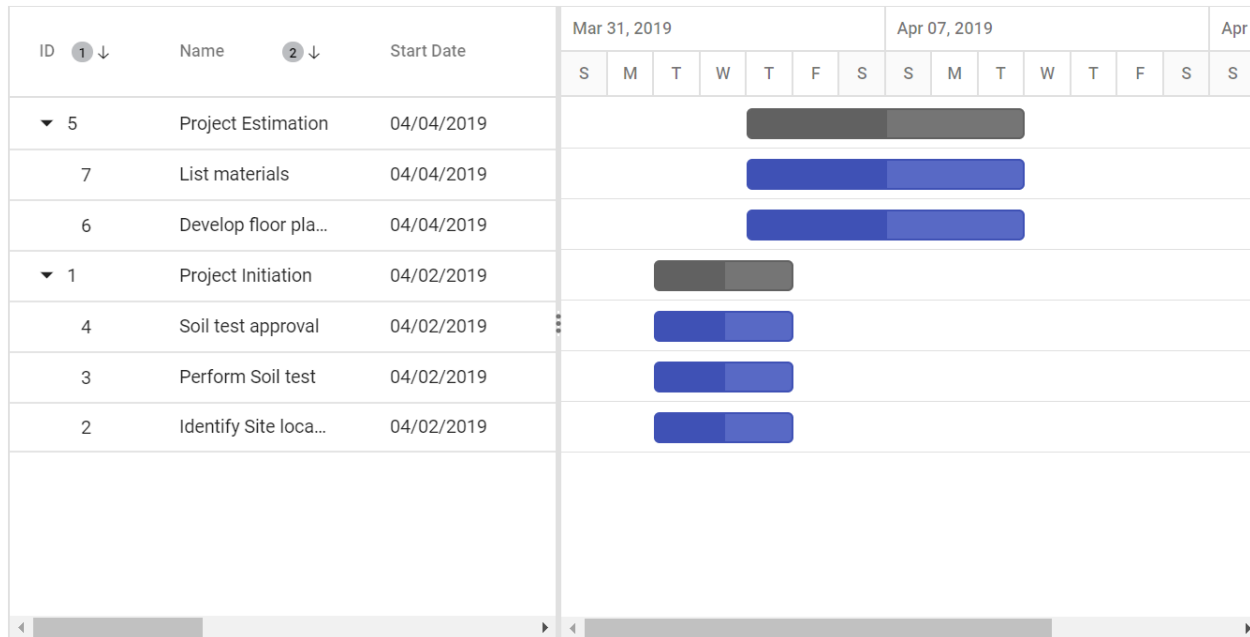

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).TaskFields(ts => ts.Id("TaskId").Name("TaskName"

).StartDate("StartDate").EndDate("EndDate").Child("SubTasks")).AllowSorting(
true).Render()
```

### ENABLESORTING.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

The following screenshot shows the output of multicolumn sorting in Gantt control.

**Note:** \* Gantt columns are sorted in the ascending order. If you click the already sorted column, the sort direction toggles.

\* To disable sorting for a particular column, set the [Columns.AllowSorting](#) property to false.

#### Sorting column on Gantt initialization

The Gantt control can be rendered with sorted columns initially, and this can be achieved by using the [SortSettings](#) property. You can add columns that are sorted initially in the [SortSettings.Columns](#) collection defined with [Field](#) and [Direction](#) properties. The following code example shows how to add the sorted column to Gantt initialization.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Height("450px").AllowSorting(true).SortSettings(ss=>
 ss.Columns(col=>
 {col.Field("TaskId").Direction(Syncfusion.EJ2.Gantt.SortDirection.Descending)
 }.Add();

 col.Field("TaskName").Direction(Syncfusion.EJ2.Gantt.SortDirection.Ascending)
 }.Add();
)))
 .TaskFields(ts =>
 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
 .Child("SubTasks").Render()
```

#### INITIALSORT.CS

```
public IActionResult Index()
{
```

```
ViewBag.DataSource = GanttData.ProjectNewData();
return View();
}
```

### Sorting column dynamically

Columns in the Gantt control can be sorted dynamically using the `sortColumn` method. The following code example demonstrates how to invoke the `sortColumn` method by clicking the custom button.

#### CSHTML

```
@Html.EJS().Button("Sort").Content("Sort TaskId Column").CssClass("e-
primary").Render()

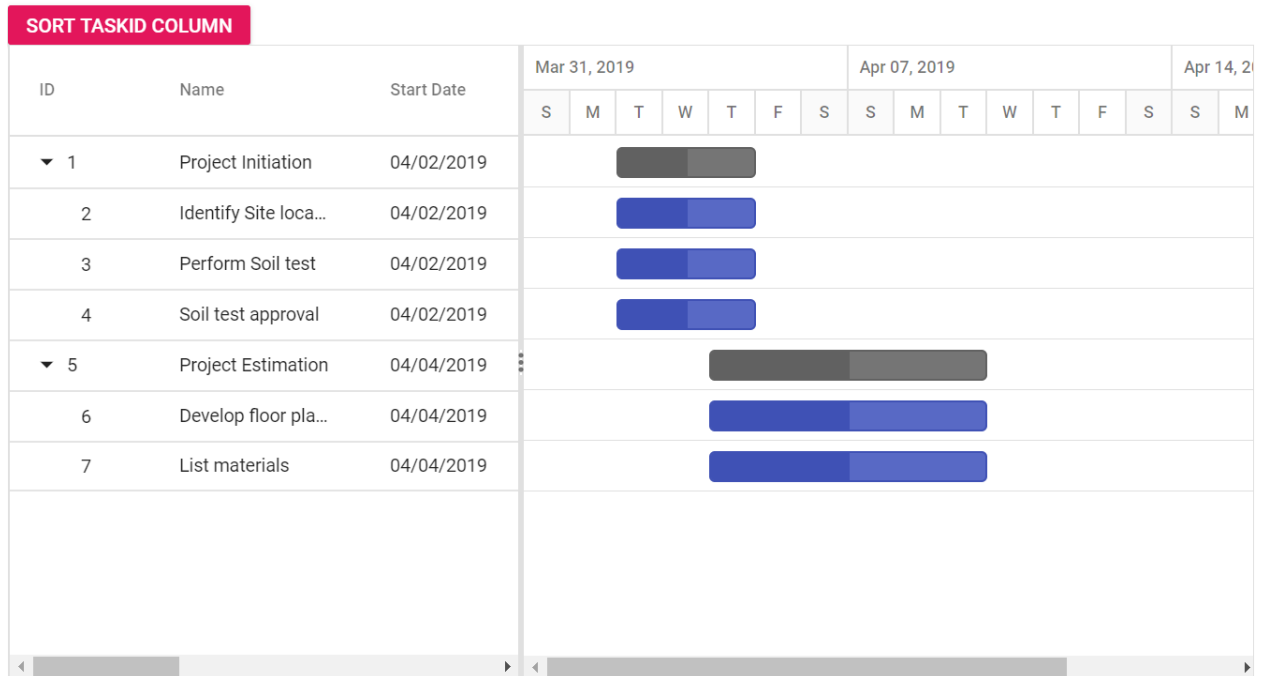

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.TaskFields(ts => ts.Id("TaskId").Name("TaskName"

).StartDate("StartDate").EndDate("EndDate").Child("SubTasks")).AllowSorting(
true).Render()

 <script>
 document.getElementById('Sort').addEventListener('click', function
(args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.sortModule.sortColumn('TaskId', "Descending", false)
 });
 </script>
```

#### DYNAMICSORT.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

Before Sorting

After Sorting

[Clear all the sorted columns dynamically](#)

In the Gantt control, you can clear all the sorted columns and return to previous position using the `clearSorting` public method. The following code snippet shows how to clear all the sorted columns by clicking the custom button.

### CSHTML

```

 @Html.EJS().Button("clearSort").Content("Clear Sorting").CssClass("e-
 primary").Render()

 @Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSourc
 e).TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate(
 "StartDate").EndDate("EndDate").Child("SubTasks")).AllowSorting(true).Render
 ()

 <script>
 document.getElementById('clearSort').addEventListener('click',
 function (args) {
 var ganttObj =
 document.getElementById('Gantt').ej2_instances[0];
 ganttObj.clearSorting();
 });
 </script>

```

### **CLEARSORTING.CS**

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

### Sorting events

During the sort action, the Gantt control triggers two events. The [ActionBegin](#) event triggers before the sort action starts, and the [ActionComplete](#) event triggers after the sort action is completed.

### **CSHTML**

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSourc
e).TaskFields(ts => ts.Id("TaskId").Name("TaskName"
).StartDate("StartDate").EndDate("EndDate").Child("SubTasks")).ActionBegin("
actionHandler").ActionComplete("actionHandler"
).AllowSorting(true).Render()

<script>
 function actionHandler(args) {
 alert(args.requestType + ' ' + args.type);
 }
</script>

```

### **EVENTHANDLERS.CS**

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

**Note:** The `args.requestType` is the current action name. For example, for sorting the `args.requestType`, value is **sorting**.

### Sorting custom columns

In Gantt, you can sort custom columns of different types like string, numeric, etc., By adding the custom column in the column collection, you can perform initial sort using the `sortSettings` or you can also sort the column dynamically by a button click.

The following code snippets explains how to achieve this.

#### CSHTML

```
@Html.EJS().Button("Sort").Content("Sort Custom Column").CssClass("e-
primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSourc
e).TaskFields(ts => ts.Id("TaskId").Name("TaskName"
).StartDate("StartDate").EndDate("EndDate").Progress("Progress").Child("SubT
asks")).AllowSorting(true).Columns(col =>
{
 col.Field("TaskId").Width(150).Add();
 col.Field("TaskName").HeaderText("Job
Name").Width(250).Add();
 col.Field("StartDate").HeaderText("Star
tDate").Width(250).Add();
 col.Field("EndDate").HeaderText("End
Date").Width(250).Add();

 col.Field("Progress").HeaderText("Progress").Width(250).Add();
 col.Field("CustomColumn").HeaderText("Custom
Column").Width(250).Add();
}).Render()

<script>
 document.getElementById('Sort').addEventListener('click', function
(args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.sortModule.sortColumn('CustomColumn', "Ascending",
false)
 });
</script>
```

#### CUSTOMCOLUMNS.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}

public static List<GanttDataSource> ganttData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
```

```
GanttDataSource Record1 = new GanttDataSource()
{
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
};
GanttDataSource Child1 = new GanttDataSource()
{
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
 CustomColumn= 2
};
GanttDataSource Child2 = new GanttDataSource()
{
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 CustomColumn= 3
};
GanttDataSource Child3 = new GanttDataSource()
{
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50,
 CustomColumn= 1
};
Record1.SubTasks.Add(Child1);
Record1.SubTasks.Add(Child2);
Record1.SubTasks.Add(Child3);
GanttDataSource Record2 = new GanttDataSource()
{
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
};
GanttDataSource Child4 = new GanttDataSource()
{
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70,
 CustomColumn= 5
};
GanttDataSource Child5 = new GanttDataSource()
{
```

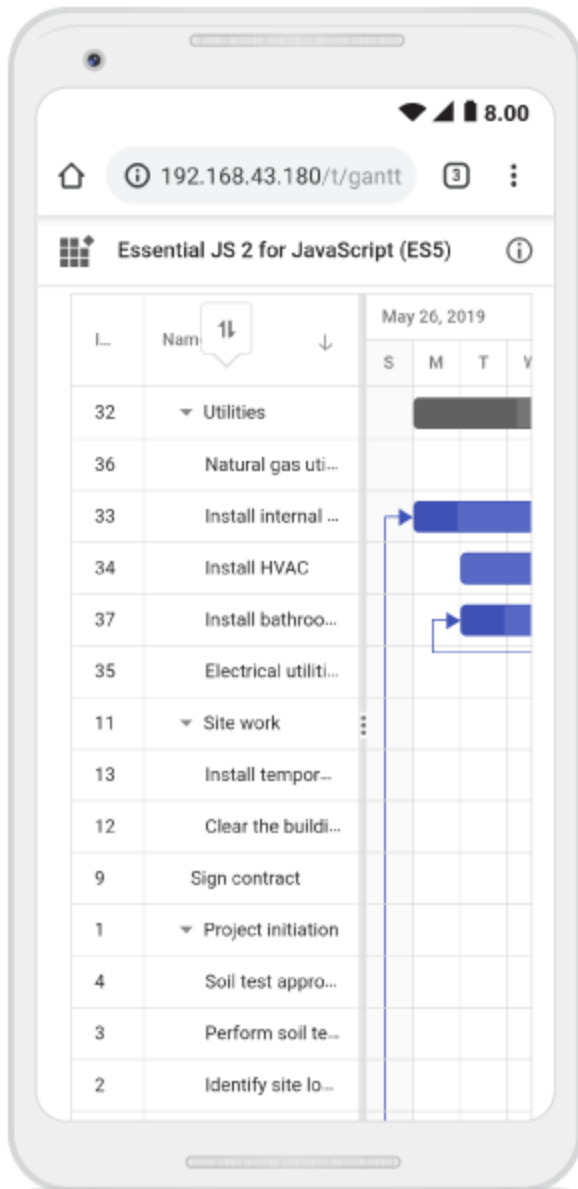

```
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50,
 CustomColumn= 4
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public int CustomColumn { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}
```

### Touch interaction

To perform **tap** action on a column header, trigger [sorting](#) operation to the selected column. A popup is displayed for multi-column sorting. To sort multiple columns, tap the popup, and then tap the desired column headers.

The following screenshot shows Gantt touch sorting,

## Selection

Selection provides an option to highlight a row or a cell. It can be done using arrow keys or by scrolling down the mouse. To disable selection in the Gantt control, set the [AllowSelection](#) to false.

The Gantt control supports two types of selection that can be set by using the [SelectionSettings.Type](#) property. They are:

- **Single:** Sets a single value by default and allows only selection of a single row or a cell.
- **Multiple:** Allows you to select multiple rows or cells. To perform the multi-selection, press and hold the CTRL key and click the desired rows or cells.

### Selection mode

The Gantt control supports three types of selection modes that can be set by using the [SelectionSettings.Mode](#). They are:

- **Row**: Allows you to select only rows, and the row value is set by default.
- **Cell**: Allows you to select only cells.
- **Both**: Allows you to select rows and cells at the same time.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts =>

 ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")

).SelectionSettings(ss=>ss.Mode(Syncfusion.EJ2.Grids.SelectionMode.Both)).Render()
```

### BOTHTYPE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Toggle selection

The toggle selection allows you to select and deselect a specific row or cell. To enable toggle selection, set the **enableToggle** property of the selectionSettings to **true**. If you click the selected row or cell, then it will be deselected and vice versa. By default, the **enableToggle** property is set to **false**.

### CSHTML

```
@Html.EJS().Button("toggle").Content("Disable Toggle").CssClass("e-primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").AllowSelection(true).SelectionSettings(ss =>

 ss.Type(Syncfusion.EJ2.Grids.SelectionType.Multiple).EnableToggle(true)).TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate(

"StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).Render()

 <script>
 document.getElementById('toggle').addEventListener('click', function
 (args) {
 var ganttObj =
 document.getElementById('Gantt').ej2_instances[0];
 ganttObj.selectionSettings.enableToggle = false;
 });
 </script>
```

```
});
</script>
```

### TOGGLESELECTION.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Clear selection

You can clear the selected cells and selected rows by using a method called `clearSelection`. The following code example demonstrates how to clear the selected rows in Gantt Chart.

### CSHTML

```
@Html.EJS().Button("selectRows").Content("Select Rows").CssClass("e-
primary").Render()
@Html.EJS().Button("clearSelection").Content("Clear
Selection").CssClass("e-primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSourc
e).Height("450px").AllowSelection(true).SelectionSettings(ss =>
 ss.Type(Syncfusion.EJ2.Grids.SelectionType.Multiple)).TaskFields(ts
=> ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate(
"EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).Rend
er()

<script>
 document.getElementById('selectRows').addEventListener('click',
function (args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.selectionModule.selectRows([1, 2, 3]); // passing the
record index as array collection
 });
 document.getElementById('clearSelection').addEventListener('click',
function (args) {
 var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
 ganttObj.clearSelection(); // Clear the selected rows
 });
</script>
```

### CLEARSELECTION.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Get selected row indexes and records

You can get the selected row indexes by using the [getSelectedRowIndexes](#) method. And by using [getSelectedRecords](#) method, you can get the selected record details.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id(
 "TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration(
 "Duration").Progress("Progress").Child("SubTasks")
).SelectionSettings(ss=>ss.Mode(Syncfusion.EJ2.Grids.SelectionMode.Row).Type(
 Syncfusion.EJ2.Grids.SelectionType.Multiple)).RowSelected("rowSelected").Render()

<script>
 function rowSelected(args) {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 var selectedrowindex =
ganttObj.selectionModule.getSelectedRowIndexes(); // get the selected row
indexes.
 alert(selectedrowindex); // to alert the selected row indexes.
 var selectedrecords =
ganttObj.selectionModule.getSelectedRecords(); // get the selected records.
 console.log(selectedrecords); // to print the selected records
in console window.
 }
</script>
```

#### GETSELECTEDROWINDEX.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Multiple selection based on condition

You can select multiple rows based on condition by using the [selectRows](#) method.

In the following code, the rows which contains **TaskId** value as 3 and 4 are selected at initial rendering.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id(
 "TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration(
 "Duration").Progress("Progress").Child("SubTasks")
).SelectionSettings(ss=>ss.Mode(Syncfusion.EJ2.Grids.SelectionMode.Row).Type(
 Syncfusion.EJ2.Grids.SelectionType.Multiple)).DataBound("dataBound").Render()

<script>
 function dataBound(args) {
```

```
var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
var rowIndexes = [];
ganttObj.treeGrid.grid.dataSource.forEach((data, index) => {
 if (data.TaskId === 3 || data.TaskId === 4) {
 rowIndexes.push(index);
 }
});
ganttObj.selectionModule.selectRows(rowIndexes);
}
</script>
```

### **CONDITIONALSELECTION.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

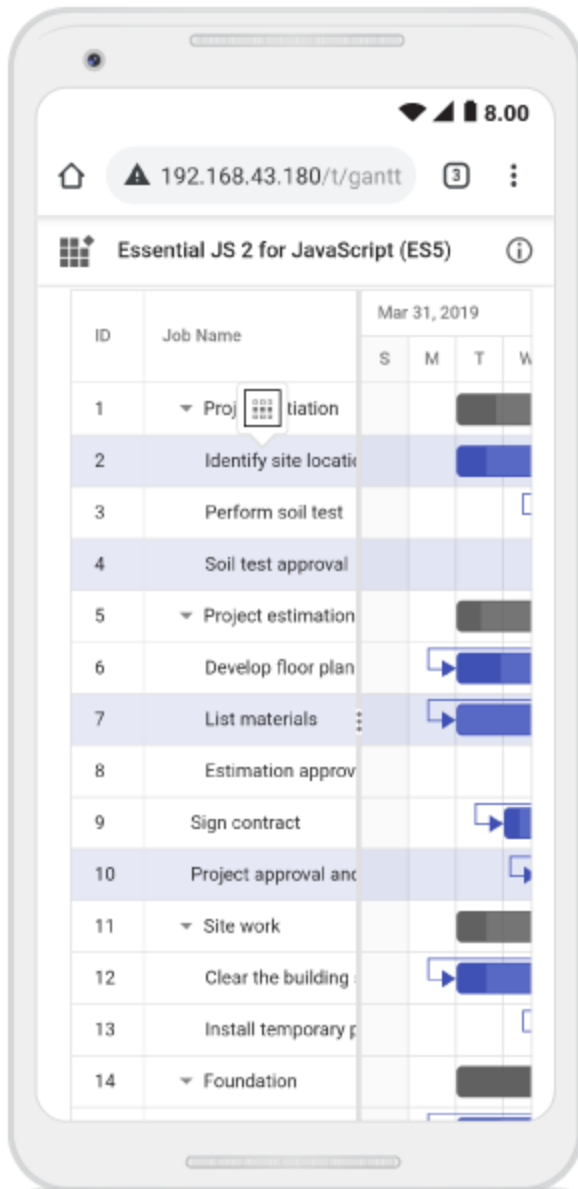

![Alt text](images/conditionalSelection.png)

#### Touch interaction

When you **tap** gantt row, tapped row will be selected.

[Single selection](#) : To select a single row or cell, perform **single tap** on it.

[Multiple selection](#) : To perform multiple selection, **tap** on the multiple selection popup, and then tap the desired rows or cells.

See Also

- [Touch interaction](#)

### Rows in ASP.NET MVC Gantt Component

Row represents a task information from the data source, and it is possible to perform the following actions in Gantt rows.

#### Row height

It is possible to change the height of the row in Gantt by setting row height in pixels to the [RowHeight](#) property. The following code example explains how to change the row height in Gantt at load time.

#### **CSHTML**

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").RowHeight(60).TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).Render()
```

### ROWHEIGHT.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Expand/Collapse row

In Gantt parent tasks are expanded/collapsed by using expand/collapse icons, expand all/collapse all toolbar items and by using public methods. By default all tasks in Gantt was rendered in expanded state but we can change this status in Gantt.

### Collapse all tasks at gantt chart load

All tasks available in Gantt was rendered in collapsed state by setting [CollapseAllParentTasks](#) property as **true**. The following code example shows how to use this property.

### CSHTML

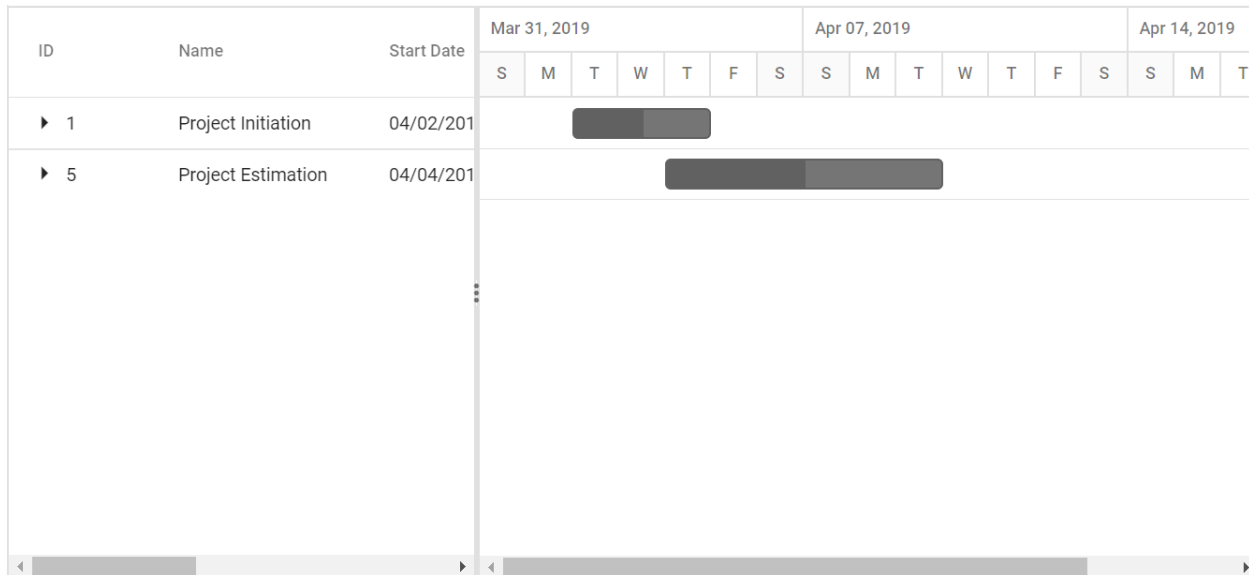

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").CollapseAllParentTasks(true).TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")
```

```
).Render();
```

### ENABLECOLLAPSEALL.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

#### Define expand/collapse status of tasks

In Gantt, we can render some tasks in collapsed state and some tasks in expanded state, this can be done by defining expand status of the task in data source. This value was mapped to Gantt control by using [ExpandState](#) property. The following code example shows how to use this property.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
.StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
.Child("SubTasks").ExpandState("isExpand")).Render()
```

### EXPANDSTATE.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ProjectNewData();
 return View();
}

public static List<GanttDataSource> ProjectNewData()
```

```
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project Initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 isExpand = true
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify Site location",
 StartDate = new DateTime(2019, 04, 02),
 Progress = 50,
 Duration = 3
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform Soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 3,
 Progress = 50,
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Progress = 50,
 Duration = 3,
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project Estimation",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 0,
 Progress = 50,
 SubTasks = new List<GanttDataSource>(),
 isExpand = false
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 4,
```

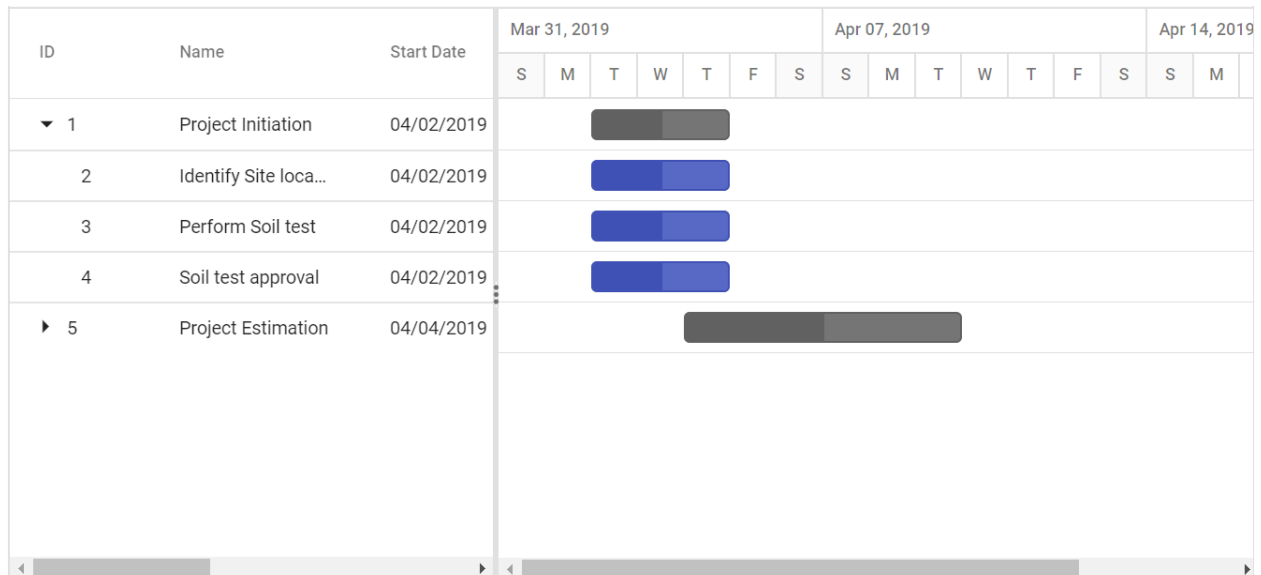

```

 Progress = 50,
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 4,
 Progress = 50,

 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public bool isExpand { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

#### Customize expand/collapse action

On expand action [Expanding](#) and [Expanded](#) event will be triggered with current expanding row's information. Similarly on collapse action [Collapsing](#) and [Collapsed](#) event will be triggered. Using this events and it's arguments we can customize the expand/collapse action. The following code example

shows how to prevent the particular row from expand/collapse action using [Expanding](#) and [Collapsing](#) event.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").Collapsing("collapsing").Expanding(
 "expanding").TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress(
 "Progress").Child("SubTasks")).Render()

<script>
 function collapsing(args) {
 if (args.data.TaskId == 1) // we can't collapse Task Id 1
 args.cancel = true;
 }
 function expanding(args) {
 if (args.data.TaskId == 5) // we can't expand Task Id 5
 args.cancel = true;
 }
</script>
```

#### EXPANDCOLLAPSEEVENT.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

#### Customize rows

You can customize the appearance of a row in grid side, by using the [rowDataBound](#) event and in chart side by using [queryTaskbarInfo](#) event.

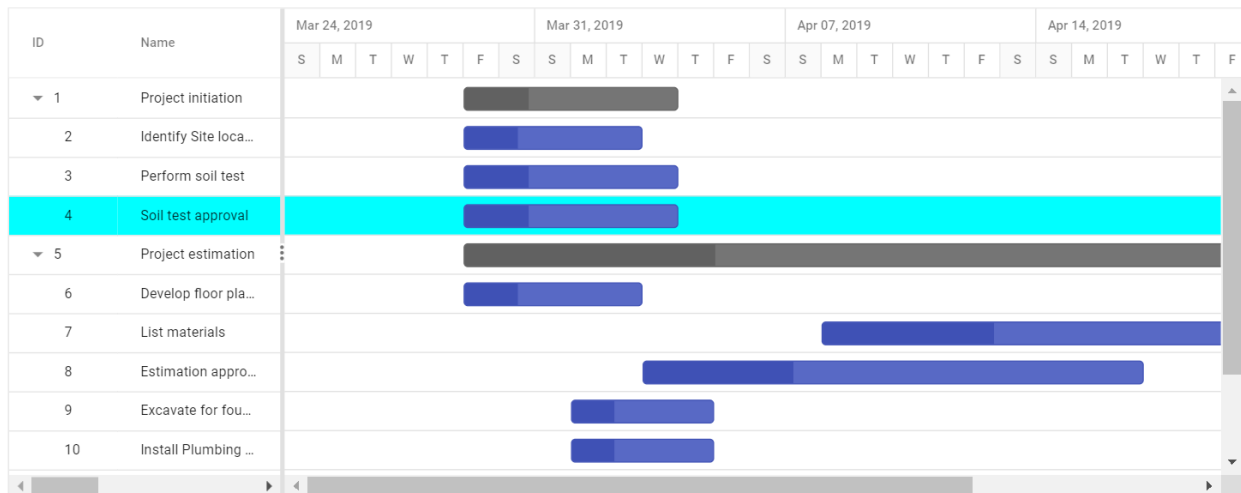

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).QueryTaskbarInfo(
 "queryTaskbarInfo").RowDataBound("rowDataBound").Render()

<script>
 function rowDataBound(args) {
 if (args.data['TaskId'] == 4) {
 args.row.style.background = 'cyan';
 }
 }
 function queryTaskbarInfo(args) {
 if (args.data['TaskId'] == 4) {
 args.rowElement.style.background = 'cyan';
 }
 }
</script>
```

**CUSTOMIZEROWS.CS**

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

**Styling alternate rows**

You can change the background colour of alternative rows in Gantt chart, by overriding the class as shown below.

```
`css
.e-altrow, tr.e-chart-row:nth-child(even) {
background-color: #f2f2f2;
}
```

**CSHTML**

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

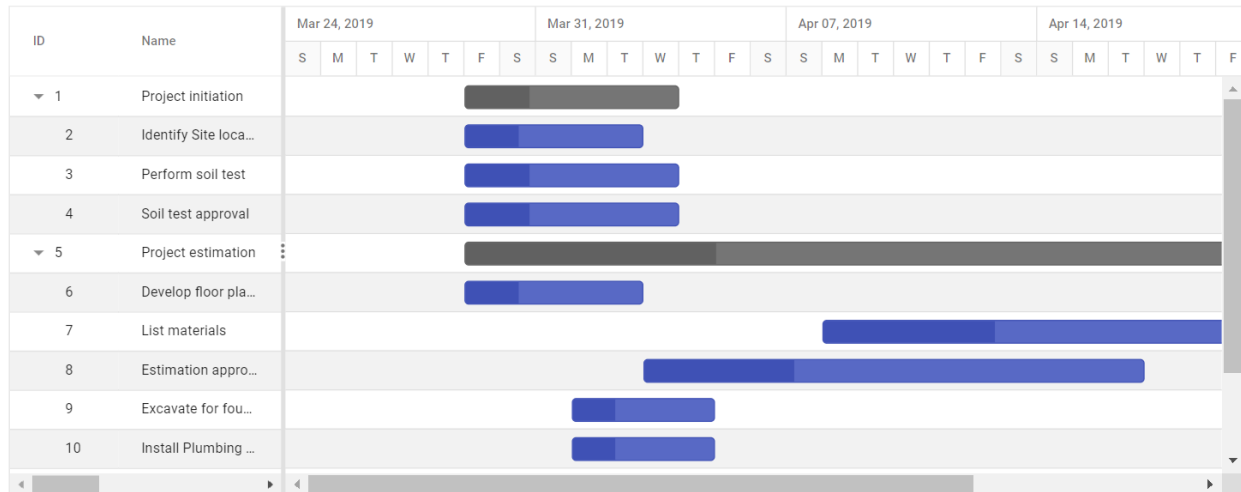

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).Render()

<style>
 .e-altrow, tr.e-chart-row:nth-child(even) {
 background-color: #f2f2f2;
 }
</style>
```

**STYLEALTERNATEROWS.CS**

```
public IActionResult Index()
```

```
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Row spanning

Gantt chart has an option to span row cells. You can achieve this using [rowSpan](#) attribute to span cells in the [QueryCellInfo](#) event.

In the following demo, **Soil test approval** cell is spanned to two rows in the **TaskName** column.

### CSHTML

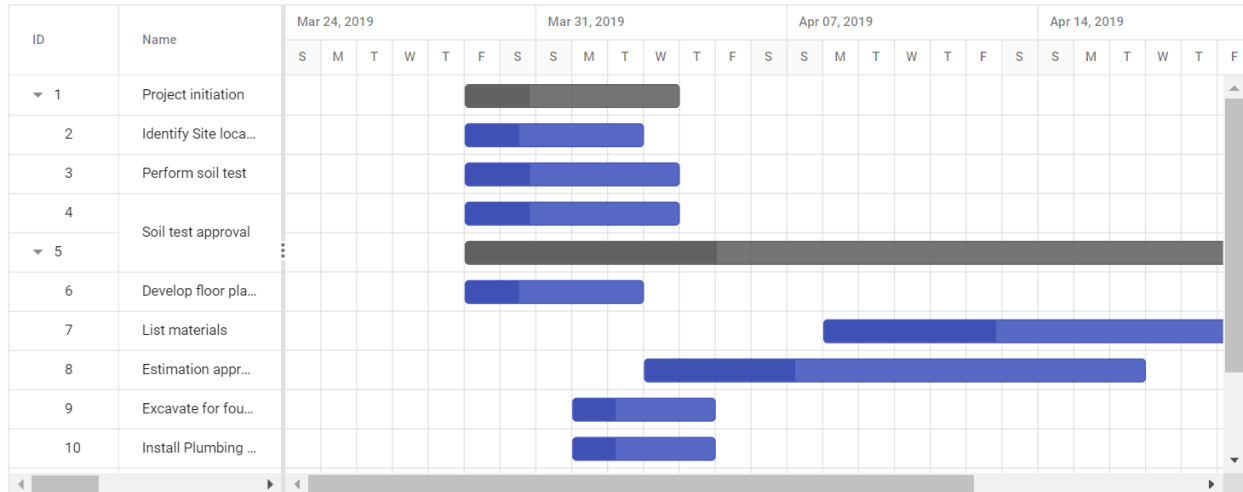

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks").GridLines(
Syncfusion.EJ2.Gantt.GridLine.Both).QueryCellInfo("queryCellInfo").Render()

<script>
 function queryCellInfo(args) {
 if (args.data['TaskId'] == 4 && args.column.field ===
'TaskName') {
 args.rowSpan = 2;
 }
 }
</script>
```

### ROWSPANNING.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Customize rows and cells

While rendering the TreeGrid part in Gantt, the [RowDataBound](#) and [QueryCellInfo](#) events trigger for every row and cell. Using these events, you can customize the rows and cells. The following code example shows how to customize the cell and row elements using these events.

#### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").QueryCellInfo("queryCellInfo").RowDataBound("rowDataBound").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks")).Render()

<script>
function queryCellInfo(args) {
 if (args.column.field == "Progress") {
 if (args.data.Progress < 60)
 args.cell.style.backgroundColor = "lightgreen"
 else
 args.cell.style.backgroundColor = "yellow"
 }
}
function rowDataBound(args) {
 if (args.data.TaskId == 4)
 args.row.style.backgroundColor = "red"
}
</script>
```

#### CUSTOMIZEROW.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = ganttData();
 return View();
}
public static List<GanttDataSource> ganttData()
{
 }
```

```
List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
GanttDataSource Record1 = new GanttDataSource()
{
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
};
GanttDataSource Child1 = new GanttDataSource()
{
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 70,
};
GanttDataSource Child2 = new GanttDataSource()
{
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
};
GanttDataSource Child3 = new GanttDataSource()
{
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 50
};
Record1.SubTasks.Add(Child1);
Record1.SubTasks.Add(Child2);
Record1.SubTasks.Add(Child3);
GanttDataSource Record2 = new GanttDataSource()
{
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>()
};
GanttDataSource Child4 = new GanttDataSource()
{
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70
};
GanttDataSource Child5 = new GanttDataSource()
{
 TaskId = 7,
 TaskName = "List materials",
```

```

 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 50
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

ID	Name	Progress	Start Date	Mar 31, 2019							Apr 07, 2019			
				S	M	T	W	T	F	S	S	M	T	V
▼ 1	Project initiation	56	04/02/2019											
2	Identify site locat...	70	04/02/2019											
3	Perform soil test	50	04/02/2019											
4	Soil test approval	50	04/02/2019											
▼ 5	Project estimation	60	04/04/2019											
6	Develop floor pla...	70	04/04/2019											
7	List materials	50	04/04/2019											

### Clip mode

The clip mode provides options to display its overflow cell content and it can be defined by the [Columns.ClipMode](#) property.

The following are three types of **ClipMode**:

- **Clip**: Truncates the cell content when it overflows its area.
- **Ellipsis**: Displays ellipsis when content of the cell overflows its area.
- **EllipsisWithTooltip**: Displays ellipsis when content of the cell overflows its area; it displays the tooltip content when hover over ellipsis.

**Note:** By default, all the column's [ClipMode](#) property is defined as `EllipsisWithTooltip`.

### Cell tooltip

You can enable or disable the Grid cell tooltip using the [Columns.ClipMode](#) property.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
.StartDate("StartDate").Duration("Duration").Progress("Progress")
.Child("SubTasks")).Columns(col =>
{
 col.Field("TaskId").Add();

 col.Field("TaskName").Width(100).ClipMode(Syncfusion.EJ2.Grids.ClipMode.EllipsisWithTooltip).Add();
 col.Field("StartDate").Add();

 col.Field("Duration").ClipMode(Syncfusion.EJ2.Grids.ClipMode.Clip).Add();
 col.Field("Progress").Add();
}).Render()
```

### GRIDCELLTOOLTIP.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

## Export

### Excel Export in gantt control

Gantt supports client-side exporting, which allows you to export its data to the Excel and CSV formats.

Use the `excelExport` and `csvExport` methods for exporting. To enable Excel export in the Gantt, set the [AllowExcelExport](#) to true.

### CSHTML

```
@(Html.EJS().Gantt("GanttContainer").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowExcelExport(true).TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate")
.Duration("Duration").Progress("Progress").Child("SubTasks")).Toolbar(new List<string>() {
 "ExcelExport", "CsvExport"
}).ToolbarClick("toolbarClick").Render())
<script>
 function toolbarClick(args) {
 var ganttObj =
document.getElementById("GanttContainer").ej2_instances[0];
 if (args.item.id === "GanttContainer_excelexport") {
 ganttObj.excelExport();
 }
 else if (args.item.id === "GanttContainer_csvexport") {

```

```
 ganttObj.csvExport();
 }
}
</script>
```

## EXCELEXPORT.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = FirstData();
 return View();
}
public static List<GanttDataSource> FirstData()
{
 List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
 GanttDataSource Record1 = new GanttDataSource()
 {
 TaskId = 1,
 TaskName = "Project initiation",
 StartDate = new DateTime(2019, 04, 02),
 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child1 = new GanttDataSource()
 {
 TaskId = 2,
 TaskName = "Identify site location",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 90
 };
 GanttDataSource Child2 = new GanttDataSource()
 {
 TaskId = 3,
 TaskName = "Perform soil test",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 40
 };
 GanttDataSource Child3 = new GanttDataSource()
 {
 TaskId = 4,
 TaskName = "Soil test approval",
 StartDate = new DateTime(2019, 04, 02),
 Duration = 4,
 Progress = 10
 };
 Record1.SubTasks.Add(Child1);
 Record1.SubTasks.Add(Child2);
 Record1.SubTasks.Add(Child3);
 GanttDataSource Record2 = new GanttDataSource()
 {
 TaskId = 5,
 TaskName = "Project estimation",
 StartDate = new DateTime(2019, 04, 02),
```

```

 EndDate = new DateTime(2019, 04, 21),
 SubTasks = new List<GanttDataSource>(),
 };
 GanttDataSource Child4 = new GanttDataSource()
 {
 TaskId = 6,
 TaskName = "Develop floor plan for estimation",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 85
 };
 GanttDataSource Child5 = new GanttDataSource()
 {
 TaskId = 7,
 TaskName = "List materials",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 15
 };
 GanttDataSource Child6 = new GanttDataSource()
 {
 TaskId = 8,
 TaskName = "Estimation approval",
 StartDate = new DateTime(2019, 04, 04),
 Duration = 3,
 Progress = 70
 };
 Record2.SubTasks.Add(Child4);
 Record2.SubTasks.Add(Child5);
 Record2.SubTasks.Add(Child6);
 GanttDataSourceCollection.Add(Record1);
 GanttDataSourceCollection.Add(Record2);
 return GanttDataSourceCollection;
}

public class GanttDataSource
{
 public int TaskId { get; set; }
 public string TaskName { get; set; }
 public DateTime StartDate { get; set; }
 public DateTime EndDate { get; set; }
 public int? Duration { get; set; }
 public int Progress { get; set; }
 public List<GanttDataSource> SubTasks { get; set; }
}

```

## Export

### PDF Export

PDF export allows exporting Gantt data to PDF document. You need to use the `pdfExport` method for exporting. To enable PDF export in the Gantt, set the [allowPdfExport](#) to true.

To export data to PDF document, inject the `PdfExport` module in Gantt.

---

**Note:** Currently, we don't have support for exporting the manually scheduled tasks.

---

### CSHTML

```
@using Syncfusion.EJ2
@{
 ViewBag.Title = "DefaultFunctionalities";
}
<div class="container body-content">

@(Html.EJS().Gantt("GanttContainer").DataSource((IEnumerable<object>)ViewBag
.DataSource).AllowPdfExport(true).TaskFields(ts => ts.Id(
"TaskId").Name("TaskName").StartDate("StartDate").Duration("Duration").Progr
ess("Progress").Child("SubTasks")).Toolbar(new List<string>() {
 "PdfExport" }).ToolbarClick("toolbarClick").Render())
<script>
 function toolbarClick(args) {
 var ganttObj =
document.getElementById("GanttContainer").ej2_instances[0];
 if (args.item.id === "GanttContainer_pdfexport") {
 ganttObj.pdfExport();
 }
 }
</script>
</div>
```

### PDFEXPORT.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}
```

### Indicators in PDF exporting

The PDF export functionality allows users to export Gantt charts enriched with dynamic indicators and accompanying images.

These indicators, represented by images, can be effortlessly defined using the `base64` encoding value in the data object of datasource. This data object field should be mapped to indicator property of [task fields](#).

### CSHTML

```
@using Syncfusion.EJ2
@{
 ViewBag.Title = "DefaultFunctionalities";
}
<div class="container body-content">

@(Html.EJS().Gantt("GanttContainer").DataSource((IEnumerable<object>)ViewBag
.DataSource).AllowPdfExport(true).TaskFields(ts => ts.Id(
"TaskId").Name("TaskName").StartDate("StartDate").Duration("Duration").Progr
ess("Progress").Child("SubTasks")).Toolbar(new List<string>() {
 "PdfExport"
})).ToolbarClick("toolbarClick").Indicators("indicators").Render())
<script>
```

```
function toolbarClick(args) {
 var ganttObj =
document.getElementById("GanttContainer").ej2_instances[0];
 if (args.item.id === "GanttContainer_pdfexport") {
 ganttObj.pdfExport();
 }
}
</script>
</div>
```

**PDFEXPORT.CS**

### Exporting Gantt data as a blob object

In Gantt, you can export the Gantt chart data as a blob object, which allows you to preview or modify the data before exporting it.

To export the Gantt chart data as a blob object, follow these steps:

step 1: pdfExport fourth argument set as `true`.

step 2: Then , `pdfExpComplete` return as blob object.

### CSHTML

```

@(Html.EJS().Gantt("GanttContainer").DataSource((IEnumerable<object>)ViewBag
.DataSource).AllowPdfExport(true).AllowExcelExport(true).TaskFields(ts =>
ts.Id(

"TaskId").Name("TaskName").StartDate("StartDate").Duration("Duration").Progr
ess("Progress").Child("SubTasks").Toolbar(new List<string>() {
"PdfExport", "ExcelExport"
}).ToolbarClick("toolbarClick").PdfExportComplete("pdfExpComplete").ExcelExp
ortComplete("excelExpComplete").TreeColumnIndex(1).Render())
<script>
 function toolbarClick(args) {
 var ganttObj =
document.getElementById("GanttContainer").ej2_instances[0];
 if (args.item.id === "GanttContainer_pdfexport") {
 ganttObj.pdfExport(null, null, null, true);
 }
 }

```

```

 if (args.item.id === "GanttContainer_excelexport") {
 ganttObj.excelExport(null, null, null, true);
 }
 }
 let excelExpComplete = (args) => {
 //This event will be triggered when excel exporting.
 args.promise.then((e) => {
 //In this `then` function, we can get blob data through the
 arguments after promise resolved.
 exportBlob(e.blobData);
 });
 };
 let pdfExpComplete = (args) => {
 //This event will be triggered when pdf exporting.
 args.promise.then((e) => {
 //In this `then` function, we can get blob data through the
 arguments after promise resolved.
 exportBlob(e.blobData);
 });
 };
 let exportBlob = (blob) => {
 let a = document.createElement('a');
 document.body.appendChild(a);
 a.style.display = 'none';
 let urlg = window.URL.createObjectURL(blob);
 a.href = url;
 a.download = 'Export';
 a.click();
 window.URL.revokeObjectURL(url);
 document.body.removeChild(a);
 }
</script>

```

### **BLOB-DATA.CS**

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.ProjectNewData();
 return View();
}

```

#### *Single page exporting in gantt*

In Gantt, we have provided support to export the Gantt component where each rows are auto-fit to the PDF document page width by setting `IsFitToWidth` as true in `FitToWidthSettings` of `PdfExportProperties`.

Also, we can customize the chart width and grid width in exported file using `ChartWidth` and `GridWidth` by defining it as percentage in string.

### **CSHTML**

```

@using Syncfusion.EJ2
@{
 ViewBag.Title = "DefaultFunctionalities";
}

```

```

<div class="container body-content">

@ (Html.EJS () .Gantt ("GanttContainer") .DataSource ((IEnumerable<object>) ViewBag
.DataSource) .AllowPdfExport (true) .TaskFields (ts => ts.Id (

"TaskId") .Name ("TaskName") .StartDate ("StartDate") .Duration ("Duration") .Progr
ess ("Progress") .Child ("SubTasks") .Toolbar (new List<string> () {
 "PdfExport" }) .ToolBarClick ("toolbarClick") .Render ())

<script>
 function toolbarClick (args) {
 var ganttObj =
document.getElementById ("GanttContainer") .ej2_instances [0];
 if (args.item.id === "GanttContainer_pdfexport") {
 var exportProperties = {
 fitToWidthSettings: {
 isFitToWidth: true,
 }
 };
 ganttObj.pdfExport (exportProperties);
 }
 }
</script>
</div>

```

### **SINGLE-PAGE-EXPORT.CS**

```

public IActionResult Index ()
{
 ViewBag.DataSource = GanttData.ProjectNewData ();
 return View ();
}

```

#### *Exporting with column template*

The PDF export functionality allows to export Grid columns that include images, hyperlinks, and custom text to an PDF document using [pdfQueryCellInfo](#) event.

In the following sample, the hyperlinks and images are exported to PDF using [hyperlink](#) and [image](#) properties in the [pdfQueryCellInfo](#) event.

Note: PDF Export supports base64 string to export the images.

### **CHTML**

```

@Html.EJS () .Gantt ("Gantt") .DataSource ((IEnumerable<object>) ViewBag.DataSource
e) .AllowPdfExport (true) .Height ("450px") .TaskFields (ts
=>

ts.Id ("TaskId") .Name ("TaskName") .StartDate ("StartDate") .EndDate ("EndDate") .D
uration ("Duration") .Progress ("Progress") .Child (
 "SubTasks") .Toolbar (new List<string> () {
 "PdfExport"
 }) .ToolBarClick ("toolbarClick") .PdfQueryCellInfo ("pdfQueryCellInfo") .Resourc
eInfo ("ResourceId") .ResourceFields (rf =>
 rf.Id ("ResourceId") .Name ("ResourceName") .Resources ((
 IEnumerable<object>) ViewBag.projectResources) .Columns (col =>
 {

```

```

 col.Field("TaskId").HeaderText("Task ID").Width(250).Add();
 col.Field("TaskName").HeaderText("Task Name").Width(250).Add();

col.Field("ResourceId").HeaderText("Resources").Template("#columnTemplate").
Add();

 col.Field("StartDate").Add();
 col.Field("Duration").Add();
 col.Field("Progress").Add();
 }).Render()
</script>
 function toolbarClick(args) {
 var ganttObj =
document.getElementById("GanttContainer").ej2_instances[0];
 if (args.item.id === "GanttContainer_pdfexport") {
 ganttObj.pdfExport();
 }
 }
 function pdfQueryCellInfo(args) {
 if (args.column.headerText === 'Resources') {
 {
 args.image = { height: 40, width: 40,
base64: (args).data.taskData.resourcesImage };
 }
 }
 }
</script>
<script type="text/x-jsrender" id="columnTemplate">
 ${if(ganttProperties.resourceNames)}
 <div class="image">
 <div
style="display:inline-block;width:100%;position:relative;left:30px;top:-
14px">${ganttProperties.resourceNames}</div>
 </div>
 ${/if}
</script>

```

### Context menu in ASP.NET MVC Gantt component

The Gantt control allows you to perform quick actions by using context menu. When right-clicking the context menu, the context menu options are shown. To enable this feature, set the

`enableContextMenu` to true. The default context menu options are enabled using the `editSettings` property. The context menu options can be customized using the `contextMenuItems` property.

The default items are listed in the following table.

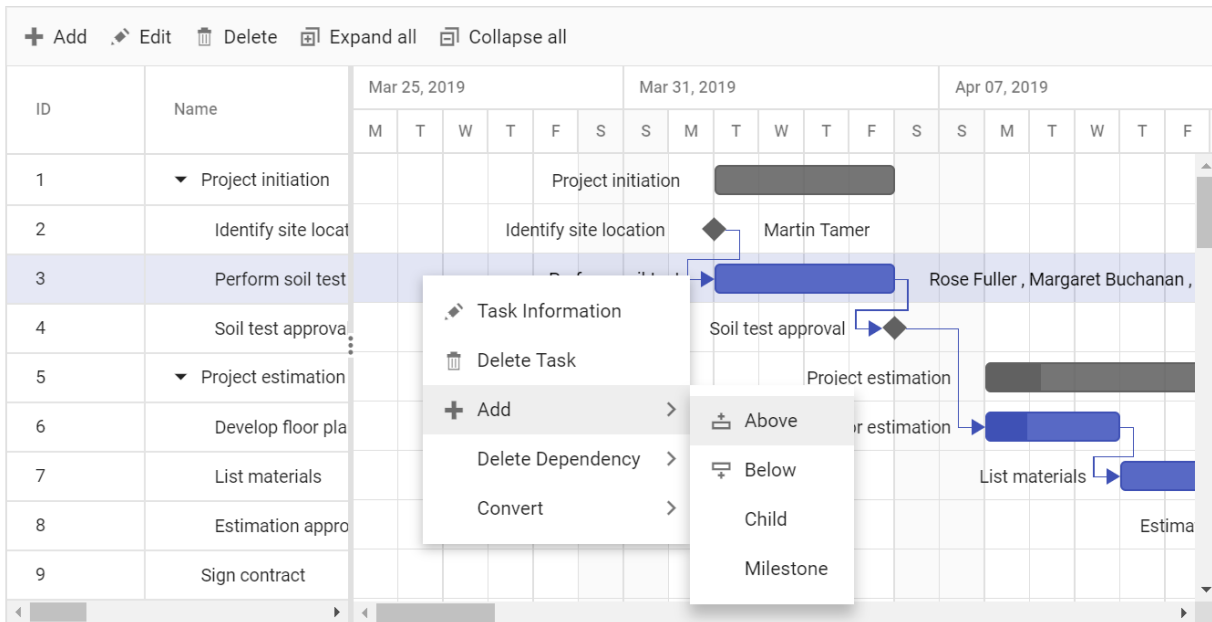

Items	Description
----	----
<code>AutoFit</code>	Auto-fits the current column.
<code>AutoFitAll</code>	Auto-fits all columns.
<code>SortAscending</code>	Sorts the current column in ascending order.
<code>SortDescending</code>	Sorts the current column in descending order.
<code>TaskInformation</code>	Edits the current task.
<code>Add</code>	Adds a new row to the Gantt.
<code>Indent</code>	Indent the selected record to one level.
<code>Outdent</code>	Outdent the selected record to one level.
<code>DeleteTask</code>	Deletes the current task.
<code>Save</code>	Saves the edited task.
<code>Cancel</code>	Cancel the edited task.
<code>DeleteDependency</code>	Deletes the current dependency task link.
<code>Convert</code>	Converts current task to milestone or vice-versa.

### CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
 "TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
 rogress("Progress").Dependency("Predecessor").Child("SubTasks")
).EnableContextMenu(true).AllowSorting(true).AllowResizing(true).EditSetting
 s(es => es.AllowAdding(true).AllowEditing(
 true).AllowDeleting(true)).Render()
```

### CONTEXTMENU.CS

```
public IActionResult Index()
{
 ViewBag.DataSource = GanttData.EditingData();
 return View();
}
```

### Custom context menu items

The custom context menu items can be added by defining the [contextMenuItems](#) as a collection of [\[contextMenuItemModel\]](#). Actions for the customized items can be defined in the [contextMenuClick](#) event and the visibility of customized items can be defined in the [\[contextMenuOpen\]](#) event.

To create custom context menu items for header area, define the target property as [.e-gridheader](#).

The following sample shows context menu item for parent rows to expand or collapse child rows in the content area and a context menu item to hide columns in the header area.

### CSHTML

```
@{
 List<object> contextItems = new List<object> { "AutoFitAll",
 "AutoFit", "TaskInformation", "DeleteTask", "Save", "Cancel",
 "SortAscending", "SortDescending", "Add", "DeleteDependency",
 "Convert" };
 contextItems.Add(new { text = "Collapse the Row", target = ".e-
content", id = "collapserow" });
 contextItems.Add(new { text = "Expand the Row", target = ".e-
content", id = "expandrow" });
 contextItems.Add(new { text = "Hide Column", target = ".e-
gridheader", id = "hidecols" });
}

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSourc
e).Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName"

).StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("P
rogress").Dependency("Predecessor").Child("SubTasks")

).EnableContextMenu(true).AllowSorting(true).AllowResizing(true).EditSetting
s(es => es.AllowAdding(true).AllowEditing(true).AllowDeleting(true))
```

```

).ContextMenuItems(contextItems).ContextMenuOpen("ContextMenuOpen").ContextM
enuClick("ContextMenuClick").Render()
<script>
 function ContextMenuOpen(args) {
 var record = args.rowData;
 if (args.type !== 'Header') {
 if (!record.hasChildRecords) {
 args.hideItems.push("Collapse the Row");
 args.hideItems.push("Expand the Row");
 } else {
 if (record.expanded) {
 args.hideItems.push("Expand the Row");
 } else {
 args.hideItems.push("Collapse the Row");
 }
 }
 }
 }

 function ContextMenuClick(args) {
 var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
 var record = args.rowData;
 if (args.item.id === 'collapserow') {
 ganttObj.collapseByID(Number(record.ganttProperties.taskId));
 }
 if (args.item.id === 'expandrow') {
 ganttObj.expandByID(Number(record.ganttProperties.taskId));
 }
 if (args.item.id === 'hidecols') {
 ganttObj.hideColumn(args.column.headerText);
 }
 }
}
</script>

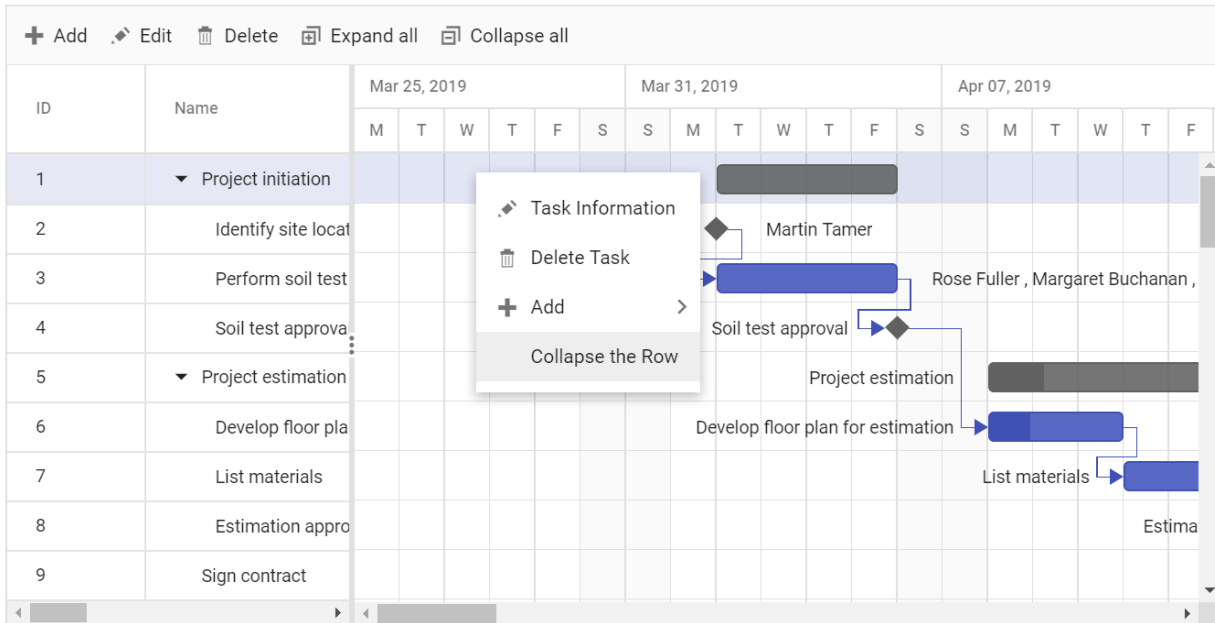

```

### **CUSTOMCONTEXTMENU.CS**

```

public IActionResult Index()
{
 ViewBag.DataSource = GanttData.EditingData();
 return View();
}

```

**Note:** You can show an specific item in context menu for header/content area in the Gantt control by defining the `target` property.

### Touch interaction

To perform **long press** action on a row, [context menu](#) is opened, and then tap a menu item to trigger its action.

### State Persistence Feature

State persistence refers to the Gantt's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores gantt's model object in the local storage when the [enablePersistence](#) is defined as true.

### Get or set localStorage value

If the [enablePersistence](#) property is set to true, the gantt property value is saved in the **window.localStorage** for reference. You can get/set the localStorage value by using the `getItem/setItem` method in the **window.localStorage**.

``typescript`

`//get the Gantt model.`

`var value = window.localStorage.getItem('ganttGantt'); // "ganttGantt" is component name + component id.`

`var model = JSON.parse(model);`

```

``typescript`

`//set the Gantt model.`

window.localStorage.setItem('ganttgantt', JSON.stringify(model)); //"ganttgantt" is component name + component id.

Prevent columns from persisting

When the [EnablePersistence](#) property is set to true, the Gantt properties such as [Filtering](#), [Sorting](#), and [Columns](#) will persist. You can use the `addOnPersist` method to prevent these Gantt properties from persisting.

The following example demonstrates how to prevent Gantt columns from persisting. In the [DataBound](#) event of the Gantt, you can override the `addOnPersist` method and remove the columns from the key list given for persistence.

Note: When the [EnablePersistence](#) property is set to true, the Gantt properties such as column template, column formatter, header text, and value accessor will not persist.

CSHTML

```
@Html.EJS().Button("add").Content("Add Columns").IsPrimary(true).Render()
@Html.EJS().Button("remove").Content("Remove Columns").IsPrimary(true).Render()
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).DataBound("onBound").EnablePersistence(true).Columns(col =>
{
    col.Field("TaskID").HeaderText("Task ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("TaskName").HeaderText("Task Name").Width("170").Add();
    col.Field("StartDate").HeaderText("Start Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Duration").HeaderText("Duration").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).Render()
<script>
    function onBound(args) {
        var cloned = this.addOnPersist;
        this.addOnPersist = function (key) {
            key = key.filter(item => item !== "columns");
            return cloned.call(this, key);
        };
    }
    document.getElementById('add').onclick = function () {
        var obj = { field: "Progress", headerText: 'Progress', width: 100 };
        document.getElementById('Gantt').ej2_instances[0].columns.push(obj);
        //you can add the columns by using the Grid columns method

        document.getElementById('Gantt').ej2_instances[0].treeGrid.refreshColumns();
    }
    document.getElementById('remove').onclick = function () {
        document.getElementById('Gantt').ej2_instances[0].columns.pop();

        document.getElementById('Gantt').ej2_instances[0].treeGrid.refreshColumns();
    }
</script>
```

COLUMN-PREVENT.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = GanttData.EditingData();
    return View();
}
```

Persist the header template and header Text

By default, the Gantt properties such as column template, header text, header template, column formatter, and value accessor will not persist when [EnablePersistence](#) is set to true. Because the column template and header text can be customized at the application level.

If you wish to restore all these column properties, then you can achieve it by cloning the gantt's columns property using JavaScript Object's assign method and storing this along with the persist data manually. While restoring the settings, this column object must be assigned to the gantt's columns property to restore the column settings as demonstrated in the following sample.

CSHTML

```
@Html.EJS().Button("restore").Content("Restore").IsPrimary(true).Render()
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.dataSource).EnablePersistence(true).Columns(col =>
{
    col.Field("TaskID").HeaderText("Task ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("TaskName").HeaderText("Task Name").Width("170").HeaderTemplate("#customertemplate").Add();
    col.Field("StartDate").HeaderText("Start Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Duration").HeaderText("Duration").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).Render()
<script>
document.getElementById('restore').onclick = function () {
    var savedProperties =
JSON.parse(document.getElementById('Gantt').ej2_instances[0].getPersistData());
    var gridColumnState = Object.assign([],
document.getElementById('Gantt').ej2_instances[0].gantColumns);
    savedProperties.columns.forEach(function (col) {
        var headerText = gridColumnState.find(function (colColumnsState) {
return colColumnsState.field === col.field; })['headerText'];
        var colTemplate = gridColumnState.find(function (colColumnsState) {
return colColumnsState.field === col.field; })['template'];
        var headerTemplate = gridColumnState.find(function
(colColumnsState) { return colColumnsState.field === col.field;
})['headerTemplate'];
        col.headerText = 'Text Changed';
        col.template = colTemplate;
        col.headerTemplate = headerTemplate;
    });
};
```

```

        console.log(savedProperties);

document.getElementById('Gantt').ej2_instances[0].TreeGrid.setProperties(savedProperties);
}
</script>

<script id="customertemplate" type="text/x-template">
    <span class="e-icons e-header" ></span>
    Task Name
</script>

<style>

    return View();
}

```

Accessibility

The Gantt component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Gantt component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

```
| Mobile Device Support |  |  
  
| Keyboard Navigation Support |  |  
  
| Accessibility Checker Validation |  |  
  
| Axe-core Accessibility Validation |   
  
|  
  
<style>  
.post .post-content img {  
display: inline-block;  
margin: 0.5em 0;  
}  
</style>  
  
<div> - All  
features of the component meet the requirement.</div>  
  
<div> - Some features of the component do not meet the requirement.</div>  
  
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Gantt component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Gantt component:

The following ARIA attributes are used in Gantt:

- | Attributes | Purpose |
|---------------------|--|
| grid (role) | This attribute is added to the e-table element present in the Gantt, which represents Grid part |
| gridcell (role) | This attribute is added to the td elements present within the e-table, which represents the work cells of Gantt |
| columnheader (role) | This attribute is added to the th elements within the e-table, which represents the header cells of Grid table |
| separator (role) | This attribute is added to the e-split-bar element, which represents the splitter between the Grid table and Chart |
| dialog (role) | This attribute is added to the e-dialog element, which represents the pop-up dialog |

| **toolbar (role)** | This attribute is added to the **e-gantt-toolbar** element, which represents the toolbars of Gantt |

| **aria-label** | It indicates the element's information
 It is assigned to the Gantt UI elements such as timeline cell, taskbar, left label, right label, dependency line, and event markers. |

| **aria-selected** | This attribute is assigned to the Gantt chart row, and it defaults to **false**. The value is changed to **true** when the user selects a grid cell or task |

| **aria-expanded** | This attribute is assigned to the Gantt chart parent task row. The value is changed to **true** when the user clicks a parent taskbar to expand. After the user clicked a parent taskbar to collapse, the attribute value is changed to **false** |

| **aria-grabbed** | This attribute is assigned to the taskbars of Gantt when the user tries to achieve taskbar editing |

Keyboard navigation

The Gantt component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Gantt component.

| **Press** | **To do this** |

| --- | --- |

| **Home** | Selects the first row. |

| **End** | Selects the last row. |

| **DownArrow** | Moves the cell focus/row or cell selection downward. |

| **UpArrow** | Moves the cell focus/row or cell selection upward. |

| **LeftArrow** | Moves the cell focus/row or cell selection left side. |

| **RightArrow** | Moves the cell focus/row or cell selection right side. |

| **Ctrl + Up Arrow** | Collapses all tasks. |

| **Ctrl + Down Arrow** | Expands all tasks. |

| **Ctrl + Shift + Up Arrow** | Collapses the selected row. |

| **Ctrl + Shift + Down Arrow** | Expands the selected row. |

| **Enter** | Saves request. |

| **Esc** | Cancels request. |

| **Insert** | Adds a new row. |

| **Ctrl + Insert** | Opens addRowDialog. |

| **Ctrl + F2** | Opens editRowDialog. |

| **Delete** | Deletes the selected row. |

| **Shift + F5** | FocusTask |

- | Ctrl + Shift + F | Focus search |
- | Shift + DownArrow | Extends the row/cell selection downwards. |
- | Shift + UpArrow | Extends the row/cell selection upwards. |
- | Shift + LeftArrow | Extends the cell selection to the left side. |
- | Shift + RightArrow | Extends the cell selection to the right side. |
- | Tab / Shift + Tab | To focus the close icon in the message. |
- | Alt + j | Focus Gantt component. |

Ensuring accessibility

The Gantt component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Gantt component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Gantt component with accessibility tools.

Globalization in Gantt control

Localization

The [Localization](#) library allows you to localize default text content of the Gantt. The Gantt component has static text on some features (like toolbar area text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the Gantt.

- | Locale key words | Text |
- | ----- | ----- |
- | emptyRecord | No records to display |
- | id | ID |
- | name | Name |
- | startDate | Start Date |
- | endDate | End Date |
- | duration | Duration |
- | progress | Progress |
- | dependency | Dependency |
- | notes | Notes |
- | baselineStartDate | Baseline Start Date |
- | baselineEndDate | Baseline End Date |
- | type | Type |

offset	Offset
resourceName	Resources
resourceID	Resource ID
day	day
hour	hour
minute	minute
days	days
hours	hours
minutes	minutes
generalTab	General
customTab	Custom Columns
writeNotes	Write Notes
addDialogTitle	New Task
editDialogTitle	Task Information
add	Add
edit	Edit
update	Update
delete	Delete
cancel	Cancel
search	Search
task	task
tasks	tasks
zoomIn	Zoom in
zoomOut	Zoom out
zoomToFit	Zoom to fit

Loading translations

To load translation object in an application use [load](#) function of [L10n](#) class.

The below example demonstrates the Gantt in **Deutsch** culture.

CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
    .Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
    "TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
    rogress("Progress").Child("SubTasks").Locale("de-DE").Render()

<script>
    ej.base.L10n.load({
        'de-DE': {
            'gantt': {
                "id": "Ich würde",
                "name": "Name",
                "startDate": "Anfangsdatum",
                "duration": "Dauer",
                "progress": "Fortschritt",
            }
        }
    });
```

```
</script>
```

LOCALE.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}
```

Internationalization

The [Internationalization](#) library is used to globalize number, date, and time values in gantt component.

CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
    ).Child("SubTasks").Locale("de-DE").Render()

<script>
    ej.base.L10n.load({
        'de-DE': {
            'gantt': {
                'id': "Ich würde",
                'name': "Name",
                'startDate': "Anfangsdatum",
                'duration': "Dauer",
                'progress': "Fortschritt",
            }
        }
    });

    loadCultureFiles('de-DE');
    function loadCultureFiles(name) {
        var files = ['ca-gregorian.json', 'numbers.json'];
        var loader = ej.base.loadCldr;
        var loadCulture = function (prop) {
            var val, ajax;
            if (files[prop] === 'numberingSystems.json') {
                ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-data/supplemental/' + files[prop], 'GET', false);
            } else {
                ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
            }
            ajax.onSuccess = function (value) {
                val = value;
            };
            ajax.send();
            loader(JSON.parse(val));
        };
        for (var prop = 0; prop < files.length; prop++) {
```

```

        loadCulture(prop);
    }
}
</script>

```

INTERNATIONALIZATION.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}

```

Note: * In the above sample, **Timeline** is formatted by **NumberFormatOptions** and **DateFormatOptions**.

 * By default, [locale](#) value is **en-US**. If you want to change **en-US** culture, then set the [locale](#).

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Gantt component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Urdu, etc.). To enable RTL Gantt, set the [EnableRtl](#) to true.

CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").Toolbar(new List<string>()
{ "CollapseAll", "ExpandAll" }).TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
).Child("SubTasks").Locale("ar-AE").EnableRtl(true).Render()
<script>
    ej.base.L10n.load({
        'ar-AE': {
            "gantt": {
                "emptyRecord": "لا سجلات لعرضها",
                "id": "هوية شخصية",
                "name": "اسم",
                "startDate": "تاريخ البدء",
                "endDate": "تاريخ الانتهاء",
                "duration": "المدة الزمنية",
                "progress": "تقدم",

Styling

To modify the Gantt Chart appearance, you need to override the default CSS of gantt chart. Find the list of CSS classes and its corresponding section in Gantt Chart. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

|Section | CSS Class | Purpose of Class|

|-----|-----|-----|

|**Root**|e-gantt|This class is in the root element (div) of the gantt chart control.|

|**Header**|e-gridheader|This class is added in the root element of header element. In this class, You can override thin line between header and content of the gantt chart.|

|e-table|This class is added at 'table' of the gantt chart header. This CSS class makes table width as 100 %.|

|e-columnheader|This class is added at 'tr' of the gantt chart header.|

|**Grid Content**|e-gridcontent|This class is added at root of body content. This is to override background color of the body.|

|e-table|This class is added to table of content. This CSS class makes table width as 100 %.|

|e=row|This class is added to rows of gantt chart.|

|e-altrow|This class is added to alternate rows of gantt chart. This is to override alternate row color of the gantt chart.|

|e-rowcell|This class is added to all cells in the gantt chart. This is to override cells appearance and styling.|

|**Chart Content**|e-gantt-chart|This class is added to the chart side of the gantt chart.|

|e-chart-row|This class is added to rows of gantt chart.|

|**Timeline**|e-timeline-header-container|This class is added to timeline of the gantt chart.|

|e-header-cell-label|This class is added to the header cell of the timeline.|

|e-weekend-header-cell|This class is added to the weekend cells.|

|**Taskbar**|e-taskbar-main-container|This class is added to taskbar of the gantt chart.|

|e-gantt-parent-taskbar|This class is added to the parent task bar of the gantt chart.|

|e-gantt-milestone|This class is added to the milestone tasks of the gantt chart.|

|e-gantt-unscheduled-taskbar|This class is added to the unscheduled tasks.|

|e-gantt-manualparenttaskbar|This class is added to the manual scheduled parent taskbar.|

|e-gantt-child-manualtaskbar|This class is added to the manual scheduled child taskbar.|

|e-gantt-unscheduled-manualtask|This class is added to the manual unscheduled tasks.|

|**Splitter**|e-split-bar|This class is added to the gantt chart splitter.|

|e-resize-handler|This class is added to the resize handler of the gantt chart splitter.|

|e-arrow-left| This class is added to the left arrow of the resize handler. |

|e-arrow=right| This class is added to the right arrow of the resize handler. |

|Connector Lines|e-line| This class is added to the connector lines. |

|e-connector-line-right-arrow| This class is added to the right arrow of the connector line. |

|e-connector-line-left-arrow| This class is added to the left arrow of the connector line. |

|Labels|e-task-label| This class is added to the task labels. |

|e-right-label-container| This class is added to the right label. |

|e-left-label-container| This class is added to the left label. |

|Event Markers|e-event-markers| This class is added to the event markers. |

|Baseline|e-baseline-bar| This class is added to the baseline. |

|e-baseline-gantt-milestone-container| This class is added to the baseline of milestone tasks. |

|Tooltip|e-gantt-tooltip| This class is added to the tooltip. |

Grid lines

In the Gantt control, you can show or hide the grid lines in the TreeGrid side and chart side by using the [GridLines](#) property.

The following options are available in the Gantt control for rendering the grid lines:

- **Horizontal:** The horizontal grid lines alone will be visible.
- **Vertical:** The vertical grid lines alone will be visible.
- **Both:** Both the horizontal and vertical grid lines will be visible on the TreeGrid and chart sides.
- **None:** Gridlines will not be visible on TreeGrid and chart sides.

Note: By default, the [GridLines](#) property is set to Horizontal type.

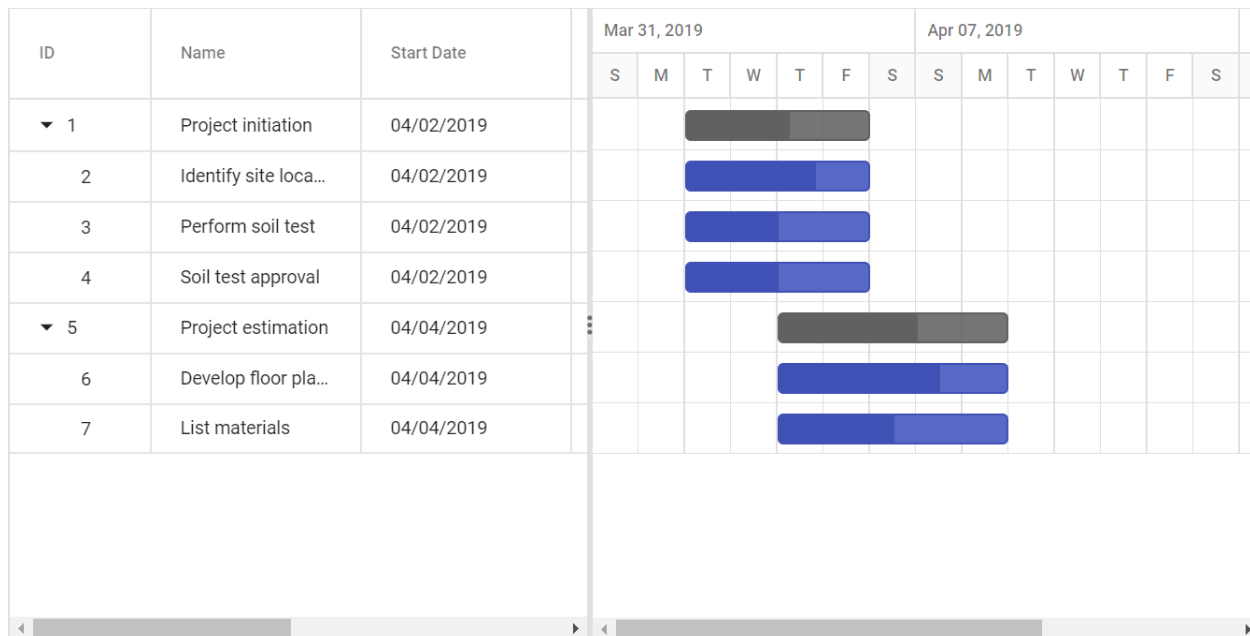

The following code example shows how to change the gridlines rendering mode in the Gantt control.

CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>) ViewBag.DataSource)
.Height("450px").GridLines(
    Syncfusion.EJ2.Gantt.GridLine.Both).TaskFields(ts
=>ts.Id("TaskId").Name("TaskName").StartDate(
"StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Ch
ild("SubTasks")).Render()
```

GRIDLINES.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}
```

Timezone

The Gantt makes use of the current system time zone by default. If it needs to follow some other user-specific time zone, then the `timezone` property needs to be used.

Understanding date manipulation in JavaScript

The `new Date()` in JavaScript returns the exact current date object with complete time and timezone information. For example, it may return value such as `Wed Dec 12 2018 05:23:27 GMT+0530 (India Standard Time)` which indicates that the current date is December 12, 2018 and the current time is 5.23 AM on browsers following the IST timezone.

Display same time everywhere with no time difference

Setting `timezone` to UTC for Gantt will display the same time as in the database for all the users in different time zone.

CSHTML

```
@ (Html.EJS() .Gantt("Gantt") .DataSource((IEnumerable<object>) ViewBag.DataSource)
    .TaskFields(ts =>
ts.Id("TaskId") .Name("TaskName") .StartDate("StartDate") .EndDate("EndDate") .Duration("Duration") .Progress("Progress")
    .Dependency("Predecessor") .ParentID("ParentID"))
    .Height("450px") .IncludeWeekend(true) .DurationUnit(Syncfusion.EJ2.Gantt.DurationUnit.Hour)
    .TimelineSettings(ts =>
ts.TimelineUnitSize(65) .TopTier(tt => tt.Format("MMM dd, yyyy") .Unit(Syncfusion.EJ2.Gantt.TimelineViewMode.Day))
    .BottomTier(bt => bt.Format("hh:mm a") .Unit(Syncfusion.EJ2.Gantt.TimelineViewMode.Hour))
    .Timezone("UTC") .DateFormat("hh:mm a")
    .DayWorkingTime(dt =>
```

```
        {  
            dt.From(0).To(24).Add();  
        })  
        .Render()  
    )
```

SAME-TIME.CS

```

```

CRUD operations with timezone

CRUD operations can be performed with timezone, and the gantt is rendered based on the timezone specified in the load time. All the editing actions will be done based on the user timezone, but on database save action, we have reversed this conversion to local time and provided data to client side events for better understanding purpose. Refer to the following code example.

CSHTML

```

@(Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
    .TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
        .Dependency("Predecessor").ParentID("ParentID"))
    .Height("450px").IncludeWeekend(true).DurationUnit(Syncfusion.EJ2.Gantt.DurationUnit.Hour)
    .EditSettings(es =>
es.AllowAdding(true).AllowEditing(true).AllowDeleting(true).AllowTaskbarEditing(true).ShowDeleteConfirmDialog(true))

```

```

        .TimelineSettings(ts =>
ts.TimelineUnitSize(65).TopTier(tt => tt.Format("MMM dd,
yyyy").Unit(Syncfusion.EJ2.Gantt.TimelineViewMode.Day))
        .BottomTier(bt => bt.Format("hh:mm
a").Unit(Syncfusion.EJ2.Gantt.TimelineViewMode.Hour))
        .Timezone("America/New_York").DateFormat("hh:mm a")
        .DayWorkingTime(dt =>
        {
            dt.From(0).To(24).Add();
        })
        .Render()
    )

```

TIMEZONE-CRUD.CS

```

Timezone methods

offset

This method is used to calculate the difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
Timezone	String	Timezone.

Returns **number**

`sh

```
// Assume your local timezone as IST/UTC+05:30
var timezone = new ej.schedule.Timezone();
var date = new Date(2018,11,5,15,25,11);
var timeZoneOffset = timezone.offset(date,"Europe/Paris");
console.log(timeZoneOffset); //-60
`
```

convert

This method is used to convert the passed date from one timezone to another timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
fromOffset	number/string	Timezone from which date need to be converted.
toOffset	number/string	Timezone to which date need to be converted.

Returns **Date**

```
`sh
// Assume your local timezone as IST/UTC+05:30
var timezone = new ej.schedule.Timezone();
var date = new Date(2018,11,5,15,25,11);
var convertedDate = timezone.convert(date, "Europe/Paris", "Asia/Tokyo");
var convertedDate1 = timezone.convert(date, 60, -360);
console.log(convertedDate); //2018-12-05T17:55:11.000Z
console.log(convertedDate1); //2018-12-05T16:55:11.000Z
`
```

remove

This method is used to remove the time difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC as date object.
Timezone	String	Timezone.

Returns **Date**

```
`sh
// Assume your local timezone as IST/UTC+05:30
var timezone = new ej.schedule.Timezone();
var date = new Date(2018,11,5,15,25,11);
```

```
var convertedDate = timezone.remove(date, "Europe/Paris");
console.log(convertedDate); //2018-12-05T14:25:11.000Z
,
```

Migration from Essential JS 1

This topic shows the API equivalent of JS2 Gantt component to be used, while migrating your project that uses JS1 Gantt.

Data Binding and Task mapping

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Data Binding | **Property:** *Datasource*

@(Html.EJ().Gantt("Gantt")
.Datasource(ViewBag.datasources)
) | **Property:** *Datasource*

@Html.EJS().Gantt("Gantt")
.DataSource((IEnumerable<object>)ViewBag.DataSources)
.Render() |

| To map id of task from data source | **Property:** *TaskIdMapping*

@(Html.EJ().Gantt("Gantt")
.TaskIdMapping("Id")
) | **Property:** *TaskFields.Id*

@Html.EJS().Gantt("Gantt")

How To

Open add/edit dialog dynamically

Gantt add and edit dialogs can be opened dynamically by using `openAddDialog` and `openEditDialog` methods. The following code example shows how to open add and dialog on separate button click actions.

CSHTML

```
@Html.EJS().Button("editDialog").Content("Open Edit  
Dialog").CssClass("e-primary").Render()
@Html.EJS().Button("addDialog").Content("Open Add Dialog").CssClass("e-  
primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSourc  
e).Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P  
rogress("Progress").Child("SubTasks").EditSettings(es =>
es.AllowEditing(true).AllowAdding(true)).Render()

<script>
```

```

        document.getElementById('editDialog').addEventListener('click',
function (args) {
    var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
    ganttObj.editModule.dialogModule.openEditDialog();
});
        document.getElementById('addDialog').addEventListener('click',
function (args) {
    var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
    ganttObj.editModule.dialogModule.openAddDialog();
});
</script>

```

OPENEDITADDDIALOG.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}

```

Note: We should select any one of the row in Gantt to open the edit dialog.

Set the vertical scroll position

In the Gantt control, you can set the vertical scroller position dynamically by clicking the custom button using the `setScrollTop` method.

CSHTML

```

@Html.EJS().Button("setScrollTop").Content("Change Scroll
Position").CssClass("e-primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress").Child("SubTasks")
).Render()

<script>
    document.getElementById('setScrollTop').addEventListener('click',
function (args) {
    var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
    ganttObj.ganttChartModule.scrollObject.setScrollTop(300);
});
</script>

```

SETSCROLLTOP.CS

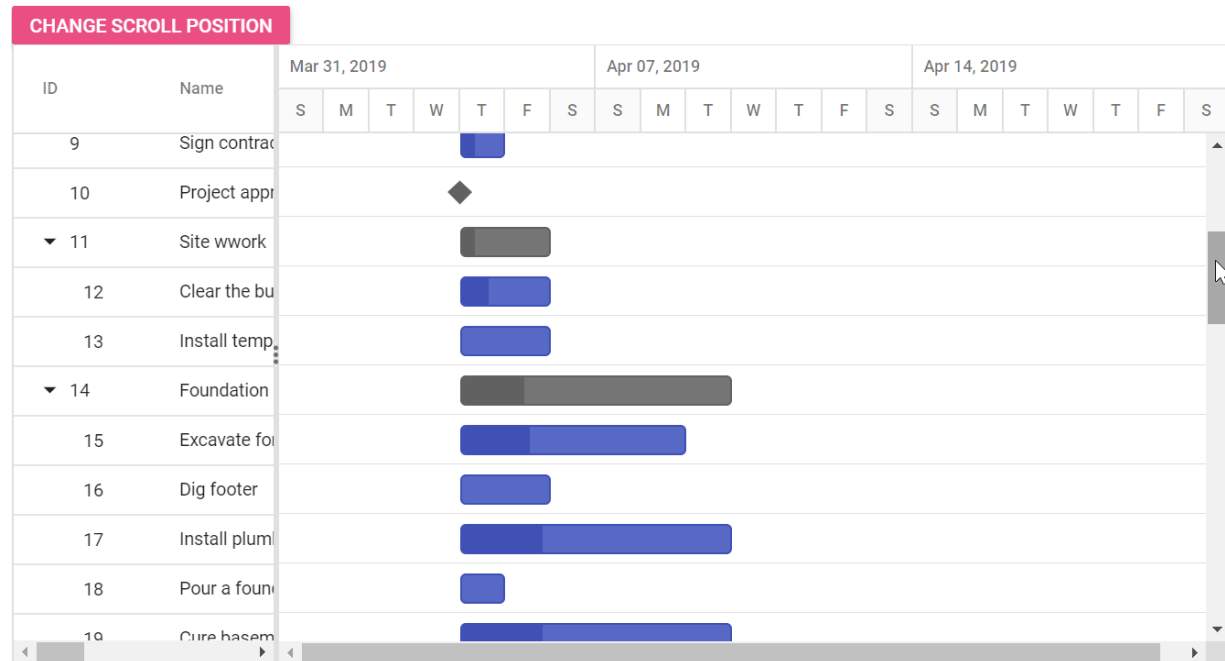

```

public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}

```

```
}

```

Change schedule start and end dates

In the Gantt control, you can change the schedule start and end dates by clicking the custom button programmatically using the `updateProjectDates` method. You can pass the start and end dates as method arguments to the `updateProjectDates` method. You can also pass the Boolean value as an additional parameter, which is used to round-off the schedule start and end dates displayed in Gantt timeline.

CSHTML

```
@Html.EJS().Button("updateSchedule").Content("Update
Schedule").CssClass("e-primary").Render()

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress").Child("SubTasks")
).Render()

<script>

document.getElementById("updateSchedule").addEventListener('click', () => {
    var ganttObj =
document.getElementById("Gantt").ej2_instances[0];
    ganttObj.updateProjectDates(new Date('01/10/2019'), new
Date('06/20/2019'), true);
});

</script>
```

CHANGESCHEDULEDATES.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}
```

Copy and Paste records in Gantt

You can copy and paste a record in the Gantt chart by using the `addRecord` method and `custom context menu`. It is also possible to copy and paste the parent record with multiple hierarchical child records on the required position.

CSHTML

```
@{
    List<object> contextItems = new List<object> { "AutoFitAll", "AutoFit",
    "TaskInformation", "DeleteTask", "Save", "Cancel",
        "SortAscending", "SortDescending", "Add", "DeleteDependency",
    "Convert"};
    contextItems.Add(new { text= "Copy", target= ".e-content", id= "copy"
    });
    contextItems.Add(new { text= "Paste", target= ".e-content", id= "paste"
    });
}

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName"

).StartDate("StartDate").Duration("Duration").Progress("Progress").Dependenc
y("Predecessor").Child("SubTasks")
).EnableContextMenu(true).EditSettings(es =>
es.AllowAdding(true).AllowEditing(true).AllowDeleting(true)

).ContextMenuItems(contextItems).ContextMenuOpen("ContextMenuOpen").ContextM
enuClick("ContextMenuClick").Render()
<script>
    var copiedRecord;
    function ContextMenuOpen(args) {
        if (args.type !== 'Header') {
            if (copiedRecord) {
                args.hideItems.push('Copy');
            } else {
                args.hideItems.push('Paste');
            }
        }
    }
    function ContextMenuClick(args) {
        var gantt = document.getElementById("Gantt").ej2_instances[0];
        if (args.item.id === 'copy') {
            copiedRecord = args.rowData;
            copiedRecord.taskData.TaskID = gantt.currentViewData.length + 1;
        }
        if (args.item.id === 'paste') {
            gantt.addRecord(copiedRecord.taskData, 'Below', args.rowData.index);
            if (copiedRecord.hasChildRecords) {
                addChildRecords(copiedRecord, args.rowData.index + 1);
            }
        }
    }
}
```

```

    }
    copiedRecord = undefined;
  }
}
function addChildRecords(record, index) {
  for(var i=0; i<record.childRecords.length; i++) {
    var childRecord = record.childRecords[i];
    childRecord.taskData.TaskID = gantt.currentViewData.length + 1;
    gantt.addRecord(childRecord.taskData, 'Child', index);
    if(childRecord.hasChildRecords) {
      addChildRecords(childRecord, index + (i+1));
    }
  }
}
}
</script>

```

COPYPASTERECORDS.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = ProjectNewData();
    return View();
}

```

Updating row drag and dropped index position on server side

Row dropped record's index position can be maintained in the Gantt chart by changing the database table index position using the `rowDrop` event. In this event, the `fromIndex` and `dropIndex` values can be passed to the server side using Ajax request. On the server side, the `insert` and `insertAtTop` methods are used to update the row index position. The following code snippets explain the solution.

CSHTML

```

@Html.EJS().Gantt("DragAndDrop").DataSource(dataManager =>
{
    dataManager.Url("https://localhost:44379/Home/UrlDatasource").Adaptor("UrlAdaptor")
}).AllowRowDragAndDrop(true).Height("450px").TreeColumnIndex(1).TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Dependency("Predecessor").Child("SubTasks")).Render()
<script>
    function rowDrop(args) {
        var record = this.flatData[args.fromIndex][this.taskFields.id];
        var record2 = this.flatData[args.dropIndex][this.taskFields.id];
        var data = args.data[0];
        var uri = 'https://localhost:44379/Home/RowDropMethod';
        var dragdropdata = {
            record: data[0].taskData,
            position: args.dropIndex,
            dragidMapping: record,
            dropidMapping: record2
        };
        var ajax = new Ajax(

```

```

        {
            url: uri,
            type: 'POST',
            contentType: "application/json",
            data: JSON.stringify(dragdropdata),
        });
        ajax.send();
    }
}
</script>

```

MAINTAINRECORDINDEX.CS

```

public IActionResult RowDropMethod([FromBody] DragDropData value)
{
    var data = new CRUDModel();
    copyRecord = true;
    if (value.position == "bottomSegment" || value.position ==
"topSegment")
    {
        {
            var childCount = 0;
            int parent1 = (int)value.record.parentID;
            childCount += FindChildRecords(parent1);
            if (childCount == 1)
            {
                var i = 0;
                for (; i < DataList.Count; i++)
                {
                    if (DataList[i].taskID == parent1)
                    {
                        DataList[i].isParent = false;
                        break;
                    }
                    if (DataList[i].taskID == value.record.taskID)
                    {
                        DataList[i].parentID = null;
                        break;
                    }
                }
            }
            DataList.Remove(DataList.Where(ds => ds.taskID ==
value.dragidMapping).FirstOrDefault());
            var j = 0;
            for (; j < DataList.Count; j++)
            {
                if (DataList[j].taskID == value.dropidMapping)
                {
                    value.record.parentID = DataList[j].parentID;
                    break;
                }
            }
            data.Value = value.record;
            if (value.position == "bottomSegment")
            {

```

```

        this.Insert(data, value.dropidMapping);
    }
    else if (value.position == "topSegment")
    {
        this.InsertAtTop(data, value.dropidMapping);
    }
}
else if (value.position == "middleSegment")
{
    DataList.Remove(DataList.Where(ds => ds.taskID ==
value.dragidMapping).FirstOrDefault());
    value.record.parentID = value.dropidMapping;
    FindDropdata(value.dropidMapping);
    data.Value = value.record;
    this.Insert(data, value.dropidMapping);
}
copyRecord = false;
return Json(new { updatedRecords = value.record });
}

```

Add Custom Fields in the General Tab in Add/Edit Dialog

Generally in Gantt, Custom fields are displayed in the Custom Tab of the Add/Edit dialogs. However, they can be included in the General Tab of Add/Edit Dialog Box using `actionBegin` and `actionComplete` events. These events are used to append the custom field to the dialog box. The following code snippets demonstrate the solution.

CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name(
"TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").P
rogress("Progress").Child("SubTasks")).EditDialogFields(edf =>
{
    edf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.General).HeaderText("General")
.Add();
    edf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.Dependency).Add();
    edf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.Resources).Add();
    edf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.Notes).Add();
}).AddDialogFields(adf=> {
    adf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.General).HeaderText("General
Tab").Add();
    adf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.Dependency).Add();
    adf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.Resources).Add();
    adf.Type(Syncfusion.EJ2.Gantt.DialogFieldType.Notes).Add();
}).Columns(col =>
{
    col.Field("TaskId").Width(150).Add();
    col.Field("TaskName").HeaderText("Job
Name").Width(250).Add();
    col.Field("StartDate").Width(250).Add();
    col.Field("EndDate").Width(250).Add();
    col.Field("Duration").Width(250).Add();
}

```

```

        col.Field("Progress").Width(250).Add();
        col.Field("CustomField").Width(250).Add();
    }).Toolbar(new List<string>()
    { "Add", "Cancel", "CollapseAll", "Delete", "Edit", "ExpandAll",
    "NextTimeSpan", "PrevTimeSpan", "Search", "Update" }).EditSettings(es=>
es.AllowAdding(true).AllowEditing(true).Mode(Syncfusion.EJ2.Gantt.EditMode.D
ialog)).ActionBegin(
    "actionBegin").ActionComplete("actionComplete").Render()
<script>
    var divElement;
    var inputs = {
        booleanedit: ej.buttons.CheckBox,
        dropdownedit: ej.dropdowns.DropDownList,
        datepickeredit: ej.calendars.DatePicker,
        datetimepickeredit: ej.calendars.DateTimePicker,
        maskededit: ej.inputs.MaskedTextBox,
        numericedit: ej.inputs.NumericTextBox,
        stringedit: ej.inputs.TextBox
    };
    function actionBegin(args) {
        var ganttObj = document.getElementById("Gantt").ej2_instances[0];
        if (args.requestType === "beforeOpenEditDialog" || args.requestType
=== "beforeOpenAddDialog") {
            var column = ganttObj.columnByField["CustomField"];
            divElement = ganttObj.createElement("div", {
                className: "e-edit-form-column"
            });
            var inputElement;
            inputElement = ganttObj.createElement("input", {
                attrs: {
                    type: "text",
                    id: this.controlId + "" + column.field,
                    name: column.field,
                    title: column.field
                }
            });
            divElement.appendChild(inputElement);
            var input = {
                enabled: true,
                floatLabelType: "Auto",
                placeholder: "CustomField",
                value: args.rowData.CustomField
            };
            var inputObj = new inputs[column.editType](input);
            inputObj.appendTo(inputElement);
        }
        function actionComplete(args) {
            var ganttObj = document.getElementById("Gantt").ej2_instances[0];
            if (args.requestType === "openEditDialog" || args.requestType ===
"openAddDialog") {
                var generalTab = document.getElementById(
                    ganttObj.controlId + "GeneralTabContainer"
                );
                generalTab.appendChild(divElement);
            }
        }
    }

```

```
}
</script>
```

CUSTOMFIELD.CS

```
public ActionResult Index()
{
    ViewBag.DataSource = ProjectNewData();
    return View();
}
```

Maintain zoomToFit

In the Gantt control, While performing edit actions or dynamically change dataSource, the timeline gets refreshed. When zoomToFit toolbar item is clicked and perform editing actions or dynamically change dataSource, the timeline gets refreshed. So that, the timeline will not fit to the project any more.

Maintain zoomToFit after edit actions

We can maintain zoomToFit after editing actions(cell edit,dialog edit,taskbar edit) by using fitToProject method in actionComplete and taskbarEdited event.

CSHTML

```
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.ActionComplete("actionComplete").TaskbarEdited("taskbarEdited").Height("450px")
.TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration")
.Progress("Progress").Dependency("Predecessor").Child("SubTasks").Toolbar(new List<string>()
{"Edit", "ZoomToFit"}).LabelSettings(ls =>
ls.LeftLabel("TaskName").EditSettings(es =>

es.AllowTaskbarEditing(true).AllowEditing(true)).ProjectStartDate("03/24/2019").ProjectEndDate(
"04/28/2019").Render()

<script>
    function actionComplete(args) {
        if ((args.action === "CellEditing" || args.action === "DialogEditing") && args.requestType === "save") {
            var obj = document.getElementById("Gantt").ej2_instances[0];
            obj.dataSource = '@(ViewBag.DataSource)';
            obj.fitToProject();
        }
    }
    function taskbarEdited(args) {
        if (args) {
            var obj = document.getElementById("Gantt").ej2_instances[0];
            obj.dataSource = '@(ViewBag.DataSource)';
            obj.fitToProject();
        }
    }
</script>
```

MAINTAINZOOMTOFIT.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = ganttData();
    return View();
}

public static List<GanttDataSource> ganttData()
{
    List<GanttDataSource> GanttDataSourceCollection = new
List<GanttDataSource>();
    GanttDataSource Record1 = new GanttDataSource()
    {
        TaskId = 1,
        TaskName = "Project initiation",
        StartDate = new DateTime(2019, 04, 02),
        EndDate = new DateTime(2019, 04, 21),
        SubTasks = new List<GanttDataSource>(),
    };
    GanttDataSource Child1 = new GanttDataSource()
    {
        TaskId = 2,
        TaskName = "Identify site location",
        StartDate = new DateTime(2019, 04, 02),
        Duration = 4,
        Progress = 70,
    };
    GanttDataSource Child2 = new GanttDataSource()
    {
        TaskId = 3,
        TaskName = "Perform soil test",
        StartDate = new DateTime(2019, 04, 02),
        Duration = 4,
        Progress = 50,
        Predecessor = "2FS"
    };

        Duration = 4,
        Progress = 50,
        Predecessor = "3FS"
    };
    Record1.SubTasks.Add(Child1);
    Record1.SubTasks.Add(Child2);
    Record1.SubTasks.Add(Child3);
    GanttDataSource Record2 = new GanttDataSource()
    {
        TaskId = 5,
        TaskName = "Project estimation",
        StartDate = new DateTime(2019, 04, 02),
        EndDate = new DateTime(2019, 04, 21),
        SubTasks = new List<GanttDataSource>()
    };
    GanttDataSource Child4 = new GanttDataSource()
    {
        TaskId = 6,
```

```

        TaskName = "Develop floor plan for estimation",
        StartDate = new DateTime(2019, 04, 04),
        Duration = 3,
        Progress = 70
    };
    GanttDataSource Child5 = new GanttDataSource()
    {
        TaskId = 7,
        TaskName = "List materials",
        StartDate = new DateTime(2019, 04, 04),
        Duration = 3,
        Progress = 50,
        Predecessor = "6SS"
    };
    Record2.SubTasks.Add(Child4);
    Record2.SubTasks.Add(Child5);
    GanttDataSourceCollection.Add(Record1);
    GanttDataSourceCollection.Add(Record2);
    return GanttDataSourceCollection;
}

public class GanttDataSource
{
    public int TaskId { get; set; }
    public string TaskName { get; set; }
    public DateTime StartDate { get; set; }
    public DateTime EndDate { get; set; }
    public int? Duration { get; set; }
    public int Progress { get; set; }
    public string Predecessor { get; set; }
    public List<GanttDataSource> SubTasks { get; set; }
}

```

Maintain zoomToFit after change dataSource dynamically

We can maintain `zoomToFit` after change dataSource dynamically, by calling `fitToProject` method in dataBound event.

CSHTML

```

@Html.EJS().Button("changedata").Content("Change Data").CssClass("e-
primary").Render()
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSourc
e).DataBound("dataBound").Height("450px").TaskFields(ts =>

ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").D
uration("Duration").Progress("Progress").Dependency(
    "Predecessor").Child("SubTasks").Toolbar(new List<string>()
    {"ZoomToFit"}).LabelSettings(ls =>
ls.LeftLabel("TaskName").ProjectStartDate("03/24/2019").ProjectEndDate(
    "04/28/2019").Render()

<script>
    document.getElementById('changedata').addEventListener('click',
function (args) {
    var ganttObj =
document.getElementById('Gantt').ej2_instances[0];
    ganttObj.dataSource = '@(ViewBag.Data)';
});

```

```
function dataBound(args) {  
    var ganttObj =  
document.getElementById('Gantt').ej2_instances[0];  
    obj.fitToProject();  
}  
</script>
```

MAINTAINZOOMTOFITDATASOURCE.CS

```

        EndDate = new DateTime(2019, 04, 21),
        SubTasks = new List<GanttDataSource>(),
    };
    GanttDataSource Child5 = new GanttDataSource()
    {
        TaskId = 7,
        TaskName = "Customer strength",
        StartDate = new DateTime(2019, 04, 04),
        Duration = 4,
        Progress = 30,
        Predecessor = "6SS"
    };
    Record2.SubTasks.Add(Child4);
    Record2.SubTasks.Add(Child5);
    GanttDataSourceCollection.Add(Record1);
    GanttDataSourceCollection.Add(Record2);
    return GanttDataSourceCollection;
}
```

Drag and Drop the Record from another component to Gantt

In Gantt, it is possible to drag a record from another component and drop it in Gantt chart with updating the Gantt record. Here, dragging an item from **TreeView** component to Gantt and that item is updated as a resource for the Gantt record, we can achieve this, by using [nodeDragStop](#) event of **TreeView** control.

CSHTML

```
@(Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("280px").AllowSelection(true)
.TaskFields(ts =>
ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")

.Dependency("Predecessor").Child("SubTasks").ResourceInfo("Resources")
.EditSettings(es => es.AllowEditing(true))
.Resources((IEnumerable<object>)ViewBag.Resources)
.ResourceFields(rf => rf.Id("ResourceId").Name("ResourceName"))
.LabelSettings(ls => ls.RightLabel("Resources"))
.Render()
)
)
@ (Html.EJS().TreeView("treedata").AllowDragAndDrop(true).Fields(field =>
field.Id("ResourceId").Text("ResourceName").DataSource(ViewBag.Resources)
.NodeDragStop("nodeDragStop")
.Render()
)
)
<script>
function nodeDragStop(args) {
    var ganttChart = document.getElementById('Gantt').ej2_instances[0];
    var chartEle = ej.base.closest(args.target, '.e-chart-row');
    var gridEle = ej.base.closest(args.target, '.e-row');
    if (gridEle) {
        var index = ganttChart.treeGrid.getRows().indexOf(gridEle);
        ganttChart.selectRow(index);
    }
    if (chartEle) {
        var index = chartEle.ariaRowIndex;
        ganttChart.selectRow(Number(index));
    }
    var record = args.draggedNodeData;
    var selectedData = ganttChart.flatData[ganttChart.selectedRowIndex];
    var selectedDataResource = selectedData.taskData.Resources;
    var resources = [];
    if (selectedDataResource) {
        for (var i = 0; i < selectedDataResource.length; i++) {
            resources.push(selectedDataResource[i].ResourceId);
        }
    }
    resources.push(parseInt(record.id));
    if (chartEle || gridEle) {
        var data = {
            TaskId: selectedData.taskData.TaskId,
            Resources: resources
        }
    }
}
```

```

    };
    ganttChart.updateRecordByID(data);
    var elements = document.querySelectorAll('.e-drag-item');
    while (elements.length > 0 && elements[0].parentNode) {
        elements[0].parentNode.removeChild(elements[0]);
    }
}
}
</script>

```

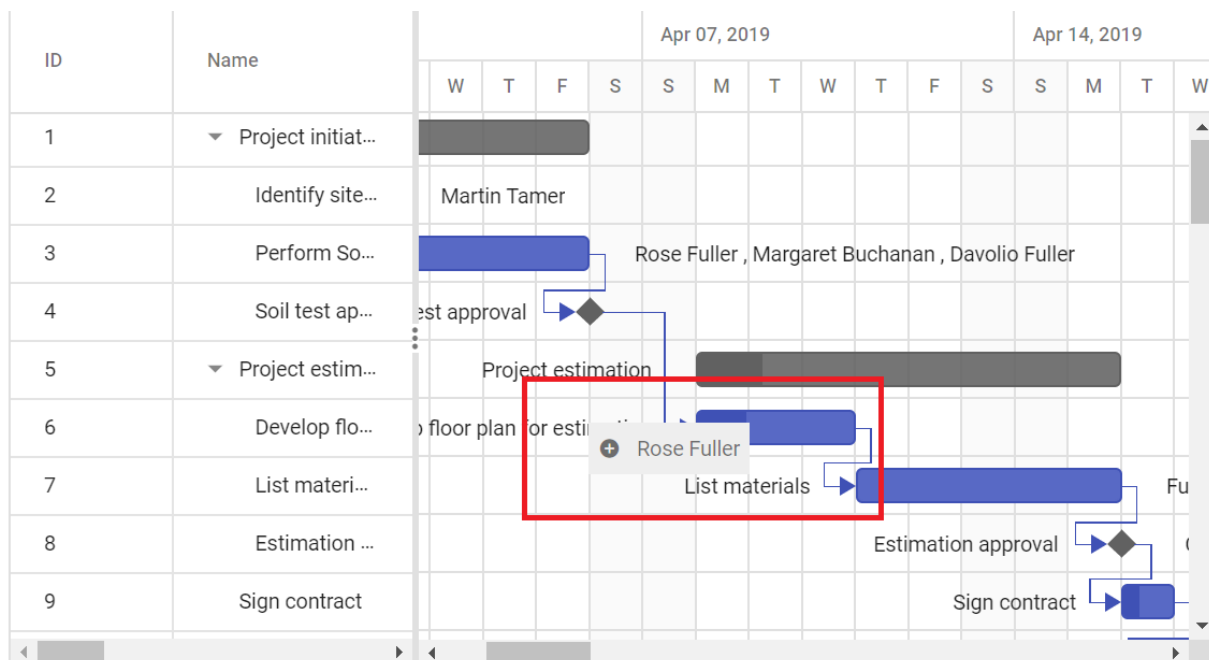

DRAGANDDROP.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    ViewBag.projectResources = projectResources();
    return View();
}

```

The following screenshot shows dropping record from another component in to Gantt, and **Rose Fuller** is added as resource for the task **Develop floor plan estimation**.

Flat list

Martin Tamer
Rose Fuller
Margaret Buchanan
Fuller King

Set new row position in Gantt

In Gantt, a new row can be added in one of the following positions: Top, Bottom, Above, Below and Child. This position can be specified through the `newRowPosition` property. We can make use of the `toolbarClick` event to create a context menu that specifies the position in which the new row is to be added when adding a record through toolbar click.

The following code snippets demonstrate how to achieve this.

CSHTML

```
@{
    List<object> toolbarItems = new List<object>();
    toolbarItems.Add("Add");
    toolbarItems.Add("Edit");
}

@Html.EJS().ContextMenu("contextmenu").Items((IEnumerable<object>)ViewBag.menuItems).Select("itemSelect").Render()
@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource).Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName").StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress").Child("SubTasks"))
).ToolbarClick("toolbarClick").Toolbar(toolbarItems).EditSettings(es=>es.AllowEditing(true).AllowAdding(true).AllowDeleting(true)).Render()
<script>

    function toolbarClick(args) {
        if (args.item.text === "Add") {
            args.cancel = true;
            var contextMenuObj =
document.getElementById("contextmenu").ej2_instances[0];
            contextMenuObj.open(60, 78);
        }
    }

    function itemSelect(args) {
        var ganttObj = document.getElementById("Gantt").ej2_instances[0];
        if (args.item.text === "Bottom") {
            ganttObj.editSettings.newRowPosition = "Bottom";
            ganttObj.openAddDialog();
        } else if (args.item.text === "Above") {
            if (ganttObj.selectedRowIndex == -1) {
                alert("Please select any row");
            } else {
                ganttObj.editSettings.newRowPosition = "Above";
                ganttObj.openAddDialog();
            }
        } else if (args.item.text === "Below") {
            if (ganttObj.selectedRowIndex == -1) {
                alert("Please select any row");
            } else {
                ganttObj.editSettings.newRowPosition = "Below";
                ganttObj.openAddDialog();
            }
        } else if (args.item.text === "Child") {
            if (ganttObj.selectedRowIndex == -1) {
```

```

        alert("Please select any row");
    } else {
        ganttObj.editSettings.newRowPosition = "Child";
        ganttObj.openAddDialog();
    }
} else if (args.item.text === "Top") {
    ganttObj.editSettings.newRowPosition = "Top";
    ganttObj.openAddDialog();
}
}

</script>

```

NEWROWPOSITION.CS

```

public IActionResult Index()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "Top"
    });
    menuItems.Add(new
    {
        text = "Bottom"
    });
    menuItems.Add(new
    {
        text = "Above"
    });
    menuItems.Add(new
    {
        text = "Below"
    });
    menuItems.Add(new
    {
        text = "Child"
    });
    ViewBag.menuItems = menuItems;
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}

```

Open add/edit dialog dynamically

Restriction of collapsing the records when clicking on gantt chart rows can be performed by using the [collapsing](#) event.

CSHTML

```

@Html.EJS().Gantt("Gantt").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("450px").TaskFields(ts => ts.Id("TaskId").Name("TaskName")
.StartDate("StartDate").EndDate("EndDate").Duration("Duration").Progress("Progress")
.Child("SubTasks")).EditSettings(es =>

```

```
es.AllowEditing(true).AllowAdding(true)).Collapsing("Collapsing").Render()

<script>
function Collapsing(args) {
    var gantt = document.getElementById("Gantt").ej2_instances[0];
    if (gantt.ganttChartModule.isExpandCollapseFromChart) {
        args.cancel = true;
    }
}
</script>
```

RESTRICTCOLLAPSECHARTROWS.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = GanttData.ProjectNewData();
    return View();
}
```

Grid

Getting Started with ASP.NET MVC Grid Control

This section briefly explains about how to include [ASP.NET MVC Grid](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in nuget.org. Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Grid control

Now, add the Syncfusion ASP.NET MVC Grid control in **~/Views/Home/Index.cshtml** page.

CSHTML

```
@Html.EJS().Grid("Grid").Render()
```

Defining Row Data

To bind data for the Grid component, you can assign a `IEnumerable` object to the [DataSource](#) property. The list data source can also be provided as an instance of the **DataManager**.

CSHTML

```
@model List<GridSample.Controllers.OrdersDetails>
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)Model).Render()
```

HOMECONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View(OrdersDetails.GetAllRecords());
    }
}

public class OrdersDetails
{
    public static List<OrdersDetails> order = new List<OrdersDetails>();
    public OrdersDetails()
    {
    }
    public OrdersDetails(int OrderID, string CustomerId, int EmployeeId, double
    Freight, bool Verified, DateTime OrderDate, string ShipCity, string
    ShipName, string ShipCountry, DateTime ShippedDate, string ShipAddress)
    {
        this.OrderID = OrderID;
        this.CustomerID = CustomerId;
        this.EmployeeID = EmployeeId;
        this.Freight = Freight;
        this.ShipCity = ShipCity;
        this.Verified = Verified;
        this.OrderDate = OrderDate;
        this.ShipName = ShipName;
        this.ShipCountry = ShipCountry;
        this.ShippedDate = ShippedDate;
        this.ShipAddress = ShipAddress;
    }
    public static List<OrdersDetails> GetAllRecords()
    {
        if (order.Count() == 0)
        {
            int code = 10000;

Defining Columns

The columns are automatically generated when columns declaration is empty or undefined while initializing the grid.

The Grid has an option to define columns using [Columns](#) property.

Let's check the properties used here:

- The [Field](#) property is to map with a property name an array of JavaScript objects.
- The [HeaderText](#) property is to change the title of columns.
- The [TextAlign](#) property is to change the alignment of columns. By default, columns will be left aligned. To change columns to right align, you need to define **textAlign** as **Right**.
- Using [Format](#) property you can format number and date values to standard or custom formats. Here, you have defined it for the conversion of numeric values to currency.

CSHTML

```
@model List<GridSample.Controllers.OrdersDetails>
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)Model).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).Render()
```

Order ID	Customer Name	Order Date	Ship Country
10001	ALFKI	5/15/1991	Denmark
10002	ANATR	4/4/1990	Brazil
10003	ANTON	11/30/1957	Germany
10004	BLONP	10/22/1930	Austria
10005	BOLID	2/18/1953	Switzerland
10006	ALFKI	5/15/1991	Denmark
10007	ANATR	4/4/1990	Brazil
10008	ANTON	11/30/1957	Germany
10009	BLONP	10/22/1930	Austria
10010	BOLID	2/18/1953	Switzerland

Enable Paging

The paging feature enables users to view the grid record in a paged view. It can be enabled by setting the [AllowPaging](#) property to true. Pager can be customized using the [PageSettings](#) property.

CSHTML

```
@model List<GridSample.Controllers.OrdersDetails>
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)Model).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging(true).PageSettings(page => page.PageSize(5)).Render()
```

Order ID	Customer Name	Order Date	Ship Country
10001	ALFKI	5/15/1991	Denmark
10002	ANATR	4/4/1990	Brazil
10003	ANTON	11/30/1957	Germany
10004	BLONP	10/22/1930	Austria
10005	BOLID	2/18/1953	Switzerland
<div> ⏪ < 1 of 4 pages > ⏩ </div>			

Enable Sorting

The sorting feature enables you to order the records. It can be enabled by setting the [AllowSorting](#) property as true. Sorting feature can be customized using the [SortSettings](#) property.

CSHTML

```
@model List<GridSample.Controllers.OrdersDetails>
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)Model).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging(true).AllowSorting(true).PageSettings(page =>
page.PageSize(5)).Render()
```

Order ID	Customer Name	Order Date	Ship Country
10001	ALFKI	5/15/1991	Denmark
10006	ALFKI	5/15/1991	Denmark
10011	ALFKI	5/15/1991	Denmark
10016	ALFKI	5/15/1991	Denmark
10002	ANATR	4/4/1990	Brazil
<div> ⏪ ⏴ 1 of 4 pages ⏵ ⏩ </div>			

Enable Filtering

The filtering feature enables you to view reduced amount of records based on filter criteria. It can be enabled by setting the [AllowFiltering](#) property as true. Filtering feature can be customized using the [FilterSettings](#) property.

CSHTML

```
@model List<GridSample.Controllers.OrdersDetails>
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)Model).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging(true).AllowSorting(true).AllowFiltering(true).PageSettings(pa
ge => page.PageSize(5)).Render()
```

Order ID	Customer Name	Order Date	Ship Country
	B		
10004	BLONP	10/22/1930	Austria
10005	BOLID	2/18/1953	Switzerland
10009	BLONP	10/22/1930	Austria
10010	BOLID	2/18/1953	Switzerland

<div> <div>⏪</div> <div>⏩</div> <div>1 of 2 pages</div> <div>⏪</div> <div>⏩</div> </div> <div>Customer Name: B</div>			

Enable Grouping

The grouping feature enables users to view the grid record in a grouped view. It can be enabled by setting the [AllowGrouping](#) property to true. Grouping feature can be customized using the [GroupSettings](#) property.

CSHTML

```
@model List<GridSample.Controllers.OrdersDetails>
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)Model).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging(true).AllowSorting(true).AllowFiltering(true).AllowGrouping(t
rue).PageSettings(page => page.PageSize(5)).Render()
```

Drag a column header here to group its column

Data Binding

The Grid uses DataManager, which supports both RESTful JSON data services binding and local JavaScript object array binding. The [DataSource](#) property can be assigned either with the instance of DataManager or JavaScript object array collection.

It supports the following kinds of data binding method:

- List binding
- DataTable binding
- Remote data

Sending additional parameters to the server

To add a custom parameter to the data request, use the addParams method of **Query** class. Assign the **Query** object with additional parameters to the grid [Query](#) property.

CSHTML

```
@Html.EJS().Grid("Params").DataSource(dataManger =>
{
    dataManger.Url("https://ej2services.syncfusion.com/production/web-services/api/Orders").CrossDomain(true).Adaptor("ODataV4Adaptor");
}).Query("new ej.data.Query().addParams('ej2Grid', 'true')").Columns(col =>
{
```

```
col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width("160").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

col.Field("Freight").HeaderText("Freight").Width("150").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().Render()
```

PARAMS.CS

```
public IActionResult Index()
{

    return View();
}
```

Note: The parameters added using the [Query](#) property will be sent along with the data request for every grid action.

Handling HTTP error

During server interaction from the grid, some server-side exceptions may occur, and you can acquire those error messages or exception details in client-side using the [ActionFailure](#) event.

The argument passed to the [ActionFailure](#) event contains the error details returned from the server.

CSHTML

```
@Html.EJS().Grid("check").DataSource(dataManger =>
{
    dataManger.Url("http://some.com/invalidUrl");
}).Columns(col =>
{
    col.Field("ProductID").HeaderText("Product
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ProductName").HeaderText("Product Name").Width("150").Add();
    col.Field("UnitPrice").HeaderText("Supplier
ID").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("UnitsInStock").HeaderText("QuantityPerUnit").Width("120").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Discontinued").HeaderText("Discontinued").Width("140").TextAlign(
Syncfusion.EJ2.Grids.TextAlign.Center).Type("boolean").DisplayAsCheckBox(tru
e).Add();
}).ActionFailure("actionFailure").Render()
<script>
    function actionFailure(args) {
        var span = document.createElement('span');
        this.element.parentNode.insertBefore(span, this.element);
        span.style.color = '#FF0000'
        span.innerHTML = 'Server exception: 404 Not found';
    }
```

```
</script>
```

HTTPERROR.CS

```
public IActionResult Index()
{
    return View();
}
```

Note: The [ActionFailure](#) event will be triggered not only for the server errors, but also when there is an exception while processing the grid actions.

Binding with ajax

You can use Grid [DataSource](#) property to bind the datasource to Grid from external ajax request. In the below code we have fetched the datasource from the server with the help of ajax request and provided that to [DataSource](#) property by using `onSuccess` event of the ajax.

```
`javascript
<script type="text/javascript">
var grid = document.getElementById('Grid').ej2_instances[0]; // Grid instance
var ajax = new ej.base.Ajax('/Home/UrlDatasource', 'GET');
ajax.send();
ajax.onSuccess = function (data) {
    grid.dataSource = JSON.parse(data).result;
};
</script>
```

Note: * If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server side crud actions.

Troubleshoot: Grid render rows without data

In ASP.NET Core, by default the JSON results are returned in camelCase format. So grid field names are also changed in camelCase.

To avoid this problem, you need to add **DefaultContractResolver** in **Startup.cs** file.

```
`javascript
public void ConfigureServices(IServiceCollection services)
{
    services.AddMvc().AddJsonOptions(options =>
    {
        options.SerializerSettings.ContractResolver = new
        Newtonsoft.Json.Serialization.DefaultContractResolver();
    });
}
```

```
});
}
,
```

Data Annotation in Grid Component

Data Annotation helps you define rules for the model class to perform data validation and display suitable messages to end users as validation message in the edit form.

The Data Annotation can be enabled by referencing the **System.ComponentModel.DataAnnotations** namespace which maps data annotation to the corresponding DataGrid Column property.

Note: The DataGrid Property has more priority than the Data Annotation. For Instance, if the DisplayName Attribute is set to a Field in the DataGrid model class and the HeaderText is set to the same DataGrid column property, the value of the HeaderText property will be considered and shown in the DataGrid header.

CSHTML

```
@using DataAnnotation.Controllers;
@(Html.EJS().Grid<HomeController.Orders>("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Width("150").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

    col.Field("Freight").HeaderText("Freight").EditType("numericedit").Width("160").Format("N2").Add();
    col.Field("ShipCountry").EditType("dropdownedit").HeaderText("Ship Country").Width("140").Add();
}).AllowPaging().PageSettings(page => page.PageCount(2)).EditSettings(edit => { edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true);
}).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel"
}).Render())
```

ANNOTATION.CS

```
namespace DataAnnotation.Controllers
{
    public class HomeController : Controller
    {
        public static List<Orders> order = new List<Orders>();
        public ActionResult Index()
        {
            ViewBag.DataSource = Orders.getAllRecords().ToList();
            ViewBag.Type = typeof(Orders);
            return View();
        }
        public class Orders
```

```

    {
        public Orders(long OrderId, string Customerid, int EmployeeId,
double Freight, string ShipCity)
        {
            this.OrderID = OrderId;
            this.CustomerID = Customerid;
            this.EmployeeID = EmployeeId;
            this.Freight = Freight;
            this.ShipCity = ShipCity;
        }
        public static List<Orders> getAllRecords()
        {
            if (order.Count == 0)
            {
                int code = 10000;
                for (int i = 1; i < 2; i++)
                {
                    order.Add(new Orders(code + 1, "ALFKI", i + 0, 2.3 *
i, "Berlin"));
                    order.Add(new Orders(code + 2, "ANATR", i + 2, 3.3 *
i, "Madrid"));
                    order.Add(new Orders(code + 3, "ANTON", i + 1, 4.3 *
i, "Cholchester"));
                    order.Add(new Orders(code + 4, "BLONP", i + 3, 5.3 *
i, "Marseille"));
                    order.Add(new Orders(code + 5, "BOLID", i + 4, 6.3 *
i, "Tsawassen"));
                    code += 5;
                }
            }
            return order;
        }
        [Key]
        [DisplayName = "Order ID"]
        [Required(ErrorMessage = "Order ID is required")]
        public long OrderID { get; set; }
        [DisplayName = "Customer ID"]
        [Required(ErrorMessage = "Customer ID is required")]
        [StringLength(8, MinimumLength = 3, ErrorMessage = "Customer ID
length should between 3 and 8")]
        public string CustomerID { get; set; }
        [DisplayName = "Employee ID"]
        [Range(1, 10, ErrorMessage = "Employee ID should be between 1
and 10")]
        public int EmployeeID { get; set; }
        [DisplayFormat(DataFormatString = "c2")]
        [Range(1, 1000, ErrorMessage = "Freight should be between 1 and
1000")]
        public double Freight { get; set; }
        [DisplayName = "Ship City"]
        [Editable(false)]
        public string ShipCity { get; set; }
    }
}

```

Immutable Mode

The immutable mode optimizes the Grid re-rendering performance by using the object reference and [deep compare](#) concept. When performing the Grid actions, it will only re-render the modified or newly added rows and prevent the re-rendering of the unchanged rows.

To enable this feature, you have to set the [enableImmutableMode](#) property as **true**.

Note: * This feature uses the primary key value for data comparison. So, you need to provide the [isPrimaryKey](#) column.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.EnableImmutableMode(true).AllowPaging(true).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.
n.Right).Add();
    col.Field("ProductName").HeaderText("Product Name").Width("160").Add();
    col.Field("ProductID").HeaderText("Product
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("120").Add();
    col.Field("CustomerName").HeaderText("Customer
Name").Width("160").Add();
}).Render()
```

IMMUTABLE.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Limitations

The following features are not supported in the immutable mode:

- Frozen rows and columns
- Row Template
- Detail Template
- Hierarchy Grid
- Column reorder
- Virtual scroll
- Infinite scroll
- Grouping

Performance tips for ASP.NET MVC Grid control

This article is a comprehensive guide on improving the loading performance of the ASP.NET MVC Grid, especially when dealing with large datasets along with large number of columns. It provides valuable insights into the steps that need to be followed to bind a large data source without experiencing any performance degradations. By offering detailed explanations and actionable tips, this resource aims to

empower readers with the knowledge and best practices necessary to optimize the performance of the ASP.NET MVC Grid during data binding, ensuring a smooth and efficient user experience.

How to improve loading performance by binding large dataset

As you all know, a grid is made up of rows and columns. For instance, when you bind 10 rows and 10 columns, it means 100 elements will be rendered in the DOM (Document Object Model). So, it is recommended to render only a limited number of rows and columns to guarantee the best loading performance for the control.

Optimizing performance with paging

To boost the performance efficiency of your application, especially when dealing with large datasets, it is advised to implement paging. [Paging](#) allows you to display grid data in segmented pages, facilitating easier navigation through substantial datasets. This feature proves particularly beneficial in enhancing the overall performance of your application. For more information on implementing paging, you can refer to the [documentation](#) section dedicated to this feature.

Optimizing performance with row virtualization or infinite scrolling

To enhance your application's efficiency, especially when dealing with substantial datasets, it is recommended to either using [virtualization](#) or [infinite scrolling](#). Implementing these techniques can significantly reduce the load on your application and elevate its overall performance.

1. **Virtualization:** The Virtual scrolling feature in the ASP.NET MVC Grid enables the efficient handling and display of large volumes of data without compromising performance. This approach optimizes the rendering process by loading only the visible rows within the Grid viewport, rather than rendering the entire dataset simultaneously. For more information on implementing row virtualization , you can refer to the [documentation](#) section dedicated to this feature.
2. **Infinite scrolling:** The Infinite Scrolling feature in the ASP.NET MVC Grid is a powerful tool for seamlessly handling extensive data sets without compromising grid performance. It operates on a "load-on-demand" concept, ensuring that data is fetched only when needed. In the default infinite scrolling mode, a new block of data is loaded each time the scrollbar reaches the end of the vertical scroller. For more information on implementing infinite scrolling , you can refer to the [documentation](#) section dedicated to this feature.

Optimizing performance with column virtualization in large no of columns

[Column virtualization](#) feature in the ASP.NET MVC Grid that allows you to optimize the rendering of columns by displaying only the columns that are currently within the viewport. It allows horizontal scrolling to view additional columns. This feature is particularly useful when dealing with grids that have a large number of columns, as it helps to improve the performance and reduce the initial loading time.

It is possible to enable both row and column virtualization. This feature allows for efficient handling of large datasets by dynamically loading only the visible rows and columns, optimizing performance and enhancing the overall responsiveness of the grid. For more information on implementing column virtualization , you can refer to the [documentation](#) section dedicated to this feature.

How to overcome browser height limitation in virtual scrolling

[Documentation link](#)

How to improve loading performance by binding large data by showing custom text or element
When integrating image or template elements into a column, it's recommended to utilize the [Column Template](#) feature rather than customizing the data through [rowDataBound](#) or [queryCellInfo](#) events.

These events are triggered for each row and cell rendering, introducing delays in the control's rendering process. Moreover, rendering custom elements using these events may result in the persistence of rendered elements, potentially causing longer rendering times over time. By opting for the column template feature, you can efficiently meet this requirement without experiencing rendering delays and ensure a more streamlined rendering process.

[How to improve loading performance by referring individual script and CSS](#)

To improve the performance of Syncfusion Grid control during the initial render as well as certain actions, suggested you to download the specific control scripts using CRG (Custom Resource Generator) to speed up the project. By default, the ej2.min.js script file contains all the Syncfusion control scripts. So, it will take some time to load the scripts to the project. Using [CRG](#), you can select the controls which you want to use, and the modules for those controls, then you can download the scripts and CSS for the selected controls and use them as per your need.

[CRG website link](#)

So to improve the performance of grid during the initial rendering, suggested you to refer individual script and CSS.

[How to update cell values without frequent server calls](#)

Efficiently update cell values without the need for frequent server calls, especially beneficial for live update scenarios. Even when the data is initially bound from the server, performing edit operations can be done without triggering a database refresh. Utilize the [setCellValue](#) method to update the Grid without affecting the database and only refresh the UI.

[How to optimize server-side data operations with adaptors](#)

The ASP.NET MVC Grid provides support for various adaptors (OData, ODataV4, WebAPI, URL, etc.) to facilitate server-side data operations and CRUD functionalities. By leveraging these adaptors along with the **DataManager** control, you can seamlessly bind remote data sources to the grid and execute actions. During data operations like filtering, sorting, and paging, the corresponding action queries are generated as per the adaptor's requirements. It is crucial to handle these actions on the application end and return the processed data back to the grid. Refer to the documentation for comprehensive details. It's worth noting that for efficient data processing, the suggested order for returning processed data to the grid is as follows

- Filtering
- Sorting
- Aggregates
- Paging
- Grouping

[How to avoid MaxJsonLength error while passing large amount of records](#)

The ASP.NET MVC Grid control is client-server based. So, we send the data as JSON object between client and server. The reported issue occurs due to the serialization of the large-sized JSON object. We need to increase the maximum length for serializing the large-sized JSON object. You have to alter the [MaxJsonLength](#) property on your web.config file or in the place of deserialization.

Solution: 1

```
`csharp
<configuration>
```

```
<system.web.extensions>
<scripting>
<webServices>
<jsonSerialization maxJsonLength="25000000"/>
</webServices>
</scripting>
</system.web.extensions>
</configuration>
```

Solution : 2

```
`csharp
var serializer = new JavaScriptSerializer { MaxJsonLength = Int32.MaxValue };
`
```

Microsoft excel limitation while exporting millions of records to excel file format

By default, Microsoft Excel supports only 1,048,576 records in an excel sheet. Hence it is not possible to export millions of records to excel. You can refer the [documentation](#) link for more details on Microsoft excel specifications and limits. So suggest to export the data in CSV (Comma-Separated Values) or other formats that can handle large datasets more efficiently than Excel.

Columns in ASP.NET MVC Grid Component

The column definitions are used as the [DataSource](#) schema in the Grid. This plays a vital role in rendering column values in the required format.

The grid operations such as sorting, filtering and grouping etc. are performed based on column definitions. The [Field](#) property of the [Columns](#) is necessary to map the data source values in Grid columns.

Note: 1. If the column [Field](#) is not specified in the dataSource, the column values will be empty.

 2. If the [Field](#) name contains “dot” operator, it is considered as complex binding.

Column types

Column type can be specified using the [Type](#) property of [Columns](#). It specifies the type of data the column binds.

If the [Format](#) is defined for a column, the column uses [Type](#) to select the appropriate format option **number** or **date**.

Grid column supports the following types:

- string
- number
- boolean
- date
- datetime

Note: If the [Type](#) is not defined, it will be determined from the first record of the [DataSource](#).

 In case if the first record of the [DataSource](#) is null/blank value for a column then it is necessary to define the [Type](#) for that column.

ValueAccessor

The **valueAccessor** is used to access/manipulate the value of display data. You can achieve custom value formatting by using the valueAccessor.

CSHTML

```
@{
    var valueAccessor = "valueAccessorFn";
}
@Html.EJS().Grid("ValueAccessor").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("ShipCity").HeaderText("Ship City").ValueAccessor(valueAccessor).Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("130").Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Format("C2").Add();
}).AllowPaging().Render()
<script>
    function valueAccessorFn(field, data, column){
        var value = data[field]
        if (data['ShipCountry'] !== undefined) {
            value = value + ' - ' + data['ShipCountry'];
        }
        return value;
    }
</script>
```

VALUEACCESSOR.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Format

To format cell values based on specific culture, use the [Format](#) property of [Columns](#). The grid uses Internalization library to format number and date values.

CSHTML

```
@Html.EJS().Grid("Format").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
```

```
{
    col.Field("OrderID").HeaderText("Order
ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("130").Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.Te
xtAlign.Right).Width("120").Format("C2").Add();
}).AllowPaging().Render();
```

FORMAT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: By default, the number and date values are formatted in **en-US** locale.

Number formatting

The number or integer values can be formatted using the below format strings.

Format	Description	Remarks
----- ----- -----		
N	Denotes numeric type.	The numeric format is followed by integer value as N2, N3. etc which denotes the number of precision to be allowed.
C	Denotes currency type.	The currency format is followed by integer value as C2, C3. etc which denotes the number of precision to be allowed.
P	Denotes percentage type	The percentage format expects the input value to be in the range of 0 to 1. For example the cell value 0.2 is formatted as 20% . The percentage format is followed by integer value as P2, P3. etc which denotes the number of precision to be allowed.

Date formatting

You can format date values either using built-in date format string or custom format string.

For built-in date format you can specify [Format](#) property as string(Example: `yMd`).

You can also use custom format string to format the date values. Some of the custom formats and the formatted date values are given in the below table.

Format	Formatted value
----- -----	
{ type:'date', format:'dd/MM/yyyy' }	04/07/1996
{ type:'date', format:'dd.MM.yyyy' }	04.07.1996
{ type:'date', skeleton:'short' }	7/4/96

| { type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' } | 04/07/1996 12:00 AM |

| { type: 'dateTime', format: 'MM/dd/yyyy hh:mm:ss a' } | 07/04/1996 12:00:00 AM |

CSHTML

```
@Html.EJS().Grid("Format").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("130").Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.Te
xtAlign.Right).Width("120").Format("C2").Add();

    col.Field("Price").HeaderText("Price").TextAlign(Syncfusion.EJ2.Grids.TextAl
ign.Right).Width("120").Format("P2").Add();
}).AllowPaging().Render()
```

FORMAT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Render boolean value as checkbox

To render boolean values as checkbox in columns, you need to set [DisplayAsCheckBox](#) property as **true**.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.dataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").ValidationRules(new { required = "true"
}).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Width("150").ValidationRules(new { required = "true", minLength = 3
}).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();

    col.Field("Verified").HeaderText("Verified").DisplayAsCheckBox(true).Width("
150").Add();
}).AllowPaging().Render()
```

BOOLEANASCHECKBOX.CS

```
public IActionResult Index()
{
    var orders = OrdersDetails.GetAllRecords();
    ViewBag.DataSource = orders;
    return View();
}
```

Visibility

You can hide any particular column in Grid before rendering by defining [Visible](#) property as false. In the below sample **ShipCity** column is defined as visible false.

CSHTML

```
@Html.EJS().Grid("Visibility").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("ShippedDate").HeaderText("Shipped Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCity").Visible(false).HeaderText("Ship City").Width("150").Add();
}).AllowPaging().Render()
```

VISIBILITY.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Lock columns

You can lock columns by using [LockColumn](#) property. The locked columns will be moved to the first position. Also you cannot reorder its position.

In the below example, Ship City column is locked and its reordering functionality is disabled.

CSHTML

```
@Html.EJS().Grid("Reorder").DataSource((IEnumerable<object>)ViewBag.dataSource).AllowReordering().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();
    col.Field("ShipCity").Width("130").LockColumn(true).Add();
    col.Field("ShipName").Width("150").Add();
    col.Field("ShipPostalCode").Width("125").Add();
    col.Field("ShipRegion").Width("120").Add();
}).Render()
```

LOCK.CS

```
public IActionResult Index()
{
    var order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = order;
    return View();
}
```

Controlling Grid actions

You can enable or disable grid action for a particular column by setting the [AllowFiltering](#), [AllowGrouping](#), [AllowEditing](#), [AllowReordering](#), and [AllowSorting](#) properties.

CSHTML

```
@Html.EJS().Grid("ControlGridAction").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).AllowGrouping(false).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").AllowFiltering(false).AllowEditing(false).AllowReordering(false).Add();
    col.Field("OrderDate").HeaderText("Order Date").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("130").Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").AllowSorting(false).Format("C2").Add();
})
.AllowPaging().AllowGrouping().AllowFiltering().AllowSorting().AllowReordering().EditSettings(edit => {
    edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true);
}).Render()
```

CONTROLLINGACTIONS.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Show or hide columns by external button

You can show or hide grid columns dynamically using external buttons by invoking the **showColumns** or **hideColumns** method.

CSHTML

```
@Html.EJS().Button("Show").Content("Show").IsPrimary(true).Render()
@Html.EJS().Button("Hide").Content("Hide").IsPrimary(true).Render()
@Html.EJS().Grid("ShowHide").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
```

```

{
    col.Field("OrderID").HeaderText("Order
ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("130").Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.Te
xtAlign.Right).Width("120").Format("C2").Add();
}).AllowPaging().Render()
<script>
    document.getElementById("Show").addEventListener("click", () => {
        var grid = document.getElementById("ShowHide").ej2_instances[0];
        grid.showColumns(['Customer Name', 'Order Date']); //show by
HeaderText
    });
    document.getElementById("Hide").addEventListener("click", () => {
        var grid = document.getElementById("ShowHide").ej2_instances[0];
        grid.hideColumns(['Customer Name', 'Order Date']); //hide by
HeaderText
    })
</script>

```

SHOWHIDE.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Customize column styles

You can customize the appearance of the header and content of a particular column using the [customAttributes](#) property.

To customize the grid column, follow the given steps:

Step 1: Create a CSS class with custom style to override the default style for rowcell and headercell.

```

`css
.e-grid .e-rowcell.customcss{
background-color: #ecedee;
color: 'red';
font-family: 'Bell MT';
font-size: 20px;
}
.e-grid .e-headercell.customcss{
background-color: #2382c3;

```

```
color: white;
font-family: 'Bell MT';
font-size: 20px;
}
`
```

Step 2: Add the custom CSS class to the specified column by using the [customAttributes](#) property.

```
`typescript
```

```
col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).CustomAttributes(new { @class = "customcss" }).Add();
`
```

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).CustomAttributes(new { @class =
"customcss" }).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Render()
<style>
    .e-grid .e-rowcell.customcss {
        background-color: #ecedee;
        color: red;
        font-family: 'Bell MT';
        font-size: 20px;
    }
    .e-grid .e-headercell.customcss {
        background-color: #2382c3;
        color: white;
        font-family: 'Bell MT';
        font-size: 20px;
    }
</style>
```

CUSTOM-COLUMN-STYLE.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Display custom tooltip for columns

To display a custom ToolTip (**EJ2 Tooltip**), you can render the Grid control inside the Tooltip component and set the target as ".e-rowcell". The tooltip is displayed when hovering the grid cells.

Change the tooltip content for the grid cells by using the following code in the (**beforeRender**) event.

`typescript

```
function beforeRender(args) {
    // event triggered before render the tooltip on target element.
    var tooltip = document.getElementById("Tooltip").ej2_instances[0]
    tooltip.content = args.target.closest("td").innerText;
}
```

CSHTML

```
@Html.EJS().Tooltip("Tooltip").Target(".e-rowcell").ContentTemplate(@<div>

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship
Country").Width("120").Add();
}).Render()
</div>).BeforeRender("beforeRender").Render()
<script>
    function beforeRender(args) {
        // event triggered before render the tooltip on target element.
        var tooltip = document.getElementById("Tooltip").ej2_instances[0]
        tooltip.content = args.target.closest("td").innerText;
    }
</script>
```

CUSTOM-TOOLTIP.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Align the text of Grid content and header

For aligning the text of Grid content and header part, use [TextAlign](#) and [HeaderTextAlign](#) properties.

Grid column supports the following alignments:

- Left
- Right
- Center
- Justify

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).HeaderText
Align(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Width("150").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Left).HeaderTex
tAlign(Syncfusion.EJ2.Grids.TextAlign.Left).Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Center).HeaderT
extAlign(Syncfusion.EJ2.Grids.TextAlign.Center).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Justify).HeaderTextAlign(Syncfusion.EJ2.Gr
ids.TextAlign.Justify).Add();
}).Render()
```

ALIGNMENT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

How to prevent checkbox in the blank row

By default, cells in the grid will be blank if the corresponding column values in the data source are null or undefined. The grid also has the option to prevent the rendering of checkboxes in such cases, even if the [DisplayAsCheckBox](#) property is set to true for that column, by using the [RowDataBound](#) event of the Grid.

In the following sample, the [RowDataBound](#) event of the Grid is used to set the innerHTML of the checkbox element to empty.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
```

```

        col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
        col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
        col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

        col.Field("Verified").HeaderText("Verified").Width("120").DisplayAsCheckBox(true).Add();
    }).RowDataBound("rowBound").Render()
<script>
    function rowBound(args) {
        let grid = document.getElementById('Grid').ej2_instances[0];
        let count = 0;
        let keys = Object.keys(args.data);
        for (let i = 0; i < keys.length; i++) {
            if (args.data[keys[i]] == null || args.data[keys[i]] == '' || args.data[keys[i]] == undefined) {
                count++;
            }
        }
        if (count == keys.length) {
            for (let i = 0; i < grid.columns.length; i++) {
                if (grid.columns[i].displayAsCheckBox) {
                    args.row.children[i].innerHTML = '';
                }
            }
        }
    }
</script>

```

BLANK-ROW.CS

```

public IActionResult Index()
{
    var orders = OrdersDetails.GetAllRecords();
    ViewBag.DataSource = orders;
    return View();
}

```

Row in ASP.NET MVC Grid Control

The row represents record details fetched from data source.

Row customization

Using event

You can customize the appearance of a row by using the [RowDataBound](#) event. The [RowDataBound](#) event triggers for every row. In the event handler, you can get the **RowDataBoundEventArgs** that contains details of the row.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).RowDataBound("rowBound").AllowSelection(false).PageSettings(p => {
p.PageSize(6); }).EnableHover(false).Render()
<script>
    function rowBound(args) {
        if (args.data['Freight'] < 10) {
            args.row.classList.add('below-10');
        } else if (args.data['Freight'] < 80) {
            args.row.classList.add('below-80');
        } else {
            args.row.classList.add('above-80');
        }
    }
</script>
<style>
    .below-10 {
        background-color:aqua;
    }
    .below-80 {
        background-color: aquamarine;
    }
    .above-80 {
        background-color: orange;
    }
</style>
```

CUSTOM-ROWS.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Styling alternate rows

You can change the grid's alternative rows' background color by overriding the **.e-altrow** class.

```
`css
.e-grid .e-altrow {
background-color: #fafafa;
}
```

Refer to the following example.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).Render()
<style>
    .e-grid .e-altrow {
        background-color: #fafafa;
    }
</style>
```

STYLE-ALT-ROW.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Using CSS customize selected row

The background color of the selected row can be changed by overriding the following CSS style.

```
`css
.e-grid td.e-active {
background-color: #f9920b;
}
```

This is demonstrated in the following sample:

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).Render()
<style>
    .e-grid td.e-active {
        background-color: #f9920b;
    }
</style>
```

SELECTED-ROW.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Adding a new row programmatically

The Grid can add a new row between the existing rows using the `addRecord` method of the Grid.

This is demonstrated in the following sample:

CSHTML

```
@Html.EJS().Button("add").Content("Add Row").IsPrimary(true).Render()
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).IsPrimaryK
ey(true).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("130").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("120").Add();
}).EditSettings(edit => {
    edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Normal); }).Render()
<script>
    document.getElementById('add').onclick = function () {
```

```

        document.getElementById('Grid').ej2_instances[0].addRecord(
            { OrderID: 3232, CustomerID: 'ALKIT', ShipCity: 'London', Freight:
40, ShipName: 'Que Delícia'}, 2);
    }
</script>

```

ADD-ROW.CS

```

public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}

```

Note: When working with remote data, it is impossible to add a new row between the existing rows.

How to get the row information when hovering over the cell

It is possible to get the row information when hovering over the specific cell. This can be achieved by using the [RowDataBound](#) event and `getRowInfo` method of the Grid.

In the following sample, the `mouseover` event is bound to a grid row in the `RowDataBound` event, and when hovering over the specific cell, using the `getRowInfo` method, row information will be retrieved and displayed in the console.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.RowDataBound("rowDataBound").EditSettings(edit => {
    edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true);
}).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).Render()
<script>
    function rowDataBound(args) {
        var gridElement = document.getElementById('Grid').ej2_instances[0];
        args.row.addEventListener('mouseover', function (e) {
            console.log(gridElement.getRowInfo(e.target))
        })
    }
</script>

```

ROW-INFO.CS

```

public IActionResult Index()

```

```
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

- [How to set textbox and Grid in one row in ASP.NET MVC Grid](#)

Cell

Cell customization

The appearance of cells can be customized by using the [QueryCellInfo](#) event. The [QueryCellInfo](#) event triggers for every cell. In that event handler, you can get **QueryCellInfoEventArgs** that contains the details of the cell.

CSHTML

```
@Html.EJS().Grid("CellCustomize").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().QueryCellInfo("customiseCell").Render()
<style>
    .below-5 {
        background-color: orangered;
    }
    .below-8 {
        background-color: yellow;
    }
    .above-8 {
        background-color: greenyellow;
    }
</style>
<script>
    function customiseCell(args) {
        if (args.column.field === 'Freight') {
            if (args.data['Freight'] < 5) {
                args.cell.classList.add('below-5');
            } else if (args.data['Freight'] < 8) {
                args.cell.classList.add('below-8');
            } else {
                args.cell.classList.add('above-8');
            }
        }
    }
}
```

```
</script>
```

CUSTOMIZE.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Custom attributes

You can customize the grid cells by adding a CSS class to the [customAttribute](#) property of the column.

```
`CSS
```

```
.e-attr {
background: #d7f0f4;
}
`
```

In the below example, we have customized the cells of **OrderID** and **ShipCity** columns.

CSHTML

```
@Html.EJS().Grid("CellCustomize").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").CustomAttributes(new { @class = "customcss" })
    .TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();
    col.Field("ShipCity").HeaderText("Ship City").CustomAttributes(new { @class = "e-attr" })
    .Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd")
    .Add();
}).AllowPaging().Render()
<style>
    .e-attr {
        background: #d7f0f4;
    }
</style>
```

CUSTOMSTYLE.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Grid lines

The [GridLines](#) have option to display cell border and it can be defined by the [GridLines](#) property.

The available modes of grid lines are:

- | Modes | Actions |
- |-----|-----|
- | Both | Displays both the horizontal and vertical grid lines. |
- | None | No grid lines are displayed. |
- | Horizontal | Displays the horizontal grid lines only. |
- | Vertical | Displays the vertical grid lines only. |
- | Default | Displays grid lines based on the theme. |

CSHTML

```
@Html.EJS().Grid("GridLine").DataSource((IEnumerable<object>)ViewBag.dataSource).GridLines(Syncfusion.EJ2.Grids.GridLine.Both).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("C2").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().PageSettings(page => { page.PageCount(5);}).Render()
```

GRIDLINES.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: By default, the grid renders with **Default** mode.

Editing in ASP.NET MVC Grid Component

The Grid component has options to dynamically insert, delete and update records. Editing feature requires a primary key column for CRUD operations. To define the primary key, set [IsPrimaryKey](#) property of [Column](#) to **true** in particular column.

You can start the edit action either by double clicking the particular row or by selecting the required row and click on **Edit** button in the toolbar. Similarly, you can add a new record to grid either by clicking on **Add** button in the toolbar or on an external button which is bound to invoke the [addRecord](#) method of the grid, **Save** and **Cancel** while in edit mode is possible using respective toolbar icon in grid.

Deletion of the record is possible by selecting the required row and click on **Delete** button in the toolbar.

CSHTML

```
@Html.EJS().Grid("NormalEdit").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Width("120").ValidationRules(new { required = "true"}).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").ValidationRules(new { required = "true", minLength=3 }).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().PageSettings(page => page.PageCount(2)).EditSettings(edit => {
    edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusion.EJ2.Grids.EditMode.Normal);
}).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel" }).Render()
```

EDIT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: If [IsIdentity](#) is enabled, then it will be considered as a read-only column when editing and adding a record.

 You can disable editing for a particular column, by specifying [AllowEditing](#) to **false**.

Toolbar with edit option

The grid toolbar has the [built-in items](#) to execute Editing actions. You can define this by using the [Toolbar](#) property.

CSHTML

```
@Html.EJS().Grid("EditToolbar").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).ValidationRules(new { required = "true"}).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").ValidationRules(new { required = "true", minLength = 3 }).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}
```

```
col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().EditSettings(edit => {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusion.EJ2.Grids.EditMode.Normal); }).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel" }).Render()
```

EDITTOOLBAR.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Disable editing for particular column

You can disable editing for particular columns by using the [AllowEditing](#) property of [Column](#).

In the following demo, editing is disabled for the **CustomerID** column.

CSHTML

```
@Html.EJS().Grid("InlineEditing").DataSource((IEnumerable<object>)ViewBag.datasources).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).ValidationRules(new { required = "true" }).Add();
    col.Field("CustomerID").HeaderText("Customer Name").AllowEditing(false).Width("150").ValidationRules(new { required = "true", minLength = 3 }).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().EditSettings(edit => {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusion.EJ2.Grids.EditMode.Normal); }).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel" }).Render()
```

DISABLEEDITFORCOLUMN.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Disable editing for a particular row or cell

You can disable the editing for a particular row by using the [ActionBegin](#) event of Grid.

In the below demo, the rows which are having the value for **ShipCountry** column as Denmark is prevented from editing.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width(30).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width(30).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width(30).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width(30).Add();
}).EditSettings(edit => edit.AllowEditing(true)).Toolbar(new List<string>()
{ "Edit", "Cancel", "Update" }).ActionBegin("actionBegin").Render()
<script>
    function actionBegin(args) {
        if (args.requestType === "beginEdit") {
            if (args.rowData.ShipCountry === "Denmark") {
                args.cancel = true;
            }
        }
    }
</script>
```

DISABLE-EDIT.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

For batch mode of editing, you can use [CellEdit](#) event of Grid. In the below demo, the cells which are having the value as Denmark is prevented from editing.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width(30).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width(30).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width(30).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width(30).Add();
}).EditSettings(edit =>
edit.AllowEditing(true).Mode(Syncfusion.EJ2.Grids.EditMode.Batch)).Toolbar(n
ew List<string>() { "Edit", "Cancel", "Update"
}).CellEdit("cellEdit").Render()
<script>
    function cellEdit(args) {
        if (args.value === "Denmark") {
            args.cancel = true;
        }
    }
}
```

```
</script>
```

DISABLE-EDIT-BATCH.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Editing template column

You can edit the template column value by defining the [Field](#) for that particular column.

In the below demo, the **ShipCountry** column is rendered with the template.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign
n.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship
Country").Width("150").Template("#template").EditType("dropdownedit").Add();
}).AllowPaging().EditSettings(edit => {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Normal); }).Toolbar(new List<string>() { "Add", "Edit",
"Delete", "Update", "Cancel" }).Render()
<script id="template" type="text/x-template">
    <a href="#">${ShipCountry}</a>
</script>
```

EDIT-TEMP.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Troubleshoot editing works only for first row

The Editing functionalities can be performed based upon the primary key value of the selected row. If [IsPrimaryKey](#) is not defined in the grid, then edit or delete action take places the first row.

How to make a Grid column always editable

Make the Grid column always editable using the column template feature of the Grid.

In the following example, the textbox is rendered in the Freight column using a column template. The keyup event for the Grid is bound using the [created](#) event of the Grid, and the edited changes are saved in the data source using the `updateRow` method of the Grid.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Created("created").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).IsPrimaryK
ey(true).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
    col.Field("Freight").HeaderText("Receipt
Amount").Width("120").Template("#template").Add();
}).Render()
<script id="template" type="text/x-template">
    <input id='${OrderID}' value='${Freight}' class='custemp' type='text'
style='width: 100%'>
</script>
<script>
    function created(e) {

document.getElementById('Grid').ej2_instances[0].element.addEventListener('k
eyup', function (e) { // Bind the keyup event for the grid.
    if (e.target.classList.contains('custemp')) { // Based on this
condition, you can find whether the target is an input element or not.
        var row = ej.grids.parentsUntil(e.target, 'e-row');
        var rowIndex = row.rowIndex; // Get the row index.
        var uid = row.getAttribute('data-uid');
        var rowData =
document.getElementById('Grid').ej2_instances[0].getRowObjectFromUID(uid).da
ta; // Get the row data.
        rowData.Freight = e.target.value; // Update the new value
for the corresponding column.

document.getElementById('Grid').ej2_instances[0].updateRow(rowIndex,
rowData); // Update the modified value in the row data.
    }
});
}
</script>
```

COLUMN-EDIT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Sorting

Sorting enables you to sort data in the **Ascending** or **Descending** order. To sort a column, click the column header.

To enable sorting in the Grid, set the [AllowSorting](#) to true. Sorting options can be configured through the [SortSettings](#).

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>) ViewBag.datasource)
.AllowSorting().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("170").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).AllowPaging().PageSettings(page => page.PageCount(5)).Render()
```

SORTING.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Note: Grid columns are sorted in the **Ascending** order. If you click the already sorted column, the sort direction toggles.

 You can apply and clear sorting by invoking **sortColumn** and **clearSorting** methods.

 To disable sorting for a particular column, set the [AllowSorting](#) property of [Column](#) to false.

Initial sort

To sort at initial rendering, set the **Field** and **Direction** in [Columns](#) property of [SortSettings](#).

CSHTML

```
@{
    List<object> cols = new List<object>();
    cols.Add(new { field = "OrderDate", direction = "Ascending" });
}
```

```

        cols.Add(new { field = "Freight", direction = "Descending" });
    }
    @Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasources)
    .AllowSorting().Columns(col =>
    {
        col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
        col.Field("CustomerID").HeaderText("Customer Name").Width("170").Add();
        col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

        col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
        col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
    }).AllowPaging().PageSettings(page => page.PageCount(2)).SortSettings(sort
=> sort.Columns(cols)).Render()

```

INITIAL-SORT.CS

```

public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasources = orders;
    return View();
}

```

Multi-column sorting

You can sort more than one column in a Grid. To sort multiple columns, press and hold the **CTRL** key and click the column header. The sorting order will be displayed in the header while performing multi-column sorting.

To clear sorting for a particular column, press the "Shift + mouse left click".

Note: The [AllowSorting](#) must be **true** while enabling multi-column sort.

 Set [AllowMultiSorting](#) property as **false** to disable multi-column sorting.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasources)
.AllowSorting().AllowMultiSorting().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("170").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).AllowPaging().PageSettings(page => page.PageCount(5)).Render()

```

MULTI-COLUMN-SORT.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Sort order

By default, the sorting order will be as **ascending -> descending -> none**.

When first click a column header it sorts the column in ascending. Again click the same column header, it will sort the column in descending. A repetitive third click on the same column header will clear the sorting.

Sort foreign key column based on Text

For local data in Grid, sorting will be performed based on the [ForeignKeyValue](#) property of [Column](#).

For remote data in Grid, sorting will be performed based on the [ForeignKeyField](#) instead of [ForeignKeyValue](#). To sort a column based on the displayed text and not based on the [ForeignKeyField](#), we need to handle the sorting operation at the server side.

The following code example describes the handling of sorting operation at the server side.

CSHTML

```
@Html.EJS().Grid("ItemGrid").DataSource(dataManger => {
    dataManger.Url("/OData/Items").Adaptor("ODataV4Adaptor"); }).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign("Right").Add();

    col.Field("EmployeeID").ForeignKeyField("EmployeeID").ForeignKeyValue("First
Name").DataSource(dm => { dm.Url("/OData/Brands").Adaptor("ODataV4Adaptor");
}).HeaderText("First Name").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn("Right").Add();
    col.Field("ShipName").HeaderText("Ship Name").Add();

}).AllowPaging().AllowSorting(true).AllowMultiSorting(true).Render()
```

FOREIGN-SORT.CS

```
public class ItemsController : ODataController
{
    [EnableQuery]
    public IQueryable<Item> Get()
    {
        List<Item> GridData =
        JsonConvert.DeserializeObject<Item[]>(Properties.Resources.ItemsJson).AsQuer
yable().ToList();
        List<Brand> empData =
        JsonConvert.DeserializeObject<Brand[]>(Properties.Resources.BrandsJson).AsQu
eryable().ToList();
    }
}
```

```

        var queryString = HttpContext.Current.Request.QueryString;
        var allUrlKeyValues =
ControllerContext.Request.GetQueryNameValuePairs();
        string key = allUrlKeyValues.LastOrDefault(x => x.Key ==
"$orderby").Value;
        if (key != null)
        {
            if (key == "EmployeeID") {
                GridData = SortFor(key); //Only for foreignKey Column
ascending
            }
            else if (key == "EmployeeID desc") {
                GridData = SortFor(key); //Only for foreignKey Column
descending
            }
        }
        var count = GridData.Count();
        var data = GridData.AsQueryable();
        return data;
    }

    public List<Item> SortFor(String Sorted)
    {
        List<Item> GridData =
JsonConvert.DeserializeObject<Item[]>(Properties.Resources.ItemsJson).AsQuer
yable().ToList();
        List<Brand> empData =
JsonConvert.DeserializeObject<Brand[]>(Properties.Resources.BrandsJson).AsQu
eryable().ToList();
        if (Sorted == "EmployeeID") //check whether ascending or descending
            empData = empData.OrderBy(e => e.FirstName).ToList();
        else if (Sorted == "EmployeeID desc")
            empData = empData.OrderByDescending(e => e.FirstName).ToList();
        List<Item> or = new List<Item>();
        for (int i = 0; i < empData.Count(); i++) {
            //Select the Field matching records
            IEnumerable<Item> list = GridData.Where(pred => pred.EmployeeID
== empData[i].EmployeeID).ToList();
            or.AddRange(list);
        }
        return or;
    }
}

```

Sorting events

During the sort action, the grid component triggers two events. The [ActionBegin](#) event triggers before the sort action starts, and the [ActionComplete](#) event triggers after the sort action is completed. Using these events you can perform the needed actions.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasources)
.AllowSorting(true).ActionComplete("sortEvent").ActionBegin("sortEvent").Col
umns(col =>
{

```

```

col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer Name").Width("170").Add();
col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).AllowPaging().PageSettings(page => page.PageCount(5)).Render()
<script>
    function sortEvent(args){
        alert(args.requestType + ' ' + args.type); //custom Action
    }
</script>

```

SORT-EVENT.CS

```

public IActionResult Index()
{
    ViewBag.datasource = OrdersDetails.GetAllRecords();
    return View();
}

```

Note: The **args.requestType** is the current action name. For example, in sorting the **args.requestType** is sorting.

Touch interaction

When you tap the grid header on touchscreen devices, the selected column header is sorted. A popup

is displayed for multi-column sorting. To sort multiple columns, tap the popup , and then tap the desired grid headers.

Note: The [AllowMultiSorting](#) and [AllowSorting](#) should be **true** then only the popup will be shown.

The following screenshot shows grid touch sorting.

- [How to perform own sorting logic in ASP.NET MVC Grid](#)

Grouping in ASP.Net MVC Grid Component

The Grid has options to group records by dragging and dropping the column header to the group drop area. When grouping is applied, grid records are organized into a hierarchical structure to facilitate easier expansion and collapse of records.

To enable grouping in the grid, set the [AllowGrouping](#) as true. Grouping options can be configured through the [GroupSettings](#).

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowGrouping().Render()
```

GROUP.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: You can group and ungroup columns by using the [groupColumn](#) and [ungroupColumn](#) methods.

 To disable grouping for a particular column, set [AllowGrouping](#) property of [Column](#) to false.

Initial group

To apply group at initial rendering, set the column field name in the [Columns](#) property of [GroupSettings](#).

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowGrouping().GroupSettings(group => { group.Columns(new string[] {
"CustomerID" }); }).Render()
```

INITIAL-GROUP.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Hide drop area

To avoid ungrouping or further grouping of a column after initial column grouping, define the [ShowDropArea](#) of [GroupSettings](#) as false.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
}
```

```
col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowGrouping().GroupSettings(group => {
group.ShowDropArea(false).Columns(new string[] { "Freight" }); }).Render()
```

HIDE-DROP-AREA.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Group with paging

On grouping columns with paging feature, the aggregated information and total items are displayed based on the current page. The grid does not consider aggregated information and total items from other pages. To get additional details (aggregated information and total items) from other pages, set the [DisablePageWiseAggregates](#) of [GroupSettings](#) to false.

Note: If remote data is bound to grid dataSource, two requests will be sent when performing grouping action; one for getting the grouped data and another for getting aggregate details and total items count.

Group by format

By default, a column will be grouped by the data or value present for the particular row. To group the numeric or datetime column based on the mentioned format, you have to enable the [EnableGroupByFormat](#) property of the corresponding grid columns.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").EnableGroupByFormat(true).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).EnableGroupByFormat(true).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowGrouping().GroupSettings(group => {
group.ShowDropArea(false).Columns(new string[] { "OrderDate", "Freight" });
}).Render()
```

GROUP-FORMAT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Grouping events

During the group action, the grid component triggers two events. The [ActionBegin](#) event triggers before the group action starts and the [ActionComplete](#) event triggers after the group action is completed. Using these events you can perform any action.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.dataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
})
.AllowPaging().AllowGrouping().ActionBegin("actionHandler").ActionComplete
("actionHandler").Render()
<script>
    function actionHandler(args) {
        alert(args.requestType + ' ' + args.type); //Custom Action
    }
</script>
```

GROUPING-EVENTS.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: The **args.requestType** is based on the current action name. For example, when grouping, the **args.requestType** value will be grouping.

Collapse by external button

You can collapse the selected group from an external button by invoking the `expandCollapseRows` method.

CSHTML

```
@Html.EJS().Button("collapse").Content("Collapse").IsPrimary(true).Render()
```

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowGrouping().GroupSettings(group => { group.Columns(new string[] {
"Freight" }).ShowDropArea(false); }).Render()
<script>
    document.getElementById('collapse').addEventListener('click', () => {
        var grid = document.getElementById('Grid').ej2_instances[0];
        if (grid.getSelectedRowIndex().length) {
            var currentTr = grid.getRows()[grid.getSelectedRowIndex()[0]];
            while (currentTr.classList && currentTr.classList.length) {
                currentTr = currentTr.previousSibling;
            }
            let collapseElement = currentTr.querySelector('.e-
recordplusexpand');
            grid.groupModule.expandCollapseRows(collapseElement); //Pass the
collapse row element.
        }
    });
</script>
```

COLLAPSE.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Sort grouped columns in descending order during initial grouping

By default, grouped columns are sorted in ascending order. To sort grouped columns in descending order during initial grouping, you can set the **field** and **direction** in the [Columns](#) property of **SortSettings**.

The **CustomerID** column will be sorted in descending order when the grid is initially grouped, as shown in the following example.

CSHTML

```
@{
    List<object> cols = new List<object>();
    cols.Add(new { field = "CustomerID", direction = "Descending" });
}
```

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowGrouping().AllowSorting().SortSettings(sort =>
sort.Columns(cols)).GroupSettings(group => { group.Columns(new string[] {
"CustomerID" }); }).Render()
```

SORT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

- [Exporting grouped records](#)

Filtering in ASP.Net MVC Grid Component

Filtering allows you to view particular records based on filter criteria. To enable filtering in the Grid, set the [AllowFiltering](#) to true. Filtering options can be configured through [FilterSettings](#) property.

<!--

Grid supports two types of filter, they are:

- Filter bar
- Excel

-->

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowFiltering(true).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
```

```
col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Render()
```

FILTER.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: You can apply and clear filtering by using [filterByColumn](#) and [clearFiltering](#) methods.

 To disable filtering for a particular column, set [AllowFiltering](#) of [Column](#) to false.

Initial filter

To apply the filter at initial rendering, set the filter **Predicate** object in [FilterSettings](#) property of [Column](#).

CSHTML

```
@{
    List<object> filterColumns = new List<object>();
    filterColumns.Add(new { field = "EmployeeID", matchCase = false,
@operator = "equal", predicate = "and", value = 1 });
    filterColumns.Add(new { field = "ShipCountry", matchCase = false,
@operator = "startswith", predicate = "and", value = "Denmark" });
}
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowFiltering(true).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("EmployeeID").HeaderText("Employee ID").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).FilterSettings(filter =>
filter.Columns(filterColumns)).AllowPaging().Render()
```

INITIALFILTER.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Filter operators

The filter operator for a column can be defined in the [Operators](#) property of [FilterSettings](#).

The available operators and its supported data types are:

Operator	Description	Supported Types
----- ----- -----		
startswith	Checks whether the value begins with the specified value.	String
endswith	Checks whether the value ends with the specified value.	String
contains	Checks whether the value contains the specified value.	String
doesnotstartwith	Checks whether the value does not begin with the specified value.	String
doesnotendwith	Checks whether the value does not end with the specified value.	String
doesnotcontain	Checks whether the value does not contain the specified value.	String
equal	Checks whether the value is equal to the specified value.	String | Number | Boolean | Date
notequal	Checks for values not equal to the specified value.	String | Number | Boolean | Date
greaterthan	Checks whether the value is greater than the specified value.	Number | Date
greaterthanorequal	Checks whether a value is greater than or equal to the specified value.	Number | Date
lessthan	Checks whether the value is less than the specified value.	Number | Date
lessthanorequal	Checks whether the value is less than or equal to the specified value.	Number | Date
isnull	Returns the values that are null.	String | Number | Date
isnotnull	Returns the values that are not null.	String | Number | Date
isempty	Returns the values that are empty.	String
isnotempty	Returns the values that are not empty.	String
between	Filter the values based on the range between the start and end specified values.	Number | Date

Wildcard and LIKE operator filter

Wildcard and **LIKE** filter operators filters the value based on the given string pattern, and they apply to string-type columns. But it will work slightly differently.

Wildcard filtering

The **Wildcard** filter can process one or more search patterns using the "*" symbol, retrieving values matching the specified patterns.

- The **Wildcard** filter option is supported for the DataGrid that has all search options.

For example:

Operator | Description

%ab% | Returns all the value that are contains "ab" character.

ab% | Returns all the value that are ends with "ab" character.

%ab | Returns all the value that are starts with "ab" character.

![LIKEFilter](../images/like_filter.gif)

Note: By default, the [Operators](#) value is **equal**.

See Also

- [Customizing Filter Dialog by using an additional parameter](#)
- [Hide sorting options on Excel filter Dialog](#)

Search in ASP.NET MVC Grid Component

You can search records in a Grid, by using the [search](#) method with search key as a parameter. This also provides an option to integrate search text box in grid's toolbar by adding **Search** item to the [Toolbar](#).

Note: The clear icon is shown in the Data Grid search text box when it is focused on search text or after typing the single character in the search text box. A single click of the clear icon clears the text in the search box as well as the search results in the Data Grid.

CSHTML

```
@Html.EJS().Grid("Search").DataSource((IEnumerable<object>)ViewBag.datasourc
e).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("160").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("170").Add();

    col.Field("Freight").HeaderText("Freight").Width("170").TextAlign(Syncfusion
.EJ2.Grids.TextAlign.Right).Format("C2").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("170").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
}).AllowPaging().PageSettings(page => page.PageCount(2)).Toolbar(new
List<string>() { "Search" }).Render()
```

SEARCH.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Initial search

To apply search at initial rendering, set the fields, operator, key, and ignoreCase in the [SearchSettings](#) property.

CSHTML

```
@Html.EJS().Grid("Search").DataSource((IEnumerable<object>)ViewBag.datasourc
e).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("160").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("170").Add();

    col.Field("Freight").HeaderText("Freight").Width("170").TextAlign(Syncfusion
.EJ2.Grids.TextAlign.Right).Format("C2").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("170").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
}).AllowPaging().SearchSettings(search => { search.Fields(new string[] {
"CustomerID" }).Key("Ha").Operator("contains").IgnoreCase(true);
}).PageSettings(page => page.PageCount(2)).Toolbar(new List<string>() {
"Search" }).Render()
```

INITIAL-SEARCH.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Note: By default, grid searches all the bound column values. To customize this behavior define the [Fields](#) of [SearchSettings](#) property.

Search operators

The search operator can be defined in the [Operator](#) property of [SearchSettings](#) to configure specific searching.

The following operators are supported in searching:

Operator	Description
----- -----	
startswith	Checks whether a value begins with the specified value.
endswith	Checks whether a value ends with the specified value.
contains	Checks whether a value contains the specified value.
equal	Checks whether a value is equal to the specified value.
notequal	Checks for values not equal to the specified value.

Note: By default, the [Operator](#) value is **contains**.

Search by external button

To search grid records from an external button, invoke the [search](#) method.

CSHTML

```
@Html.EJS().Button("search").Content("Search").Render()
@Html.EJS().Grid("Search").DataSource((IEnumerable<object>)ViewBag.datasourc
e).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("160").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("170").Add();

    col.Field("Freight").HeaderText("Freight").Width("170").TextAlign(Syncfusion
.EJ2.Grids.TextAlign.Right).Format("C2").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("170").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
}).AllowPaging().PageSettings(page=>page.PageCount(2)).Render()
<script>
    document.getElementById('search').addEventListener('click', () => {
        var gridObj = document.getElementById("Search").ej2_instances[0];
        var searchString = "AL";
        gridObj.search(searchString);
    });
</script>
```

EXTERNAL-BTN.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Search specific columns

By default, grid searches all visible columns. You can search specific columns by defining the specific column's field names in the [Fields](#) property of [SearchSettings](#).

CSHTML

```
@Html.EJS().Grid("Search").DataSource((IEnumerable<object>)ViewBag.datasourc
e).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("160").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("170").Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("170").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("140").Add();
}).AllowPaging().SearchSettings(search => { search.Fields(new string[] {
"CustomerID", "ShipCity", "ShipName" }); }).PageSettings(page =>
page.PageCount(2)).Toolbar(new List<string>() { "Search" }).Render()
```

SEARCH-A-COLUMN.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Clear search by external button

To clear the searched grid records from the external button, set [Key](#) property as **empty** string.

CSHTML

```
@Html.EJS().Button("clear").Content("Clear Search").Render()
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasources)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("160").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("170").Add();

    col.Field("Freight").HeaderText("Freight").Width("170").TextAlign(Syncfusion
.EJ2.Grids.TextAlign.Right).Format("C2").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("170").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
}).AllowPaging().SearchSettings(search => { search.Fields(new string[] {
"CustomerID" }).Key("Ha").Operator("contains").IgnoreCase(true);
}).PageSettings(page => page.PageCount(2)).Toolbar(new List<string>() {
"Search" }).Render()
<script>
    document.getElementById('clear').addEventListener('click', () => {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        gridObj.searchSettings.key = '';
    });
</script>
```

CLEAR-SEARCH.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasources = orders;
    return View();
}
```

Search on each key stroke

You can search the Grid data on each key stroke by binding the **keyup** event for the search input element inside the [created](#) event. Inside the **keyup** handler you can search the Grid by invoking the [search](#) method of the Grid component.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasources)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("160").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("170").Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("170").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("140").Add();
}).AllowPaging().Created("created").Toolbar(new List<string>() { "Search"
}).Render()
<script>
```

```
function created() {
    var grid = document.getElementById("Grid").ej2_instances[0];
    document.getElementById(grid.element.id +
        "_searchbar").addEventListener('keyup', () => {
        grid.search(event.target.value)
    });
}
</script>
```

SEARCH-EACH-KEY.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Perform search operation in Grid using multiple keywords

You can perform a searching operation in the Grid using multiple keywords. This can be achieved by the [ActionBegin](#) event of the Grid.

In the following sample, we have performed the searching with multiple keywords by using the query property of grid when the requestType is searching in the [ActionBegin](#) event.

CSHTML

```
@using dotnet_mvc_sample.Controllers;
@{
    List<object> toolbarItems = new List<object>();
    toolbarItems.Add("Search");
}
@(Html.EJS().Grid<HomeController.BigData>("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("OrderID").IsPrimaryKey(true).Width("120").Add();
    col.Field("CustomerID").HeaderText("CustomerID").Width("120").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").Add();
    col.Field("ShipCity").HeaderText("ShipCity").Width("120").Add();
}).Toolbar(toolbarItems).ActionBegin("actionBegin").ActionComplete("actionComplete").Render())
<script>
    var values;
    var key = '';
    var refresh = false;
    var removeQuery = false;
    var valueAssign = false;
    function actionBegin(args) {
        if (args.requestType == 'searching') {
            const keys = args.searchString.split(',');
            var flag = true;
            var predicate;
```

```

        if (keys.length > 1) {
            if (this.searchSettings.key !== '') {
                values = args.searchString;
                keys.forEach((key) => {
                    this.getColumns().forEach((col) => {
                        if (flag) {
                            predicate = new ej.data.Predicate(
                                col.field,
                                'contains',
                                key,
                                true
                            );
                            flag = false;
                        } else {
                            var predic = new ej.data.Predicate(
                                col.field,
                                'contains',
                                key,
                                true
                            );
                            predicate = predicate.or(predic);
                        }
                    });
                });
            }
            this.query = new ej.data.Query().where(predicate);
            this.searchSettings.key = '';
            refresh = true;
            valueAssign = true;
            removeQuery = true;
            this.refresh();
        }
    }
}

function actionComplete(args) {
    if (args.requestType === 'refresh' && valueAssign) {
        document.getElementById(this.element.id + '_searchbar').value =
values;
        valueAssign = false;
    } else if (
document.getElementById(this.element.id + '_searchbar').value
=== '' &&
args.requestType === 'refresh' &&
removeQuery
) {
        this.query = new ej.data.Query();
        removeQuery = false;
        this.refresh();
    }
}
</script>

```

SEARCH-MULTIPLE-KEYWORDS.CS

```

public IActionResult Index()
{

```

```
var orders = OrderDetails.GetAllRecords();
ViewBag.Datasource = orders;
return View();
}
```

Note: * Define multiple keywords by using a comma separator in search bar to search.

Note: * Search operation can be performed in foreign key column based on following way.

 * When a value is searched on a grid with the foreign key column, a filter query is sent to the foreign key data source, and the appropriate column is filtered depending on the search value. The search query will be sent to the grid data source, and the value of the associated field will be returned.

Paging

Paging provides an option to display Grid data in page segments. To enable paging, set the [AllowPaging](#) to true. When paging is enabled, pager component renders at the bottom of the grid. Paging options can be configured through the [PageSettings](#).

In the below sample, **pageSize** is calculated based on the grid height by using the [Load](#) event.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Height("325").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Load("load").Render()
<script>
    function load() {
        var grid = document.getElementById('Grid').ej2_instances[0];
        var rowHeight = grid.getRowHeight(); //height of the each row
        var gridHeight = grid.height; //grid height
        var pageSize = grid.pageSettings.pageSize; //initial page size
        var pageResize = (gridHeight - (pageSize * rowHeight)) / rowHeight;
        //new page size is obtained here
        grid.pageSettings.pageSize = pageSize + Math.round(pageResize);
    }
</script>
```

PAGE.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Note: You can achieve better performance by using grid paging to fetch only a pre-defined number of records from the data source.

Template

You can use custom elements inside the pager instead of default elements. The custom elements can be defined by using the [Template](#) property of [PageSettings](#). Inside this template, you can access the **CurrentPage**, **PageSize**, **TotalPage** and **TotalRecordCount** values.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().PageSettings(page => {
    page.PageSize(7).Template("#template");
}).ActionComplete("actionComplete").DataBound("dataBind").Render()
<script>
    function updateTemplate() {
        var numeric;
        var grid = document.getElementById("Grid").ej2_instances[0];
        numeric = new ej.inputs.NumericTextBox({
            min: 1,
            max: 3,
            step: 1,
            width: 100,
            format: '###.##',
            change: function (args) {
                let value = args.value;
                grid.goToPage(value);
            }
        });
        numeric.appendTo('#currentPage');
    };
    var flag = true;
    function dataBind() {
        if (flag) {
            flag = false;
            updateTemplate();
        }
    }
}
```

```

function actionComplete(args) {
    if (args.requestType === 'paging') {
        updateTemplate();
    }
}
</script>
<script id="template" type="text/x-template">
    <div class="e-pagertemplate">
        <div>
            <div class="content-wrapper">
                <input id="currentPage" type="text" value=${currentPage}>
            </div>
        </div>
        <div id="totalPages" class="e-pagertemplatemessage" style="margin-top:5px;margin-left:30px;border: none; display: inline-block ">
            <span class="e-pagenomsg">${currentPage} of ${totalPages} pages
            (${totalRecordsCount} items)</span>
        </div>
    </div>
</script>

```

PAGE-TEMP.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}

```

Pager with Page Size Dropdown

The pager Dropdown allows you to change the number of records in the Grid dynamically. It can be enabled by defining the [PageSizes](#) property of [PageSettings](#) as true.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().PageSettings(page=> { page.PageSizes(true); }).Render()

```

PAGERDROPDOWN.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
}

```

```
return View();
}
```

How to render Pager at the Top of the Grid

By default, Pager will be rendered at the bottom of the Grid. You can also render the Pager at the top of the Grid by using the [DataBound](#) event.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
})
.AllowPaging().DataBound("dataBound").Toolbar(new List<string>() { "Add",
"Edit", "Delete", "Update", "Cancel" }).Render()
<script>
    var initialGridLoad = true;
    function dataBound() {
        if (initialGridLoad) {
            initialGridLoad = false;
            var pager = document.getElementsByClassName('e-gridpager');
            var toolbar = document.getElementsByClassName('e-toolbar');
            this.element.insertBefore(pager[0], toolbar[0]);
        }
    }
</script>
```

PAGERATTOP.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Note: During the paging action, the pager component triggers the below three events.

 The created event triggers when Pager is created.

 The click event triggers when the numeric items in the pager is clicked.

 The dropDownChanged event triggers when pageSize DropDownList value is selected.

See Also

- [Group with Paging](#)

Scrolling

The scrollbar will be displayed in the grid when content exceeds the element [Width](#) or [Height](#). The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the grid exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the grid element width.
- The [Height](#) and [Width](#) are used to set the grid height and width, respectively.

Note: The default value for [Height](#) and [Width](#) is **auto**.

Set width and height

To specify the [Width](#) and [Height](#) of the scroller in the pixel, set the pixel value to a number.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.Height("400").Width("auto").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShippedDate").HeaderText("Shipped
Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipAddress").HeaderText("Ship Address").Width("170").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("170").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).Render()
```

WIDTH-HEIGHT.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Responsive with parent container

Specify the [Width](#) and [Height](#) as **100%** to make the grid element fill its parent container. Setting the [Height](#) to **100%** requires the grid parent element to have explicit height.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.Height("100%").Width("auto").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShippedDate").HeaderText("Shipped
Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipAddress").HeaderText("Ship Address").Width("170").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("170").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).Render()
```

RESPONSIVE-PARENT.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Scroll to selected row

You can scroll the grid content to the selected row position by using the [RowSelected](#) event.

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Placeholder("Enter index to select a
row").Change("onChange").Width("200").Render()
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.Height("400").Width("auto").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShippedDate").HeaderText("Shipped
Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipAddress").HeaderText("Ship Address").Width("170").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("170").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}
```

```

}).RowSelected("rowSelected").Render()
<script>
    function onChange(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        gridObj.selectRow(parseInt(this.getText(), 10));
    }
    function rowSelected(args) {
        var rowHeight =
this.getRows()[this.getSelectedRowIndex()[0]].scrollHeight;
        this.getContent().children[0].scrollTop = rowHeight *
this.getSelectedRowIndex()[0];
    }
</script>

```

SCROLL-SELECTED-ROW.CS

```

public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}

```

Hide the scrollbar when the content is not overflown

You can hide the scrollbar of Grid content by using the [hideScroll](#) method when the content doesn't overflow its parent element.

In the following sample, we have invoked the [hideScroll](#) method inside the [dataBound](#) event.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.Height("400").Width("auto").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShippedDate").HeaderText("Shipped
Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
}).DataBound("dataBound").AllowPaging().PageSettings(page=> {
page.PageSize(2); }).Render()
<script>
    function dataBound() {
        var grid = document.getElementById('Grid').ej2_instances[0];
        grid.hideScroll();
    }
</script>

```

HIDE-SCROLL.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Frozen rows and columns

Frozen rows and columns provides an option to make rows and columns always visible in the top and left side of the grid while scrolling.

In this demo, the [FrozenColumns](#) is set as **2** and the [FrozenRows](#) is set as **3**. Hence, the left two columns and top three rows are frozen.

CSHTML

```
@Html.EJS().Grid("FrozenGrid").DataSource((IEnumerable<object>)ViewBag.datasource).AllowSelection(false).AllowResizing().Height("410").FrozenRows(2).FrozenColumns(1).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("200").Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShippedDate").HeaderText("Shipped Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("200").Add();
    col.Field("ShipAddress").HeaderText("Ship Address").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).Render()
```

FREEZE-ROW-COLUMN.CS

```
public IActionResult Index()
{
    ViewBag.datasource = OrdersDetails.GetAllRecords();
    return View();
}
```

Note: Frozen rows and columns should not be set outside the grid view port.

 Frozen Grid will support row and column virtualization feature, which helps to improve the Grid performance while loading a large dataset.

Limitations of Frozen Grid

The following features are not supported in frozen rows and columns:

- Detail Template
- Hierarchy Grid

Freeze particular columns

To freeze particular column in the grid, the [IsFrozen](#) property can be used.

In this demo, the columns with field name **OrderID** and **CustomerID** is frozen using the [IsFrozen](#) property.

CSHTML

```
@Html.EJS().Grid("FrozenGrid").DataSource((IEnumerable<object>)ViewBag.datas
ource).AllowSelection(false).AllowResizing().Height("410").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").IsFrozen(true).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Ri
ght).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").IsFrozen(true).Width("200").Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShippedDate").HeaderText("Shipped
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("200").Add();
    col.Field("ShipAddress").HeaderText("Ship Address").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).Render()
```

FREEZE-COLUMN.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Freeze Direction

You can freeze the Grid columns on the left or right side by using the [column.freeze](#) property and the remaining columns will be movable. The grid will automatically move the columns to the left or right position based on the [column.freeze](#) value.

Types of the [column.freeze](#) directions:

- **Left:** Allows you to freeze the columns at the left.
- **Right:** Allows you to freeze the columns at the right.

- **Fixed:** Allows you to lock the column at a fixed position by ensuring its visibility during horizontal scroll.

In this demo, the **ShipCountry** column is frozen at the left and the **CustomerID** column is frozen at the right side of the content table.

CSHTML

```
@Html.EJS().Grid("FrozenGrid").DataSource((IEnumerable<object>)ViewBag.datas
ource).FrozenRows(2).Height("410").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
ID").Width("150").Freeze(Syncfusion.EJ2.Grids.FreezeDirection.Right).Add();
    col.Field("EmployeeID").HeaderText("Employee
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipAddress").HeaderText("Ship Address").Width("150").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship
Country").Width("150").Freeze(Syncfusion.EJ2.Grids.FreezeDirection.Left).Add
();
}).Render()
```

FREEZE-COLUMN.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Note: * Freeze Direction is not compatible with the `isFrozen` and `frozenColumns` properties.

Deprecated Methods

Deprecated Methods | [Previous](#) | [Current](#) | [Suggested Alternative Methods](#) | [Example for achieving the same results](#)

getMovableRows() | In the previous architecture of frozen grid, three separate tables were created for the left, right, and movable contents. When calling this method, it would return only the movable table rows (tr's). | In the current architecture, the frozen left, right, and movable sections are applied within a single table. When calling this method, it will return all table rows (tr's) of the entire table. However, in this approach, we have introduced the `e-unfreeze` class for movable cells. This allows us to selectively retrieve the movable rows using the `e-unfreeze` class selector. | **getRows()** |

`gridInstance.getMovableRows()[0].querySelectorAll('.e-unfreeze')` // Deprecated
 (or)
`gridInstance.getRows()[0].querySelectorAll('.e-unfreeze')` // Alternative method

`getFrozenRightRows()` | In the previous architecture, this method would return only the table rows (tr's) from the freeze right table. | In the current architecture, the frozen left, right, and movable sections are applied within a single table. When calling this method, it will return all the rows (tr's) of the entire table. In this new approach, we have introduced the `e-rightfreeze` class for right freeze cells. As a result, you can now selectively retrieve the right freeze rows using the `e-rightfreeze` class selector.
 | `getRows()` | `gridInstance.getFrozenRightRows()[0].querySelectorAll('.e-rightfreeze')` // Deprecated
 (or)
`gridInstance.getRows()[0].querySelectorAll('.e-rightfreeze')` // Alternative method

`getMovableRowByIndex()` (or) `getFrozenRowByIndex()` (or) `getFrozenRightRowByIndex()` | In the previous architecture, you could select rows by using separate methods for each table section. Like,
 (or) `getMovableRowByIndex` - select a movable row (or) `getFrozenRowByIndex` - select a freeze row (or) `getFrozenRightRowByIndex` - select a right freeze row. | In the current architecture, the `getMovableRowByIndex`, `getFrozenRightRowByIndex` and `getFrozenRowByIndex` methods all return the same table row (tr) based on the given index. Additionally, class names for table cells (td's) have been separated as follows: (or) Left-Freeze : `e-leftfreeze` (or) Movable : `e-unfreeze` (or) Right-Freeze : `e-rightfreeze`. This separation of class names makes it easier to target and customize the cells within the particular row. | `getRowByIndex()` | **To get the left freeze cells:**
`gridInstance.getRowByIndex(1).querySelectorAll('.e-leftfreeze')` (or) **To get the movable cells:**
`gridInstance.getRowByIndex(1).querySelectorAll('.e-unfreeze')` (or) **To get the right freeze cells:**
`gridInstance.getRowByIndex(1).querySelectorAll('.e-rightfreeze')`

`getMovableCellFromIndex()` (or) `getFrozenRightCellFromIndex()` | `getMovableCellFromIndex()` - select a particular cell in the movable table. (or) `getFrozenRightCellFromIndex()` - select a particular cell in the right freeze table. | In the new approach, you can select a particular cell by using both the `getFrozenRightCellFromIndex` and `getMovableCellFromIndex` methods. | `getCellFromIndex()`
`gridInstance.getCellFromIndex(1,1)`

`getMovableDataRows()` (or) `getFrozenRightDataRows()` (or) `getFrozenDataRows()` | These methods returns the viewport data rows for the freeze, movable, and right tables separately. | In the new approach, when calling the `getMovableDataRows`, `getFrozenRightDataRows`, and `getFrozenDataRows` methods, returns the entire viewport data rows. You can then select specific cells within these rows using the following selectors (or) Left-Freeze : `e-leftfreeze` (or) Movable : `e-unfreeze` (or) * Right-Freeze : `e-rightfreeze`. | `getDataRows()` | **To get the movable data cells:**
`gridInstance.getDataRows()[0].querySelectorAll('.e-unfreeze')` (or) **To get the right freeze data cells:**
`gridInstance.getDataRows()[0].querySelectorAll('.e-rightfreeze')` (or) **To get the left freeze data cells:**
`gridInstance.getDataRows()[0].querySelectorAll('.e-leftfreeze')`

`getMovableColumnHeaderByIndex()` (or) `getFrozenRightColumnHeaderByIndex()` (or) `getFrozenLeftColumnHeaderByIndex()` | In the previous architecture, these methods selects the movable, right freeze, and left freeze headers from the table separately. | In the new approach, when calling the `getMovableColumnHeaderByIndex`, `getFrozenRightColumnHeaderByIndex`, and `getFrozenLeftColumnHeaderByIndex` methods, you will still receive the same results as before. | `getColumnHeaderByIndex()` | `gridInstance.getColumnHeaderByIndex(1)`

When a validation message is displayed in the frozen part (Left, Right, Fixed) of the table, scrolling is prevented until the validation message is cleared.

Virtualization in ASP.NET MVC Grid Component

Grid allows you to load large amount of data without performance degradation.

Row Virtualization

Row virtualization allows you to load and render rows only in the content viewport. It is an alternative way of paging in which the data will be loaded while scrolling vertically. To setup the row virtualization, you need to define [EnableVirtualization](#) as true and content height by [Height](#) property.

The number of records displayed in the Grid is determined implicitly by height of the content area. Also, you have an option to define a visible number of records by the [PageSettings.PageSize](#) property. The loaded data will be cached and reused when it is needed for next time.

CSHTML

```
@Html.EJS().Grid("VirtualGrid").DataBound("hide").EnableVirtualization().Height("500").Columns(col =>
{
    col.Field("Field1").HeaderText("S.No").IsPrimaryKey(true).ValidationRules(new { required = "true" }).Width("140").Add();

    col.Field("Field2").HeaderText("Year").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Field3").HeaderText("Stint").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Field4").HeaderText("TMID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Field5").HeaderText("LGID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).EditSettings(edit => {
    edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusion.EJ2.Grids.EditMode.Normal);
}).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel" }).Render()

```

ROW-VIRTUALIZATION.CS

```

public IActionResult Index()
{
    return View();
}

```

Column Virtualization

Column virtualization allows you to virtualize columns. It will render columns which are in the viewport. You can scroll horizontally to view more columns.

To setup the column virtualization, set the [EnableVirtualization](#) and [EnableColumnVirtualization](#) properties as **true**.

CSHTML

```
@Html.EJS().Grid("VirtualGrid").DataBound("hide").EnableColumnVirtualization
().EnableVirtualization().Height("500").Columns(col =>
{
    col.Field("Field1").HeaderText("S.No").Width("140").IsPrimaryKey(true).Valid
ationRules(new { required = "true"}).Add();

    col.Field("Field2").HeaderText("Year").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field3").HeaderText("Stint").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field4").HeaderText("TMID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field5").HeaderText("LGID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field6").HeaderText("GP").Width("120").TextAlign(Syncfusion.EJ2.G
rids.TextAlign.Right).Add();

    });
    }
}
</script>

```

COLUMN-VIRTUALIZATION.CS

```

public IActionResult Index()
{
    return View();
}

```

Note: Column's [Width](#) is required for column virtualization. If column's width is not defined then Grid will consider its value as 200px.

Virtualization with Grouping

Both the row and column virtualization can be used along with grouping. At initial rendering, the virtual height of scrollbar will be set based on the total number of records and after grouping, it will be refreshed based on the grouped state(expand/collapse). While collapse the group caption row in current viewport then the next view page grouped records are shown.

Note: The collapsed/expanded state will persist only for local dataSource while scrolling.

Limitations for virtual scrolling

- While using column virtual scrolling, column width should be in the pixel. Percentage values are not accepted.
- Due to the element height limitation in browsers, the maximum number of records loaded by the grid is limited by the browser capability.
- The cell selection is not supported for both row and column virtual scrolling.
- Virtual scrolling is not compatible with batch editing, detail template, rowspan, colspan and hierarchy features.
- Group expand and collapse state will not be persisted.
- Since data is virtualized in grid, the aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the [Group with Page](#) topic.
- The page size provided must be two times larger than the number of visible rows in the grid. If the page size is failed to meet this condition then the size will be determined by grid.

- The height of the grid content is calculated using the row height and total number of records in the data source and hence features which changes row height such as text wrapping are not supported. If you want to increase the row height to accommodate the content then you can specify the row height as below to ensure all the table rows are in same height.

```
`css
.e-grid .e-row {
height: 2em;
}
`
```

- Programmatic selection using the `selectRows` method is not supported in virtual scrolling.

Browser height limitation in virtual scrolling and solution

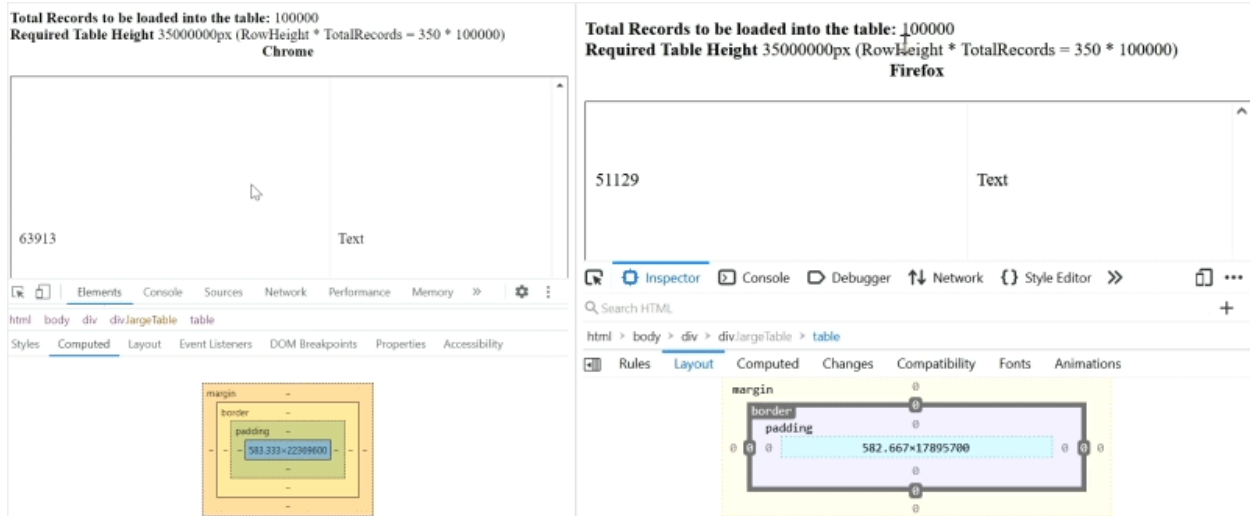

You can load millions of records in the Grid by using virtual scrolling, where the grid loads and renders rows on-demand while scrolling vertically. As a result, Grid lightens the browser's load by minimizing the DOM elements and rendering elements visible in the viewport. The height of the grid is calculated using the Total Records Count * [Row Height](#) property.

The browser has some maximum pixel height limitations for the scroll bar element. The content placed above the maximum height can't be scrolled if the element height is greater than the browser's maximum height limit. The browser height limit affects the virtual scrolling of the grid. When a large number of records are bound to the Grid, it can only display the records until the maximum height limit of the browser. Once the browser's height limit is reached while scrolling, the user won't be able to scroll further to view the remaining records.

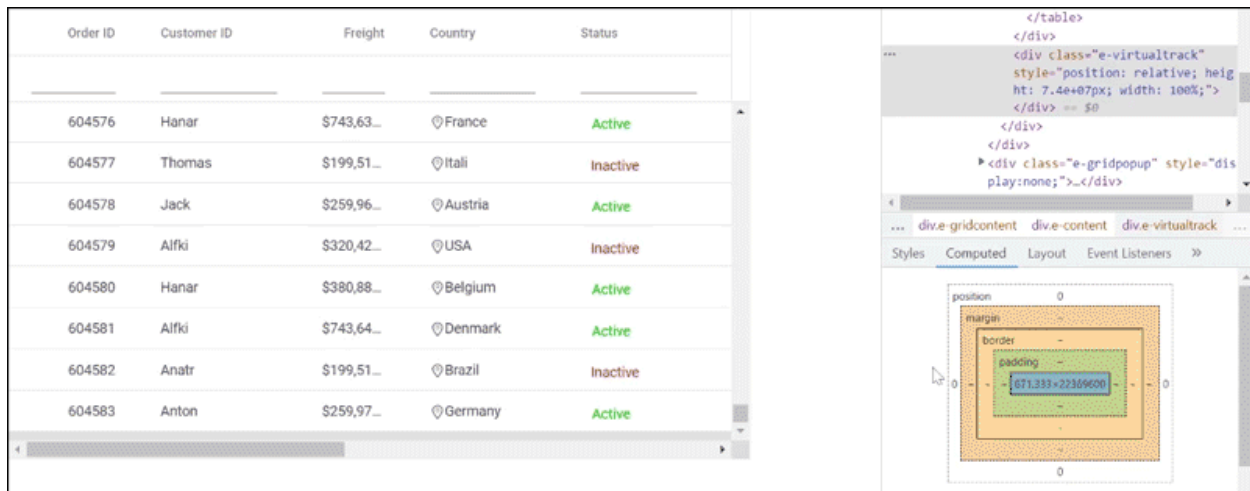

For example, if the row height is set as 30px and the total record count is 1000000 (1 million), then the height of the grid element will be 30,000,000 pixels. In this case, the browser's maximum height limit for a div is about 22,369,600 (The maximum pixel height limitation differs for different browsers). The records above the maximum height limit of the browser can't be scrolled.

This height limitation is not related to the Grid component. It fully depends on the default behavior of the browser. The same issue is reproduced in the normal HTML table too.

The following image illustrates the height limitation issue of a normal HTML table in different browsers (Chrome and Firefox).

Grid component also faced the same issue as mentioned in the below image.

The Grid has an option to overcome this limitation of the browser in the following ways.

[Solution 1: Using external buttons](#)

You can prevent the height limitation problem in the browser when scrolling through millions of records by loading the segment of data through different strategy.

In the following sample, Grid is rendered with a large number of records(nearly 2 million). Here, you can scroll 0.5 million records at a time in Grid. Once you reach the last page of 0.5 million records, the **Load Next Set** button will be shown at the bottom of the Grid. By clicking that button, you can view the next set of 0.5 million records in Grid. Also, the **Load Previous Set** button will be shown at the top of the Grid to load the previous set of 0.5 million records.

Let's see the step by step procedure for how we can overcome the limitation in the Syncfusion Grid component.

1. Create a custom adaptor by extending `UrlAdaptor` and binding it to the grid `DataSource` property. In the `processQuery` method of the custom adaptor, we handled the `Skip` query based on the current page set to perform the data operation with whole records on the server.

`csharp

```

export class CustomUrlAdaptor extends UrlAdaptor {
processQuery(args) {
if (arguments[1].queries) {
for (var i = 0; i < arguments[1].queries.length; i++) {
if (arguments[1].queries[i].fn === 'onPage') {
// pageSet - defines the number of segments that we are going to split the 2million records. In this
// example we have considered 0.5 million records for each set so the pageSet is 1, 2, 3 and 4.
// maxRecordsPerPageSet – In this example we define the value as 0.5 million.
// gridPageSize – the pageSize that we have defined in the Grid pageSettings->pageSize property
// customize the pageIndex based on the current pageSet (It send the skip query including the previous
// pageSet ) so that the other operations performed for total 2millions records instead of 0.5 million alone.
arguments[1].queries[i].e.pageIndex = (((pageSet - 1) * maxRecordsPerPageSet) / gridPageSize) +
arguments[1].queries[i].e.pageIndex;
}
}
}
var original = super.processQuery.apply(this, arguments);
return original;
}
}

this.dataManager = new DataManager({
adaptor: new CustomUrlAdaptor(),
url: "Home/UrlDatasource"
});
`

```

2.Render the grid by define the following features.

```

`csharp
<GridComponent id='grid' ref={g => this.grid = g} dataSource={this.dataManager}
enableVirtualization={true} pageSettings={this.pageSettings} height={360}
beforeDataBound={this.beforeDataBound}>
<ColumnsDirective>
.....
</ColumnsDirective>
</GridComponent>

```

3. In the `beforeDataBound` event, we set the `args.count` as 0.5 million to perform scrolling with 0.5 million records and all the data operations are performed with whole records which is handled using the custom adaptor. And also particular segment records count is less than 0.5 million means it will directly assigned the original segmented count instead of 0.5 million.

```
`csharp
beforeDataBound(args) {
// storing the total records count which means 2 million records count
totalRecords = args.count;
// change the count with respect to maxRecordsPerPageSet (maxRecordsPerPageSet = 500000)
args.count = args.count - ((pageSet - 1) * maxRecordsPerPageSet) > maxRecordsPerPageSet ?
maxRecordsPerPageSet : args.count - ((pageSet - 1) * maxRecordsPerPageSet);
}
```

4. Render “Load Next Set” button and “Load Previous Set” button at bottom and top of the grid component.

```
`csharp
<div className="pagearea1">
<ButtonComponent cssClass='e-info prevbtn' onClick={this.prevBtnClick} style="width:100%" >Load
Previous Set...</ButtonComponent>
</div>

<GridComponent id='grid' ref={g => this.grid = g} dataSource={this.dataManager}
enableVirtualization={true} pageSettings={this.pageSettings} height={360}
beforeDataBound={this.beforeDataBound} >
<ColumnsDirective>
.....
.....
</ColumnsDirective>
</GridComponent>
<div className="pagearea2">
<ButtonComponent cssClass='e-info nxtbtn' onClick={this.nxtBtnClick} style="width:100%" >Load Next
Set...</ButtonComponent>
</div>
```

5. While click on the **Load Next Set** / **Load Previous Set** button corresponding page data set is loaded to view remaining records of total 2 millions records after doing some simple calculation.

```

`typescript
// Triggered when clicking the Previous/ Next button.
prevNxtBtnClick(args) {
if (this.grid.element.querySelector('.e-content') && this.grid.element.querySelector('.e-
content').getAttribute('aria-busy') === 'false') {
// Increase/decrease the pageSet based on the target element.
pageSet = args.target.classList.contains('prevbtn') ? --pageSet : ++pageSet;
this.rerenderGrid(); // Re-render the Grid component.
}
}
`

```

You can find the full code sample from the below GitHub location.

Note: [View GitHub Sample](#)

Also, you can view the hosted link for this sample [here](#).

LOAD PREVIOUS SET...

Order ID	Customer ID	Freight	Country	Status
1	Alfki	\$12.30	📍Denmark	Active
2	Anatr	\$3.30	📍Brazil	Inactive
3	Anton	\$4.30	📍Germany	Active
4	Blomp	\$5.30	📍Austria	Inactive
5	Bolid	\$6.30	📍Switzerland	Active
6	Hanar	\$12.30	📍France	Active
7	Thomas	\$3.30	📍Itali	Inactive
8	Jack	\$4.30	📍Austria	Active
9	Alfki	\$5.30	📍USA	Inactive
10	Hanar	\$6.30	📍Belgium	Active

LOAD NEXT SET...

Note: If you perform grid actions such as filtering, sorting, etc., after scrolling through the 0.5 million data, the Grid performs those data actions with the whole records, not just the current loaded 0.5 million data.

Solution 2: Using RowHeight property

You can reduce the [row height](#) using the [RowHeight](#) property of the Grid. It will reduce the overall height to accommodate more rows. But this approach optimizes the limitation, but if the height limit is reached after reducing row height also, you have to opt for the previous solution or use paging.

In the following image, you can see how many records will be scrollable when setting rowHeight to "36px" and "30px".

RowHeight = 36px

Order ID	Customer ID	Freight	Country	Status
1	Alfki	\$12.30	📍Denmark	Active
2	Anatr	\$3.30	📍Brazil	Inactive
3	Anton	\$4.30	📍Germany	Active
4	Blomp	\$5.30	📍Austria	Inactive
5	Bolid	\$6.30	📍Switzerland	Active
6	Hanar	\$12.30	📍France	Active
7	Thomas	\$3.30	📍Itali	Inactive
8	Jack	\$4.30	📍Austria	Active

RowHeight = 30px

Order ID	Customer ID	Freight	Country	Status
1	Alfki	\$12.30	📍Denmark	Active
2	Anatr	\$3.30	📍Brazil	Inactive
3	Anton	\$4.30	📍Germany	Active
4	Blomp	\$5.30	📍Austria	Inactive
5	Bolid	\$6.30	📍Switzerland	Active
6	Hanar	\$12.30	📍France	Active
7	Thomas	\$3.30	📍Itali	Inactive
8	Jack	\$4.30	📍Austria	Active
9	Alfki	\$5.30	📍USA	Inactive
10	Hanar	\$6.30	📍Belgium	Active

Solution 3: Using paging instead of virtual scrolling

Similar to virtual scrolling, the [paging](#) feature also loads the data in an on-demand concept. Pagination is also compatible with all the other features (Grouping, Editing, etc.) in Grid. So, use the paging feature instead of virtual scrolling to view a large number of records in the Grid without any kind of performance degradation or browser height limitation.

- Programmatic selection using the `selectRows` method is not supported in virtual scrolling.

Infinite scrolling in ASP.NET MVC Grid Component

Infinite scrolling is used to load a huge amount of data without degrading the Grid performance. This feature works like the lazy loading concept, which means the buffer data is loaded only when the scrollbar reaches the end of the scroller.

To enable Infinite scrolling, set `enableInfiniteScrolling` property as true.

Note: * In this feature, Grid will not make a new data request when you visit the same page again.

CSHTML

```
@Html.EJS().Grid("InfiniteGrid").DataBound("hide").EnableInfiniteScrolling()
.Height("500").Columns(col =>
{
    col.Field("Field1").HeaderText("PlayerName").Width("140").Add();

    col.Field("Field2").HeaderText("Year").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field3").HeaderText("Stint").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field4").HeaderText("TMID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field5").HeaderText("LGID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();
}).Render()

<script>

        {
            var grid =
            document.getElementById("InfiniteGrid").ej2_instances[0]
            if (!infiniteData.length) {
                show();
                dataSource();
                date1 = new Date().getTime();
                grid.dataSource = infiniteData;
            } else {
                flag = true;
                show();
                date1 = new Date().getTime();
                grid.refresh();
            }
        })
        function show() {
            document.getElementById('popup').style.display = 'inline-block';
        }
        function hide(args) {
            if (flag && date1) {
                var date2 = new Date().getTime();
                document.getElementById('performanceTime').innerHTML = 'Time
Taken: ' + (date2 - date1) + 'ms';
                flag = false;
            }
            document.getElementById('popup').style.display = 'none';
        }
        function dataSource() {
            for (var i= 0; i < 100000; i++) {
                infiniteData.push({
                    'Field1': names[Math.floor(Math.random() *
names.length)],
                    'Field2': 1967 + (i % 10),
                    'Field3': Math.floor(Math.random() * 200),
                    'Field4': Math.floor(Math.random() * 100),
                    'Field5': Math.floor(Math.random() * 2000),
                });
            }
        }
    }
</script>

```

INFINITE-SCROLL-NORMAL.CS

```

public IActionResult Index()
{
    return View();
}

```

InitialBlocks

You can define the initial loading pages count by using `infiniteScrollSettings.initialBlocks` property. By default, this feature loads three pages in initial rendering.

In the below demo, we have changed this property value to load five page records instead of three.

CSHTML

```

@Html.EJS().Grid("InfiniteGrid").DataBound("hide").EnableInfiniteScrolling()
.InfiniteScrollSettings(settings => { settings.InitialBlocks(5);
}).Height("500").Columns(col =>
{
    col.Field("Field1").HeaderText("PlayerName").Width("140").Add();

col.Field("Field2").HeaderText("Year").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

col.Field("Field3").HeaderText("Stint").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

col.Field("Field4").HeaderText("TMID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

col.Field("Field5").HeaderText("LGID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();
}).Render()
<script>
    var infiniteData = [], date1=null, date2=null, flag= true;
    var names = ['hardire', 'abramjo01', 'aubucch01', 'Hook',
'Rumpelstiltskin', 'Belle', 'Emma', 'Regina', 'Aurora', 'Elsa',
    'Anna', 'Snow White', 'Prince Charming', 'Cora', 'Zelena',
'August', 'Mulan', 'Graham', 'Discord', 'Will', 'Robin Hood',
    'Jiminy Cricket', 'Henry', 'Neal', 'Red', 'Aaran', 'Aaren',
'Aarez', 'Aarman', 'Aaron', 'Aaron-James', 'Aarron', 'Aaryan', 'Aaryn',
    'Aayan', 'Aazaan', 'Abaan', 'Abbas', 'Abdallah', 'Abdalroof',
'Abdihakim', 'Abdirahman', 'Abdisalam', 'Abdul', 'Abdul-Aziz',
    'Abdulbasir', 'Abdulkadir', 'Abdulkarem', 'Abdulkhader',
'Abdullah', 'Abdul-Majeed', 'Abdulmalik', 'Abdul-Rehman', 'Abdur',
    'Abdurraheem', 'Abdur-Rahman', 'Abdur-Rehmaan', 'Abel',
'Abhinav', 'Abhisumant', 'Abid', 'Abir', 'Abraham', 'Abu', 'Abubakar',
    'Ace', 'Adain', 'Adam', 'Adam-James', 'Addison', 'Addisson',
'Adegbola', 'Adegbolahan', 'Aden', 'Adenn', 'Adie', 'Adil', 'Aditya',
    'Adnan', 'Adrian', 'Adrien', 'Aedan', 'Aedin', 'Aedyn', 'Aeron',
'Afonso', 'Ahmad', 'Ahmed', 'Ahmed-Aziz', 'Ahoua', 'Ahtasham',
    'Aiadan', 'Aidan', 'Aiden', 'Aiden-Jack', 'Aiden-Vee'];
    document.getElementById("generate").addEventListener('click', () =>
{
    var grid =
document.getElementById("InfiniteGrid").ej2_instances[0]
    if (!infiniteData.length) {
        show();
        dataSource();
        date1 = new Date().getTime();
        grid.dataSource = infiniteData;
    } else {
        flag = true;
        show();
        date1 = new Date().getTime();
        grid.refresh();
    }
})
function show() {

```

```

        document.getElementById('popup').style.display = 'inline-block';
    }
    function hide(args) {
        if (flag && datel) {
            var date2 = new Date().getTime();
            document.getElementById('performanceTime').innerHTML = 'Time
Taken: ' + (date2 - datel) + 'ms';
            flag = false;
        }
        document.getElementById('popup').style.display = 'none';
    }
    function dataSource() {
        for (var i= 0; i < 100000; i++) {
            infiniteData.push({
                'Field1': names[Math.floor(Math.random() *
names.length)],
                'Field2': 1967 + (i % 10),
                'Field3': Math.floor(Math.random() * 200),
                'Field4': Math.floor(Math.random() * 100),
                'Field5': Math.floor(Math.random() * 2000),
            });
        }
    }
}
</script>

```

INFINITE-SCROLL-INITIALBLOCKS.CS

```

public IActionResult Index()
{
    return View();
}

```

Cache Mode

Cache is used to store the loaded rows object in the Grid instance which can be reused for creating the row elements whenever you scroll to already visited page. Also, this mode maintains row elements based on the `infiniteScrollSettings.maxBlocks` count value, once this limit exceeds then it will remove row elements from DOM for new rows.

To enable the cache mode in Infinite scrolling, set `infiniteScrollSettings.enableCache` property as true.

CSHTML

```

@Html.EJS().Grid("InfiniteGrid").DataBound("hide").EnableInfiniteScrolling()
.InfiniteScrollSettings(settings => { settings.EnableCache(true);
}).Height("500").Columns(col =>
{
    col.Field("Field1").HeaderText("PlayerName").Width("140").Add();

    col.Field("Field2").HeaderText("Year").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

    col.Field("Field3").HeaderText("Stint").Width("120").TextAlign(Syncfusion.EJ
2.Grids.TextAlign.Right).Add();
}

```

```

col.Field("Field4").HeaderText("TMID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();

col.Field("Field5").HeaderText("LGID").Width("120").TextAlign(Syncfusion.EJ2
.Grids.TextAlign.Right).Add();
}).Render()
<script>
    var infiniteData = [], date1=null, date2=null, flag= true;
    var names = ['hardire', 'abramjo01', 'aubucch01', 'Hook',
'Rumpelstiltskin', 'Belle', 'Emma', 'Regina', 'Aurora', 'Elsa',
    'Anna', 'Snow White', 'Prince Charming', 'Cora', 'Zelena',
'August', 'Mulan', 'Graham', 'Discord', 'Will', 'Robin Hood',
    'Jiminy Cricket', 'Henry', 'Neal', 'Red', 'Aaran', 'Aaren',
'Aarez', 'Aarman', 'Aaron', 'Aaron-James', 'Aarron', 'Aaryan', 'Aaryn',
    'Aayan', 'Aazaan', 'Abaan', 'Abbas', 'Abdallah', 'Abdalroof',

        'Field4': Math.floor(Math.random() * 100),
        'Field5': Math.floor(Math.random() * 2000),
    });
    }
}
</script>

```

INFINITE-SCROLL-CACHE.CS

```

public IActionResult Index()
{
    return View();
}

```

Limitations for Infinite Scrolling

- Due to the element height limitation in browsers, the maximum number of records loaded by the grid is limited due to the browser capability.
- Initial loading rows total height must be greater than the viewport height.
- Cell selection will not be persisted in cache mode.
- Infinite scrolling is not compatible with batch editing, detail template and hierarchy features.
- The group records cannot be collapsed in cache mode.
- The aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the [Group with Page](#) topic.
- Programmatic selection using the [selectRows](#) and [selectRow](#) method is not supported in infinite scrolling.

Selection

Selection provides an option to highlight a row or a cell. It can be done through simple mouse down or arrow keys. To disable selection in the Grid, set the [AllowSelection](#) to false.

The grid supports two types of selection that can be set by using the [Type](#) property of [SelectionSettings](#). They are:

- **Single:** The Single value is set by default, and it only allows selection of a single row or a cell or a column.
- **Multiple:** Allows you to select multiple rows or cells or columns. To perform the multi-selection, press and hold CTRL key and click the desired rows or cells or columns. To select range of rows or cells or columns, press and hold the SHIFT key and click the rows or cells or columns.

CSHTML

```

@Html.EJS().Grid("SelectionAPI").DataSource((IEnumerable<object>) ViewBag.dataSource).AllowSelection().Columns(col =>
{
    col.Field("Inventor").HeaderText("Inventor Name").Width("180").Add();
}

```

```
col.Field("NumberofPatentFamilies").HeaderText("No of Patent
Families").Width("195").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add(
);

col.Field("Country").HeaderText("Country").Width("120").TextAlign(Syncfusion
.EJ2.Grids.TextAlign.Right).Add();
col.Field("Active").HeaderText("Active").Width("130").Add();
}).AllowPaging().SelectionSettings(select =>
select.Type(Syncfusion.EJ2.Grids.SelectionType.Multiple)).PageSettings(page
=> page.PageCount(2)).Render()
```

SELECTION.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Selection mode

The grid supports three types of selection mode that can be set by using the [Mode](#) property of [SelectionSettings](#). They are:

- **Row:** The Row value is set by default, and allows you to select only rows.
- **Cell:** Allows you to select only cells.
- **Both:** Allows you to select rows and cells at the same time.

CSHTML

```
@Html.EJS().Grid("SelectionAPI").DataSource((IEnumerable<object>)ViewBag.dat
asource).AllowSelection().Columns(col =>
{
    col.Field("Inventor").HeaderText("Inventor Name").Width("180").Add();
    col.Field("NumberofPatentFamilies").HeaderText("No of Patent
Families").Width("195").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add(
);

col.Field("Country").HeaderText("Country").Width("120").TextAlign(Syncfusion
.EJ2.Grids.TextAlign.Right).Add();
col.Field("Active").HeaderText("Active").Width("130").Add();
}).AllowPaging().SelectionSettings(select =>
select.Mode(Syncfusion.EJ2.Grids.SelectionMode.Both)).PageSettings(page =>
page.PageCount(2)).Render()
```

SELECTION-MODE.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

```
}
```

Touch interaction

When you tap a grid row on touchscreen device, the tapped row is selected. It also shows a popup

![selection](images/selection.jpg)

for multi-row selection. To select multiple rows or cells, tap the popup

![mselection](images/mselection.jpg) and then tap the desired rows or cells.

Note: Multi-selection requires the selection **Type** to be **Multiple**.

The following screenshot represents a grid touch selection in the device.

![Touch interaction](images/touch-selection.jpg)

Aggregates

Aggregate values are displayed in the footer, group footer, or group caption of the Grid. It can be configured through [Aggregates](#) property. The [Field](#) and [Type](#) are the minimum properties required to represent an aggregate column.

By default, the aggregate value can be displayed in the footer, group, and caption cells. To show the aggregate value in one of the cells, use the [FooterTemplate](#), [GroupFooterTemplate](#), or [GroupCaptionTemplate](#) property.

Built-in aggregate types

The aggregate type should be specified in the [Type](#) property to configure an aggregate column.

The built-in aggregates are,

- Sum
- Average
- Min
- Max
- Count
- TrueCount
- FalseCount

Note: Multiple aggregates can be used for an aggregate column by setting the [Type](#) property with an array of aggregate types.

 Multiple types for a column is supported only when one of the aggregate templates is used.

Print in ASP.NET MVC Grid Component

To print the Grid, use the [print](#) method from grid instance. The print option can be displayed on the [Toolbar](#) by adding the **Print** toolbar item.

CSHTML

```
@Html.EJS().Grid("Print").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
```

```
col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().Toolbar(new List<string>() { "Print" }).Render()
```

PRINT.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Page setup

Some of the print options cannot be configured through JavaScript code. So, you have to customize the layout, paper size, and margin options using the browser page setup dialog. Refer to the following links to know more about the browser page setup:

- [Chrome](#)
- [Firefox](#)
- [Safari](#)
- [IE](#)

Print using an external button

To print the grid from an external button, invoke the [print](#) method.

CSHTML

```
@Html.EJS().Button("printbtn").Content("Print").IsPrimary(true).Render()
@Html.EJS().Grid("Print").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().Render()
<script>
    document.getElementById('printbtn').onclick = function () {
        document.getElementById('Print').ej2_instances[0].print();
    }
}
```

```
</script>
```

EXTERNAL-BTN.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Print the visible page

By default, the grid prints all the pages. To print the current page alone, set the [PrintMode](#) to **CurrentPage**.

CSHTML

```
@Html.EJS().Grid("Print").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().Toolbar(new List<string>() { "Print" })
.PrintMode(Syncfusion.EJ2.Grids.PrintMode.CurrentPage).Render()
```

CURRENT-PAGE.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Print the hierarchy grid

By default, the grid will be print the master and expanded child grids alone. you can change the print option by using the [hierarchyPrintMode](#) property. The available options are,

- | | | |
|----------|---|--|
| Mode | Behavior | |
| ----- | ----- | |
| Expanded | Prints the master grid with expanded child grids. | |
| All | Prints the master grid with all the child grids. | |
| None | Prints the master grid alone. | |

CSHTML

```
@{
    var SecondChildGrid = new Syncfusion.EJ2.Grids.Grid() { DataSource =
        (IEnumerable<object>)ViewBag.CustomerDataSource,
        QueryString = "CustomerID",
        Columns = new List<Syncfusion.EJ2.Grids.GridColumn>
        {
            new Syncfusion.EJ2.Grids.GridColumn() { Field="CustomerID",
            HeaderText="Customer ID", Width="90",
            TextAlign=Syncfusion.EJ2.Grids.TextAlign.Right },
            new Syncfusion.EJ2.Grids.GridColumn() { Field="ShipCountry",
            HeaderText="Ship Country", Width="90" },
        }
    };
    var ChildGrid = new Syncfusion.EJ2.Grids.Grid() { DataSource =
        (IEnumerable<object>)ViewBag.DataSource,
        QueryString = "EmployeeID",
        Columns = new List<Syncfusion.EJ2.Grids.GridColumn>
        {
            new Syncfusion.EJ2.Grids.GridColumn() { Field="OrderID",
            HeaderText="Order ID", Width="120" },
            new Syncfusion.EJ2.Grids.GridColumn() { Field="Freight",
            HeaderText="Freight", Width="120", Format="C2",
            TextAlign=Syncfusion.EJ2.Grids.TextAlign.Right },
            new Syncfusion.EJ2.Grids.GridColumn() { Field="ShipName",
            HeaderText="Ship Name", Width="150" },
            new Syncfusion.EJ2.Grids.GridColumn() { Field="ShipCity",
            HeaderText="Ship City", Width="120" },
        },
        ChildGrid = SecondChildGrid
    };
}
@Html.EJS().Grid("HierarchyPrint").DataSource((IEnumerable<object>)ViewBag.EmpDataSource).HierarchyPrintMode(Syncfusion.EJ2.Grids.HierarchyGridPrintMode.All).Columns(col =>
{
    col.Field("EmployeeID").HeaderText("Employee ID").Width("125").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("FirstName").HeaderText("Name").Width("125").Add();
    col.Field("Country").HeaderText("Country").Width("180").Add();
    col.Field("City").HeaderText("City").Width("135").Add();
}).AllowSorting().Toolbar(new List<string>() {
    "Print"}).ChildGrid(ChildGrid).Render()
```

HIERARCHYPRINT.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrdersDetails.GetAllRecords();
    ViewBag.EmpDataSource = EmployeeView.GetAllRecords();
    ViewBag.CustomerDataSource = Customer.GetAllRecords();
    return View();
}
```

HIERARCHYPRINT.CS

```
public IActionResult Index()
```

```
{
    ViewBag.DataSource = OrdersDetails.GetAllRecords();
    ViewBag.EmpDataSource = EmployeeView.GetAllRecords();
    ViewBag.CustomerDataSource = Customer.GetAllRecords();
    return View();
}
```

Note: By default, the hierarchy grid prints the expanded child grids from the visible page only. Refer [To Print the expanded state grid from all pages.](#)

Print the master detail grid

The Grid has the option to visualize details of a record in another Grid in a master and detailed manner. By default, Grid will print the master grid alone. Instead of this, it is possible to print both the master and detail grids by using the [BeforePrint](#) event of the Grid.

In the following sample, the detail grid is added to the `element` argument of the `BeforePrint` event, resulting in both the master and detail grids being printed on the page.

CSHTML

```
<div>
    <B>Master Grid</B>

    @Html.EJS().Grid("masterGrid").DataSource((IEnumerable<object>)ViewBag.dataSource).Width("auto").SelectedRowIndex(0).Columns(col =>
    {

        col.Field("EmployeeID").HeaderText("EmployeeID").IsPrimaryKey(true).Add();
        col.Field("OrderID").HeaderText("OrderID").Add();
        col.Field("CustomerID").HeaderText("FirstName").Add();
    }).RowSelected("selected").BeforePrint("beforePrint").Toolbar(new
    List<string>() { "Print" }).Render()
</div>
<p><div class='e-statustext'> Showing orders of Customer: <b
id=key></b></div></p>
<div>

    @Html.EJS().Grid("detailGrid").DataSource((IEnumerable<object>)ViewBag.dataSource).Columns(col =>
    {

        col.Field("EmployeeID").HeaderText("EmployeeID").IsPrimaryKey(true).Add();

        col.Field("ShipCountry").HeaderText("ShipCountry").Add();
        col.Field("ShipName").HeaderText("ShipName").Add();
    }).Render()

</div>
<script>
    function selected(args) {
        var selectedRecord = args.data;
        var data = @Html.Raw(Json.Encode(ViewBag.dataSource));
        var employeeID = args.data.EmployeeID;
        var detaildata = new ej.data.DataManager(data).executeLocal(new
        ej.data.Query().where("EmployeeID", "equal", employeeID, false).take(10));
        var grid = document.getElementById("detailGrid").ej2_instances[0];
```

```

document.getElementById('key').innerHTML =
selectedRecord.EmployeeID;
grid.dataSource = new ej.data.DataManager(detaildata.slice(0,
5)).dataSource.json;
}
function beforePrint(args) {
    var customEle = document.createElement('div');
    var grid = document.getElementById("detailGrid").ej2_instances[0];
    customEle.innerHTML = document.getElementsByClassName('e-
statustext')[0].innerHTML + grid.element.innerHTML;
    customEle.appendChild(document.createElement('br'));
    args.element.append(customEle);
}
</script>

```

MASTER-DETAIL.CS

```

public IActionResult Index()
{
    ViewBag.dataSource = OrderDetails.GetAllRecords();
    return View();
}

```

Print large number of columns

By default, the browser uses A4 as page size option to print pages and to adapt the size of the page the browser print preview will auto-hide the overflowed contents. Hence grid with large number of columns will cut off to adapt the print page.

To show large number of columns when printing, adjust the scale option from print option panel based on your content size.

Show or Hide columns while Printing

You can show a hidden column or hide a visible column while printing the grid using [ToolBarClick](#) and [PrintComplete](#) events.

In the [ToolBarClick](#) event, based on **args.item.id** as **grid_print**. We can show or hide columns by setting [Visible](#) property of [Column](#) to **true** or **false** respectively.

In the [PrintComplete](#) event, We have reversed the state back to the previous state.

In the below example, we have **CustomerID** as a hidden column in the grid. While printing, we have changed **CustomerID** to visible column and **ShipCity** as hidden column.

CSHTML

```
@Html.EJS().Grid("Print").DataSource((IEnumerable<object>)ViewBag.DataSource)
.ToolbarClick("toolbarClick").PrintComplete("printComplete").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Visible(false).Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("150").Add();
}).AllowPaging().ToolBar(new List<string>() { "Print" }).Render()
<script>
    function toolbarClick(args) {
        for (var i = 0; i < this.columns.length; i++) {
            if (this.columns[i].field == "CustomerID") {
                this.columns[i].visible = true;
            }
            else if (this.columns[i].field == "ShipCity") {
                this.columns[i].visible = false;
            }
        }
    }
    function printComplete(args) {
        for (var i = 0; i < this.columns.length; i++) {
            if (this.columns[i].field == "CustomerID") {
                this.columns[i].visible = false;
            }
            else if (this.columns[i].field == "ShipCity") {
                this.columns[i].visible = true;
            }
        }
    }
}
</script>
```

SHOW-HIDE.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
}
```

```
return View();
}
```

Limitations of Printing Large Data

When grid contains large number of data, printing all the data at once is not a best option for the browser performance. Because to render all the DOM elements in one page will produce performance issues in the browser. It leads to browser slow down or browser hang. Grid have option to handle large number of data by Virtualization. However while printing, it is not possible to use virtualization for rows and columns.

If printing of all the data is still needed, we suggest to Export the grid to **Excel** or **CSV** or **Pdf** and then print it from another non-web based application.

Adaptive View

The Grid user interface (UI) was redesigned to provide an optimal viewing experience and improve usability on small screens. This interface will render the filter, sort, column chooser, column menu(supports only when the `rowRenderingMode` as Horizontal) column chooser, column menu(supports only when the `rowRenderingMode` as Horizontal) and edit dialogs adaptively and have an option to render the grid row elements in the vertical direction.

Render adaptive dialogs

When we enable the [enableAdaptiveUI](#) property, the grid will render the filter, sort, and edit dialogs in full screen for a better user experience. This behavior is demonstrated in the below demo.

CSHTML

```
<div class="e-bigger">
@Html.EJS().Grid("adaptivebrowser").DataSource((IEnumerable<object>)ViewBag.
DataSource).EnableAdaptiveUI(true).AllowPaging(true).AllowFiltering(true).Al
lowSorting(true).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("180").IsPrimaryKey(true).ValidationRules(new { required = true,
number = true }).Add();

    col.Field("Freight").HeaderText("Freight").Width("180").Format("C2").EditTyp
e("numericedit").ValidationRules(new { required = true }).Add();
    col.Field("CustomerID").HeaderText("Customer
ID").Width("180").ValidationRules(new { required = true, minLength = 3
}).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("180").Add();
}).FilterSettings(filter => {
filter.Type(Syncfusion.EJ2.Grids.FilterType.Excel); }).EditSettings(edit =>
{
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Dialog); }).Toolbar(new List<string>() { "Add", "Edit",
"Delete", "Update", "Cancel", "Search" }).Render()
```

```
</div>
```

DEFAULT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Vertical row rendering

The grid will render the row elements in vertical order while setting the [rowRenderingMode](#) property value as **Vertical**.

CSHTML

```
<div class="e-bigger">
@Html.EJS().Grid("adaptivebrowser").DataSource((IEnumerable<object>)ViewBag.
DataSource).EnableAdaptiveUI(true).RowRenderingMode(Syncfusion.EJ2.Grids.Row
RenderingDirection.Vertical).AllowPaging(true).AllowFiltering(true).AllowSor
ting(true).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("180").IsPrimaryKey(true).ValidationRules(new { required = true,
number = true }).Add();

    col.Field("Freight").HeaderText("Freight").Width("180").Format("C2").EditTyp
e("numericedit").ValidationRules(new { required = true }).Add();
    col.Field("CustomerID").HeaderText("Customer
ID").Width("180").ValidationRules(new { required = true, minLength = 3
}).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("180").Add();
}).FilterSettings(filter => {
filter.Type(Syncfusion.EJ2.Grids.FilterType.Excel); }).EditSettings(edit =>
{
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Dialog); }).Toolbar(new List<string>() { "Add", "Edit",
"Delete", "Update", "Cancel", "Search" }).Aggregates(agg =>
{
    agg.Columns(new List<Syncfusion.EJ2.Grids.GridAggregateColumn>() { new
Syncfusion.EJ2.Grids.GridAggregateColumn() { Field = "Freight", Format =
"C2", Type = "Sum", FooterTemplate = "Sum: ${Sum}" } }).Add();
}).Render()
</div>
```

DEFAULT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: * [enableAdaptiveUI](#) property must be enabled for vertical row rendering.

Supported features by vertical row rendering

The following features are only supported in vertical row rendering:

- Paging, including Page size dropdown
- Sorting
- Filtering
- Selection
- Dialog Editing
- Aggregate
- Infinite scroll
- Toolbar - Options like **Add**, **Filter**, **Sort**, **Edit**, **Delete**, **Search**, and **Toolbar template** are available when their respective features are enabled. The toolbar dynamically includes a three-dotted icon, containing additional features like **ColumnChooser**, **Print**, **PdfExport**, **ExcelExport**, or **CsvExport**, once these features are enabled. Please refer to the following snapshot.

![VerticalmodeColumnMenu](../images/VerticalmodeColumnMenu.gif)

A snapshot of the adaptive grid displaying enabled paging along with a pager dropdown.

![AdaptivePagerDropdown](../images/PagerDropdown_Adaptive.gif)

The Column Menu feature, which includes grouping, sorting, autofit, filter, and column chooser, is exclusively supported for the Grid in **Horizontal** [rowRenderingMode](#).

Scaffolding

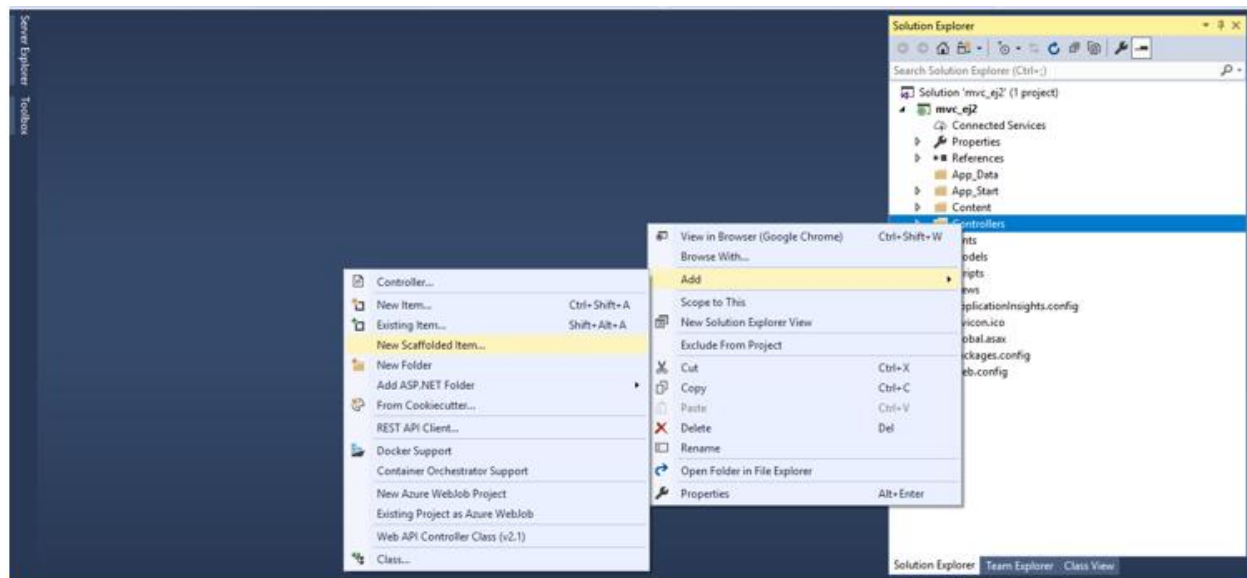

Syncfusion provides the **Visual Studio Scaffolding** for the Syncfusion ASP.NET MVC platform to quickly add code that interacts with data models and reduce the amount of time to develop with data operation in your project. Scaffolding provides an easier way to create Views and Controller action methods for Syncfusion ASP.NET MVC DataGrid controls.

Note: The Syncfusion ASP.NET MVC UI Scaffolder is available from **v16.4.0.40**.

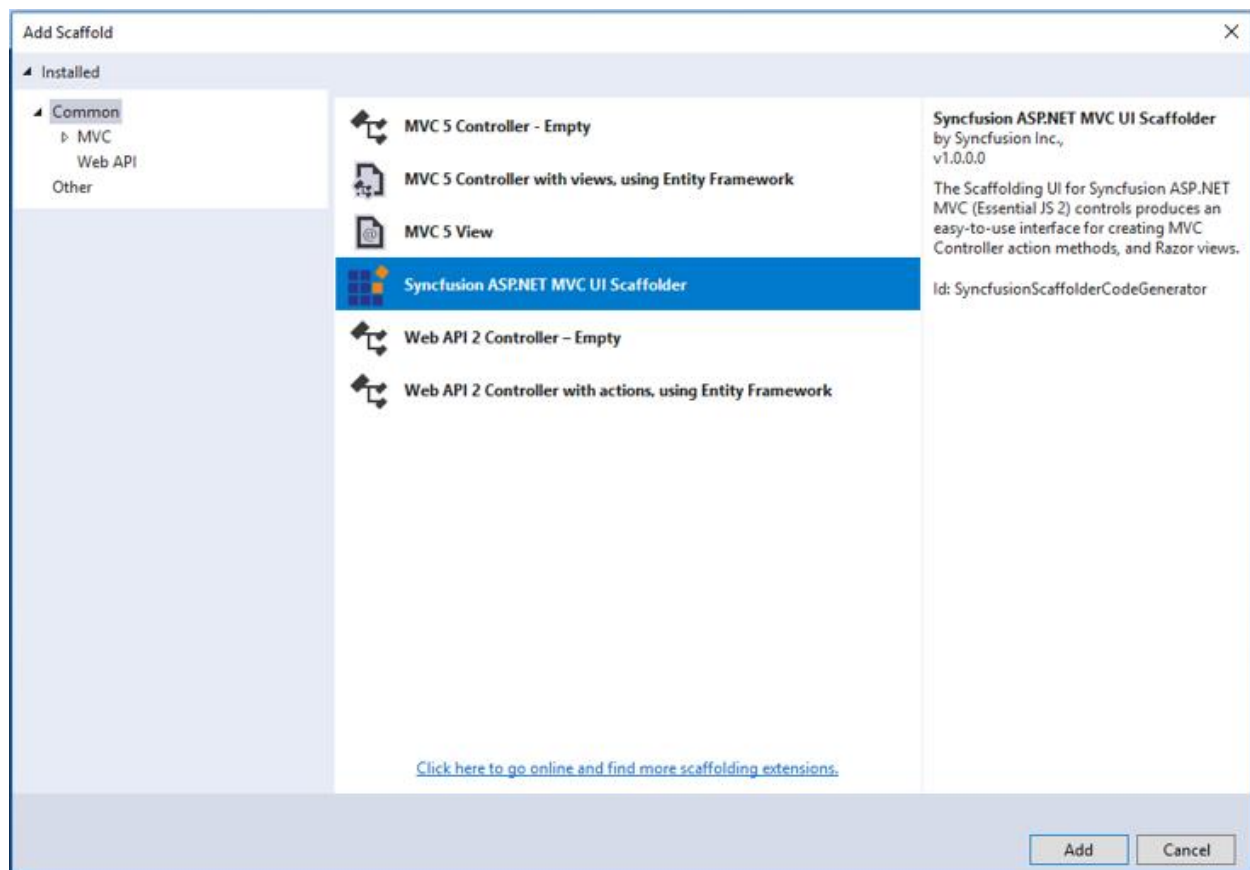

Add a Scaffolded Item

The following steps direct you to add a Scaffolded item to your ASP.NET MVC Web Application.

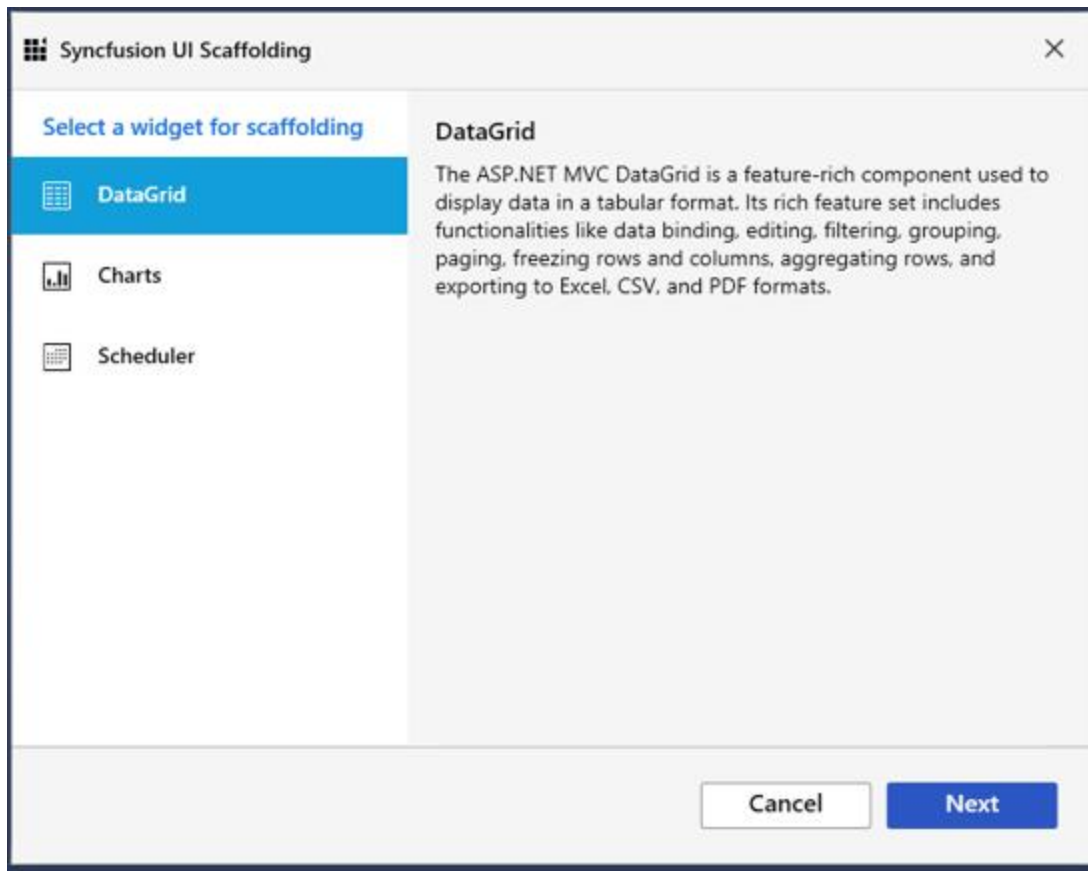

- Right-click on Controller folder in the Solution Explorer and select **Add → New Scaffolded Item**.

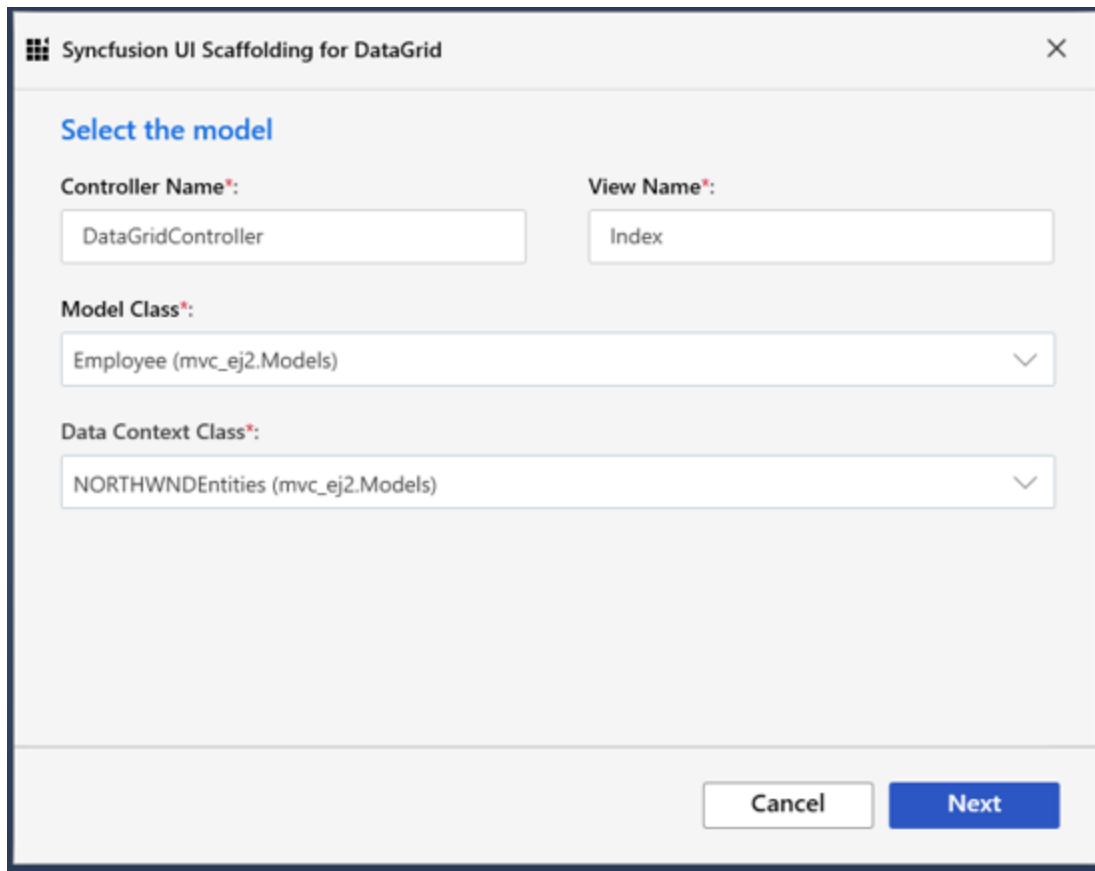

- You will see the Add Scaffold dialog. Select **Syncfusion ASP.NET MVC UI Scaffolder** and click 'Add' button, which will display the Syncfusion UI Scaffolding dialog.

- Select the DataGrid control to perform Scaffolding and click **Next**.

- Syncfusion UI Scaffolding for the selected control dialog will be opened. Enter the **Controller and View** names as per the application requirement. Also, select the required **Model Class** of the active project and its relevant **Data Context Class** and then Click **Next**.

Syncfusion UI Scaffolding for DataGrid

Select the model

Controller Name*: DataGridController

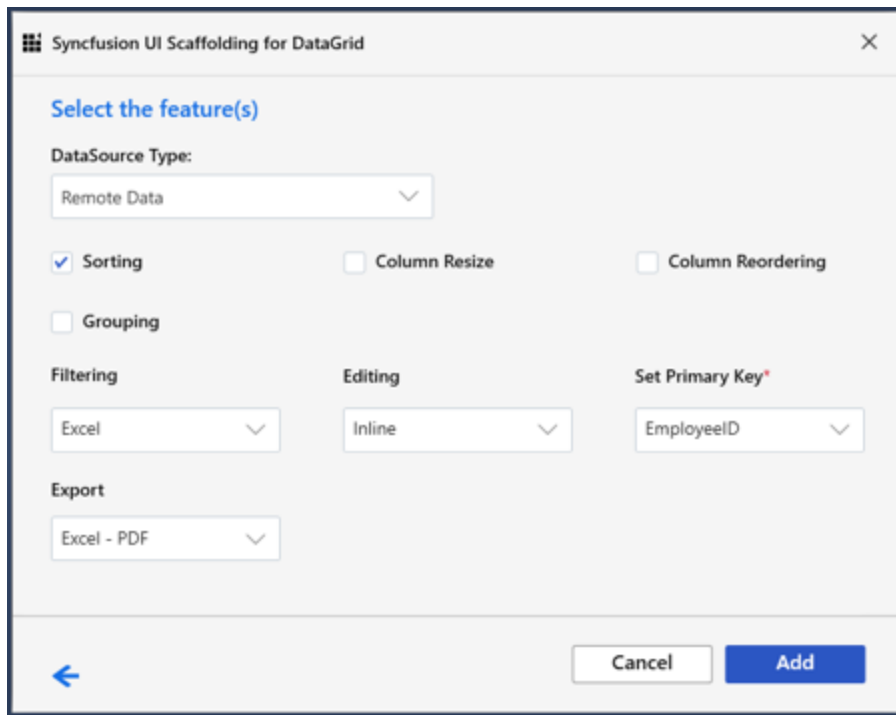

View Name*: Index

Model Class*: Employee (mvc_ej2.Models)

Data Context Class*: NORTHWNDEntities (mvc_ej2.Models)

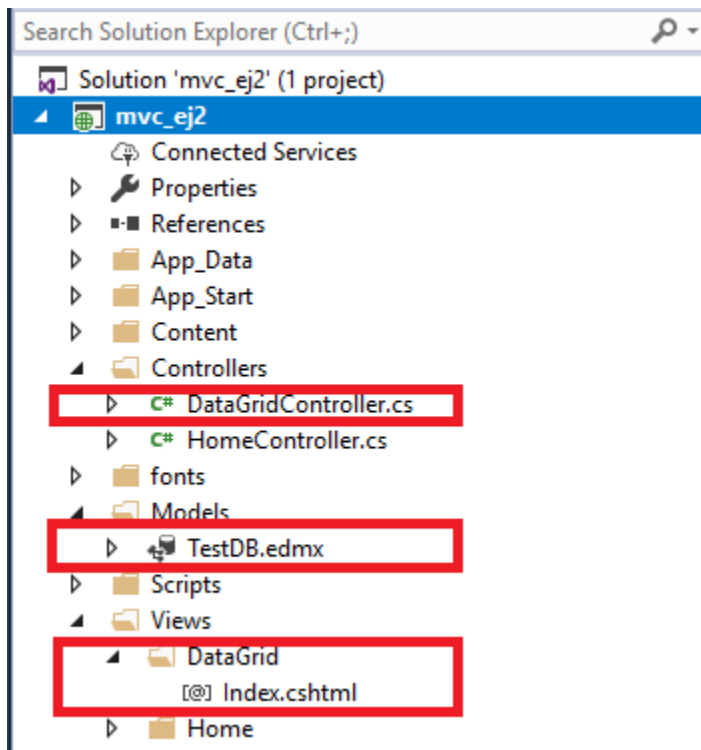

Cancel Next

- Syncfusion UI Scaffolding for the DataGrid control feature dialog will be opened. Select the required features and Click **Add**. Use the **back arrow** if you want to modify the already provided Controller or View name, and to change the **selected Model Class and Data Context Class**.

select the corresponding DataGrid features from option.

- The **Controller** and the corresponding **View** files are now generated with the selected features code snippet.

Note: * Ensure at least one Entity Framework model has been exists and the application compiled once.

 * If no Entity Framework model exists in your application, refer to the [documentation](#) to generate the Entity Framework model. Once model file added, ensure required DbContext and properties are added. Now, build the application and try scaffolding. If any changes done in model properties later, compile the application once before perform scaffolding.

How to render Syncfusion Control'?

Refer to the following UG links to render Syncfusion control after performed scaffolding.

MVC4: [Configure Essential JS 2 using Syncfusion.EJ2.MVC4 package](#)

MVC5: [Configure Essential JS 2 using Syncfusion.EJ2.MVC5 package](#)

State Persistence

State persistence refers to the Grid's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser. State persistence stores grid's model object in the local storage when the [EnablePersistence](#) is defined as true.

Restore initial Grid state

When the [EnablePersistence](#) property is set to **true**, the Grid will keep its state even if the page is reloaded. In some cases, you may be required to retain the Grid in its initial state. The Grid will not retain its initial state now since the [EnablePersistence](#) property has been enabled.

You can achieve this by destroying the grid after disabling the [EnablePersistence](#) property and clearing the local storage data, as shown in the sample below.

CSHTML

```
@Html.EJS().Button("restore").Content("Restore to initial
state").IsPrimary(true).Render()
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>) ViewBag.dataSource)
.AllowFiltering(true).EnablePersistence(true).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("170").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).AllowPaging(true).PageSettings(page => page.PageCount(5)).Render()
<script>
    document.getElementById('restore').onclick = function () {
        document.getElementById('Grid').ej2_instances[0].enablePersistence =
false;
        window.localStorage.setItem("gridGrid", "");
        document.getElementById('Grid').ej2_instances[0].destroy();
        //reloads the page
        location.reload();
    }
</script>
```

INITIAL-GRID.CS

```
public IActionResult Index()
```

```
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Maintaining custom query in a persistent state

The grid does not maintain the query params after page load event when the [EnablePersistence](#) is set to true. This is because the grid refreshes its query params for every page load. You can maintain the custom query params by resetting the `addParams` method in the [ActionBegin](#) event.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.AllowFiltering(true).EnablePersistence(true).ActionBegin("actionBegin").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("170").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).AllowPaging().PageSettings(page => page.PageCount(5)).Render()

<script>
    function actionBegin(args) {
        this.query.addParams('$filter', 'EmployeeID eq 1');
    }
</script>
```

STATE-PERSIST.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Add a new column in persisted columns list

The Grid columns can be persisted when the [enablePersistence](#) property is set to true. If you want to add the new columns with the existing persist state, you can use the Grid inbuilt method such as `column.push` and call the `refreshColumns()` method for UI changes. Refer to the following sample for more information.

CSHTML

```
@Html.EJS().Button("add").Content("Add Columns").IsPrimary(true).Render()
```

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.EnablePersistence(true).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("170").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).AllowPaging(true).PageSettings(page => page.PageCount(5)).Render()
<script>
    document.getElementById('add').onclick = function () {
        var obj = { field: "Freight", headerText: 'Freight', width: 120 }
        document.getElementById('Grid').ej2_instances[0].columns.push(obj);
        //you can add the columns by using the Grid columns method
        document.getElementById('Grid').ej2_instances[0].refreshColumns();
    }
</script>
```

COLUMN-ADD.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.Datasource = orders;
    return View();
}
```

ToolBar in ASP.NET MVC Grid Component

The Grid provides ToolBar support to handle grid actions. The [ToolBar](#) property accepts either the collection of built-in toolbar items and **ItemModel** objects for custom toolbar items or HTML element ID for toolbar template.

Enable or disable toolbar items

You can enable/disable toolbar items by using the **enableItems** method.

CSHTML

```
@Html.EJS().Button("disable").Content("Disable").Render()
@Html.EJS().Button("enable").Content("Enable").Render()
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.ToolbarClick("toolbarClick").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlig
n.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

col.Field("Freight").HeaderText("Freight").Width("120").EditType("numericedi
t").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
```

```

        col.Field("ShipCountry").HeaderText("Ship
Country").Width("150").EditType("dropdownedit").Add();
    }).AllowPaging().PageSettings(page =>
page.PageCount(2)).AllowGrouping().GroupSettings(group => group.Columns(new
string[] { "CustomerID" })).ToolBar(new List<string>() { "Expand",
"Collapse" }).Render()
<script>
    document.getElementById("enable").addEventListener('click', () => {
        var grid = document.getElementById("Grid").ej2_instances[0];
        grid.toolbarModule.enableItems(['Grid_Collapse', 'Grid_Expand'],
true); // enable toolbar items.
    });
    document.getElementById("disable").addEventListener('click', () => {
        var grid = document.getElementById("Grid").ej2_instances[0];
        grid.toolbarModule.enableItems(['Grid_Collapse', 'Grid_Expand'],
false); // disable toolbar items.
    });
    function toolbarClick(args) {
        if (args.item.id === 'Grid_Collapse') { // grid_Collapse is
component id + '_' + toolbar item name.
            this.groupModule.collapseAll();
        }
        if (args.item.id === 'Grid_Expand') {
            this.groupModule.expandAll();
        }
    }
</script>

```

ENABLE-DISABLE.CS

```

public IActionResult Index()
{
    var orders = orderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}

```

Add toolbar at the bottom of Grid

You can add the Grid toolbar component at the bottom of Grid using the [Created](#) event.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("140").Add();

    col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("C").Width("120").Add();
    col.Field("OrderDate").HeaderText("Order
Date").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Width("140").Add();
}
)

```

```

}).Created("created").Toolbar(new List<string>() { "Print", "Search"
}).Render()
<script>
    function created() {
        let toolbar = this.element.querySelector('.e-toolbar');
        this.element.appendChild(toolbar);
    }
</script>

```

TOOLBAR-BOTTOM.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}

```

PDF Export

PDF export allows exporting Grid data to PDF document. You need to use the [PdfExport](#) method for exporting. To enable PDF export in the grid, set the [AllowPdfExport](#) as true.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPdfExport().ToolbarClick("toolbarClick").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Toolbar(new List<string>() { "PdfExport" }).Render()
<script>
    function toolbarClick(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        if (args.item.id === 'Grid_pdfexport') {
            gridObj.pdfExport();
        }
    }
</script>

```

PDF-EXPORT.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Show spinner while exporting

You can show/ hide spinner component while exporting the grid using **showSpinner/ hideSpinner** methods. You can use [ToolBarClick](#) event to show spinner before exporting and hide a spinner in the [PdfExportComplete](#) or [ExcelExportComplete](#) event after the exporting.

In the [ToolBarClick](#) event, based on the parameter **args.item.id** as **Gridpdfexport** or **Gridexcelexport** we can call the **showSpinner** method from grid instance.

In the [PdfExportComplete](#) or [ExcelExportComplete](#) event, We can call the **hideSpinner** method.

In the below demo, we have rendered the default spinner component when exporting the grid.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPdfExport().AllowExcelExport().ToolBarClick("toolbarClick").PdfExportC
omplete("pdfExportComplete").ExcelExportComplete("excelExportComplete").Colu
mns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Visible(false).Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("ShipCity").HeaderText("ShipCity").Width("120").TextAlign(Syncfusi
on.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().ToolBar(new List<string>() { "PdfExport", "ExcelExport"
}).Render()
<script>
    function toolbarClick(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        if (args.item.id === 'Grid_pdfexport') {
            gridObj.showSpinner();
            gridObj.pdfExport();
        }
        else if (args.item.id === 'Grid_excelexport') {
            gridObj.showSpinner();
            gridObj.excelExport();
        }
    }
    function pdfExportComplete(args) {
        this.hideSpinner();
    }
    function excelExportComplete(args) {
        this.hideSpinner();
    }
}
</script>
```

SHOW-SPINNER.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
```

```

    ViewBag.DataSource = Order;
    return View();
}

```

Custom data source

PDF export provides an option to define datasource dynamically before exporting. To export data dynamically, define the [dataSource](#) in [PdfExportProperties](#).

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPdfExport().ToolBarClick("toolbarClick").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().ToolBar(new List<string>() { "PdfExport" }).Render()
<script>
    function toolbarClick(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        if (args.item.id === 'Grid_pdfexport') {
            var data = [
                { OrderID: "100", CustomerID: "Vinet", Freight: "2.00",
OrderDate: new Date() },
                { OrderID: "101", CustomerID: "Hanar", Freight: "2.01",
OrderDate: new Date() },
                { OrderID: "102", CustomerID: "Mega", Freight: "4.48",
OrderDate: new Date() },
                { OrderID: "103", CustomerID: "Sam", Freight: "19.23",
OrderDate: new Date() }
            ];
            var pdfExportProperties = {
                dataSource: data
            };
            gridObj.pdfExport(pdfExportProperties);
        }
    }
</script>

```

CUSTOM-DATA.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Passing additional parameters to the server when exporting

You can pass the additional parameter in the [Query](#) property by invoking **addParams** method. In the [ToolbarClick](#) event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed **recordcount** as **12** using **addParams** method.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPdfExport().AllowExcelExport().ToolbarClick("toolbarClick").PdfExportC
omplete("pdfExportComplete").ExcelExportComplete("excelExportComplete").Colu
mns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("ShipCity").HeaderText("ShipCity").Width("120").TextAlign(Syncfusi
on.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Toolbar(new List<string>() { "PdfExport", "ExcelExport"
}).Render()
<script>
    var queryClone;
    function toolbarClick(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        if (args.item.id === 'Grid_pdfexport') {
            queryClone = gridObj.query;
            gridObj.query = new ej.data.Query().addParams("recordcount",
"12");
            gridObj.pdfExport();
        }
        else if (args.item.id === 'Grid_excelexport') {
            queryClone = gridObj.query;
            gridObj.query = new ej.data.Query().addParams("recordcount",
"12");
            gridObj.excelExport();
        }
    }
    function pdfExportComplete(args) {
        this.query = queryClone;
    }
    function excelExportComplete(args) {
        this.query = queryClone;
    }
</script>
```

ADDITIONAL-PARAMETER.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
```

```

    ViewBag.DataSource = Order;
    return View();
}

```

ADDITIONAL-PARAMETER.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Export large number of columns in a single page

By default, when the grid has large number of columns, then the PDF export will split more pages for the exceeded columns rendering. To achieve large number of columns exported in a single page, you need to set the **allowHorizontalOverflow** property as **false** in the [toolbarClick](#) event.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPdfExport().ToolbarClick("toolbarClick").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Visible(false).Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("ShipCity").HeaderText("ShipCity").Width("120").TextAlign(Syncfusi
on.EJ2.Grids.TextAlign.Right).Add();

    col.Field("EmployeeID").HeaderText("EmployeeID").Width("120").TextAlign(Sync
fusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("ShipCity").HeaderText("ShipCity").Width("120").TextAlign(Syncfusi
on.EJ2.Grids.TextAlign.Right).Add();

    col.Field("ShipAddress").HeaderText("ShipAddress").Width("120").TextAlign(Sy
ncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("ShippedDate").HeaderText("ShippedDate").Width("120").TextAlign(Sy
ncfusion.EJ2.Grids.TextAlign.Right).Add();

    col.Field("ShipName").HeaderText("ShipName").Width("120").TextAlign(Syncfusi
on.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Toolbar(new List<string>() { "PdfExport" }).Render()
<script>
    function toolbarClick(args) {
        let pdfDocument = new ej.pdfexport.PdfDocument();
        let page = pdfDocument.pages.add();
        var grid = document.getElementById('Grid').ej2_instances[0];
    }

```

```

var pdfGrid = new ej.pdfexport.PdfGrid();
pdfGrid.style.allowHorizontalOverflow = false;
let format = new ej.pdfexport.PdfLayoutFormat();
var collength = grid.columns.length;
pdfGrid.columns.add(collength);
pdfGrid.headers.add(1);
var pdfGridHeader = pdfGrid.headers.getHeader(0);
for (let j = 0; j < collength; j++) {
    pdfGridHeader.cells.getCell(j).value =
grid.columns[j].headerText;
}
let pdfGridRow1 = [];
for (let k = 0; k < grid.dataSource.length; k++) {
    pdfGridRow1[k] = pdfGrid.rows.addRow();
}
for (let k = 0; k < grid.dataSource.length; k++) {
    for (let r = 0; r < grid.columnModel.length; r++) {
        pdfGridRow1[k].cells.getCell(r).value =
grid.dataSource[k][grid.columnModel[r].field].toString();
    }
}
pdfGrid.draw(page, new ej.pdfexport.PointF(0, 0), format);
pdfDocument.save('output.pdf');
pdfDocument.destroy();
}
</script>

```

LARGE-COLUMNS.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Excel Export

The excel export allows exporting Grid data to Excel document. You need to use the [excelExport](#) method for exporting. To enable Excel export in the grid, set the [AllowExcelExport](#) property as true.

To use excel export, You need to define the **ExcelExport** in inbuild toolbar and define the [ToolbarClick](#) event for exporting the Grid.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowExcelExport().ToolbarClick("toolbarClick").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}
)

```

```

        col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
        col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
        col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
    }).AllowPaging().Toolbar(new List<string>() { "ExcelExport" }).Render()
<script>
    function toolbarClick(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        if (args.item.id === 'Grid_excelexport') {
            gridObj.excelExport();
        }
    }
</script>

```

EXCEL-EXPORT.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Show spinner while exporting

You can show/ hide spinner component while exporting the grid using **showSpinner/ hideSpinner** methods. You can use [ToolbarClick](#) event to show spinner before exporting and hide a spinner in the [PdfExportComplete](#) or [ExcelExportComplete](#) event after the exporting.

In the [ToolbarClick](#) event, based on the parameter **args.item.id** as **Gridpdfexport or Gridexcelexport** we can call the **showSpinner** method from grid instance.

In the [PdfExportComplete](#) or [ExcelExportComplete](#) event, We can call the **hideSpinner** method.

In the below demo, we have rendered the default spinner component when exporting the grid.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPdfExport().AllowExcelExport().ToolbarClick("toolbarClick").PdfExportC
omplete("pdfExportComplete").ExcelExportComplete("excelExportComplete").Colu
mns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Visible(false).Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("ShipCity").HeaderText("ShipCity").Width("120").TextAlign(Syncfusi
on.EJ2.Grids.TextAlign.Right).Add();
}

```

```

        col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
    }).AllowPaging().Toolbar(new List<string>() { "PdfExport", "ExcelExport"
    }).Render()
<script>
    function toolbarClick(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];
        if (args.item.id === 'Grid_pdfexport') {
            gridObj.showSpinner();
            gridObj.pdfExport();
        }
        else if (args.item.id === 'Grid_excelexport') {
            gridObj.showSpinner();
            gridObj.excelExport();
        }
    }
    function pdfExportComplete(args) {
        this.hideSpinner();
    }
    function excelExportComplete(args) {
        this.hideSpinner();
    }
</script>

```

SHOW-SPINNER.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Custom data source

The excel export provides an option to define datasource dynamically before exporting. To export data dynamically, define the [dataSource](#) in [ExcelExportProperties](#).

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowExcelExport().ToolbarClick("toolbarClick").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Toolbar(new List<string>() { "ExcelExport" }).Render()
<script>
    function toolbarClick(args) {
        var gridObj = document.getElementById("Grid").ej2_instances[0];

```

```

        if (args.item.id === 'Grid_excelexport') {
            var data = [
                { OrderID: "100", CustomerID: "Vinet", Freight: "2.00",
OrderDate: new Date() },
                { OrderID: "101", CustomerID: "Hanar", Freight: "2.01",
OrderDate: new Date() },
                { OrderID: "102", CustomerID: "Mega", Freight: "4.48",
OrderDate: new Date() },
                { OrderID: "103", CustomerID: "Sam", Freight: "19.23",
OrderDate: new Date() }
            ];
            var excelExportProperties = {
                dataSource: data
            };
            gridObj.excelExport(excelExportProperties);
        }
    }
</script>

```

CUSTOM-DATA.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Passing additional parameters to the server when exporting

You can pass the additional parameter in the [Query](#) property by invoking **addParams** method. In the [ToolbarClick](#) event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed **recordcount** as **12** using **addParams** method.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowPdfExport().AllowExcelExport().ToolbarClick("toolbarClick").PdfExportC
omplete("pdfExportComplete").ExcelExportComplete("excelExportComplete").Colu
mns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("ShipCity").HeaderText("ShipCity").Width("120").TextAlign(Syncfusi
on.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().Toolbar(new List<string>() { "PdfExport", "ExcelExport"
}).Render()
<script>

```

```

var queryClone;
function toolbarClick(args) {
    var gridObj = document.getElementById("Grid").ej2_instances[0];
    if (args.item.id === 'Grid_pdfexport') {
        queryClone = gridObj.query;
        gridObj.query = new ej.data.Query().addParams("recordcount",
"12");
        gridObj.pdfExport();
    }
    else if (args.item.id === 'Grid_excelexport') {
        queryClone = gridObj.query;
        gridObj.query = new ej.data.Query().addParams("recordcount",
"12");
        gridObj.excelExport();
    }
}
function pdfExportComplete(args) {
    this.query = queryClone;
}
function excelExportComplete(args) {
    this.query = queryClone;
}
</script>

```

ADDITIONAL-PARAMETER.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

ADDITIONAL-PARAMETER.CS

```

Globalization in ASP.NET MVC Grid control

Localization

The [Localization](#) library allows you to localize default text content of the Grid. The grid component has static text on some features (like group drop area text, pager information text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [Locale](#) value and translation object.

The following list of properties and its values are used in the grid.

|Locale keywords|Text|

|----|----|

|EmptyRecord |No records to display.|

|True |true|

|False |false|

|InvalidFilterMessage |Invalid filter data.|

|GroupDropArea |Drag a column header here to group its column.|

|UnGroup |Click here to ungroup.|

|GroupDisable |Grouping is disabled for this column.|

|FilterbarTitle |\s filter bar cell.|

previousPagerTooltip	Go to previous pager items
pagerDropDown	Items per page
pagerAllDropDown	Items
All	All

Loading translations

To load translation object in an application, use **load** function of the **L10n** class.

The following example demonstrates the Grid in **Deutsch** culture.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().AllowGrouping().Locale("de-DE").PageSettings(page =>
page.PageSize(6)).Render()
<script>
    ej.base.L10n.load({
        'de-DE': {
            'grid': {
                'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
                'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
                'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
                'EmptyDataSourceError': 'DataSource darf bei der
Erstauslastung nicht leer sein, da Spalten aus der dataSource im
AutoGenerate Spaltenraster',
                'Item': 'Artikel',
                'Items': 'Artikel'
            },
            'pager': {
                'currentPageInfo': '{0} von {1} Seiten',
                'totalItemsInfo': '({0} Beiträge)',
                'firstPageTooltip': 'Zur ersten Seite',
                'lastPageTooltip': 'Zur letzten Seite',
                'nextPageTooltip': 'Zur nächsten Seite',
                'previousPageTooltip': 'Zurück zur letzten Seit',
                'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-
Elementen',
                'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
            }
        }
    });
</script>
```

LOCALIZATION.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Internationalization

The [Internationalization](#) library is used to globalize number, date, and time values in grid component using format strings in the Format.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("Freight").HeaderText("Ship
Name").Format("C2").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().AllowGrouping().Locale("de-DE").PageSettings(page =>
page.PageSize(6)).Render()
<script>
    ej.base.setCurrencyCode('EUR');
    ej.base.L10n.load({
        'de-DE': {
            'grid': {
                'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
                'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
                'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
                'EmptyDataSourceError': 'DataSource darf bei der
Erstauslastung nicht leer sein, da Spalten aus der dataSource im
AutoGenerate Spaltenraster',
                'Item': 'Artikel',
                'Items': 'Artikel'
            },
            'pager': {
                'currentPageInfo': '{0} von {1} Seiten',
                'totalItemsInfo': '({0} Beiträge)',
                'firstPageTooltip': 'Zur ersten Seite',
                'lastPageTooltip': 'Zur letzten Seite',
                'nextPageTooltip': 'Zur nächsten Seite',
                'previousPageTooltip': 'Zurück zur letzten Seit',
                'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-
Elementen',
                'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
            }
        }
    });
</script>
```

INTERNATIONALIZATION.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

```
}

```

Note: In the above sample, **Freight** column is formatted by **NumberFormatOptions**.

By default, [Locale](#) value is **en-US**. If you want to change the **en-US** culture to a different culture, you have to change the [Locale](#) accordingly.

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Grid component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Grid, set the [EnableRtl](#) to true.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().AllowGrouping().EnableRtl(true).Locale("de-
DE").PageSettings(page => page.PageSize(6)).Render()
<script>
    ej.base.L10n.load({
        'de-DE': {
            'grid': {
                'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
                'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
                'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
                'EmptyDataSourceError': 'DataSource darf bei der
Erstauslastung nicht leer sein, da Spalten aus der dataSource im
AutoGenerate Spaltenraster',
                'Item': 'Artikel',
                'Items': 'Artikel'
            },
            'pager': {
                'currentPageInfo': '{0} von {1} Seiten',
                'totalItemsInfo': '({0} Beiträge)',
                'firstPageTooltip': 'Zur ersten Seite',
                'lastPageTooltip': 'Zur letzten Seite',
                'nextPageTooltip': 'Zur nächsten Seite',
                'previousPageTooltip': 'Zurück zur letzten Seit',
                'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-
Elementen',
                'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
            }
        }
    });
</script>
```

RIGHTTOLEFT.CS

```
public IActionResult Index()
{
    var orders = OrderDetails.GetAllRecords();
    ViewBag.datasource = orders;
    return View();
}
```

Accessibility in Grid component

The Grid component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

WAI-ARIA attributes

The Grid component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Grid component:

Attributes	Purpose
---	---
<code>role=grid</code>	To represent the element containing the grid component.
<code>role=row</code>	To represent the element containing the cells of the row in the grid.
<code>role=rowgroup</code>	To represent the group of rows in the grid.
<code>role=columnheader</code>	To represent the cell in a row contains header information for a column in the grid.
<code>role=gridcell</code>	To represent a cell in the grid component.
<code>role=button</code>	To represent the element that acts as a button in the grid.
<code>role=search</code>	To represent the element that acts as a search region in the grid.
<code>role=presentation</code>	To represent the element to be not available for accessibility concerns.
<code>role=navigation</code>	To represent the element containing pager elements to navigate from one page to another.
<code>aria-colindex</code>	Defines the column index of the column with respect to the total number of columns within the grid.
<code>aria-rowindex</code>	Defines row index of the row with respect to the total number of rows within the grid.
<code>aria-rowspan</code>	Defines the number of rows spanned by a cell within the grid.
<code>aria-colspan</code>	Defines the number of columns spanned by a cell within the grid.
<code>aria-rowcount</code>	Defines the total number of rows in the grid.

- | **aria-colcount** | Defines the total number of columns in the grid. |
- | **aria-selected** | Indicates the current "selected" state of the rows and cells in the grid. |
- | **aria-expanded** | Indicate if the expand icon in the hierarchy grid or grouped grid or detail grid is expanded or collapsed |
- | **aria-sort** | Indicates whether the data in the grid are sorted in ascending or descending order. |
- | **aria-busy** | Indicates an element is being modified and that assistive technologies may want to wait until the changes are complete before informing the user about the update. |
- | **aria-owns** | Identifies an element in order to define a visual, functional, or contextual relationship between a parent and its child elements. |
- | **aria-hidden** | Hides the element from accessibility concerns. |
- | **aria-labelledby** | Provides an accessible name for the checkbox labels in excel filter, checkbox filter and column chooser dialog. |
- | **aria-describedby** | Provides an description about the features enabled in the header when the grid header cell is focused. |

Keyboard interaction

The Grid component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Grid component.

Pager

Windows | MAC | To do this

Home | Fn + Left Arrow | Moves the focus to the first cell of the focused row.

End | Fn + Right Arrow | Moves the focus to the last cell of the focused row.

Ctrl + Home | Command + Fn + Left Arrow | Moves the focus to the first Cell of the first row in the grid.

Ctrl + End | Command + Fn + Right Arrow | Moves the focus to the last Cell of the last row in the grid.

Up Arrow | Up Arrow | Moves the cell focus upward from the focused cell.

Down Arrow | Down Arrow | Moves the cell focus downward from the focused cell.

Right Arrow | Right Arrow | Moves the cell focus right side from the focused cell.

Left Arrow | Left Arrow | Moves the cell focus left side from the focused cell.

Alt + J | Alt + J | Moves the focus to the entire grid.

Alt + W | Alt + W | Move the focus to the grid content element.

Selection

Windows | MAC | To do this

Ctrl + Up Arrow | Command + Up Arrow | Collapses all the visible groups.

Ctrl + Down Arrow | Command + Down Arrow | Expands all the visible groups.

Ctrl + Space | Ctrl + Space | Performs grouping when focused on a header element.

Enter | Enter | If the current cell is an expand/collapse cell then expands/collapses the current group/detailrow/childgrid.

Print

Windows | MAC | To do this

Ctrl + C | Command + C | Copies selected rows or cells data into the clipboard.

Ctrl + Shift + H | Ctrl + Shift + H | Copies selected rows or cells data with header into clipboard

Editing

Windows | MAC | To do this

Alt + Down arrow | Alt + Down arrow | Opens the filter menu(excel, menu and checkbox filter) when its header element is in focused state.

Column Menu

Windows | MAC | To do this

Ctrl + left arrow or right arrow | Command + left arrow or right arrow | Reorders the focused header column to the left or right side.

Sorting

Windows | MAC | To do this

Enter | Enter | Performs sorting(ascending/descending) on a column when its header element is in focused state.

Ctrl + Enter | Command + Enter | Performs multi-sorting on a column when its header element is in focused state.

Shift + Enter | Shift + Enter | Clears sorting for the focused header column.

*** The Command and Control keys on Mac devices can be interchanged. When this switch occurs, use the Command key in place of the Control key and the Control key in place of the Command key for the above listed key interactions with Mac devices.**

*** For example, after switching the keys to group the columns when the header element is focused use Command + Space and for expanding the visible groups use Ctrl + Down Arrow.**

Ensuring accessibility

The Grid component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Grid component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Grid component with accessibility tools.

- [Accessibility in Syncfusion Grid control](#)

Clipboard

The clipboard provides an option to copy selected rows or cells data into the clipboard.

The following list of keyboard shortcuts is supported in the Grid to copy selected rows or cells data into the clipboard.

Interaction keys	Description
----- -----	
Ctrl + C	Copy selected rows or cells data into clipboard.
Ctrl + Shift + H	Copy selected rows or cells data with header into clipboard.

CSHTML

```
@(Html.EJS().Grid("Clipboard").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("C2").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().PageSettings(new Syncfusion.EJ2.Grids.GridPageSettings() { PageCount = 5 }).Render())
```

LOCAL.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Copy to clipboard by external buttons

To copy selected rows or cells data into the clipboard with help of toolbar buttons, you need to define the [ToolbarClick](#) event and invoke the [copy](#) method.

CSHTML

```
@Html.EJS().Button("Copy").Content("Copy").IsPrimary(true).Render()
@Html.EJS().Button("CopyHeader").Content("Copy With Header").IsPrimary(true).Render()
@Html.EJS().Grid("CopyBtn").DataSource((IEnumerable<object>)ViewBag.DataSource).Columns(col =>
```

```

{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.Te
xtAlign.Right).Width("120").Format("C2").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().Render()
<script>
    document.getElementById("Copy").onclick = function () {
        var grid = document.getElementById("CopyBtn").ej2_instances[0];
        grid.copy();
    }
    document.getElementById("CopyHeader").onclick = function () {
        var grid = document.getElementById("CopyBtn").ej2_instances[0];
        grid.copy(true);
    }
</script>

```

LOCAL.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

AutoFill

AutoFill Feature allows you to copy the data of selected cells and paste it to another cells by just dragging the autofill icon of the selected cells up to required cells. This feature is enabled by defining [EnableAutoFill](#) property as true.

CSHTML

```

@Html.EJS().Grid("Autofill").DataSource((IEnumerable<object>)ViewBag.DataSou
rce).AllowSelection().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").ValidationRules(new { required =
"true"}).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Width("150").ValidationRules(new { required = "true", minLength=3
}).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().PageSettings(page =>
page.PageCount(2)).EnableAutoFill().SelectionSettings(select =>

```

```
select.CellSelectionMode(Syncfusion.EJ2.Grids.CellSelectionMode.Box).Mode(Syncfusion.EJ2.Grids.SelectionMode.Cell).Type(Syncfusion.EJ2.Grids.SelectionType.Multiple)).EditSettings(edit => {
    edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusion.EJ2.Grids.EditMode.Batch); }).Toolbar(new List<string>() { "Add", "Update", "Cancel" }).Render()
```

AUTOFILL.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: If [EnableAutoFill](#) is set to true, then the autofill icon will be displayed on cell selection to copy cells.

 It requires the selection [Mode](#) to be **Cell**, [CellSelectionMode](#) to be **Box** and also Batch Editing should be enabled.

Limitations of AutoFill

- Since the string values are not parsed to number and date type, so when the selected string type cells are dragged to number type cells then it will display as **NaN**. For date type cells, when the selected string type cells are dragged to date type cells then it will display as an **empty cell**.
- Linear series and the sequential data generations are not supported in this autofill feature.

Paste

You can able to copy the content of a cell or a group of cells by selecting the cells and pressing Ctrl + C shortcut key and paste it to another set of cells by selecting the cells and pressing Ctrl + V shortcut key.

CSHTML

```
@Html.EJS().Grid("Paste").DataSource((IEnumerable<object>)ViewBag.DataSource).AllowSelection().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Width("120").ValidationRules(new { required = "true" }).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").ValidationRules(new { required = "true", minLength=3 }).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().PageSettings(page =>
page.PageCount(2)).SelectionSettings(select =>
select.CellSelectionMode(Syncfusion.EJ2.Grids.CellSelectionMode.Box).Mode(Syncfusion.EJ2.Grids.SelectionMode.Cell).Type(Syncfusion.EJ2.Grids.SelectionType.Multiple)).Render()
```

```
pe.Multiple)).EditSettings(edit => {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusion.EJ2.Grids.EditMode.Batch); }).Toolbar(new List<string>() { "Add",
"Update", "Cancel" }).Render()
```

PASTE.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Note: To perform paste functionality, it requires the selection [Mode](#) to be **Cell**, [CellSelectionMode](#) to be **Box** and also Batch Editing should be enabled.

Limitations of Paste Functionality

- Since the string values are not parsed to number and date type, so when the copied string type cells are pasted to number type cells then it will display as **NaN**. For date type cells, when the copied string format cells are pasted to date type cells then it will display as an **empty cell**.

Context menu in ASP.NET MVC Grid Component

The Grid has options to show the context menu when right clicked on it. To enable this feature, you need to define either default or custom item in the [ContextMenuItems](#).

The default items are in the following table.

Items	Description
----	----
AutoFit	Auto fit the current column.
AutoFitAll	Auto fit all columns.
Edit	Edit the current record.
Delete	Delete the current record.
Save	Save the edited record.
Cancel	Cancel the edited state.
Copy	Copy the selected records.
PdfExport	Export the grid data as Pdf document.
ExcelExport	Export the grid data as Excel document.
CsvExport	Export the grid data as CSV document.
Group	Group the current column.
Ungroup	Ungroup the current column.

|SortAscending | Sort the current column in ascending order.|

|SortDescending | Sort the current column in descending order.|

|FirstPage | Go to the first page.|

|PrevPage | Go to the previous page.|

|LastPage | Go to the last page.|

|NextPage | Go to the next page.|

CSHTML

```
@Html.EJS().Grid("ContextMenu").DataSource((IEnumerable<object>)ViewBag.Data
Source).AllowSorting(true).AllowExcelExport(true).AllowPdfExport(true).EditS
ettings(edit =>
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true)).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").IsPrimaryKey(true).TextAlign(Syncfusion.EJ2.Grids.TextAlig
n.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShippedDate").HeaderText("Shipped
Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().ContextMenuItems(new List<object>() { "AutoFit",
"AutoFitAll", "SortAscending", "SortDescending", "Copy", "Edit", "Delete",
"Save", "Cancel", "PdfExport", "ExcelExport", "CsvExport", "FirstPage",
"PrevPage", "LastPage", "NextPage" }).Render()
```

CONTEXTMENU.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Custom context menu items

The custom context menu items can be added by defining the [ContextMenuItems](#) as a collection of **ContextMenuitemModel**. Actions for this customized items can be defined in the [ContextMenuClick](#) event.

CSHTML

```
@{
    List<object> ContextMenuItems = new List<object>();
}
```

```

        ContextMenuItems.Add(new { text = "Copy with headers", target = ".e-
content", id = "copywithheader" });
    }
    @Html.EJS().Grid("Customcontext").DataSource((IEnumerable<object>)ViewBag.Data
taSource).Columns(col =>
    {
        col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
        col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
        col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

        col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
        col.Field("ShippedDate").HeaderText("Shipped
Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
        col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
    }).AllowPaging().ContextMenuItems(ContextMenuItems).ContextMenuClick("Contex
tMenuClick").Render()
<script>
    function ContextMenuClick(args) {
        if (args.item.id === 'copywithheader') {
            this.copy(true);
        }
    }
</script>

```

CUSTOMCONTEXTMENU.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Note: You can hide or show an item in context menu for specific area inside of grid by defining the **Target** property.

Show context menu on left click

By default, the context menu items will be shown in the Grid using the right mouse click action. Show the context menu items during the left mouse click action using the [Created](#) and context menu's [beforeOpen](#) events of the Grid.

Using the `onclick` eventlistener of Grid, you can get the clicked position values and send them to the `open` method of the context menu in the `onclick` event of the Grid. Also, we have prevented the default right click action to open the context menu items using the `Created` event of the Grid.

This is demonstrated in the following sample.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.dataSource)
.Created("created").EditSettings(edit =>
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true)).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").IsPrimaryKey(true).TextAlign(Syncfusion.EJ2.Grids.TextAlign
n.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
}).AllowPaging().ContextMenuItems(new List<object>() { "Copy", "Edit",
"Delete", "Save"}).Render()
<script>
function created() {
    var grid = document.getElementById("Grid").ej2_instances[0];
    grid.contextMenuModule.contextMenu.beforeOpen = (args) => {
        if (args.event && args.event.which === 3) args.cancel = true;
        args.event = values;
        grid.contextMenuModule.contextMenuBeforeOpen(args);
    };
}
document.getElementById('Grid').onclick = (event) => {
    values = event;
    var grid = document.getElementById("Grid").ej2_instances[0];
    grid.contextMenuModule.contextMenu.open(
        values.pageY + pageYOffset,
        values.pageX + pageXOffset
    );
};
</script>
```

CONTEXTMENUCLICK.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Enable or disable context menu items

It is possible to enable or disable the default and custom context menu items in the Grid component. This is achieved by using the `enableItems` method of the ContextMenu. To enable or disable menu items, set the `enable` parameter in the `enableItems` method to true, and vice versa.

In the following sample, the Copy item is enabled or disabled based on some condition (as per the needs of the application) in the [RowSelected](#) event of the Grid.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.RowSelected("rowSelected").EditSettings(edit =>
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true)).Columns(col
=>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").IsPrimaryKey(true).TextAlign(Syncfusion.EJ2.Grids.TextAlign
n.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShippedDate").HeaderText("Shipped
Date").Width("140").Format("yMd").TextAlign(Syncfusion.EJ2.Grids.TextAlign.R
ight).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().ContextMenuItems(new List<object>() { "Copy", "Edit",
"Delete"}).Render()
<script>
function rowSelected(args) {
    var grid = document.getElementById("Grid").ej2_instances[0];
    var contextMenuObj = grid.contextMenuModule.contextMenu;
    if (args.data.OrderID % 2 === 0) {
        contextMenuObj.enableItems(['Copy'], false);
    } else {
        contextMenuObj.enableItems(['Copy'], true);
    }
}
</script>
```

CONTEXTMENU.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Loading Animation ASP.NET MVC Grid Component

The grid has an option to show a loading indicator in-between the time of fetching the data and binding it to the grid during initial rendering or refreshing or after performing any grid action like sorting, filtering, grouping, and more. The grid supports two indicator types, which is achieved by setting the `loadingIndicator.indicatorType` property to `Spinner` or `Shimmer`. The default value of the indicator type is "Spinner."

In the following sample, the Shimmer indicator is displayed while the grid is loading and refreshing when using the remote data.

CSHTML

```
@Html.EJS().Grid("Grid").AllowSorting(true).AllowFiltering(true).DataSource(
    dataManger =>
    {
        dataManger.Url("https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders/").Adaptor("ODataAdaptor");
        }).Columns(col =>
        {
            col.Field("OrderID").HeaderText("Order ID").Width("130").Add();
            col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();
            col.Field("EmployeeID").HeaderText("Employee ID").Width("115").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
            col.Field("Freight").HeaderText("Freight").Width("150").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
            col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
        })
        .AllowPaging().PageSettings(page=>page.PageCount(3)).LoadingIndicator(l =>
        { l.IndicatorType(Syncfusion.EJ2.Grids.IndicatorType.Shimmer); }).Render()
```

LOADING-ANIMATION.CS

```
public IActionResult Index()
{
    return view();
}
```

Style and Appearance

To modify the Grid appearance, you need to override the default CSS of grid. Find the CSS structure that can be used to modify the Grid appearance. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

Customizing the Grid root element

Use the below CSS to customize the Grid root element.

```
`css
.e-grid {
font-family: cursive;
}
`
```

You can modify the grid styling appearance by overriding the default CSS style of the Grid.

In the following sample, the font family of grid content is changed to **cursive**, and the background color of rows, selected rows, alternate rows, and row hovering color is modified using the below CSS styles.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>) ViewBag.DataSource)
.Columns(col =>
{
```

```

        col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("100").Add();
        col.Field("CustomerID").HeaderText("Customer ID").Width("120").Add();

col.Field("Freight").HeaderText("Freight").Format("C2").TextAlign(Syncfusion
.EJ2.Grids.TextAlign.Right).Width("100").Add();
        col.Field("ShipName").HeaderText("Ship Name").Width("180").Add();
    }).AllowPaging().PageSettings(page => { page.PageSize(8);
    }).SelectionSettings(select =>
select.Type(Syncfusion.EJ2.Grids.SelectionType.Multiple)).Render()
<style>
    .e-grid {
        font-family: cursive;
    }
    .e-grid .e-row:hover .e-rowcell {
        background-color: rgb(204, 229, 255) !important;
    }
    .e-grid .e-rowcell.e-selectionbackground {
        background-color: rgb(230, 230, 250);
    }
    .e-grid .e-row.e-altrow {
        background-color: rgb(150, 212, 212);
    }
    .e-grid .e-row {
        background-color: rgb(180, 180, 180);
    }
</style>

```

STYLE-AND-APPEARANCE.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}

```

How To

Migration from Essential JS 1

This article describes the API migration process of Grid component from Essential JS 1 to Essential JS 2.

Sorting

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----| -----| -----|

| Default | **Property:** *AllowSorting*

@(Html.EJ().Grid<object>("Grid")
 .AllowSorting().Columns(col
=>{
 col.Field("OrderID").Add();
})| **Property:** *AllowSorting*

@Html.EJS().Grid("Grid")
 .AllowSorting().Columns(col =>{
 col.Field("OrderID").Add();
}).Render()|

| Clear the Sorted columns | **Method:** *clearSorting()*

@(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>)
ViewBag.data

Source))
Script:
<script>
var gridObj =
\$("#Grid").data("ejGrid");
gridObj.clearSorting();
</script>| **Method:**
clearSorting()

@Html.EJS().Grid("Grid")
.DataSource((IEnumerable<object>)
ViewBag.dataSource)
.Render()
Script:
<script>
var gridObj =
document.getElementById
('Grid').ej2_instances[0];
gridObj.clearSorting()
</script>
| Get the Sorted Columns by using the Fieldname | **Method:** *getsortColumnByField(field)*

@(Html.EJ().Grid<object>
("Grid").DataSource
((IEnumerable<object>)
ViewBag.dataSource))
Script:
<script>
var gridObj =
\$("#Grid").data("ejGrid");
gridObj.getsortColumnByField("OrderID");
</script>| **Property:**
sortSettings.columns

Sorted Column for a particular field can be get by iterating the
sortSettings.columns with the fieldname

| Remove the Sorted Columns | **Method:** *removeSortedColumns(fieldName)*

@(Html.EJ().Grid<object>
("Grid").DataSource
((IEnumerable<object>)
ViewBag.dataSource))
Script:
<script>
var gridObj =
\$("#Grid").data("ejGrid");
gridObj.removeSortedColumns("OrderID");
</script>| **Method:**
removeSortColumn(fieldName)

@Html.EJS().Grid("Grid")
.DataSource((IEnumerable<
object>)
ViewBag.dataSource)
.Render()
Script:
<script>
var gridObj =
document
.getElementById('Grid').ej2_instances[0];
gridObj.removeSortColumn("OrderI
D")
</script>

| Sort a Column by using the method | **Method:** *sortColumn(columnName, [sortingDirection])*

@(Html.EJ().Grid<object>
("Grid").DataSource
((IEnumerable<object>)
ViewBag.dataSource))
Script:
<script>
var gridObj =
\$("#Grid").data("ejGrid");
gridObj.sortColumn("OrderID", "ascending");
</script>|
Method: *sortColumn(columnName,
Direction)*

@Html.EJS().Grid("Grid")
.DataSource((IEnumerable<object>)
ViewBa
g.dataSource)
.Render()
Script:
<script>
var gridObj =
document.getElementById
('Grid').ej2_instances[0];
gridObj.sortColumn("OrderID",
"ascending");
</script>

Grouping

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *AllowGrouping*

@(Html.EJ().Grid<object>("Grid")
 .AllowGrouping().Columns(col =>{
 col.Field("OrderID").Add();
})
)|

Property:

AllowGrouping

@Html.EJS().Grid("Grid")
 .AllowGrouping().Columns(col
=>{
 col.Field("OrderID").Add();
}).Render()|

| Group Columns initially | **Property:** *AllowGrouping.GroupedColumns*

@(Html.EJ().Grid<object>("Grid")
 .AllowGrouping()
.GroupSettings(group => {
group
.GroupedColumns(col => { col.Add("ShipCountry"); }); })
.Columns(col
=>{
 col.Field("OrderID").Add();
 col.Field("ShipCountry").Add();
 col.Field("ShipCity").Add();
})
)| **Property:**
AllowGrouping.Columns

@Html.EJS().Grid("Grid")
.AllowGrouping()
.GroupSettin

```
gs(group=><br>group.Columns(new string[] { "ShipCountry" }));<br>.Columns(col =>{<br>
    &#160;&#160;col.Field("OrderID").Add();<br> &#160;&#160;col.Field("ShipCountry").Add();<br>
    &#160;&#160;col.Field("ShipCity").Add();<br>}).Render();
```

| Caption Template | **Property:** *GroupSettings.CaptionFormat*

 @(Html.EJ().Grid<object>("Grid")
.AllowGrouping())
.GroupSettings(group
 =>{
group.CaptionFormat("#template"); })
Script:
<script id="template"
 type="text/x-jsrender">
You can add template elements here
</script>| **Property:**
GroupSettings.CaptionTemplate

@Html.EJS().Grid("Grid")
 .AllowGrouping().Gr
 oupSettings(
group =>{group.Columns(
new string[] { "Freight" }

 .CaptionTemplate("#captiontemplate");
 })
.Render()
Script:
<script>
<script id="captiontemplate"
type="text/x-
 template">
You can add template elements here
</script>

| Show Drop Area | **Property:** *AllowGrouping.ShowDropArea*

 @(Html.EJ().Grid<object>("Grid")
.AllowGrouping())
.GroupSettings(group
 =>{
group.ShowDropArea(false) }); }
.Columns(col
 =>{
 col.Field("OrderID").Add();
 col.Field("ShipCity").Add();
})
)|
Property:
AllowGrouping.showDropArea

@Html.EJS().Grid("Grid")
 .AllowGrouping()
.
 GroupSettings(group=>
group.ShowDropArea(false))
.Columns(col =>{

 col.Field("OrderID").Add();

 col.Field("ShipCity").Add();
}).Render();

| Collapse all group caption rows | **Method:** *collapseAll()*

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>)
ViewBag.data
 Source))

AllowTextWrap<br><br>@Html.EJS().Grid("Grid")<br>&#160;.AllowTextWrap()<br>.TextWrapSet
tings(text =>
```

```
{<br>text.WrapMode<br>(Syncfusion.EJ2.Grids.WrapMode.Header);}<br>.Columns(col =><br>&#160;&#160;col.Field("OrderID").Add();<br>}.Render()|
```

| Content | **Property:** *AllowTextWrap*

 @(Html.EJ().Grid<object>("Grid")
 .AllowTextWrap()
.TextWrapSettings(wrap =>
{wrap.WrapMode(WrapMode.Content); })
.Columns(col
=>
 col.Field("OrderID").Add();
})
)| **Property:**

```
AllowTextWrap<br><br>@Html.EJS().Grid("Grid")<br>&#160;.AllowTextWrap()<br>.TextWrapSet
tings(text =>
```

```
{<br>text.WrapMode<br>(Syncfusion.EJ2.Grids.WrapMode.Content);}<br>.Columns(col =><br>&#160;&#160;col.Field("OrderID").Add();<br>}.Render()|
```

Responsive

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *IsResponsive*

 @(Html.EJ().Grid<object>("Grid")
 .IsResponsive(true)
.EnableResponsiveRow(true)
.Columns(col
=>
 col.Field("OrderID").Add();
})
)| Not Applicable

State Persistence

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|----- | ----- | ----- |

| Default | **Property:** *EnablePersistence*
 @(Html.EJ().Grid<object>("Grid")

 .EnablePersistence())
.Columns(col
 =>{
 col.Field("OrderID").Add();
})
| **Property:**
EnablePersistence
@Html.EJS().Grid("Grid")
 .EnablePersistence()
.Column
 s(col =>{
 col.Field("OrderID").Add();
}).Render()|

Right to Left - RTL

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|----- | ----- | ----- |

| Default | **Property:** *EnableRtl*
 @(Html.EJ().Grid<object>("Grid")

 .EnableRtl())
.Columns(col =>{
 col.Field("OrderID").Add();
})
| **Property:** *EnableRtl*
 @Html.EJS().Grid("Grid")

.Columns(col
 =>{
 col.Field("OrderID").Add();
}).Render()|

ToolTip

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|----- | ----- | ----- |

| Default | **Property:** *ClipMode*
 @(Html.EJ().Grid<object>("Grid")

 .Columns(col
 =>{
col.Field("OrderID")
.ClipMode(ClipMode.Clip).Add();
col.Field("CustomerID")

 >.ClipMode(ClipMode.Ellipsis).Add();
col.Field("ShipCity")
.ClipMode(ClipMode.EllipsisWi
 thTooltip).Add();
})
| **Property:**
ClipMode
@Html.EJS().Grid("Grid")
 .EnableRtl()
.Columns(col
 =>{
col.Field("OrderID")
.ClipMode(Syncfusion.EJ2.Grids
.ClipMode.Clip)
.Add();

 r>col.Field("CustomerID")
.ClipMode(Syncfusion.EJ2.Grids
.ClipMode.Ellipsis)
.Add();

col.Field("ShipCity")
.ClipMode(Syncfusion.EJ2.Grids
.ClipMode.EllipsisWithTooltip)<
 br>.Add();
}).Render()|

Aggregate/Summary

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|----- | ----- | ----- |

| Footer Aggregate | **Property:** *ShowSummary*
 @(Html.EJ().Grid<object>("Grid")

 .ShowSummary()
.SummaryRow(row
 =>{
row.Title("Sum")
.SummaryColumns(col =>
 {
col.SummaryType(SummaryType.Sum)
.Format("{0:C}")
.DisplayColumn("Freight")<
 br>.DataMember("Freight").Add();
}).Add();
})
| **Property:**
Aggregates
@Html.EJS().Grid("Grid")
 .Aggregates(agg=>{
agg.Columns(n
 ew List<Syncfusion.EJ2
.Grids.GridAggregateColumn>())
new
 Syncfusion.EJ2
.Grids.GridAggregateColumn() {
Field = "Freight", Format = "C2",
Type
 = "Sum", FooterTemplate = "Sum: \${Sum}" } }).Add();
}).Render()|

| Caption Aggregate | **Property:** *ShowSummary*
 @(Html.EJ().Grid<object>("Grid")

 .ShowSummary()
.SummaryRow(row

```
=>{<br>row.ShowTotalSummary(false)<br>.ShowCaptionSummary(true)<br>.SummaryColumns(
col
=>{<br>col.SummaryType(SummaryType.Average)<br>.Format("{0:C2}")<br>.DisplayColumn("Fr
eight")<br>.DataMember("Freight")<br>.Prefix("Average").Add();<br>}}.Add();<br>}} | Property:
Aggregates<br><br>@Html.EJS().Grid("Grid")<br>#160;.Aggregates(agg=>{<br>agg.Columns(n
ew List<Syncfusion.EJ2<br>.Grids.GridAggregateColumn>())<br>new
Syncfusion.EJ2<br>.Grids.GridAggregateColumn() {<br>Field = "Freight", Format = "C2",<br>Type
= "Sum", GroupCaptionTemplate = "Sum: ${Sum}" } }).Add();<br>}).Render();
```

| Get Summary values | **Method:** *getSummaryValues(summaryCol, summaryData)*

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.getSummaryValues(summaryCol,
 window.gridData);
</script> | Not Applicable

Grid Export

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Adds a grid model property
 which is to be ignored on exporting grid | **Method:**

addIgnoreOnExport(propertyNames)

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.addIgnoreOnExport
("filterSettings");
</script> |
 Not Applicable |

Columns

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Add or Remove Columns | **Method:** *columns(columnDetails, [action])()*

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.columns("OrderID",
 "remove");
gridObj.columns("CustomerID", "add");
</script> | **Property:**
columns

Grid is initially rendered with OrderID and CustomerID columns.
Then if you want
 to add ShipAddress column, you have to reset the value for column property as gridObj.columns =
 [{field:"OrderID"}, {field:"CustomerID"}, {field:"ShipAddress"}]; Then to remove the
 CustomerID column, reset the column property as, gridObj.columns = [{field:"OrderID"},
 {field:"ShipAddress"}];

| Get Column By Field | **Method:** *getColumnByField(fieldName)*

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.getColumnByField("OrderID");
</script> | **Method:**
getColumnByField(fieldName)

@Html.EJS().Grid("Grid")
.DataSource((IEnumerable<o
 bject>
ViewBag.dataSource)
.Render()
Script:
<script>
var gridObj =

```
document.getElementById<br>('Grid').ej2_instances[0];<br>gridObj.getColumnByField("OrderID")<br></script>
```

| Get Column By HeaderText | **Method:** `getColumnByHeaderText(headerText)`

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.getColumnByHeaderText
("Order ID");
</script> |
 Column object for a corresponding headerText can be able to get by iterating the gridObj.columns with the
 headerText

| Get Column By Index | **Method:** `getColumnByIndex(columnIndex)`

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.getColumnByIndex(1);
</script> | **Method:**
`getColumnByIndex(columnIndex)`

@Html.EJS().Grid("Grid")
.DataSource((IEnumerable
 <object>
ViewBag.dataSource)
.Render()
Script:
<script>
var gridObj =
 document.getElementById
('Grid').ej2_instances[0];
gridObj.getColumnByIndex(1)
</
 script>

| Get Column Fieldnames | **Method:** `getColumnFieldNames()`

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.getColumnFieldNames();
</script> | **Method:**
`getColumnFieldNames()`

@Html.EJS().Grid("Grid")
.DataSource((IEnumerable<object
 >
ViewBag.dataSource)
.Render()
Script:
<script>
var gridObj =
 document.getElementById
('Grid').ej2_instances[0];
gridObj.getColumnFieldNames()

 </script>

| Get Column Index By Field | **Method:** `getColumnIndexByField(fieldName)`

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.getColumnIndexByField("OrderID");
</script> |
Method:
`getColumnIndexByField(fieldName)`

@Html.EJS().Grid("Grid")
.DataSource((IEnum
 erable<object>
ViewBag.dataSource)
.Render()
Script:
<script>
var gridObj =
 document.getElementById
('Grid').ej2_instances[0];
gridObj.getColumnIndexByField("Or
 derID");
</script>

| Get Column Index By headerText | **Method:** `getColumnIndexByHeaderText(headerText,
 [field])`

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data
 Source))
Script:
<script>
var gridObj =
 \$("#Grid").data("ejGrid");
gridObj.getColumnIndexByHeaderText("Order ID");
</script> |
 The Column Index for a corresponding headerText can be get by iterating the gridObj.columns with the
 headerText

| Set Width to columns | **Method:** `setWidthToColumns()`

 @(Html.EJ().Grid<object>
("Grid").Datasource
((IEnumerable<object>
ViewBag.data

Source))
Script:
<script>
var gridObj =
\$("#Grid").data("ejGrid");
gridObj.setWidthToColumns();
</script>| **Method:**

widthService.setWidthToColumns()
</br>@Html.EJS().Grid("Grid")
.DataSource((IEnumerable<object>)
ViewBag.dataSource)
.Render()
Script:
<script>
var gridObj =
document.getElementById
('Grid').ej2_instances[0];
gridObj.widthService.setWidthToColumns()
</script>

| Get HeaderText By FieldName | **Method:** *getHeaderTextByFieldName()*

@ (Html.EJ().Grid<object>
("Grid").DataSource
((IEnumerable<object>)
ViewBag.dataSource))
Script:
<script>
var gridObj =
\$("#Grid").data("ejGrid");
gridObj.getHeaderTextByFieldName("OrderID");
</script>|
Not Applicable

```

Enable/Disable Grid and its actions

You can enable/disable the Grid and its actions by applying/removing corresponding CSS styles.

To enable/disable the grid and its actions, follow the given steps:

Step 1: Create CSS class with custom style to override the default style of Grid.

```
`css
.disablegrid {
pointer-events: none;
opacity: 0.4;
}
.wrapper {
cursor: not-allowed;
}
```

Step 2: Add/Remove the custom CSS class to the Grid in the click event handler of Button.

```
`typescript
<script>
document.getElementById('element').onclick = function () {
var gridInst = document.getElementById("Grid").ej2_instances[0];
if (gridInst.element.classList.contains('disablegrid')) {
gridInst.element.classList.remove('disablegrid');
document.getElementById("GridParent").classList.remove('wrapper');
}
else {
gridInst.element.classList.add('disablegrid');
document.getElementById("GridParent").classList.add('wrapper');
}
}
</script>
```

In the below demo, the button click will enable/disable the Grid and its actions.

CSHTML

```
@Html.EJS().Button("element").Content("Enable/Disable Grid").Render()
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").Add();
col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().EditSettings(edit => {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Normal); }).Toolbar(new List<string>() { "Add", "Edit",
"Delete", "Update", "Cancel" }).Render()
<style>
.disablegrid {
pointer-events: none;
opacity: 0.4;
}
.wrapper {
cursor: not-allowed;
}
</style>
<script>
```

```

document.getElementById('element').onclick = function () {
    var gridInst = document.getElementById("Grid").ej2_instances[0];
    if (gridInst.element.classList.contains('disablegrid')) {
        gridInst.element.classList.remove('disablegrid');
    }
    document.getElementById("GridParent").classList.remove('wrapper');
}
else {
    gridInst.element.classList.add('disablegrid');
    document.getElementById("GridParent").classList.add('wrapper');
}
}
</script>

```

DISABLEGRID.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Print the expanded state from other pages

By default, the expanded child grids will be printed from the current page alone. You can print the expanded child grids from other pages by using the [Load](#) and [ActionBegin](#) event.

In the following example, we have printed expanded child grids from other pages.

CSHTML

```

@{
    var SecondChildGrid = new Syncfusion.EJ2.Grids.Grid() { DataSource =
    (IEnumerable<object>)ViewBag.CustomerDataSource,
        QueryString = "CustomerID",
        Columns = new List<Syncfusion.EJ2.Grids.GridColumn>
        {
            new Syncfusion.EJ2.Grids.GridColumn() { Field="CustomerID",
            HeaderText="Customer ID", Width="90",
            TextAlign=Syncfusion.EJ2.Grids.TextAlign.Right },
            new Syncfusion.EJ2.Grids.GridColumn() { Field="ShipCountry",
            HeaderText="Ship Country", Width="90" },
        }
    };
    var ChildGrid = new Syncfusion.EJ2.Grids.Grid() { DataSource =
    (IEnumerable<object>)ViewBag.DataSource,
        QueryString = "EmployeeID",
        Columns = new List<Syncfusion.EJ2.Grids.GridColumn>
        {
            new Syncfusion.EJ2.Grids.GridColumn() { Field="OrderID",
            HeaderText="Order ID", Width="120" },
            new Syncfusion.EJ2.Grids.GridColumn() { Field="Freight",
            HeaderText="Freight", Width="120", Format="C2",
            TextAlign=Syncfusion.EJ2.Grids.TextAlign.Right },
            new Syncfusion.EJ2.Grids.GridColumn() { Field="ShipName",
            HeaderText="Ship Name", Width="150" },
        }
    };
}

```

```

        new Syncfusion.EJ2.Grids.GridColumn() { Field="ShipCity",
HeaderText="Ship City", Width="120" },
    },
    ChildGrid = SecondChildGrid
};
}

@Html.EJS().Grid("HierarchyPrint").DataSource((IEnumerable<object>)ViewBag.E
mpDataSource).HierarchyPrintMode(Syncfusion.EJ2.Grids.HierarchyGridPrintMode
.Expanded).Columns(col =>
{
    col.Field("EmployeeID").HeaderText("Employee
ID").Width("125").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("FirstName").HeaderText("Name").Width("125").Add();
    col.Field("Title").HeaderText("Title").Width("180").Add();
    col.Field("City").HeaderText("City").Width("135").Add();
}).AllowSorting().AllowPaging().PageSettings(page =>
page.PageSize(5)).Toolbar(new List<string>() {
"Print"}).ChildGrid(ChildGrid).ActionBegin("actionBegin").Load("load").Rende
r()

<script>
    var expandedChildGrid = {};
    function actionBegin(args) {
        if (args.requestType === 'paging') {
            expandedChildGrid = ej.base.extend({}, expandedChildGrid,
getExpandedState(this, 'Expanded', args.previousPage));
        }
    }
    function load() {
        this.on(ej.grids.printGridInit, printInit, this);
    }
    function printInit(gridModel) {
        gridModel.printgrid.expandedRows = ej.base.extend({},
expandedChildGrid, gridModel.expandedRows);
    }
    function getExpandedState(gObj, hierarchyPrintMode, currentPage) {
        var obj = {};
        var rows = gObj.getRowsObject();
        for (var i = 0; i < rows.length; i++) {
            var row = rows[i];
            if (row.isExpand && !row.isDetailRow) {
                var index = gObj.allowPaging ? row.index + (currentPage *
gObj.pageSettings.pageSize) - gObj.pageSettings.pageSize : row.index;
                obj[index] = {};
                obj[index].isExpand = true;
                obj[index].gridModel =
ej.grids.getPrintGridModel(row.childGrid, hierarchyPrintMode);
            }
        }
        return obj;
    }
}
</script>

```

HIERARCHYPRINT.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrdersDetails.GetAllRecords();
    ViewBag.EmpDataSource = EmployeeView.GetAllRecords();
    ViewBag.CustomerDataSource = Customer.GetAllRecords();
    return View();
}
```

Perform CRUD operation using anti-forgery token

Anti-forgery token is used between the client and server to prevent cross-site request forgery (CSRF) attack. For more information on preventing CSRF attack, refer to the [link](#).

While performing grid save operation, you can send anti-forgery token along with the save request using the below custom adaptor.

This custom adaptor will read the anti-forgery token from the hidden element and send it along with the request. Also content type is set to **application/x-www-form-urlencoded; charset=UTF-8** since the **ValidateAntiForgeryToken** will look for the token in the form encoded data.

```
`javascript
<script>
window.customAdaptor = new ej.data.UrlAdaptor();
customAdaptor = ej.base.extend(customAdaptor, {
processResponse: function (data, ds, query, xhr, request, changes) {
request.data = JSON.stringify(data);
return ej.data.UrlAdaptor.prototype.processResponse.call(this, data, ds, query, xhr, request, changes);
},
insert: function (dm, data, tableName) {
return {
url: dm.dataSource.insertUrl || dm.dataSource.crudUrl || dm.dataSource.url,
data: $.param({
//Added the anti-forgery token.
RequestVerificationToken: document.getElementsByName("RequestVerificationToken")[0].value,
value: data,
table: tableName,
action: 'insert'
}),
contentType: 'application/x-www-form-urlencoded; charset=UTF-8'
}
},
update: function (dm, keyField, value, tableName) {
```

```

return {
url: dm.dataSource.updateUrl || dm.dataSource.crudUrl || dm.dataSource.url,
data: $.param({
//Added the anti-forgery token.
RequestVerificationToken: document.getElementsByName("RequestVerificationToken")[0].value,
value: value,
table: tableName,
action: 'insert'
}),
contentType: 'application/x-www-form-urlencoded; charset=UTF-8'
};
},
});
</script>
`

```

Now assign the custom adaptor to the grid as follows.

```

`javascript
<script>
function load(args) {
this.dataSource.adaptor = customAdaptor;
}
</script>
`

```

CSHTML

```

@Html.EJS().Grid("RemoteSaveAdaptor").DataSource(dataManager => {
dataManager.Json(ViewBag.dataSource.ToArray()).InsertUrl("/Home/Insert").RemoveUrl("/Home/Delete").UpdateUrl("/Home/Update").Adaptor("RemoteSaveAdaptor");
}).EditSettings(e => {
e.AllowAdding(true).AllowEditing(true).AllowDeleting(true); }).Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Width("120").IsPrimaryKey(true).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width("150").Add();

col.Field("Freight").HeaderText("Freight").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("C2").Add();

```

```

        col.Field("OrderDate").HeaderText("Order
Date").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();
    }).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel"
    }).Render()
    <script type="text/javascript">
        window.customAdaptor = new ej.data.RemoteSaveAdaptor();
        customAdaptor = ej.base.extend(customAdaptor, {
            insert(dm, data, tableName) {
                this.updateType = 'add';
                return {

Perform Grid actions by keyboard shortcut keys

Using keyboard shortcuts, Grid performs navigation and actions.

In addition, You can also perform grid actions with custom keyboard shortcuts. This operation has to be achieved outside of the grid with the help of **keydown** event.

The following example demonstrates on **Adding** a new row when **Enter** key is pressed in the grid.

CSHTML

```
@using Syncfusion.EJ2
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").ValidationRules(new { required = true
}).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

col.Field("Freight").HeaderText("Freight").EditType("numericedit").Format("C
2").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship
Country").EditType("dropdownedit").Width("150").Add();
}).AllowPaging().PageSettings(page => page.PageCount(2)).EditSettings(edit
=> {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Normal); }).Toolbar(new List<string>() { "Add", "Edit",
"Delete", "Update", "Cancel" }).Render()
<script>
    var grid = document.getElementById("Grid");
    grid.addEventListener("keydown", keyDownHandler)
    function keyDownHandler(e) {
        if (e.keyCode === 13) {
            var gridIns = grid.ej2_instances[0];
            gridIns.addRecord();
        }
    }
</script>
```

KEYS.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

KEYS.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Customize Pager DropDown

To customize default values of pager dropdown, you need to define in [PageSizes](#) property as array of strings.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowPaging().PageSettings(page => { page.PageSizes((new string[] { "5",
"10", "All" })); }).Render()
```

PAGERDROPDOWN.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Hide the expand/collapse icon in parent row with no record in child grid

By default, the expand/collapse icon will be visible even if the child grid is empty.

You can use [RowDataBound](#) event to hide the icon when there are no records in child grid.

To hide the expand/collapse icon in parent row when no records in child grid, follow the given steps:

Step 1: Create CSS class with custom style to override the default style of Grid.

```
`css
.e-row[aria-selected="true"].e-customizedExpandcell {
background-color: #e0e0e0;
}
.e-grid.e-gridhover tr[role='row']:hover {
background-color: #eee;
}
`
```

Step 2: Add the CSS class to the Grid in the [RowDataBound](#) event handler of Grid.

```
`typescript
function rowDataBound(args) {
var filter = args.data.EmployeeID;
```

```

var data = new ej.data.DataManager(this.childGrid.dataSource).executeLocal(new
ej.data.Query().where("EmployeeID", "equal", parseInt(filter), true));
if (data.length == 0) {
//here hide which parent row has no child records
args.row.querySelector('td').innerHTML = " ";
args.row.querySelector('td').className = "e-customizedExpandcell";
}
}
,

```

In the below demo, the expand/collapse icon in the row with **EmployeeID** as **1** is hidden as it does not have record in child Grid.

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Load("load").RowDataBound("rowDataBound").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").Add();
    col.Field("EmployeeID").HeaderText("Employee ID").Width("150").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().Render()
<style>
    .e-row[aria-selected="true"] .e-customizedExpandcell {
        background-color: #e0e0e0;
    }
    .e-grid.e-gridhover tr[role='row']:hover {
        background-color: #eee;
    }
</style>
<script>
function load(args) {
    var grid = document.getElementById('Grid').ej2_instances[0]
    grid.childGrid = {
        dataSource: dataManger,
        queryString: 'EmployeeID',
        allowPaging: true,
        columns: [
            { field: 'Order', headerText: 'Order ID', textAlign:
'Right', width: 120 },
            { field: 'EmployeeID', headerText: 'Employee ID', width: 120
},
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
    }
    var dataManger = [{ Order: 100, ShipName: 'Berlin', EmployeeID: 2 },
        { Order: 101, ShipName: 'Capte', EmployeeID: 3 },
        { Order: 102, ShipName: 'Marlon', EmployeeID: 4 },

```

```

        { Order: 103, ShipName: 'Black pearl', EmployeeID: 5 },
        { Order: 104, ShipName: 'Pearl', EmployeeID: 6 },
        { Order: 105, ShipName: 'Noth bay', EmployeeID: 7 },
        { Order: 106, ShipName: 'baratna', EmployeeID: 8 },
        { Order: 107, ShipName: 'Charge', EmployeeID: 9 },
    ];
    function rowDataBound(args) {
        var filter = args.data.EmployeeID;
        var data = new
ej.data.DataManager(this.childGrid.dataSource).executeLocal(new
ej.data.Query().where("EmployeeID", "equal", parseInt(filter), true));
        if (data.length == 0) {
            //here hide which parent row has no child records
            args.row.querySelector('td').innerHTML = " ";
            args.row.querySelector('td').className = "e-
customizedExpandcell";
        }
    }
}
</script>

```

HIDEARROW.CS

```

public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}

```

Render both EJ1 and EJ2 Grids in same application

To achieve this requirement, you need to use the below code in **_Layout.cshtml** page. Because EJ1 and EJ2 has same library names to perform the different actions. So conflicts may occur when we refer this both controls in same application. To overcome this we need to extend this libraries in ej namespace.

```

`javascript
<script>
var dataCopy = Object.assign({}, ej.data);
$.extend(ej, Syncfusion);
$.extend(ej.data, dataCopy);
</script>
`

```

The Layout page looks like

```

`html
<head>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

@ Syncfusion Essential JS 1 Styles @
@Styles.Render("http://cdn.syncfusion.com/16.3.0.21/js/web/flat-azure/ej.web.all.min.css")
@ Syncfusion Essential JS 2 Styles @
@Styles.Render("https://cdn.syncfusion.com/ej2/styles/compatibility/material.css")
</head>
<body>
@Scripts.Render("~/bundles/jquery")
@Scripts.Render("~/bundles/bootstrap")
@Scripts.Render("~/Scripts/jsrender.min.js")
@ Syncfusion Essential JS 1 Scripts @
@Scripts.Render("~/Scripts/ej/web/ej.web.all.min.js")
@ Syncfusion Essential JS 2 Scripts @
@Scripts.Render("~/Scripts/ej2/ej2.min.js")
@RenderSection("scripts", required: false)
<script>
var dataCopy = Object.assign({}, ej.data);
$.extend(ej, Syncfusion);
$.extend(ej.data, dataCopy);
</script>
<div class="container body-content">
@RenderBody()
</div>
@Html.EJ().ScriptManager()
@Html.EJS().ScriptManager()
</body>
</html>

```

Set complex column as Foreignkey column

The following example shows how to set the complex column as foreign key column.

In the following example, **Employee.EmployeeID** is a complex column and also declared as a foreign column which shows **FirstName** column from foreign data.

CSHTML

```

@Html.EJS().Grid("ForeignKey").DataSource((IEnumerable<object>) ViewBag.DataSource).Columns(col =>
{

```

```
col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();

col.Field("Employee.EmployeeID").ForeignKeyField("EmployeeID").ForeignKeyVal
ue("FirstName").DataSource((IEnumerable<object>)ViewBag.foreign).HeaderText("
Employee Name").Width("150").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
}).Render();
```

FOREIGNKEY.CS

```
public IActionResult DefaultExporting()
{
    var order = OrdersDetails.GetAllRecords();
    ViewBag.DataSource = order;
    var emp = EmployeeView.GetAllRecords();
    ViewBag.foreign = emp;
    return View();
}
```

Complex Data Binding with list of Array Of Objects

The following example shows how to set Complex field for datasource having Array Of Objects.

CSHTML

```
@Html.EJS().Grid("Complex").DataSource((IEnumerable<object>)ViewBag.DataSour
ce).Columns(col =>
{
    col.Field("EmployeeID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAli
gn.Right).Add();
    col.Field("Name.0.FirstName").HeaderText("FirstName").Width("140").Add();

    col.Field("Name.LastName").HeaderText("LastName").Width("130").TextAlign(Syn
cfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("City").Width("120").Add();
    col.Field("Country").Width("140").Add();
}).AllowPaging().Render();
```

COMPLEXARRAY.CS

```
public IActionResult Index()
{
    var ComplexData = ComplexData.GetAllRecords();
    ViewBag.DataSource = ComplexData;
    return View();
}
```

Select grid rows based on certain condition

You can select the specific row in the grid based on a certain condition by using the **selectRows** method in the [DataBound](#) event of Grid.

In the below demo, we have selected the grid rows only when **EmployeeID** column value greater than 3.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("150").Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("120").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().DataBound("dataBound").RowDataBound("rowDataBound").SelectionSettings(select =>
select.Type(Syncfusion.EJ2.Grids.SelectionType.Multiple)).Render()
<script>
    var selIndex = [];
    function rowDataBound(args) {
        if (args.data['EmployeeID'] > 3) {
            selIndex.push(parseInt(args.row.getAttribute('aria-rowindex')));
        }
    }
    function dataBound(args) {
        if (selIndex.length) {
            this.selectRows(selIndex);
            selIndex = [];
        }
    }
</script>
```

DATABASESELECTION.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Collapse all grouped rows at initial render

You can collapse all the grouped rows at initial rendering by using [DataBound](#) event with **collapseAll** method of the grid.

In the below demo, all the grouped rows are collapsed at initial rendering.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.dataSource)
.DataBound("bound").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
```

```

col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width("150").EditType("dropdowndedit").Add();
}).AllowPaging().AllowGrouping().GroupSettings(group => group.Columns(new string[] { "ShipCountry" })).Render()
<script>
    var initial = true;
    function bound() {
        if (initial === true) {
            this.groupModule.collapseAll();
            initial = false;
        }
    }
</script>

```

COLLAPSEALL.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}

```

How to show grouped rows based on the pageSize

By default, we have displayed the no of records based on the [PageSize](#). If you want to show grouped column rows based on the [PageSize](#) then we suggest you to use the below way.

In the below sample, we have overridden the default **generateQuery** to display the grouped rows instead of grid rows based on the [PageSize](#).

CSHTML

```

<script>
    var old = ej.grids.Data.prototype.generateQuery;
    ej.grids.Data.prototype.generateQuery = function () {
        var query = old.call(this, true);
        this.pageQuery(query);
        return query;
    };
</script>
@Html.EJS().Grid("FlatGrid").DataSource((IEnumerable<object>)ViewBag.DataSource).AllowSorting().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}

```

```
}).AllowPaging().PageSettings(page =>
page.PageSize(5)).AllowGrouping().GroupSettings(group=>group.Columns(new
string[] { "ShipCountry" })).Render()
```

GROUP-PAGE-SIZE.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Get specific row and cell index in Grid

You can get the specific row and cell index of the grid by using [RowSelected](#) event of the grid. Here, we can get the row and cell index by using **aria-rowindex**(get row Index from **tr** element) and **aria-colindex**(column index from **td** element) attribute.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.RowSelected("rowSelected").Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign
n.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipName").HeaderText("Ship Name").Width("150").Add();
    col.Field("ShipCountry").HeaderText("Ship
Country").Width("150").EditType("dropdownedit").Add();
}).AllowPaging().Render()
<script>
function rowSelected(args) {
    alert("row index: " + args.row.getAttribute('aria-rowindex'));
    alert("column index: " + args.target.getAttribute('aria-colindex'));
}
</script>
```

ROWCELLIDX.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

Display the null date values at bottom of the Grid while perform sorting

By default the null values are displayed at bottom of the Grid row while perform sorting in ascending order. As well as this values are displayed at top of the Grid row while perform sorting with descending

order. But you can customize this default order to display the null values at always bottom row of the Grid by using [SortComparer](#) property of [Column](#).

In the below code we have displayed the null date values at bottom of the Grid row while sorting the **OrderDate** column in both ways.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.AllowSorting().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").Width("100").Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width("120").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Format("yMd").SortComparer("sortComparer").Width("130").Add();
    col.Field("ShipCountry").HeaderText("ShipCountry").Width("150").Add();
}).ActionBegin("actionBegin").Render()
<script type="text/javascript">
    var action;
    function actionBegin(args) {
        if (args.requestType == "sorting") {
            action = args.direction;
        }
    }
    function sortComparer(reference, comparer) {
        var sortAsc = action === "Ascending" ? true : false;
        if (sortAsc && reference === null) {
            return 1;
        }
        else if (sortAsc && comparer === null) {
            return -1;
        }
        else if (!sortAsc && reference === null) {
            return -1;
        }
        else if (!sortAsc && comparer === null) {
            return 1;
        }
        else {
            return reference - comparer;
        }
    }
</script>
```

SORT-COMPARER.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Avoid TypeScript Compilation

Syncfusion.EJ2.Javascript includes typescript declaration files. If your application is not configured to compile typescript then exception may occur. To resolve this we need to prevent the typescript compilation during MS build process by adding the below line in **.csproj** file.

```
`cs
<PropertyGroup>
<TypeScriptCompileBlocked>True</TypeScriptCompileBlocked>
</PropertyGroup>
`
```

Enable editing in single click

Normal Editing

You can make a row editable on a single click with **Normal** mode of editing in Grid, by using the **startEdit** and **endEdit** methods.

Bind the **mouseup** event for Grid and in the event handler call the **startEdit** and **endEdit**, based on the clicked target element.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>) ViewBag.DataSource)
.AllowPaging().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width(100).IsPrimaryKey
(true).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width(120).Add();

col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.Te
xtAlign.Right).Width(120).Format("C2").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width(150).Add();
}).Load("load").EditSettings(edit => {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Normal); }).Toolbar(new List<string>() { "Add", "Edit",
"Delete", "Update", "Cancel" }).Render()
<script>
function load(args) {
    var instance = document.getElementById('Grid').ej2_instances[0];
    instance.element.addEventListener('mouseup', function (e) {
        if (e.target.classList.contains("e-rowcell")) {
            if (instance.isEdit)
                instance.endEdit();
            var index = parseInt(e.target.getAttribute("Index"));
            instance.selectRow(index);
            instance.startEdit();
        }
    });
}
</script>
```

SINGLE-CLICK-NORMAL-EDIT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Open dropdown edit popup on single click

You can open the default dropdown edit popup with single click edit by focusing the dropdown element and calling the EJ2 dropdown list's **showPopup** method in the Grid's **ActionComplete** event. In this demo we have used a global flag variable in the **mouseup** event to ensure if the dropdown column is the clicked edit target.

CSHTML

```
@Html.EJS().Grid("Grid").ActionComplete("onActionComplete").DataSource((IEnumerable<object>)ViewBag.DataSource).AllowPaging().Columns(col =>
{
    col.Field("OrderID").HeaderText("Order ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width(100).IsPrimaryKey(true).Add();
    col.Field("CustomerID").HeaderText("Customer ID").Width(120).Add();

    col.Field("Freight").HeaderText("Freight").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width(120).Format("C2").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").EditType("dropdownedit").Width(150).Add();
}).Load("load").EditSettings(edit => {
    edit.AllowAdding(true).AllowDeleting(true).Mode(Syncfusion.EJ2.Grids.EditMode.Normal);
}).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel" }).Render()
<script>
    var isDropdown = false;

    function load(args) {
        var instance = document.getElementById('Grid').ej2_instances[0];
        instance.element.addEventListener('mouseup', function (e) {
            if (e.target.classList.contains("e-rowcell")) {
                if (instance.isEdit)
                    instance.endEdit();
                var rowInfo = instance.getRowInfo(e.target);
                if (rowInfo.column.field === "ShipCountry")
                    isDropdown = true;
                instance.selectRow(rowInfo.rowIndex);
                instance.startEdit();
            }
        });
    }

    function onActionComplete(args) {
        if (args.requestType === "beginEdit" && isDropdown) {
            isDropdown = false;
            var dropdownObj = args.form.querySelector('.e-dropdownlist').ej2_instances[0];
            dropdownObj.element.focus();
            dropdownObj.showPopup();
        }
    }
}
```

```
}
</script>
```

OPEN-DROPDOWN-POPUP.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Cascading DropDownList with Grid editing

You can achieve the Cascading DropDownList with grid Editing by using the Cell Edit Template feature.

In the below demo, Cascading DropDownList is rendered for the **ShipCountry** and **ShipState** column.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.dataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign
n.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Width("150").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship
Country").Width("150").EditType("dropdownedit").Edit(new
{create="countryCreate", read="countryRead", destroy="countryDestroy",
write="countryWrite" }).Add();
    col.Field("ShipState").HeaderText("Ship
State").Width("150").EditType("dropdownedit").Edit(new
{create="stateCreate", read="stateRead", destroy="stateDestroy",
write="stateWrite" }).Add();
}).AllowPaging().EditSettings(edit => {
edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true).Mode(Syncfusio
n.EJ2.Grids.EditMode.Normal); }).Toolbar(new List<string>() { "Add", "Edit",
"Delete", "Update", "Cancel" }).Render()
<script>
var countryElem;
var countryObj;
var stateElem;
var stateObj;
var country = [
    { countryName: 'United States', countryId: '1' },
    { countryName: 'Australia', countryId: '2' }
];
var state = [
    { stateName: 'New York', countryId: '1', stateId: '101' },
    { stateName: 'Virginia', countryId: '1', stateId: '102' },
    { stateName: 'Washington', countryId: '1', stateId: '103' },
    { stateName: 'Queensland', countryId: '2', stateId: '104' },
```

```

        { stateName: 'Tasmania', countryId: '2', stateId: '105' },
        { stateName: 'Victoria', countryId: '2', stateId: '106' }
    ];
    function countryCreate() {
        countryElem = document.createElement('input');
        return countryElem;
    }
    function countryRead() {
        return countryObj.text;
    }
    function countryDestroy() {
        countryObj.destroy();
    }
    function countryWrite() {
        countryObj = new ej.dropdowns.DropDownList({
            dataSource: country,
            fields: { value: 'countryId', text: 'countryName' },
            change: function() {
                stateObj.enabled = true;
                var tempQuery = new
ej.data.Query().where('countryId', 'equal', countryObj.value);
                stateObj.query = tempQuery;
                stateObj.text = null;
                stateObj.dataBind();
            },
            placeholder: 'Select a country',
            floatLabelType: 'Never'
        });
        countryObj.appendTo(countryElem);
    }
    function stateCreate() {
        stateElem = document.createElement('input');
        return stateElem;
    }
    function stateRead() {
        return stateObj.text;
    }
    function stateDestroy() {
        stateObj.destroy();
    }
    function stateWrite() {
        stateObj = new ej.dropdowns.DropDownList({
            dataSource: state,
            fields: { value: 'stateId', text: 'stateName' },
            enabled: false,
            placeholder: 'Select a state',
            floatLabelType: 'Never'
        });
        stateObj.appendTo(stateElem);
    }
}
</script>

```

CASCADING.CS

```

public IActionResult Index()
{

```

```

ViewBag.DataSource = OrderDetails.GetAllRecords();
return View();
}

```

Hide sorting options on excel filter Dialog

You can hide the sorting options on the excel filter dialog by setting display as none for the following classes.

```

`css
.e-excel-ascending,
.e-excel-descending,
.e-separator.e-excel-separator {
display: none;
}
`

```

CSHTML

```

@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
    col.Field("OrderDate").HeaderText("Order
Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("
yMd").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
}).AllowFiltering().AllowPaging().FilterSettings(filter => {
filter.Type(Syncfusion.EJ2.Grids.FilterType.Excel); }).Render()
<style>
    .e-excel-ascending,
    .e-excel-descending,
    .e-separator.e-excel-separator {
        display: none;
    }
</style>

```

DISABLE-SORTING-EXCEL.CS

```

public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}

```

Add a title to the header when using Grid print action

You can add your title in the header through an [BeforePrint](#) event. With the help of this event you can add your title element as you want.

CSHTML

```
@Html.EJS().Grid("Grid").DataSource((IEnumerable<object>)ViewBag.DataSource)
.Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Width("120").Add();
    col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();

    col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAli
gn(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("ShipCity").HeaderText("Ship City").Width("120").Add();
    col.Field("ShipCountry").HeaderText("Ship Country").Width("150").Add();
}).AllowPaging().BeforePrint("beforePrint").Toolbar(new List<string>() {
"Print" }).Render()
<script>
    function beforePrint(args) {
        var div = document.createElement("Div")
        div.innerHTML = "Title here"
        div.style.textAlign = 'center';
        div.style.color = 'red';
        div.style.padding = '10px 0';
        div.style.fontSize = '25px';
        args.element.insertBefore(div, args.element.childNodes[0]);
    }
</script>
```

TITLEPRINT.CS

```
public IActionResult Index()
{
    var Order = OrderDetails.GetAllRecords();
    ViewBag.DataSource = Order;
    return View();
}
```

Customizing Filter Dialog by using an additional Parameter

You can customize the default settings of the components which are used in Menu filter by using params of filter property in column definition. In the below sample, OrderID and Freight Columns are numeric columns, while open the filter dialog then you can see that NumericTextBox with spin button is displayed to change/set the filter value. Now using the params option we hide the spin button in NumericTextBox for OrderID Column.

CSHTML

```
@Html.EJS().Grid("ExcelFilter").DataSource((IEnumerable<object>)ViewBag.Data
Source).AllowFiltering().FilterSettings(Filter =>
Filter.Type(Syncfusion.EJ2.Grids.FilterType.Menu)).Columns(col =>
{
```

```

        col.Field("OrderID").HeaderText("Order ID").Width("120").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Filter((new { @params = new { showSpinButton = false } })).Add();
        col.Field("CustomerID").HeaderText("Customer Name").Width("150").Add();
        col.Field("OrderDate").HeaderText("Order Date").Width("130").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Format("yMd").Add();

col.Field("Freight").HeaderText("Freight").Width("120").Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
        col.Field("ShipCountry").HeaderText("Ship Country").Width("120").Add();
    }).AllowPaging().Render()

```

EXCELFILTER.CS

```

public IActionResult Index()
{
    if (orders.Count() == 0)
        DataSource();
    ViewBag.Datasource = orders;
    return View();
}

public void DataSource()
{
    int code = 10000;
    for (int i = 1; i < 10; i++)
    {
        orders.Add(new OrderDetails(code + 1, "ALFKI", i + 0, 2.3 * i, false, new DateTime(1991, 05, 15), "Berlin", "Simons bistro", "Denmark", new DateTime(1996, 7, 16), "Kirchgasse 6"));
        orders.Add(new OrderDetails(code + 2, "ANATR", i + 2, 3.3 * i, true, new DateTime(1990, 04, 04), "Madrid", "Queen Cozinha", "Brazil", new DateTime(1996, 9, 11), "Avda. Azteca 123"));
        orders.Add(new OrderDetails(code + 3, "ANTON", i + 1, 4.3 * i, true, new DateTime(1957, 11, 30), "Cholchester", "Frankenversand", "Germany", new DateTime(1996, 10, 7), "Carrera 52 con Ave. Bolívar #65-98 Llano Largo"));
        orders.Add(new OrderDetails(code + 4, "BLONP", i + 3, 5.3 * i, false, new DateTime(1930, 10, 22), "Marseille", "Ernst Handel", "Austria", new DateTime(1996, 12, 30), "Magazinweg 7"));
        orders.Add(new OrderDetails(code + 5, "BOLID", i + 4, 6.3 * i, true, new DateTime(1953, 02, 18), "Tsawassen", "Hanari Carnes", "Switzerland", new DateTime(1997, 12, 3), "1029 - 12th Ave. S.));
        code += 5;
    }
}

```

Customize the Empty Record Template

The empty record template feature in the Grid allows you to use custom content such as images, text, or other components, when the grid doesn't contain any records to display. This feature replaces the default message of 'No records to display' typically shown in the grid.

To activate this feature, set the `emptyRecordTemplate` property of the Grid. The `emptyRecordTemplate` property expects the HTML element or a function that returns the HTML element.

In the following example, an image and text have been rendered as a template to indicate that the grid has no data to display.

CSHTML

```
var DropDownList = new Syncfusion.EJ2.DropDowns.DropDownList() { DataSource
= ViewBag.datasource, Fields = new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings() { Value =
"ShipCountry", Text = "ShipCountry" } };
@Html.EJS().Grid("EmptyRecordTemplate").EmptyRecordTemplate("#emptytemplate"
).Columns(col =>
{
    col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width("140").ValidationRules(new { required = true,
number = true }).TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("CustomerID").HeaderText("Customer
Name").Width("150").ValidationRules(new { required = true, minLength = 3
}).Add();

col.Field("Freight").HeaderText("Freight").Width("140").EditType("numericedit").ValidationRules(new { required = true
}).Format("C2").TextAlign(Syncfusion.EJ2.Grids.TextAlign.Right).Add();
    col.Field("OrderDate").HeaderText("Order
Date").EditType("datetimepickeredit").Width("150").Format(new { type =
"datetime", format = "M/d/y hh:mm a" }).Add();
    col.Field("ShipCountry").HeaderText("Ship
Country").Width("150").EditType("dropdownedit").Edit(new { @params =
DropDownList }).Add();

col.Field("Verified").HeaderText("Verified").EditType("booleanedit").Display
AsCheckBox(true).Type("boolean").Width("150").Add();
}).AllowPaging().PageSettings(page => page.PageCount(5)).EditSettings(edit
=> { edit.AllowAdding(true).AllowEditing(true).AllowDeleting(true);
}).Toolbar(new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel"
}).Render()
<style type="text/css" class="cssStyles">
.emptyRecordTemplate {
    text-align: center;
}
.e-emptyRecord {
    display: block;
    margin: 10px auto;
}
</style>
<script id="emptytemplate" type="text/x-template">
    <div class='emptyRecordTemplate'>
        
        <span>There is no data available to display at the moment.</span>
    </div>
</script>
```

EMPTY-RECORD-TEMPLATE.CS

```
public IActionResult Index()
{
    ViewBag.DataSource = OrderDetails.GetAllRecords();
    return View();
}
```

HeatMap Chart

Getting Started with ASP.NET MVC HeatMapChart Control

This section briefly explains about how to include [ASP.NET MVC HeatMapChart](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in nuget.org. Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

<namespaces>

<add namespace="Syncfusion.EJ2"/>

</namespaces>

,

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

~/ _LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/ _LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC HeatMapChart control

Now, add the Syncfusion ASP.NET MVC HeatMapChart control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().HeatMap("container").Render()
```

Populate heat map with data

This section explains how to populate the following two-dimensional array data to the heat map.

CSHTML

```
@model int[,]
@Html.EJS().HeatMap("container").DataSource(Model).Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet", "Margaret",
    "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin", "Mario" };
}
```

```

ViewBag.xLabels = xlabels;
string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs", "Fri",
"Sat" };
ViewBag.yLabels = yLabels;
int[,] data = new int[,]
{
{73, 39, 26, 39, 94, 0},
{93, 58, 53, 38, 26, 68},
{99, 28, 22, 4, 66, 90},
{14, 26, 97, 69, 69, 3},
{7, 46, 47, 47, 88, 6},
{41, 55, 73, 23, 3, 79},
{56, 69, 21, 86, 3, 33},
{45, 7, 53, 81, 95, 79},
{60, 77, 74, 68, 88, 51},
{25, 25, 10, 12, 78, 14},
{25, 56, 55, 58, 12, 82},
{74, 33, 88, 23, 86, 59}
};
return View(data);
}

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC HeatMapChart control will be rendered in the default web browser.

Enable axis labels

You can add axis labels to the heat map and format those labels using the [xAxis](#) and [yAxis](#) properties. Axis labels provide additional information about the data points populated in the heat map.

CSHTML

```
@model int[,]
@Html.EJS().HeatMap("container").XAxis(
    xAxis =>
    {
        xAxis.Labels(ViewBag.xLabels);
    }).YAxis(yaxis =>
    {
        yaxis.Labels(ViewBag.yLabels);
    }).DataSource(Model).Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet", "Margaret",
    "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin", "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs", "Fri",
    "Sat" };
    ViewBag.yLabels = yLabels;
    int[,] data = new int[, ]
    {
        { 73, 39, 26, 39, 94, 0 },
        { 93, 58, 53, 38, 26, 68 },
        { 99, 28, 22, 4, 66, 90 },
        { 14, 26, 97, 69, 69, 3 },
        { 7, 46, 47, 47, 88, 6 },
        { 41, 55, 73, 23, 3, 79 },
        { 56, 69, 21, 86, 3, 33 },
        { 45, 7, 53, 81, 95, 79 },
        { 60, 77, 74, 68, 88, 51 },
        { 25, 25, 10, 12, 78, 14 },
        { 25, 56, 55, 58, 12, 82 },
        { 74, 33, 88, 23, 86, 59 }
    };
    return View(data);
}
```

Add heat map title

Add a title using the [TitleSettings](#) property to the heat map to provide quick information to the user about the data populated in the heat map.

CSHTML

```
@model int[,]
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Sales Revenue
per Employee (in 1000 US$)").TextStyle(ViewBag.textStyle)).XAxis(
    xAxis =>
    {
        xAxis.Labels(ViewBag.xLabels);
    }).YAxis(yaxis =>
    {
        yaxis.Labels(ViewBag.yLabels);
    }).DataSource(Model).Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    ViewBag.textStyle = new
    {
        size = "15px",
        fontWeight = "500",
        fontStyle = "Normal",
        fontFamily = "Segoe UI"
```

```

};
string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet", "Margaret",
"Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin", "Mario" };
ViewBag.xLabels = xlabels;
string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs", "Fri",
"Sat" };
ViewBag.yLabels = yLabels;
int[,] data = new int[,]
{
    { 73, 39, 26, 39, 94, 0 },
    { 93, 58, 53, 38, 26, 68 },
    { 99, 28, 22, 4, 66, 90 },
    { 14, 26, 97, 69, 69, 3 },
    { 7, 46, 47, 47, 88, 6 },
    { 41, 55, 73, 23, 3, 79 },
    { 56, 69, 21, 86, 3, 33 },
    { 45, 7, 53, 81, 95, 79 },
    { 60, 77, 74, 68, 88, 51 },
    { 25, 25, 10, 12, 78, 14 },
    { 25, 56, 55, 58, 12, 82 },
    { 74, 33, 88, 23, 86, 59 }
};
return View(data);
}

```

Enable legend

Use a legend for the heat map in the [LegendSettings](#) object by setting the [Visible](#) property to **true**.

CSHTML

```
@model int[,]
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Sales Revenue
per Employee (in 1000 US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.Labels(ViewBag.xLabels);
}).YAxis(yaxis =>
{
    yaxis.Labels(ViewBag.yLabels);
}).LegendSettings(ls
=>ls.Visible(true).Position(Syncfusion.EJ2.HeatMap.LegendPosition.Right).Sho
wLabel(true).Height("150px")).DataSource(Model).Render()
```

Add data label

Add data labels to improve the readability of the heat map. This can be achieved by setting the [ShowLabel](#) property to **true** in the [CellSettings](#) object.

CSHTML

```
@model int[,]
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Sales Revenue
per Employee (in 1000 US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.Labels(ViewBag.xLabels);
}).YAxis(yaxis =>
{
    yaxis.Labels(ViewBag.yLabels);
```

```

    }).LegendSettings(ls
=>ls.Visible(true).Position(Syncfusion.EJ2.HeatMap.LegendPosition.Right).ShowLabel(true).Height("150px")).CellSettings(cs
=>cs.ShowLabel(true)).DataSource(Model).Render()

```

Add custom cell palette

The default palette settings of the heat map cells can be customized by using the [PaletteSettings](#) property. Using the [Palette](#) property in [paletteSettings](#) object, you can change the color set for the cells. You can change the color mode of the cells to fixed or gradient mode using the [Type](#) property.

CSHTML

```

@model int[,]
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Sales Revenue
per Employee (in 1000 US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.Labels(ViewBag.xLabels);
}).YAxis(yaxis =>
{
    yaxis.Labels(ViewBag.yLabels);
}).LegendSettings(ls
=>ls.Visible(true).Position(Syncfusion.EJ2.HeatMap.LegendPosition.Right).ShowLabel(true).Height("150px")).CellSettings(cs
=>cs.ShowLabel(true)).PaletteSettings(ps => ps.Palette(palette =>
{
    palette.Color("#C06C84").Value(0).Add();
    palette.Color("#6C5B7B").Value(50).Add();
}

```

```
palette.Color("#355C7D").Value(100).Add();
}).Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient).DataSource(Model).Render();
```

Enable tooltip

The tooltip is used when you cannot display information by using the data labels due to space constraints. You can enable the tooltip by setting the [ShowTooltip](#) property to **true**.

CSHTML

```
@model int[,]
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Sales Revenue
per Employee (in 1000 US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.Labels(ViewBag.xLabels);
}).YAxis(yaxis =>
{
    yaxis.Labels(ViewBag.yLabels);
}).LegendSettings(ls
=>ls.Visible(true).Position(Syncfusion.EJ2.HeatMap.LegendPosition.Right).Sho
wLabel(true).Height("150px")).CellSettings(cs
=>cs.ShowLabel(true).ShowTooltip(true).PaletteSettings(ps =>
ps.Palette(palette =>
{
    palette.Color("#C06C84").Value(0).Add();
    palette.Color("#6C5B7B").Value(50).Add();
```

```
palette.Color("#355C7D").Value(100).Add();
}).Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient).DataSource(Model).Render();
```

Note: [View Sample in GitHub.](#)

Note: You can explore our [ASP.NET MVC HeatMap Chart example](#) that shows you how to render the HeatMap Chart in ASP.NET MVC.

Working with data in ASP.NET MVC HeatMap Chart Component

Heat map visualizes the JSON data and two-dimensional array data. Using the data adaptor support, data can be bound to the heat map.

Data adaptor

Heat map supports the following types of data binding with the adaptor support.

- Array
- Table Binding
- Cell Binding
- JSON data
- Table Binding
- Cell Binding

Array - table binding

This data type is a collection of one dimensional array objects, at which each inner array contains data points for an X-axis data label. This is the default data binding type for heat map. You can also directly bind the array object to the [dataSource](#) property.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("GDP Growth Rate for Major Economies (in
Percentage)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.DateTime).Minimum(new
System.DateTime(2007, 1,
1)).IntervalType(Syncfusion.EJ2.HeatMap.IntervalType.Years).LabelFormat("yyy
y");
}).YAxis(yaxis =>
yaxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.Numeric)).LegendSettings(ls
=>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()
```

ARRAY-ROW.CS

```
public ActionResult ArrayRow()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "China", "India", "Australia",
    "Mexico", "Canada", "Brazil",
    "USA", "UK", "Germany", "Russia", "France", "Japan"};
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[10] { "2008", "2009", "2010", "2011",
    "2012", "2013", "2014", "2015", "2016", "2017" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private double[,] GetDataSource()
{
    double[,] data = new double[12, 10]
    {
        { 9.5, 2.2, 4.2, 8.2, -0.5, 3.2, 5.4, 7.4, 6.2, 1.4 },
        { 4.3, 8.9, 10.8, 6.5, 5.1, 6.2, 7.6, 7.5, 6.1, 7.6 },
        { 3.9, 2.7, 2.5, 3.7, 2.6, 5.1, 5.8, 2.9, 4.5, 5.1 },
        { 2.4, -3.7, 4.1, 6.0, 5.0, 2.4, 3.3, 4.6, 4.3, 2.7 },
        { 2.0, 7.0, -4.1, 8.9, 2.7, 5.9, 5.6, 1.9, -1.7, 2.9 },
        { 5.4, 1.1, 6.9, 4.5, 2.9, 3.4, 1.5, -2.8, -4.6, 1.2 },
        { -1.3, 3.9, 3.5, 6.6, 5.2, 7.7, 1.4, -3.6, 6.6, 4.3 },
        { -1.6, 2.3, 2.9, -2.5, 1.3, 4.9, 10.1, 3.2, 4.8, 2.0 },
        { 10.8, -1.6, 4.0, 6.0, 7.7, 2.6, 5.6, -2.5, 3.8, -1.9 },
        { 6.2, 9.8, -1.5, 2.0, -1.5, 4.3, 6.7, 3.8, -1.2, 2.4 },
    }
```

```

                {1.2, 10.9, 4.0, -1.4, 2.2, 1.6, -2.6, 2.3, 1.7, 2.4},
                {5.1, -2.4, 8.2, -1.1, 3.5, 6.0, -1.3, 7.2, 9.0, 4.2}
            };
            return data;
        }
    }

```

Array - cell binding

This data type is a collection of array objects that contain information about the row index, column index, and data value for each cell. You can bind the data to heat map by using the `data` property in the [dataSource](#) and setting the `adaptorType` property to `Cell`.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Percentage of
Individuals Using Internet by
Country").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).PaletteSetting
s(ps => ps.Palette(palette =>
{
    palette.Color("#3498DB").Add();
    palette.Color("#2C3E50").Add();
}))).CellSettings(cs
=>cs.Border(ViewBag.border).TextStyle(ViewBag.cellTextStyle).Format("{value}
%")).LegendSettings(ls =>
ls.Visible(false)).TooltipRender("tooltipRender").DataSourceSettings(ds => {
ds.IsJsonData(false).AdaptorType(Syncfusion.EJ2.HeatMap.AdaptorType.Cell);
}).Render()
<script>
    var tooltipRender = function (args) {
        args.content = [args.yLabel + ' | ' + args.xLabel + ' : ' +
args.value + ' %'];
    };
</script>

```

ARRAY-CELL.CS

```

public ActionResult ArrayCell()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "China", "India", "Australia",
    "Mexico", "Canada", "Brazil",
    "USA", "UK", "Germany", "Russia", "France", "Japan" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[7] { "2000", "2005", "2010", "2011",
    "2012", "2013", "2014" };
    ViewBag.yLabels = yLabels;
    ViewBag.border = new { width = 0 };
}

```

```

        ViewBag.cellTextStyle = new { color = "white" };
        double[,] cellData = new double[,]
        {
            {0, 0, 10.75}, {0, 1, 14.5}, {0, 2, 25.5}, {0, 3, 39.5}, {0,
4, 59.75}, {0, 5, 35.50}, {0, 6, 75.5},
            {1, 0, 20.75}, {1, 1, 35.5}, {1, 2, 29.5}, {1, 3, 75.5}, {1,
4, 80}, {1, 5, 65}, {1, 6, 85},
            {2, 0, 6}, {2, 1, 18.5}, {2, 2, 30.05}, {2, 3, 35.5}, {2, 4,
40.75}, {2, 5, 50.75}, {2, 6, 65},
            {3, 0, 30.5}, {3, 1, 20.5}, {3, 2, 45.30}, {3, 3, 50}, {3,
4, 55}, {3, 5, 85.80}, {3, 6, 87.5},
            {4, 0, 10.5}, {4, 1, 20.75}, {4, 2, 35.5}, {4, 3, 35.5}, {4,
4, 45.5}, {4, 5, 65}, {4, 6, 75.5},
            {5, 0, 45.5}, {5, 1, 20.75}, {5, 2, 45.5}, {5, 3, 50.75},
{5, 4, 79.30}, {5, 5, 84.20}, {5, 6, 87.36},
            {6, 0, 26.82}, {6, 1, 70}, {6, 2, 75}, {6, 3, 79.5}, {6, 4,
88.5}, {6, 5, 89.5}, {6, 6, 91.75},
            {7, 0, 15.75}, {7, 1, 20.75}, {7, 2, 25.5}, {7, 3, 42.35},
{7, 4, 45.15}, {7, 5, 76.5}, {7, 6, 80.5},
            {8, 0, 1.98}, {8, 1, 15.23}, {8, 2, 43}, {8, 3, 49}, {8, 4,
63.80}, {8, 5, 67.97}, {8, 6, 70.52},
            {9, 0, 14.31}, {9, 1, 42.87}, {9, 2, 77.28}, {9, 3, 77.82},
{9, 4, 81.44}, {9, 5, 81.92}, {9, 6, 83.75},
            {10, 0, 25.5}, {10, 1, 35.5}, {10, 2, 40.5}, {10, 3, 45.05},
{10, 4, 50.5}, {10, 5, 75.5}, {10, 6, 90.58}
        };

        ViewBag.dataSource = cellData;
        return View();
    }

```

JSON data - table binding

In JSON table data binding, each JSON object contains an X-axis data point as row header and all the corresponding Y-axis data values. You can bind the JSON table data to the heat map using the `data` property in `dataSource`. To achieve this, you should enable the `isJsonData` property and define the `adaptorType` property as **Table**. The `xDataMapping` property is used to map the row header in JSON data.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Olympic Medal
Achievements of most Successful
Countries").TextStyle(ViewBag.textStyle)).XAxis(
xAxis =>
{
    xAxis.LabelRotation(45)
    .LabelIntersectAction(Syncfusion.EJ2.HeatMap.LabelIntersectAction.None)
    .Labels(ViewBag.xLabels);
}).YAxis(yaxis =>
{
    yaxis.Title(ViewBag.title)
    .Labels(ViewBag.yLabels);
}).PaletteSettings(ps => ps.Palette(palette =>
{

```

```

        palette.Color("#F0C27B").Add();
        palette.Color("#4B1248").Add();
    })).LegendSettings(ls => ls.Visible(false)).CellSettings(cs =>
cs.Border(ViewBag.border)).DataSource("dataSource").TooltipRender("tooltipRe
nder").
DataSourceSettings(ds => {
ds.IsJsonData(true).AdaptorType(Syncfusion.EJ2.HeatMap.AdaptorType.Table).XD
ataMapping("Region"); }).Render()
<script>
    var tooltipRender = function (args) {
        args.content = [args.yLabel + ' | ' + args.xLabel + ' : ' +
args.value + ' medals'];
    };
    var dataSource = [
        { "Region": "USA", "2000": 93, "2004": 101, "2008": 112, "2012":
103, "2016": 121 },
        { "Region": "GBR", "2000": 28, "2004": 30, "2008": 49, "2012":
65, "2016": 67 },
        { "Region": "China", "2000": 58, "2004": 63, "2008": 100,
"2012": 91, "2016": 70 },
        { "Region": "Russia", "2000": 89, "2004": 90, "2008": 60,
"2012": 69, "2016": 55 },
        { "Region": "Germany", "2000": 56, "2004": 49, "2008": 41,
"2012": 44, "2016": 42 },
        { "Region": "Japan", "2000": 18, "2004": 37, "2008": 25, "2012":
38, "2016": 41 },
        { "Region": "France", "2000": 38, "2004": 33, "2008": 43,
"2012": 35, "2016": 42 },
        { "Region": "KOR", "2000": 28, "2004": 30, "2008": 32, "2012":
30, "2016": 21 },
        { "Region": "Italy", "2000": 34, "2004": 32, "2008": 27, "2012":
28, "2016": 28 },
    ];
</script>

```

JSON-ROW.CS

```

public ActionResult JsonRow()
{
    ViewBag.textStyle = new
    {
        size = "15px",
        fontWeight = "500",
        fontStyle = "Normal",
        fontFamily = "Segoe UI"
    };
    ViewBag.border = new
    {
        width = 0,
        radius = 4,
        color = "white"
    };
    string[] xlabels = new string[9] { "China", "France", "GBR",
"Germany", "Italy", "Japan", "KOR", "Russia", "USA" };
    ViewBag.xLabels = xlabels;
}

```

```

        string[] yLabels = new string[5] { "2000", "2004", "2008",
        "2012", "2016" };
        ViewBag.yLabels = yLabels;
        ViewBag.title = new { text = "Olympic Year" };
        return View();
    }

```

JSON data - Cell binding

In JSON cell data binding, each JSON object consists a value for each cell along with a mapping value for row and column. You can bind the JSON cell data having information for each cell to the heat map using the `data` property in `dataSource`. To achieve this, you should define the `adaptorType` property as `Cell`, and enable the `isJsonData` property. Now, map the fields of data by using the `valueMapping`, `xDataMapping` and `yDataMapping` properties.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Most Visited
Destinations by International Tourist
Arrivals")).TextStyle(ViewBag.textStyle).XAxis(
xAxis => xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).DataSource("dataSource").PaletteSettings(ps
=> ps.Palette(palette =>
{
    palette.Color("#DCD57E").Add();
    palette.Color("#A6DC7E").Add();
    palette.Color("#7EDCA2").Add();
    palette.Color("#6EB5D0").Add();
})) .CellSettings(cs =>
cs.Border(ViewBag.border).ShowLabel(true).Format("{value}
M")).DataSourceSettings(ds => {
ds.IsJsonData(true).AdaptorType(Syncfusion.EJ2.HeatMap.AdaptorType.Cell).XD
aMapping("rowid").YDataMapping("columnid").ValueMapping("value");
}).Render()
<script>
    // Initializing json Data
    var dataSource = [
        { 'rowid': 'France', 'columnid': '2010', 'value': '77.6' },
        { 'rowid': 'France', 'columnid': '2011', 'value': '79.4' },
        { 'rowid': 'France', 'columnid': '2012', 'value': '80.8' },
        { 'rowid': 'France', 'columnid': '2013', 'value': '86.6' },
        { 'rowid': 'France', 'columnid': '2014', 'value': '83.7' },
        { 'rowid': 'France', 'columnid': '2015', 'value': '84.5' },
        { 'rowid': 'France', 'columnid': '2016', 'value': '82.6' },
        { 'rowid': 'USA', 'columnid': '2010', 'value': '60.6' },
        { 'rowid': 'USA', 'columnid': '2011', 'value': '65.4' },
        { 'rowid': 'USA', 'columnid': '2012', 'value': '70.8' },
        { 'rowid': 'USA', 'columnid': '2013', 'value': '73.8' },
        { 'rowid': 'USA', 'columnid': '2014', 'value': '75.3' },
        { 'rowid': 'USA', 'columnid': '2015', 'value': '77.5' },
        { 'rowid': 'USA', 'columnid': '2016', 'value': '77.6' },
        { 'rowid': 'Spain', 'columnid': '2010', 'value': '64.9' },
        { 'rowid': 'Spain', 'columnid': '2011', 'value': '52.6' },
        { 'rowid': 'Spain', 'columnid': '2012', 'value': '60.8' },
        { 'rowid': 'Spain', 'columnid': '2013', 'value': '65.6' },
    ]

```

```

{ 'rowid': 'Spain', 'columnid': '2014', 'value': '52.6' },
{ 'rowid': 'Spain', 'columnid': '2015', 'value': '68.5' },
{ 'rowid': 'Spain', 'columnid': '2016', 'value': '75.6' },
{ 'rowid': 'China', 'columnid': '2010', 'value': '55.6' },
{ 'rowid': 'China', 'columnid': '2011', 'value': '52.3' },
{ 'rowid': 'China', 'columnid': '2012', 'value': '54.8' },
{ 'rowid': 'China', 'columnid': '2013', 'value': '51.1' },
{ 'rowid': 'China', 'columnid': '2014', 'value': '55.6' },
{ 'rowid': 'China', 'columnid': '2015', 'value': '56.9' },
{ 'rowid': 'China', 'columnid': '2016', 'value': '59.3' },

];
</script>

```

```

public ActionResult JsonCell()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    ViewBag.border = new
    {
        width = 1,
        radius = 4,
        color = "white"
    };
    string[] xlabels = new string[10] { "Austria", "China", "France",
    "Germany", "Italy", "Mexico", "Spain", "Thailand", "UK", "USA" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[7] { "2010", "2011", "2012", "2013",
    "2014", "2015", "2016" };
    ViewBag.yLabels = yLabels;
    return View();
}

```

Empty points

The data points that use the **null** or **undefined** or empty string as value are considered as empty points. Empty data points are ignored and not displayed in the heat map, and these points are rendered with default palette. You can customize the empty data point color value using the [emptyPointColor](#) property.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").XAxis(xAxis =>
{
    xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.DateTime).Minimum(new
System.DateTime(2007, 1, 1)).
    IntervalType(Syncfusion.EJ2.HeatMap.IntervalType.Years).
    LabelFormat("yyyy");
}).YAxis(yaxis =>
yaxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.Numeric)).LegendSettings(ls
=>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()

```

EMPTY-POINTS.CS

```

public ActionResult EmptyPoints()
{
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {

```

```

        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, null, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, "", 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, undefined, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
    ];
    return data;
}

```

Binding nested JSON data

In complex data binding, you can bind the nested JSON data to the data points in the heat map. The nested data can be mapped using the `xDataMapping`, `yDataMapping`, `valueMapping` and `bubbleDataMapping` properties as string value concatenated by a dot.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Most Visited
Destinations by International Tourist
Arrivals")).TextStyle(ViewBag.textStyle)).XAxis(
xAxis => xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).DataSource("dataSource").PaletteSettings(ps
=> ps.Palette(palette =>
{
    palette.Color("#DCD57E").Add();
    palette.Color("#A6DC7E").Add();
    palette.Color("#7EDCA2").Add();
    palette.Color("#6EB5D0").Add();
})).CellSettings(cs =>
cs.Border(ViewBag.border).ShowLabel(true).Format("{value}
M")).DataSourceSettings(ds => {
ds.IsJsonData(true).AdaptorType(Syncfusion.EJ2.HeatMap.AdaptorType.Cell).XDat
aMapping("Labels.Xlabel").YDataMapping("Labels.Ylabel").ValueMapping("data.
value"); })Render()
<script>
    var load = function (args) {
        var selectedTheme = location.hash.split('/')[1];
        selectedTheme = selectedTheme ? selectedTheme : 'Material';
        args.heatmap.theme = (selectedTheme.charAt(0).toUpperCase() +
selectedTheme.slice(1));
    };
    var dataSource = [

- [To bind data for bubble heat map with size and color attributes](#)

Bubble HeatMap in ASP.NET MVC HeatMap Chart Component

The cell customizations and color mapping for rect tile type is defined in [appearance](#) and [palette](#) sections in detail.

Bubble types

In bubble HeatMap, you can display the data points with bubble size, bubble colors, and sector attributes of the bubble.

Bubble size

In this bubble HeatMap type, the size factor of the bubble is used to denote the data variations. The radius of the bubble varies according to data values.

By default, the bubble with small size denotes the data value with small magnitude and the larger bubble size denotes the data value with larger magnitude. This behavior can be inverted by using the [IsInversedbubblesize](#) property.

To render a bubble HeatMap with size series, set the [BubbleType](#) property to **Size**.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette =>
{
    palette.Color("#C06C84").Add();
    palette.Color("#6C5B7B").Add();
    palette.Color("#355C7D").Add();
})) .Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient)).CellSettings(cs =>
cs.ShowLabel(false).Border(ViewBag.border).TileType(Syncfusion.EJ2.HeatMap.C
ellType.Bubble).BubbleType(Syncfusion.EJ2.HeatMap.BubbleType.Size)).DataSou
rce(ViewBag.dataSource).Render()
```

SIZE-BUBBLE.CS

```
public ActionResult Gradient()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{

```

```

int[,] data = new int[,]
{
    {73, 39, 26, 39, 94, 0},
    {93, 58, 53, 38, 26, 68},
    {99, 28, 22, 4, 66, 90},
    {14, 26, 97, 69, 69, 3},
    {7, 46, 47, 47, 88, 6},
    {41, 55, 73, 23, 3, 79},
    {56, 69, 21, 86, 3, 33},
    {45, 7, 53, 81, 95, 79},
    {60, 77, 74, 68, 88, 51},
    {25, 25, 10, 12, 78, 14},
    {25, 56, 55, 58, 12, 82},
    {74, 33, 88, 23, 86, 59}
};
return data;
}

```

Bubble color

In HeatMap, defined with this tile type, the data points will be represented with same sized bubbles and the data value variations are represented with the bubble colors.

To represent the data points with variations in bubble colors, set the [BubbleType](#) property to **Color**.

CSHTML

```
@using Syncfusion.EJ2;
```

```
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette =>
{
    palette.Color("#C06C84").Add();
    palette.Color("#6C5B7B").Add();
    palette.Color("#355C7D").Add();
})) .Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient)).CellSettings(cs =>

cs.Border(ViewBag.border).TileType(Syncfusion.EJ2.HeatMap.CellType.Bubble).B
ubbleType(Syncfusion.EJ2.HeatMap.BubbleType.Color)).DataSource(ViewBag.dataS
ource).Render()
```

COLOR-BUBBLE.CS

```
public ActionResult Gradient()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},

            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Combining size and color bubble types

The following examples demonstrate different data binding with the **SizeAndColor** bubble type set in the HeatMap.

<!-- markdownlint-disable MD036 -->

Array binding

When an array of numbers is specified as the data source, the bubble HeatMap can be rendered with different sizes and colors depending on the bound data.

<!-- markdownlint-disable MD036 -->

Table

The following example illustrates how to render a bubble HeatMap with different sizes and colors using array table binding.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
    ts.Text("Commercial Aviation Accidents and Fatalities by year 2012 - 2017").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
    xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
    yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
    ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette
=> {
```

```

        palette.Color("#C06C84").Add();
        palette.Color("#6C5B7B").Add();
        palette.Color("#355C7D").Add();

    }).Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient)).CellSettings(cs =>

cs.Border(ViewBag.border).TileType(Syncfusion.EJ2.HeatMap.CellType.Bubble).B
ubbleType(Syncfusion.EJ2.HeatMap.BubbleType.SizeAndColor)).DataSource("dataS
ource").TooltipRender("tooltipRender").Render()
}
<script>
    var tooltipRender = function (args) {
        args.content = ['Year ' + ' : ' + args.xLabel + '<br/>' + 'Months '
+ ' : ' + args.yLabel + '<br/>'
            + 'Accidents ' + ' : ' + args.value[0].bubbleData + '<br/>' +
'Fatalities ' + ' : '
            + args.value[1].bubbleData];
    };
    var dataSource = [
        [[4, 39], [3, 8], [1, 3], [1, 10], [4, 4], [2, 15]],
        [[4, 28], [5, 92], [5, 73], [3, 1], [3, 4], [4, 126]],
        [[4, 45], [5, 152], [0, 44], [4, 54], [5, 243], [2, 45]]
    ];
</script>

```

SIZE-COLOR-TABLE.CS

```

public ActionResult Gradient()
{
    ViewBag.textStyle = new
    {
        size = "15px",
        fontWeight = "500",

Binding size and color values from datasource

The size and color of the bubbles in the **SizeAndColor** bubble HeatMap type can be customized by binding the datasource field name that holds the size and color values to the [Size](#) and [Color](#) properties in the [BubbleDataMapping](#).

The **BubbleDataMapping** supports only for the JSON data with cell adaptor type.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
    ts.Text("Commercial Aviation Accidents and Fatalities by year 2012 - 2017").TextStyle(ViewBag.textStyle).XAxis(xAxis =>
        xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
            yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
                ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette
=> {
                palette.Color("#C06C84").Add();
                palette.Color("#6C5B7B").Add();
                palette.Color("#355C7D").Add();
            })
        ).Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient)).CellSettings(cs =>
        cs.Border(ViewBag.border).TileType(Syncfusion.EJ2.HeatMap.CellType.Bubble).B
```

```

bubbleType(Syncfusion.EJ2.HeatMap.BubbleType.SizeAndColor)).DataSource("dataSource").TooltipRender("tooltipRender").DataSourceSettings(ds => {
    ds.IsJsonData(true).AdaptorType(Syncfusion.EJ2.HeatMap.AdaptorType.Cell).XDataMapping("Year").YDataMapping("Months").BubbleDataMapping(bm =>
        bm.Size("Accidents").Color("Fatalities")); }).Render()

<script>
var tooltipRender = function (args) {
    args.content = ['Year ' + ' : ' + args.xLabel + '<br/>' + 'Months ' + ' : ' + args.yLabel + '<br/>'
        + 'Accidents ' + ' : ' + args.value[0].bubbleData + '<br/>' + 'Fatalities ' + ' : ' + args.value[1].bubbleData];
};
var dataSource = [
    { Year: '2017', Months: 'Jan-Feb', Accidents: 4, Fatalities: 39 },

    ViewBag.yLabels = yLabels;
}

```

```
        return View();
    }
```

Rendering mode in ASP.NET MVC HeatMap Chart Component

Heat map can be displayed using **Canvas** or **Scalable Vector Graphics (SVG)** rendering logic to improve the initial load performance and scalability. Heat map can also be automatically switched between **Canvas** and **SVG** modes based on dataset size. You can enable this mode by setting the [renderingMode](#) property to **Auto**.

Note: If the **Auto** mode is enabled in the heat map and there are more than 10,000 data points, then the heat map will be rendered in a **Canvas** mode; Otherwise, the heat map will be rendered in a **SVG** mode.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000 US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(true)).RenderingMode(Syncfusion.EJ2.HeatMap.DrawType.SVG).ShowTooltip(true).DataSource(ViewBag.dataSource).Render()
```

RENDERING-MODE.CS

```

public ActionResult RenderingMode()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}

private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        { 73, 39, 26, 39, 94, 0 },
        { 93, 58, 53, 38, 26, 68 },
        { 99, 28, 22, 4, 66, 90 },
        { 14, 26, 97, 69, 69, 3 },
        { 7, 46, 47, 47, 88, 6 },
        { 41, 55, 73, 23, 3, 79 },
        { 56, 69, 21, 86, 3, 33 },
        { 45, 7, 53, 81, 95, 79 },
        { 60, 77, 74, 68, 88, 51 },
        { 25, 25, 10, 12, 78, 14 },
        { 25, 56, 55, 58, 12, 82 },
        { 74, 33, 88, 23, 86, 59 }
    };
    return data;
}

```

Axis in ASP.NET MVC HeatMap Chart Component

HeatMap consists of two axes namely, X-axis and Y-axis that displays the row headers and column headers to plot the data points respectively. You can define the type, format, and other customizing options for both axes in the HeatMap.

Types**Category axis**

Category axis type is used to represent the string values in axis labels.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>

```

```

xAxis.Labels(ViewBag.xLabels).ValueType(Syncfusion.EJ2.HeatMap.ValueType.Category)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels).ValueType(Syncfusion.EJ2.HeatMap.ValueType.Category)).DataSource(ViewBag.dataSource).Render()

```

CATEGORY.CS

```

public ActionResult Category()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        { 73, 39, 26, 39, 94, 0 },
        { 93, 58, 53, 38, 26, 68 },
        { 99, 28, 22, 4, 66, 90 },
        { 14, 26, 97, 69, 69, 3 },
        { 7, 46, 47, 47, 88, 6 },
        { 41, 55, 73, 23, 3, 79 },
        { 56, 69, 21, 86, 3, 33 },
        { 45, 7, 53, 81, 95, 79 },
        { 60, 77, 74, 68, 88, 51 },
        { 25, 25, 10, 12, 78, 14 },
        { 25, 56, 55, 58, 12, 82 },
        { 74, 33, 88, 23, 86, 59 }
    };
    return data;
}

```

Numeric axis

Numeric axis type is used to represent the numeric values in axis labels.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000 US$)").XAxis(xAxis =>
xAxis.Minimum(1).Maximum(11).ValueType(Syncfusion.EJ2.HeatMap.ValueType.Numeric)).YAxis(yaxis =>

```

```
yaxis.Minimum(1).Maximum(5).ValueType(Syncfusion.EJ2.HeatMap.ValueType.Category).DataSource(ViewBag.dataSource).Render()
```

NUMERIC.CS

```
public ActionResult Numeric()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        { 73, 39, 26, 39, 94, 0 },
        { 93, 58, 53, 38, 26, 68 },
        { 99, 28, 22, 4, 66, 90 },
        { 14, 26, 97, 69, 69, 3 },
        { 7, 46, 47, 47, 88, 6 },
        { 41, 55, 73, 23, 3, 79 },
        { 56, 69, 21, 86, 3, 33 },
        { 45, 7, 53, 81, 95, 79 },
        { 60, 77, 74, 68, 88, 51 },
        { 25, 25, 10, 12, 78, 14 },
        { 25, 56, 55, 58, 12, 82 },
        { 74, 33, 88, 23, 86, 59 }
    };
    return data;
}
```

Date-time axis

Date-time axis type is used to represent the date-time values in axis labels with a specific format. In date-time axis, you can define the start and end date/time using the [Minimum](#) and [Maximum](#) properties.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Monthly Flight Traffic at JFK
Airport").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.DateTime).Minimum(new
System.DateTime(2007, 1, 1))
    .Maximum(new System.DateTime(2017, 1,
1)).IntervalType(Syncfusion.EJ2.HeatMap.IntervalType.Years)
    .LabelFormat("yyyy").LabelRotation(45)
    .LabelIntersectAction(Syncfusion.EJ2.HeatMap.LabelIntersectAction.None);
})
```

```

}).YAxis(yaxis => yaxis.Labels( ViewBag.yLabels)).CellSettings(cs =>
cs.Border(ViewBag.border).ShowLabel(false).Format("{value}
flights")).LegendSettings(ls =>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()

```

DATETIME.CS

```

public ActionResult DateTime()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] yLabels = new string[12] { "Jan", "Feb", "Mar", "Apr",
    "May", "June", "July", "Aug",
    "Sep", "Oct", "Nov", "Dec"};
    ViewBag.yLabels = yLabels;
    ViewBag.border = new { width = 0};
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {36371, 25675, 28292, 33399, 35980, 38585, 39351, 39964,
36543, 30529, 33298, 36985},
            {34702, 27618, 31063, 34525, 36772, 35410, 38750, 39467,
35390, 34196, 35302, 35703},
            {34522, 31324, 32128, 34231, 36817, 34381, 37180, 38255,

34285, 34094, 32256, 33699},
            {31714, 29405, 33745, 32838, 33461, 35034, 36122, 37943,
34128, 30624, 32398, 33522},
            {32064, 28387, 33751, 32537, 34034, 35977, 37196, 38301,
33627, 34115, 31072, 33939},
            {32417, 27868, 30807, 33386, 35284, 36126, 39753, 40978,
35777, 35277, 31281, 35411},
            {32494, 29848, 34385, 35804, 37943, 38722, 41315, 41335,
37177, 37443, 32457, 37304},
            {34378, 29576, 30547, 35664, 36622, 38145, 40347, 41868,
38252, 36505, 29576, 36450},
            {35219, 31670, 32589, 34927, 36998, 39825, 41126, 42002,
37021, 36583, 32408, 37108}
        }
    };
    return data;
}

```

Inversed axis

HeatMap supports inverting the axis origin for both axes, where the axis labels are placed in an inversed manner. You can enable axis inverting by enabling the [IsInversed](#) property.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Monthly Flight Traffic at JFK
Airport").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.DateTime).Minimum(new
System.DateTime(2007, 1, 1))
    .Maximum(new System.DateTime(2017, 1,
1)).IntervalType(Syncfusion.EJ2.HeatMap.IntervalType.Years)
    .LabelFormat("yyyy").LabelRotation(45)

.LabelIntersectAction(Syncfusion.EJ2.HeatMap.LabelIntersectAction.None).IsIn
versed(true);
}).YAxis(yaxis => yaxis.Labels( ViewBag.yLabels)).CellSettings(cs =>
cs.Border(ViewBag.border).ShowLabel(false).Format("{value}
flights")).LegendSettings(ls =>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()
```

INVERSED.CS

```
public ActionResult Inversed()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] yLabels = new string[12] { "Jan", "Feb", "Mar", "Apr",
"May", "June", "July", "Aug",
"Sep", "Oct", "Nov", "Dec"};
    ViewBag.yLabels = yLabels;
    ViewBag.border = new { width = 0};
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()

    };
    return data;
}

```

Opposed axis

In HeatMap, you can place the axis label in an opposite position of its default axis label position by using the [OpposedPosition](#) property.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Monthly Flight Traffic at JFK
Airport").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.DateTime).Minimum(new
System.DateTime(2007, 1, 1))
    .Maximum(new System.DateTime(2017, 1,
1)).IntervalType(Syncfusion.EJ2.HeatMap.IntervalType.Years)
    .LabelFormat("yyyy").LabelRotation(45)

    .LabelIntersectAction(Syncfusion.EJ2.HeatMap.LabelIntersectAction.None).Oppo
sedPosition(true);
}).YAxis(yaxis => yaxis.Labels( ViewBag.yLabels)).CellSettings(cs =>
cs.Border(ViewBag.border).ShowLabel(false).Format("{value}
flights")).LegendSettings(ls =>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()

```

OPPOSED.CS

```

public ActionResult Opposed()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] yLabels = new string[12] { "Jan", "Feb", "Mar", "Apr",
"May", "June", "July", "Aug",

```

```

        "Sep", "Oct", "Nov", "Dec"};
        ViewBag.yLabels = yLabels;
        ViewBag.border = new { width = 0};
        ViewBag.dataSource = GetDataSource();
        return View();
    }

    private int[,] GetDataSource()
    {
        int[,] data = new int[,]{
            {36371, 25675, 28292, 33399, 35980, 38585, 39351, 39964,
36543, 30529, 33298, 36985},
            {34702, 27618, 31063, 34525, 36772, 35410, 38750, 39467,

        };
        return data;
    }
}

```

Axis labels customization

Customizing the text style

The text style of the axis labels can be customized using the following options available in the [TextStyle](#) property.

- [Color](#) - It is used to change the text color of the axis labels.
- [FontFamily](#) - It is used to change the font family of the axis labels.
- [FontStyle](#) - It is used to change the font style of the axis labels.
- [FontWeight](#) - It is used to change the font weight of the axis labels.
- [Size](#) - It is used to change the font size of the axis labels.
- [TextAlignment](#) - It is used to position and align the axis labels. This property allows you to specify values such as **Near**, **Center**, and **Far**.
- [TextOverflow](#) - When the axis label exceeds the intended space, this property is used to trim or wrap it. This property takes values such as **None**, **Trim**, and **Wrap**.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").Load("heatmapLoad").TitleSettings(ts =>
ts.Text("Product wise Monthly sales revenue for a e-commerce website").
    TextStyle(ViewBag.textStyle)).XAxis(
    xAxis =>
xAxis.Labels(ViewBag.xLabels).OpposedPosition(true).TextStyle(ViewBag.axisTextStyle)).YAxis(yaxis =>

yaxis.Labels(ViewBag.yLabels).TextStyle(ViewBag.axisTextStyle).MaxLabelLength(70)).PaletteSettings(ps => ps.Palette(palette => {
    palette.Color("#F0C27B").Add();
    palette.Color("#4B1248").Add();
}))).LegendSettings(ls =>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()
<script>
    function heatmapLoad(args) {
        args.heatmap.xAxis.textStyle.textAlignment = "Center";
        args.heatmap.yAxis.textStyle.textAlignment = "Center";
        args.heatmap.xAxis.textStyle.textOverflow = "Wrap";
        args.heatmap.yAxis.textStyle.textOverflow = "Wrap";
    }
</script>

```

TEXTSTYLE.CS

```

public ActionResult TextStyle()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    ViewBag.axisTextStyle = new
    {
        color="Red",
        size= "15px",
        fontWeight= "650",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[] { "Month of Feburary 2023", "Month of March 2023", "Month of April 2023", "Month of May 2023", "Month of June 2023", "Month of July 2023", "Month of August 2023", "Month of September 2023", "Month of October 2023", "Month of November 2023", "Month of December 2023" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[] { "Ace Apparels", "Alpha Apparels", "RL Garments", "RRD Garments", "RRD Apparels", "RR Garments", "SR Garments" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private double[,] GetDataSource()
{

```

```
double[,] dataSource = new double[,]
{
    { 52, 65, 67, 45, 37, 52, 32 },
    { 68, 52, 63, 51, 30, 51, 51 },
    { 60, 50, 42, 53, 66, 70, 41 },
    { 66, 64, 46, 40, 47, 41, 45 },
    { 65, 42, 58, 32, 36, 44, 49 },
    { 54, 46, 61, 46, 40, 39, 41 },
    { 48, 46, 61, 47, 49, 41, 41 },
    { 69, 52, 41, 44, 41, 52, 46 },
    { 50, 59, 44, 43, 27, 42, 26 },
    { 47, 49, 66, 53, 50, 34, 31 },
    { 61, 40, 62, 26, 34, 54, 56 }
};
return dataSource;
}
```

Providing line breaks

Axis labels with line breaks improve the readability of the HeatMap by splitting the text on an axis into multiple lines. The “
” character is used to add line breaks to the axis labels.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").XAxis(
    xAxis =>
xAxis.Labels(ViewBag.xLabels).OpposedPosition(true)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels).MaxLabelLength(50)).DataSource(ViewBag.dataSource).Render()
```

LINE-BREAKS.CS

```
public ActionResult TextStyle()
{
    string[] xlabels = new string[] { "Actual<br>Accept", "Actual<br>Reject" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[] { "Actual<br>Accept", "Actual<br>Reject" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private double[,] GetDataSource()
{
    double[,] dataSource = new double[,]
    {
        { 1, 76 },
        { 19, 3 }
    };
    return dataSource;
}
```

Customizing labels when intersecting with other labels

When the axis labels intersect, [LabelIntersectAction](#) property is used to handle the intersection. The [LabelIntersectAction](#) property can take the following values.

- **None** - It specifies that no action is taken when the axis labels intersect.
- **Trim** - It specifies to trim the axis labels when they intersect.
- **Rotate45** - When the axis labels intersect, they are rotated to 45 degrees.
- **MultipleRows** - It specifies to show all the axis labels as multiple rows when they intersect.

The below example demonstrates to trim the axis labels by using the [LabelIntersectAction](#) property.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Product wise
Monthly sales revenue for a e-commerce website")).
    TextStyle(ViewBag.textStyle)).XAxis(

    };
    return dataSource;
}

```

Label formatting

HeatMap supports formatting the axis labels by using the [LabelFormat](#) property. Using this property, you can customize the axis label by global string format ('P', 'C', etc) or customized format like '{value}°C'.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Monthly Flight Traffic at JFK
Airport").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.DateTime).Minimum(new
System.DateTime(2007, 1,
1)).IntervalType(Syncfusion.EJ2.HeatMap.IntervalType.Years).LabelFormat("yyy
y");
}).YAxis(yaxis =>
yaxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.Numeric).LabelFormat("${val
ue}").LegendSettings(ls =>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()

```

LABEL-FORMAT.CS

```

public ActionResult LabelFormat()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    ViewBag.dataSource = GetDataSource();
    return View();
}

```

```

}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {73, 39, 26, 39, 94, 0},
        {93, 58, 53, 38, 26, 68},
        {99, 28, 22, 4, 66, 90},
        {14, 26, 97, 69, 69, 3},
        {7, 46, 47, 47, 88, 6},
        {41, 55, 73, 23, 3, 79},
        {56, 69, 21, 86, 3, 33},
        {45, 7, 53, 81, 95, 79},
        {60, 77, 74, 68, 88, 51},
        {25, 25, 10, 12, 78, 14},
        {25, 56, 55, 58, 12, 82},
        {74, 33, 88, 23, 86, 59}
    };
    return data;
}

```

Axis intervals

In HeatMap, you can define an interval between the axis labels using the [Interval](#) property. In date-time axis, you can change the interval mode by using the [IntervalType](#) property. The date-time axis supports the following interval types:

- Years
- Months
- Days
- Hours
- Minutes

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Monthly Flight Traffic at JFK
Airport").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
{
    xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.DateTime).Minimum(new
System.DateTime(2007, 1, 1))
    .Maximum(new System.DateTime(2017, 1,
1)).IntervalType(Syncfusion.EJ2.HeatMap.IntervalType.Years)
    .LabelFormat("yyyy").Interval(2);
}).YAxis(yaxis => yaxis.Labels( ViewBag.yLabels)).CellSettings(cs =>
cs.Border(ViewBag.border).ShowLabel(false).Format("{value}
flights")).LegendSettings(ls =>
ls.Visible(false)).DataSource(ViewBag.dataSource).Render()

```

38252, 36505, 29576, 36450},
            {35219, 31670, 32589, 34927, 36998, 39825, 41126, 42002,
37021, 36583, 32408, 37108}
        }
    };
    return data;
}

```

Axis label increment

Axis label increment in the HeatMap is used to display the axis labels with regular interval values in numeric and date-time axes. The labels will be displayed with tick gaps when you set the label interval. But, to achieve the same behavior without tick gaps, use the label increment. You can set the axis label increment using the [Increment](#) property and the default value of this property is 1.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").XAxis(xAxis =>

```

```
xAxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.Numeric).Minimum(0).Increment(2)).YAxis(yaxis =>
yaxis.ValueType(Syncfusion.EJ2.HeatMap.ValueType.Numeric).Minimum(0).Increment(3)).DataSource(ViewBag.dataSource).Render()
```

INCREMENT.CS

```
public ActionResult Increment()
{
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {73, 39, 26, 39, 94, 0},
        {93, 58, 53, 38, 26, 68},
        {99, 28, 22, 4, 66, 90},
        {14, 26, 97, 69, 69, 3},
        {7, 46, 47, 47, 88, 6},
        {41, 55, 73, 23, 3, 79},
        {56, 69, 21, 86, 3, 33},
        {45, 7, 53, 81, 95, 79},
        {60, 77, 74, 68, 88, 51},
        {25, 25, 10, 12, 78, 14},
        {25, 56, 55, 58, 12, 82},
        {74, 33, 88, 23, 86, 59}
    };
    return data;
}
```

Limiting labels in date-time axis

You can display the axis labels at specific time intervals along with the date-time axis using the [ShowLabelOn](#) property. This property supports the following types:

- **None**: Displays the axis labels based on the `IntervalType` and `Interval` property of the axis. This type is default value of the `ShowLabelOn` property.
- **Years**: Displays the axis labels on every year between given date-time range.
- **Months**: Displays the axis labels on every month between given date-time range.
- **Days**: Displays the axis labels on every day between given date-time range.
- **Minutes**: Displays the axis labels on every minute between given date-time range.

CSHTML

```

        {0, 31, 2, 9, 24, 0, 1},
        {0, 8, 47, 27, 0, 35, 40},
        {0, 10, 2, 0, 44, 5, null},
    };
    return data;
}

```

Multilevel Labels

Multilevel labels are used to classify a group of axis labels as a single category, which is then displayed with a label. By using [MultiLevelLabels](#) tag, you can add multiple levels on top of the axis labels.

To divide and group the axis labels, you can use [MultiLevelLabels](#) property. The starting and ending indexes of the axis labels can be set using the [Start](#) and [End](#) properties in the [Categories](#). The [Text](#) property can be used to specify a name for the grouped axis labels.

The multilevel labels can be customized by using the following properties and tags.

- [Overflow](#) - It is used to trim or wrap the multilevel labels when the label overflows the intended space. NOTE: This property is only for x-axis.
- [Alignment](#) - It is used to place and align the multilevel labels.
- [MaximumTextWidth](#) - It is used to set the maximum width of the text. When the text length exceeds the maximum text width, the overflow action will be performed.
- [TextStyle](#) - It is used to customize the font style of the multilevel labels.
- [Border](#) - It is used to customize the border of the multilevel labels displayed in the x-axis and y-axis.

CSHTML

```

```

Palette in ASP.NET MVC HeatMap Chart Component

In heat map, each data point is displayed as a cell with applied color based on the data value. The palette in the heat map is used to define the color range for cells and gradient type for colors. You can define the colors either in RGB or hex codes using the [color](#) property in the [palette](#). The defined colors are applied to the cell background based on the palette type and cell value.

Palette types

You can display the heat map cells either in gradient colors or fixed colors.

Gradient

The smooth transition between the given palette colors can be applied for the heat map cells based on value. The heat map calculates all the gradient colors between the start and end colors for all distinct data values. Default start color and end color will be considered for gradient calculation, if the colors are not defined. The palette type must be defined as **Gradient** for the [type](#) property in the [paletteSettings](#) property.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette =>
{
    palette.Color("#C06C84").Add();
    palette.Color("#6C5B7B").Add();
    palette.Color("#355C7D").Add();
}

```

```
}).Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient)).DataSource(ViewBag.dataSource).Render()
```

GRADIENT.CS

```
public ActionResult Gradient()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Fixed

In fixed palette type, solid colors are applied to the heat map cells. The data values can be grouped based on the number of colors defined for the heat map. The palette type should be defined as **Fixed** for the [type](#) property in the `paletteSettings` property.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.HeatMap;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
```

```
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(false)).LegendSettings(ls =>
ls.Position(LegendPosition.Left)).PaletteSettings(ps =>
ps.Type(Syncfusion.EJ2.HeatMap.PaletteType.Fixed)).DataSource(ViewBag.dataSo
urce).Render()
```

FIXED.CS

```
public ActionResult Fixed()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Defining color stops

You can define the colors ranges or color stops for data values in both gradient and fixed palette types. You need to define the data value in the [value](#) property for [palette](#) property to calculate the color stops. The heat map automatically calculates the color stops if the [value](#) property is not defined. The [label](#)

property is used to provide the additional information about the color that is to be displayed in the legend. If the label is not provided, the value is displayed in the legend. The labels can be automatically calculated based on data values, if both the values and labels are not defined.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette =>
{
    palette.Color("#C06C84").Label("Low").Value(50).Add();
    palette.Color("#6C5B7B").Label("Moderate").Value(80).Add();
    palette.Color("#355C7D").Label("High").Value(100).Add();
}).Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient)).DataSource(ViewBag.dataSource).Render()
```

COLOR.CS

```
public ActionResult PaletteColor()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };

        };
        return data;
    }
}

```

Legend types

Heat map supports two legend types: Gradient and list type.

- **Gradient** - This is a continuous color legend with smooth color transition between palette color values.
- **List** - List is a fixed color legend. Each palette color information is shown separately in the list item.

You can change the legend type by using the [type](#) property in the `paletteSettings` property.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(false)).LegendSettings(ls =>
ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette =>
{
    palette.Color("#C06C84").Add();
    palette.Color("#6C5B7B").Add();
    palette.Color("#355C7D").Add();
})) .Type(Syncfusion.EJ2.HeatMap.PaletteType.Fixed)).DataSource(ViewBag.dataSource).Render()

```

TYPES.CS

```

public ActionResult LegendTypes()

```

```

{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    ViewBag.textStyle = new { fontStyle = "Italic",fontFamily = "Segoe
    UI" };
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {73, 39, 26, 39, 94, 0},
        {93, 58, 53, 38, 26, 68},
        {99, 28, 22, 4, 66, 90},
        {14, 26, 97, 69, 69, 3},
        {7, 46, 47, 47, 88, 6},
        {41, 55, 73, 23, 3, 79},
        {56, 69, 21, 86, 3, 33},
        {45, 7, 53, 81, 95, 79},
        {60, 77, 74, 68, 88, 51},
        {25, 25, 10, 12, 78, 14},
        {25, 56, 55, 58, 12, 82},

    };
}

```

```

        return data;
    }

```

Smart Legend

Smart legend is another way of showing list type legend with responsiveness and readability, when the palette has more number of items. You can enable this smart legend by using the [enableSmartLegend](#) property when the palette type is set to **Fixed**.

In smart legend, you can change the display type of legend labels by using the [labelDisplayType](#) property.

The following are the legend label display types:

- **All**: Displays all labels in the legend.
- **Edge**: Displays the legend labels only at extreme ends.
- **None**: None of the labels are displayed. The tooltip will appear for this type of label display when hovering over the legend item.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>

        { 73, 39, 26, 39, 94, 0 },
        { 93, 58, 53, 38, 26, 68 },
        { 99, 28, 22, 4, 66, 90 },
        { 14, 26, 97, 69, 69, 3 },
        { 7, 46, 47, 47, 88, 6 },
        { 41, 55, 73, 23, 3, 79 },
        { 56, 69, 21, 86, 3, 33 },
        { 45, 7, 53, 81, 95, 79 },
        { 60, 77, 74, 68, 88, 51 },
        { 25, 25, 10, 12, 78, 14 },
        { 25, 56, 55, 58, 12, 82 },
        { 74, 33, 88, 23, 86, 59 }
    };
    return data;
}
```

Cell highlighting

Enable or disable the cell highlighting while hovering over the heat map cells by using the [EnableCellHighlighting](#) property.

Note: The cell highlighting only works in a SVG rendering mode.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.EnableCellHighlighting(true)).DataSource(ViewBag.dataSource).Render()
```

CELL-HIGHLIGHT.CS

```
public ActionResult CellHighlight()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Color gradient mode

The [ColorGradientMode](#) property can be used to set the minimum and maximum values for colors based on row and column. Three types of color gradient modes are available.

- **Table:** The minimum and maximum value colors calculated for overall data.

- **Row:** The minimum and maximum value colors calculated for each row of data.
- **Column:** The minimum and maximum value colors calculated for each column of data.

Note: The default value of `ColorGradientMode` is `Table`.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.EnableCellHighlighting(true)).PaletteSettings(ps =>
ps.ColorGradientMode(Syncfusion.EJ2.HeatMap.ColorGradientMode.Column)).DataS
ource(ViewBag.dataSource).Render()
```

COLORMODE.CS

```
public ActionResult CellHighlight()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };

            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

```
}

```

Background color

The background color of the HeatMap can be customized using the [BackgroundColor](#) property.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").BackgroundColor("#c7afcf").TitleSettings(ts
=>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).Render()
```

BACKGROUNDCOLOR.CS

```
public ActionResult BackgroundColor()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},

            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Margin

Set the margin for the heat map from its container by using the [Margin](#) property.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").Margin(margin =>
margin.Left(15).Right(15).Top(15).Bottom(15)).TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).Render()
```

MARGIN.CS

```
public ActionResult Margin()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Title

The title is used to provide a quick information about the data plotted in heatmap. The [Text](#) property is used to set the title for the heatmap. The text style of the title can be customized by using the [TextStyle](#) property.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).Render()
```

TITLE.CS

```
public ActionResult Title()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Italic",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Data label

The visibility of data labels can be toggled using the [ShowLabel](#) property. By default, the data labels will be visible.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(false)).DataSource(ViewBag.dataSource).Render()
```

DATA-LABEL.CS

```
public ActionResult DataLabel()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Customize the data label

The value displayed in the HeatMap cell can be changed using the [CellRender](#) event.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellRender("cellRender").DataSource(ViewBag.d
ataSource).Render()
<script>
var cellRender = function (args) {
    args.displayText = (args.value) + '$';
};
</script>
```

CELLRENDER.CS

```
public ActionResult CellRender()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
};
```

```

        return data;
    }

```

Text style

The text attributes of the data label such as font-family, font-size, and color can be customized using the [TextStyle](#) in the [CellSettings](#) property.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.TextStyle(ViewBag.cellTextStyle)).DataSource(ViewBag.dataSource).Render()

```

TEXT-STYLE.CS

```

public ActionResult TextStyle()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    ViewBag.cellTextStyle = new { fontStyle = "Italic",fontFamily =
    "Segoe UI" };
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        { 73, 39, 26, 39, 94, 0 },
        { 93, 58, 53, 38, 26, 68 },
        { 99, 28, 22, 4, 66, 90 },
        { 14, 26, 97, 69, 69, 3 },
        { 7, 46, 47, 47, 88, 6 },
        { 41, 55, 73, 23, 3, 79 },
        { 56, 69, 21, 86, 3, 33 },
        { 45, 7, 53, 81, 95, 79 },
        { 60, 77, 74, 68, 88, 51 },
        { 25, 25, 10, 12, 78, 14 },
        { 25, 56, 55, 58, 12, 82 },
    }
}

```

```

        {74, 33, 88, 23, 86, 59}
    };
    return data;
}

```

Format

The format of the data label, such as currency, decimal, percent etc. can be changed using [Format](#) property.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.Format("{value} $")).DataSource(ViewBag.dataSource).Render()

```

FORMAT.CS

```

public ActionResult Format()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
        }
    };
}

```

```

        {74, 33, 88, 23, 86, 59}
    };
    return data;
}

```

Template

Array binding

By including `${value}` in the template content, the value from the data source for the corresponding cell can be displayed in the HeatMap cell as data label template content. Additionally, the x-axis and y-axis label values can be displayed by including `${xLabel}` and `${yLabel}` in the template content.

Table

The following example demonstrates how to add a data label template for array table binding.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
    ts.Text("Commercial Aviation Accidents and Fatalities by year 2015 -
2017").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
    xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
    yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
    ls.Visible(true)).CellSettings(cs =>
    cs.LabelTemplate("<div
style='width:25px;height:20px;text-align:center;padding-top:2px;background-
color:#5BBB9C; border: 1px solid #000000; border-radius:50%;font-
weight:bold;'>${value}</div>")).DataSource("dataSource").Render()
}
<script>
    var dataSource = [
        [[4, 39], [3, 8], [1, 3], [1, 10], [4, 4], [2, 15]],
        [[4, 28], [5, 92], [5, 73], [3, 1], [3, 4], [4, 126]],
        [[4, 45], [5, 152], [0, 44], [4, 54], [5, 243], [2, 45]]
    ];
</script>

```

TEMPLATE-ARRAY-TABLE.CS

```

public ActionResult Gradient()
{
    ViewBag.textStyle = new
    {
        size = "15px",
        fontWeight = "500",
        fontStyle = "Normal",
        fontFamily = "Segoe UI"
    };
    string[] xlabels = new string[3] { "2015", "2016", "2017" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Jan-Feb", "Mar-Apr", "May-
Jun", "Jul-Aug", "Sep-Oct", "Nov-Dec" };
    ViewBag.yLabels = yLabels;
    return View();
}

```

Cell

The following example demonstrates how to add a data label template for array cell binding.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
    ts.Text("Commercial Aviation Accidents and Fatalities by year 2015 - 2017").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
    xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
    yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
    ls.Visible(true)).CellSettings(cs =>
    cs.LabelTemplate("<div
style='width:25px;height:20px;text-align:center;padding-top:2px;background-
color:#5BBB9C; border: 1px solid #000000; border-radius:50%;font-
weight:bold;'>${value}</div>")).DataSource("dataSource").DataSourceSettings(ds => {
ds.IsJsonData(false).AdaptorType(Syncfusion.EJ2.HeatMap.AdaptorType.Cell);
}).Render()
<script>
    var dataSource = [
        [0, 0, [4, 39]], [0, 1, [3, 8]], [0, 2, [1, 3]], [0, 3, [1, 10]], [0, 4,
[4, 4]], [0, 5, [2, 15]],
        [1, 0, [4, 28]], [1, 1, [5, 92]], [1, 2, [5, 73]], [1, 3, [3, 1]], [1,
4, [3, 4]], [1, 5, [4, 126]],
        [2, 0, [4, 45]], [2, 1, [5, 152]], [2, 2, [0, 44]], [2, 3, [4, 54]], [2,
4, [5, 243]], [2, 5, [2, 45]]
    ];
</script>
```

TEMPLATE-ARRAY-CELL.CS

```
public ActionResult Gradient()
{
    ViewBag.textStyle = new
    {
        size = "15px",
        fontWeight = "500",
        fontStyle = "Normal",
        fontFamily = "Segoe UI"
    };
    string[] xlabels = new string[3] { "2015", "2016", "2017" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Jan-Feb", "Mar-Apr", "May-
Jun", "Jul-Aug", "Sep-Oct", "Nov-Dec" };
    ViewBag.yLabels = yLabels;
    return View();
}
```

JSON binding

By including the desired field name in the template content, such as **\${value}**, the value from the data source for the corresponding cell can be displayed in the HeatMap cell as data label template content.

Table

The following example demonstrates how to add a data label template for JSON table binding.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
    ts.Text("Commercial Aviation Accidents and Fatalities by year 2015 -
2017").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
    xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
    yaxis.Labels(ViewBag.yLabels)).LegendSettings(ls =>
    ls.Visible(true)).PaletteSettings(ps => ps.Palette(palette
=> {
        palette.Color("#C06C84").Add();
        palette.Color("#6C5B7B").Add();
        palette.Color("#355C7D").Add();
    })).Type(Syncfusion.EJ2.HeatMap.PaletteType.Gradient)).CellSettings(cs =>
    cs.LabelTemplate("<div><img
style='width:20px;height:20px;' src='${image}'/>
</div>")).DataSource("dataSource").DataSourceSettings(ds => {
ds.IsJsonData(true).AdaptorType(Syncfusion.EJ2.HeatMap.AdaptorType.Table).XD
ataMapping("Year"); }).Render()
<script>
    var dataSource = [
        {
            Year: '2017',
            image:
                'https://ej2.syncfusion.com/demos/src/circular-
gauge/images/golfball.png',
            'Jan-Feb': [4, 39],
            'Mar-Apr': [3, 8],
            'May-Jun': [1, 3],
            'Jul-Aug': [1, 10],
            'Sep-Oct': [4, 4],
            'Nov-Dec': [2, 15]
        },
        {

    { Year: '2015', Months: 'Jul-Aug', Accidents: 4, Fatalities: 54 },
    { Year: '2015', Months: 'Sep-Oct', Accidents: 5, Fatalities: 243 },
    { Year: '2015', Months: 'Nov-Dec', Accidents: 2, Fatalities: 45 },
  ];
</script>

```

TEMPLATE-JSON-CELL.CS

```

public ActionResult Gradient()
{
    ViewBag.textStyle = new
    {
        size = "15px",
        fontWeight = "500",
        fontStyle = "Normal",
        fontFamily = "Segoe UI"
    };
    string[] xlabels = new string[3] { "2015", "2016", "2017" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Jan-Feb", "Mar-Apr", "May-Jun", "Jul-Aug", "Sep-Oct", "Nov-Dec" };
    ViewBag.yLabels = yLabels;
    return View();
}

```

Dimensions in ASP.NET MVC HeatMap Chart Component

Size for container

Heat map can be rendered to its container size. You can set the size through inline or CSS.

```

`javascript
<div id='container'>
<div id='element' style="width:650px; height:350px;"></div>
</div>
`

```

Size for heat map

You can set the size of heat map directly by using the [width](#) and [height](#) properties.

In pixel

You can set the size for heat map in a pixel.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").Width("650px").Height("350px").TitleSettings(ts =>

```

```
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(true)).DataSource(ViewBag.dataSource).Render()
```

PIXEL.CS

```
public ActionResult Pixel()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

In percentage

By setting value in percentage, heat map gets its dimension with respect to its container. For example, when the height is '50%', heat map rendered to half of the container height.

CSHTML

```
@using Syncfusion.EJ2;
```

```
@Html.EJS().HeatMap("container").Width("80%").Height("90%").TitleSettings(ts
=>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(true)).DataSource(ViewBag.dataSource).Render()
```

PERCENTAGE.CS

```
public ActionResult Percentage()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        { 73, 39, 26, 39, 94, 0 },
        { 93, 58, 53, 38, 26, 68 },
        { 99, 28, 22, 4, 66, 90 },
        { 14, 26, 97, 69, 69, 3 },
        { 7, 46, 47, 47, 88, 6 },
        { 41, 55, 73, 23, 3, 79 },
        { 56, 69, 21, 86, 3, 33 },
        { 45, 7, 53, 81, 95, 79 },
        { 60, 77, 74, 68, 88, 51 },
        { 25, 25, 10, 12, 78, 14 },
        { 25, 56, 55, 58, 12, 82 },
        { 74, 33, 88, 23, 86, 59 }
    };
    return data;
}
```

Tooltip in ASP.NET MVC HeatMap Chart Component

Tooltip is used to provide the details of the heatmap cell, and this can be displayed, while hovering the cursor over the cell or performing tap action in touch devices.

Default tooltip

You can enable the tooltip by setting the [showTooltip](#) property to **true**.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Crude Oil
Production of Non-OPEC Countries (in Million barrels per
day)").TextStyle(ViewBag.textStyle)).XAxis(
xAxis =>{ xAxis.Labels(ViewBag.xLabels)}).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(false)).ShowTooltip(true).DataSource(ViewBag.dataSource).Render
()
```

TOOLTIP.CS

```
public ActionResult Tooltip()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[8] { "Canada", "China", "Egypt",
    "Mexico", "Norway", "Russia", "UK", "USA"};
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[11] { "2000", "2001", "2002",
    "2003", "2004", "2005", "2006", "2007", "2008", "2009", "2010" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            [0.72, 0.71, 0.71, 0.67, 0.72, 0.53, 0.53, 0.56, 0.58,
0.56],
            [2.28, 2.29, 2.09, 1.84, 1.64, 1.49, 1.49, 1.39, 1.32,
1.23],
            [2.02, 2.17, 2.30, 2.39, 2.36, 2.52, 2.62, 2.57, 2.57,
2.74],
            [3.21, 3.26, 3.45, 3.47, 3.42, 3.34, 3.14, 2.83, 2.64,
2.61],
            [3.22, 3.13, 3.04, 2.95, 2.69, 2.49, 2.27, 2.18, 2.06,
1.87],
            [3.30, 3.39, 3.40, 3.48, 3.60, 3.67, 3.73, 3.79, 3.79,
4.07],
            [5.80, 5.74, 5.64, 5.44, 5.18, 5.08, 5.07, 5.00, 5.35,
5.47],
            [6.91, 7.40, 8.13, 8.80, 9.04, 9.24, 9.43, 9.35, 9.49, 9.69]
        }
    };
    return data;
}
```

Tooltip template

In heatmap, you can customize the tooltip using the [tooltipRender](#) client side event.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Crude Oil
Production of Non-OPEC Countries (in Million barrels per
day)").TextStyle(ViewBag.textStyle)).XAxis(
xAxis =>{ xAxis.Labels(ViewBag.xLabels)}).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(false)).ShowTooltip(true).TooltipRender("tooltipRender").DataSo
urce(ViewBag.dataSource).Render()
<script>
    var tooltipRender = function (args) {
        args.content = ['In ' + args.yLabel + ', the ' + args.xLabel + '
produced ' + args.value + ' million barrels per day'];
    };
</script>
```

TEMPLATE.CS

```
public ActionResult Tooltiptemplate()
{
    ViewBag.textStyle = new
    {
        size= "15px",

        };
        return data;
    }
}
```

Selection in ASP.NET MVC HeatMap Chart Component

In the HeatMap, the cell selection is used to select single or multiple HeatMap cells at runtime and get the selected cell details using the [CellSelected](#) event. You can enable the cell selection using the [AllowSelection](#) property.

The HeatMap cells can be selected using the following interactions, as shown in the table below.

Modes of Interactions	Description
Mouse	HeatMap cells can be selected by clicking or dragging and dropping over them.
Touch	HeatMap cells can be selected by tapping or dragging and dropping over them.
Keyboard	The Ctrl key on the keyboard can be used to enable multiple cell selection with mouse and touch interaction. The Ctrl key can only be used if the EnableMultiSelect property is set to true in order to enable multiple cell selection.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
```

```
yaxis.Labels(ViewBag.yLabels)).AllowSelection(true).DataSource(ViewBag.dataSource).Render()
```

CELLSELECTION.CS

```
public ActionResult CellRender()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Enable single cell selection

In the HeatMap, the [EnableMultiSelect](#) property is used to allow single cell selection. When you set the [EnableMultiSelect](#) property to **false**, only one cell is selected. By default, [EnableMultiSelect](#) property is set to **true**.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
```

```
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).AllowSelection(true).EnableMultiSelect(false)
.DataSource(ViewBag.dataSource).Render()
```

SINGLECELLSELECTION.CS

```
public ActionResult SingleCellSelection()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

Clearing cell selection

The `clearSelection` method can be used to clear all the selected cells. The below example illustrates the same.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
```

```

xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).AllowSelection(true).DataSource(ViewBag.dataS
ource).Render()
@Html.EJS().Button("selection").IconCss("e-icons e-play-
icon").Content("ClearSelection").CssClass("e-flat").Render()
<script>
    document.getElementById('selection').onclick = function () {
        var heatmapObj =
document.getElementById('container').ej2_instances[0];
        heatmapObj.clearSelection();
    };
</script>

```

CLEARSELECTION.CS

```

public ActionResult ClearSelection()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs",
    "Fri", "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}

```

Accessibility in ASP.NET MVC HeatMap chart component

HeatMap has built-in accessibility features like screen reading. Screen reading in the HeatMap component allows all users, regardless of ability or disability, to use the component. The following HeatMap elements will be read aloud with screen reading software like Narrator for Windows.

Elements	Description
--- ---	
Title	Reads the contents of the HeatMap chart's title.
Axis labels	Reads the x and y axis labels of the HeatMap chart.
Multilevel labels	Reads the multilevel labels in the x and y axis of the HeatMap chart.
Cell labels	Reads the labels from the cells in the Heatmap chart.
Legend title	Reads the contents of the legend's title as specified in HeatMap chart.
Legend item label	Reads the label of a legend item in HeatMap chart.

Ensuring accessibility

The HeatMap component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the HeatMap component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the HeatMap component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET MVC components](#)

Events in ASP.NET MVC HeatMap Chart Component

This section describes the HeatMap chart event, which occurs when the required actions are performed.

CellClick

When you click on a HeatMap cell, the [CellClick](#) event is triggered.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").CellClick("heatmapCellClick").TitleSettings
(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).Render()
<script>
function heatmapCellClick(args) {
    console.log("The cell click event has been triggered!!!");
}
</script>
```

CELLCLICK.CS

```
public ActionResult CellClick()
```

```

{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs", "Fri",
    "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {73, 39, 26, 39, 94, 0},
        {93, 58, 53, 38, 26, 68},
        {99, 28, 22, 4, 66, 90},
        {14, 26, 97, 69, 69, 3},
        {7, 46, 47, 47, 88, 6},
        {41, 55, 73, 23, 3, 79},
        {56, 69, 21, 86, 3, 33},
        {45, 7, 53, 81, 95, 79},
        {60, 77, 74, 68, 88, 51},
        {25, 25, 10, 12, 78, 14},
        {25, 56, 55, 58, 12, 82},
        {74, 33, 88, 23, 86, 59}
    };
    return data;
}

```

CellDoubleClick

When you double click on a HeatMap cell, the [CellDoubleClick](#) event is triggered.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").CellDoubleClick("heatmapCellDoubleClick").TitleSettings(ts =>
    ts.Text("Sales Revenue per Employee (in 1000
    US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
        xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
            yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).Render()
<script>
    function heatmapCellDoubleClick(args) {
        console.log("The cell double click event has been triggered!!!");
    }
</script>

```

CELDOUBLECLICK.CS

```

public ActionResult CellDoubleClick()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };
    ViewBag.xLabels = xlabels;
    string[] yLabels = new string[6] { "Mon", "Tues", "Wed", "Thurs", "Fri",
    "Sat" };
    ViewBag.yLabels = yLabels;
    ViewBag.dataSource = GetDataSource();
    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]
    {
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}

```

CellRender

The [CellRender](#) event will be triggered before each HeatMap cell is rendered.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").CellRender("heatmapCellRender").TitleSettings(ts =>
    ts.Text("Sales Revenue per Employee (in 1000
    US$)").TextStyle(ViewBag.textStyle).XAxis(xAxis =>
        xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
            yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).Render()
<script>
    function heatmapCellRender(args) {
        console.log("The cell render event has been triggered!!!");
    }

```

```
}
</script>
```

CELLRENDER.CS

```
public ActionResult CellRender()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };

    return View();
}
private int[,] GetDataSource()
{
    int[,] data = new int[,]{
        {
            {73, 39, 26, 39, 94, 0},
            {93, 58, 53, 38, 26, 68},
            {99, 28, 22, 4, 66, 90},
            {14, 26, 97, 69, 69, 3},
            {7, 46, 47, 47, 88, 6},
            {41, 55, 73, 23, 3, 79},
            {56, 69, 21, 86, 3, 33},
            {45, 7, 53, 81, 95, 79},
            {60, 77, 74, 68, 88, 51},
            {25, 25, 10, 12, 78, 14},
            {25, 56, 55, 58, 12, 82},
            {74, 33, 88, 23, 86, 59}
        }
    };
    return data;
}
```

CellSelected

When single or multiple cells in the HeatMap are selected, the [CellSelected](#) event is triggered.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").CellSelected("heatmapCellSelected").AllowSe
lection(true).TitleSettings(ts =>
    ts.Text("Sales Revenue per Employee (in 1000
    US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
    xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
    yaxis.Labels(ViewBag.yLabels)).DataSource(ViewBag.dataSource).Render()
```

```
<script>
function heatmapCellSelected(args) {
    console.log("The cell selected event has been triggered!!!");
}
</script>
```

CELLSELECTED.CS

```
public ActionResult CellSelected()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[12] { "Nancy", "Andrew", "Janet",
    "Margaret", "Steven", "Michael", "Robert", "Laura", "Anne", "Paul", "Karin",
    "Mario" };

}

```

How To

Customizing tooltip as a table

You can show a tooltip as a table using the `template` property in `TooltipSettings`.

The following steps describe how to show the table tooltip.

Step 1: Initialize the tooltip template div as shown in the following html page.

Step 2: Set the element id to the `template` property in `TooltipSettings` to show the tooltip template.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts => ts.Text("Crude Oil
Production of Non-OPEC Countries (in Million barrels per
day)").TextStyle(ViewBag.textStyle)).XAxis(
xAxis =>{ xAxis.Labels(ViewBag.xLabels) }).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).CellSettings(cs =>
cs.ShowLabel(false)).TooltipSettings(ts =>

ts.Template("#tooltipTemplate")).ShowTooltip(true).DataSource(ViewBag.dataSo
urce).Render()
<script id="tooltipTemplate" type="text/x-template">
    <div id='template'>
        <table>
            <tr bgcolor="pink"><td
align="right">${xValue}</td><td>${yValue}</td><td >${value}</td></tr>
        </table>
    </div>
</script>

```

TOOLTIP.CS

```

public ActionResult Tooltip()
{
    ViewBag.textStyle = new
    {
        size= "15px",
        fontWeight= "500",
        fontStyle= "Normal",
        fontFamily= "Segoe UI"
    };
    string[] xlabels = new string[8] { "Canada", "China", "Egypt",
    "Mexico", "Norway", "Russia", "UK", "USA"};
    ViewBag.xLabels = xlabels;
}

            {3.30, 3.39, 3.40, 3.48, 3.60, 3.67, 3.73, 3.79, 3.79,
4.07],
            {5.80, 5.74, 5.64, 5.44, 5.18, 5.08, 5.07, 5.00, 5.35,
5.47],
            {6.91, 7.40, 8.13, 8.80, 9.04, 9.24, 9.43, 9.35, 9.49, 9.69]
        };
        return data;
    }
}

```

Change the legend label text

You can change the legend label using the **LegendRender** client-side event. You can also hide the legend label using this client-side event.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().HeatMap("container").TitleSettings(ts =>
ts.Text("Sales Revenue per Employee (in 1000
US$)").TextStyle(ViewBag.textStyle)).XAxis(xAxis =>
xAxis.Labels(ViewBag.xLabels)).YAxis(yaxis =>
yaxis.Labels(ViewBag.yLabels)).PaletteSettings(ps => ps.Palette(palette =>
{
    palette.Value(0).Color("#C2E7EC").Add();
    palette.Value(25000).Color("#AEDFE6").Add();
    palette.Value(50000).Color("#9AD7E0").Add();
    palette.Value(75000).Color("#72C7D4").Add();
    palette.Value(99000).Color("#5EBFCE").Add();
}))).LegendSettings(ls =>
ls.Position(Syncfusion.EJ2.HeatMap.LegendPosition.Right)).LegendRender("lege
ndRender")DataSource(ViewBag.dataSource).Render()
<script>
    var legendRender = function (args) {
        if(args.text=='25,000' || args.text=='50,000' ||
args.text=='99,000'){
            args.text = args.text.replace(/,/g, "");
            args.text = `${parseInt(args.text/1000)}` + "k " + "$";
        }
    }

```

```

    } else {
        args.cancel=true;
    }
};
</script>

```

Migration from Essential JS 1

This article describes the API migration process of heat map component from Essential JS 1 to Essential JS 2.

Members

| Behaviour | API in Essential JS 1 | API in Essential JS 2 |

| ---- | --- | --- |

| Specifies the width of the heat map | **Property:** `width`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
 Heatmap = new HeatMapProperties();
 Heatmap.Width = "830"; | **Property:**
`width`
 @Html.EJS().HeatMap("container").Width("300px").Render()

| Specifies the height of the heat map | **Property:** `height`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
 Heatmap = new HeatMapProperties();
 Heatmap.Height = "830"; | **Property:** `height`
 @Html.EJS().HeatMap("container").Height("300px").Render() |

| Enables or disables tooltip of heat map | **Property:**
`showtooltip`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
 Heatmap = new HeatMapProperties();
 Heatmap.ShowTooltip = true; | **Property:**
`showtooltip`
 @Html.EJS().HeatMap("container").ShowTooltip(true).Render() |

| Defines the tooltip that should be shown when the mouse hovers over cells. | **Property:**
`toolTipSettings.templateId`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
 Heatmap = new HeatMapProperties();
 Heatmap.ToolTipSettings = new ToolTipSettings() {
 templateId = "mouseovertoolTipId" }; | **Property:**
`tooltipRender`
 @Html.EJS().HeatMap("container").TooltipRender("tooltipRender").Render()
 >var tooltipRender = function (args) {};

| Specifies the source data of the heat map. | **Property:**
`itemsSource`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
 Heatmap = new HeatMapProperties();
 Heatmap.ItemsSource = []; | **Property:**
`dataSource`
 @Html.EJS().HeatMap("container").DataSource(ViewBag.dataSource).Render() |

| Specifies whether the cell content can be visible or not. | **Property:**
`heatmapCell.showContent`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
 Heatmap = new HeatMapProperties();
 Heatmap.HeatMapCell = new HeatMapCell() { showContent =
 "Hidden" }; | **Property:**
`cellSettings.showLabel`
 @Html.EJS().HeatMap("container").CellSettings(cs =>
 cs.ShowLabel(false)).Render() |

| Specifies the color of the heat map column data. | **Property:**
`colorMappingCollection.color`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
 Heatmap = new HeatMapProperties();
 List colorCollection = new List();
 colorCollection.Add(new HeatMapColorMapping() { Color = "#8ec8f8" });
 Heatmap.ColorMappingCollection = colorCollection;
 | **Property:**
`paletteSettings.palette.color`
 @Html.EJS().HeatMap("container").PaletteSettings(ps =>
 ps.Palette(palette => { palette.Value(0).Color("rgb(238,238,238)").Add(); })).Render() |

| Specifies the color values of the heat map column data. | **Property:** colorMappingCollection.value

@Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"] as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)

HeatMapProperties
 Heatmap = new HeatMapProperties(); List colorCollection = new List();
colorCollection.Add(new
 HeatMapColorMapping() { Value = 0 });
Heatmap.ColorMappingCollection = colorCollection; |

Property:

paletteSettings.palette.value

@Html.EJS().HeatMap("container").PaletteSettings(ps =>
 ps.Palette(palette => { palette.Value(20).Add(); })).Render() |

| Specifies the label text of the heat map color. | **Property:**

colorMappingCollection.label.text

@Html.EJ().HeatMap("heatmap",
 ViewData["HeatMapModel"] as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)

HeatMapProperties
 Heatmap = new HeatMapProperties(); List colorCollection = new List();
colorCollection.Add(new
 HeatMapColorMapping() { Label = new HeatMapLabel() { Text = "Moderate" }
 });
Heatmap.ColorMappingCollection = colorCollection; | **Property:**
 paletteSettings.palette.label

@Html.EJS().HeatMap("container").PaletteSettings(ps =>
 ps.Palette(palette => { palette.Label("no contributions").Add(); })).Render() |

| Specifies the style of the heat map color label. | **Property:** colorMappingCollection.label.bold

Property: colorMappingCollection.label.italic

@Html.EJ().HeatMap("heatmap",
 ViewData["HeatMapModel"] as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)

HeatMapProperties
 Heatmap = new HeatMapProperties();
List colorCollection = new List();
colorCollection.Add(new
 HeatMapColorMapping() { Label = new HeatMapLabel() { Bold = true }
 });
Heatmap.ColorMappingCollection = colorCollection; | **Property:**
 legendSettings.textStyle.fontStyle

@Html.EJS().HeatMap("container").LegendSettings(ls =>
 ls.TextStyle(ViewBag.textStyle)).Render()

ViewBag.textStyle new { fontStyle:'bold' }; |

| Specifies the font size of the heat map label. | **Property:**

colorMappingCollection.label.fontSize

@Html.EJ().HeatMap("heatmap",
 ViewData["HeatMapModel"] as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)

HeatMapProperties
 Heatmap = new HeatMapProperties(); List colorCollection = new List();
colorCollection.Add(new
 HeatMapColorMapping() { Label = new HeatMapLabel() { FontSize = 18 }
 });
Heatmap.ColorMappingCollection = colorCollection; | **Property:**
 legendSettings.textStyle.size

@Html.EJS().HeatMap("container").LegendSettings(ls =>
 ls.TextStyle(ViewBag.textStyle)).Render()

ViewBag.textStyle = new { size: 18 }; |

| Specifies the font family of the heat map label. | **Property:**

colorMappingCollection.label.fontFamily

@Html.EJ().HeatMap("heatmap",
 ViewData["HeatMapModel"] as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)

HeatMapProperties
 Heatmap = new HeatMapProperties(); List colorCollection = new List();
colorCollection.Add(new
 HeatMapColorMapping() { Label = new HeatMapLabel() { FontFamily = "Arial" }
 });
Heatmap.ColorMappingCollection = colorCollection; | **Property:**
 legendSettings.textStyle.fontFamily

@Html.EJS().HeatMap("container").LegendSettings(ls =>
 ls.TextStyle(ViewBag.textStyle)).Render()

ViewBag.textStyle = new { fontFamily: 'Arial' } |

| Specifies the font color of the heat map label. | **Property:**
`colorMappingCollection.label.fontColor`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties
 Heatmap = new HeatMapProperties();
 List colorCollection = new List();
 colorCollection.Add(new HeatMapColorMapping() { Label = new HeatMapLabel() { FontColor = "red" } });
 Heatmap.ColorMappingCollection = colorCollection; | **Property:**
`legendSettings.textStyle.fontFamily`
 @Html.EJS().HeatMap("container").LegendSettings(ls => ls.TextStyle(ViewBag.textStyle)).Render()
 ViewBag.textStyle = new { color: 'red' } |

| Specifies the mapping name of the column. | **Property:**
`itemsMapping.column.propertyName`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties
 Heatmap = new HeatMapProperties();
 TableMapping TableMapping = new TableMapping();
 TableMapping.ColumnMapping.Add(new HeaderMapping() { PropertyName = "Y2010" });
 Heatmap.ItemsMapping = TableMapping; | **Property:**
`dataSource.yDataMapping`
 @Html.EJS().HeatMap("container").DataSource(ViewBag.dataSource).Render()
 ViewBag.dataSource = new { data: heatmapData, yDataMapping: 'columnid' }; |

| Specifies the mapping name of the row. | **Property:**
`itemsMapping.row.propertyName`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties
 Heatmap = new HeatMapProperties();
 TableMapping TableMapping = new TableMapping();
 TableMapping.RowMapping.Add(new HeaderMapping() { PropertyName = "Y2010" });
 Heatmap.ItemsMapping = TableMapping; | **Property:**
`dataSource.xDataMapping`
 @Html.EJS().HeatMap("container").DataSource(ViewBag.dataSource).Render()
 ViewBag.dataSource = new { data: heatmapData, xDataMapping: 'rowid' }; |

| Specifies the mapping name of the row. | **Property:**
`itemsMapping.value.propertyName`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties
 Heatmap = new HeatMapProperties();
 TableMapping TableMapping = new TableMapping();
 TableMapping.ValueMapping.Add(new HeaderMapping() { PropertyName = "Y2010" });
 Heatmap.ItemsMapping = TableMapping; | **Property:**
`dataSource.valueMapping`
 @Html.EJS().HeatMap("container").DataSource(ViewBag.dataSource).Render()
 ViewBag.dataSource = new { data: heatmapData, valueMapping: 'value' }; |

Events

| Behaviour | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Triggered when the cell get clicked. | **Property:**
`cellSelected`
 @Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"]) as
 Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties
 Heatmap = new HeatMapProperties();
 Heatmap.CellSelected = function(args) {}; | **Property:**

```
cellClick<br><br>@Html.EJS().HeatMap("container").CellClick("cellClick").Render()<br><br>var cellClick  
= function (args) {};
```

In-place Editor

Getting Started with ASP.NET MVC In-place Editor Control

This section briefly explains about how to include [ASP.NET MVC In-place Editor](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>  
<add namespace="Syncfusion.EJ2"/>  
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>  
...
```

```
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/ _LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC In-place Editor control

Now, add the Syncfusion ASP.NET MVC In-place Editor control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().InPlaceEditor("element").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC In-place Editor control will be rendered in the default web browser.

Add the In-place Editor with Textbox

By default, the Syncfusion ASP.NET MVC TextBox control is rendered in In-place Editor with the [Type](#) property sets as Text.

CSHTML

```
<div style="margin:0 auto; width:300px;">

@Html.EJS().InPlaceEditor("element").Type(Syncfusion.EJ2.InPlaceEditor.Input
Type.Text).Value(ViewBag.value).Model(ViewBag.modalData).Render()
</div>
```

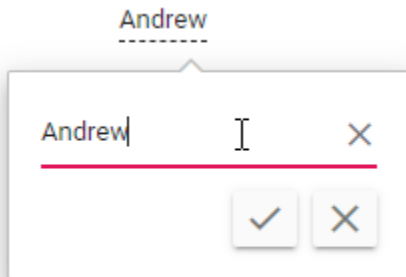

HOMECONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
```

```

    ViewBag.modalData = new { placeholder = "Enter employee name" };
    ViewBag.value = "Andrew";
    return View();
}

```

Configuring DropDownList

You can render the Syncfusion ASP.NET MVC DropDownList by changing the [Type](#) property as [DropDownList](#) and configure its properties and methods using the [Model](#) property.

In the following sample, [Type](#) and [Model](#) values are configured to render the [DropDownList](#) control.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor
<div style="margin:0 auto; width:300px;">

@Html.EJS().InPlaceEditor("element").Type(Syncfusion.EJ2.InPlaceEditor.Input
Type.DropDownList).Mode(RenderMode.Inline).Model(ViewBag.modalData).Render()
</div>

```

HOMECONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        string[] genderData = new string[] { "Male", "Female" };
        ViewBag.modalData = new { placeholder = "Select gender", dataSource
= genderData };
        return View();
    }
}

```

Integrate DatePicker

You can render the Essential JS2 DatePicker by changing the [Type](#) property as `Date` and also configure its properties and methods using the [Model](#) property.

In the following sample, `Type` and `Model` values are configured to render the `DatePicker` control.

CSHTML

```
<div style="margin:0 auto; width:300px;">

@Html.EJS().InPlaceEditor("element").Type(Syncfusion.EJ2.InPlaceEditor.Input
Type.Date).Value(ViewBag.dateValue).Model(ViewBag.modalData).Render()
</div>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.dateValue = new DateTime(2018, 12, 04);
        ViewBag.modalData = new { showTodayButton = true };
        return View();
    }
}
```

In the following sample, type and model values are configured to render the `TextBox`, `DropDownList` and `DatePicker` control.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor
<div id='container'>
    <div class="control-group">
        <div class="e-heading">
            <h3> Modify Basic Details </h3>
        </div>
        <table>
            <tr>
                <td>Name</td>
                <td class='left'>
```

```
@Html.EJS().InPlaceEditor("element").Type(Syncfusion.EJ2.InPlaceEditor.Input
```

```

Type.Text).Value(ViewBag.elementValue).Model(ViewBag.elementModel).Mode(RenderMode.Inline).Render()
        </td>
    </tr>
    <tr>
        <td>Date of Birth</td>
        <td class='left'>

@Html.EJS().InPlaceEditor("dateofbirth").Type(Syncfusion.EJ2.InPlaceEditor.InputType.Date).Value(ViewBag.dateValue).Model(ViewBag.dateModel).Mode(RenderMode.Inline).Render()
        </td>
    </tr>
    <tr>
        <td>Gender</td>
        <td class='left'>

@Html.EJS().InPlaceEditor("gender").Type(Syncfusion.EJ2.InPlaceEditor.InputType.DropDownList).Value(ViewBag.dropValue).Model(ViewBag.genderModel).Mode(RenderMode.Inline).Render()
        </td>
    </tr>
</table>
</div>
</div>
<style>
    #container .control-group {
        margin-top: 50px;
    }
    #container .control-group table {
        margin: auto;
    }
    #container .control-group table td {
        height: 70px;
        width: 150px;
    }
    #container .e-heading {
        text-align: center;
    }
    #container .control-group table td {
        text-align: left;
    }
</style>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.elementModel = new { placeholder = "Enter your name" };
        ViewBag.dateValue = new DateTime(2018, 12, 04);
        ViewBag.dateModel = new { showTodayButton = true, placeholder = "Select date of birth" };
        string[] genderData = new string[] { "Male", "Female" };
    }
}

```

```

        ViewBag.genderModel = new { placeholder = "Select gender",
        dataSource = genderData };
        ViewBag.elementValue = "Andrew";
        ViewBag.dropValue = "Male";
        return View();
    }
}

```

Modify Basic Details

Name	Andrew -----
Date of Birth	12/4/2018 -----
Gender	Male -----

Submitting data to the server (save)

You can submit editor value to the server by configuring the [Url](#), [Adaptor](#) and [PrimaryKey](#).

Property	Usage
Url	Gets the URL for server submit action.
Adaptor	Specifies the adaptor type that is used by DataManager to communicate with DataSource.
PrimaryKey	Defines the unique primary key of editable field which can be used for saving data in the data-base.

Note: The **PrimaryKey** property is mandatory. If it's not set, edited data are not sent to the server.

Refresh with modified value

The edited data is submitted to the server and you can see the new values getting reflected in the In-place Editor.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor
<div id='container'>
    <div className='control-group' style="text-align: center; width: 50%;
margin: 100px auto;">
        Best Employee of the year:

    @Html.EJS().InPlaceEditor("element").Type(Syncfusion.EJ2.InPlaceEditor.Input
Type.DropDownList).Value(ViewBag.textValue).Model(ViewBag.elementModel).Mode

```

```

(RenderMode.Inline).Name("Employee").Url(ViewBag.url).PrimaryKey("Employee")
.Adaptor(AdaptorType.UrlAdaptor).ActionSuccess("actionSuccess").Render()
</div>
<table style='margin:auto;width:50%'>
  <tr>
    <td style="text-align: left">
      Old Value :
    </td>
    <td id="oldValue" style="text-align: left"></td>
  </tr>
  <tr>
    <td style="text-align: left">
      New Value :
    </td>
    <td id="newValue" style="text-align: left">
      Andrew Fuller
    </td>
  </tr>
</table>
</div>
<style>
.e-inplaceeditor {
  min-width: 200px;
  text-align: left
}
#container .control-group {
  text-align: center;
  margin: 100px auto;
}
</style>
<script>
function actionSuccess(e) {
  var newEle = document.getElementById('newValue');
  var oldEle = document.getElementById('oldValue');
  oldEle.textContent = newEle.textContent;
  newEle.textContent = e.value;
}
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
  public ActionResult Index()
  {
    string[] frameWorkList = new string[] { "Andrew Fuller", "Janet
Leverling", "Laura Callahan", "Margaret Hamilt", "Michael Suyama", "Nancy
Davloio", "Robert King" };
    ViewBag.elementModel = new { dataSource = frameWorkList, placeholder
= "Select employee", popupHeight = "200px" };
    ViewBag.url = "https://ej2services.syncfusion.com/development/web-
services/api/Editor/UpdateData";
    ViewBag.textValue = "Andrew Fuller";
    return View();
  }
}

```

Best Employee of the year: Margaret Hamilt

Old Value : Andrew Fuller
New Value : Margaret Hamilt

Note: [View Sample in GitHub.](#)

- [Real time example using In-place Editor](#)
- [Types of rendering the editor](#)

List of controls

In-place Editor renders various controls based on the [Type](#) property and it have built-in and injectable controls. To use injectable controls, inject the required modules into `InPlaceEditor`. By default, the `type` property set to `Text` and render the `TextBox`.

The following table explains Injectable components module name and built-in components and their types.

Injectable Components Built in Components	
----- -----	
AutoComplete (AutoComplete)	TextBox (Text)
ComboBox (ComboBox)	DatePicker (Date)
MultiSelect (MultiSelect)	DateTimePicker (DateTime)
TimePicker (Time)	DropDownList (DropDownList)
DateRangePicker (DateRange)	MaskedTextBox (Mask)
Slider (Slider)	NumericTextBox (Numeric)
Rte (RTE)	
ColorPicker (Color)	

In the following sample, built-in and injectable based In-place Editor controls are rendered.

CSHTML

```

Slider 34

TimePicker 2:30 AM

Model configuration

Control properties and events can be customized using the In-place Editor [Model](#) property.

In the following code, the [Type](#) defined as the `Date` and `DatePicker` properties are configured through `Model` property to customize the `DatePicker` control at In-place Editor.

CSHTML

```
<div style="margin:0 auto; width:300px;">

@Html.EJS().InPlaceEditor("element").Type(Syncfusion.EJ2.InPlaceEditor.Input
Type.Date).Value(ViewBag.dateValue).Model(ViewBag.dateModelData).Render()
</div>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.dateValue = new DateTime(2018, 12, 04);
        ViewBag.dateModelData = new { showTodayButton = true, placeholder =
"Select date" };
        return View();
    }
}
```

- [Animate the editor during popup mode](#)

Configuration

Rendering modes

This section explains the supported rendering modes of the In-place Editor. Possible Rendering modes are as follows.

- Popup
- Inline

Note: By default, `Popup` mode will be rendered, when opening an editor.

- For `Popup` mode, editable container displays as like tooltip or popover above the element.
- For `Inline` mode, editable container displays as instead of the element. To render `Inline` mode while opening the editor, specify [Mode](#) as `Inline`.

In the following sample, the In-place Editor renders with `Inline` mode. You can dynamically switch into another mode by changing the drop-down item value.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">
        <tr>
            <td> Mode: </td>
            <td>

@Html.EJS().DropDownList("dropDown").Width("auto").DataSource(ViewBag.modeData).Value(ViewBag.value).Change("onChange").Placeholder("Select Mode").Render()
            </td>
        </tr>
        <tr>
            <td class="sample-td"> Enter your name: </td>
            <td class="sample-td">

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Value("Andrew").Model(ViewBag.modelData).Render()
            </td>
        </tr>
    </table>
</div>
<style>
    .table-section {
        margin: 0 auto;
    }
    tr td:first-child {
        text-align: right;
        padding-right: 20px;
    }
    .sample-td {
        padding-top: 10px;
        min-width: 230px;
        height: 100px;
    }
</style>
<script>
    function onChange(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        var mode = e.itemData.value;
        editObj.mode = mode;
        editObj.dataBind();
    }
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.modeData = new string[] { "Inline", "Popup" };
        ViewBag.value = "Inline";
        ViewBag.modalData = new { placeholder = "Enter some text" };
        return View();
    }
}

```

```
}

```

The output will be as follows.

Pop-up customization

In-place Editor popup mode can be customized by using the **Title** and **Model** properties in [PopupSettings](#) API.

Popup mode rendered by using the Syncfusion ASP.NET MVC Tooltip control, so you can use tooltip properties and events to customize the behavior of popup via the **Model** property of **PopupSettings** API.

Note: For more details, refer the tooltip documentation section.

In the following sample, popup **Title** and **Position** customized using the **PopupSettings** property. All possible tooltip position data configured in the drop-down, if we change drop down item, selected value bound to **Model** property and applied it to **Tooltip** control. **Tooltip** have following position options.

- TopLeft
- TopCenter
- TopRight
- BottomLeft
- BottomCenter
- BottomRight
- LeftTop
- LeftCenter
- LeftBottom
- RightTop
- RightCenter
- RightBottom

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">
        <tr>
            <td> Position: </td>
            <td>
                @Html.EJS().DropDownList("dropDown").DataSource(ViewBag.positionData).Value(
```

```

ViewBag.text).Change("onChange").Placeholder("Select a
position").PopupHeight("150px").Render()
    </td>
</tr>
<tr>
    <td class="edit-heading sample-td"> Enter your name: </td>
    <td class="sample-td">

@Html.EJS().InPlaceEditor("element").PopupSettings(e=>e.Title("Enter
name").Model(ViewBag.model)).Mode(RenderMode.Popup).Value(ViewBag.textValue)
.Model(ViewBag.modelData).Render()
    </td>
</tr>
</table>
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
    }
    .table-section {
        margin: 0 auto;
    }
    .sample-td {
        padding-top: 150px;
    }
    .edit-heading {
        padding-right: 20px;
    }
</style>
<script>
    function onChange(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        editObj.popupSettings.model.position = e.value;
        editObj.dataBind();
    }
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.positionData = new string[] { "TopLeft", "TopCenter",

Event actions for editing

The event action of the editor that enable in the edit mode based on the [EditableOn](#) property, by default **Click** is assigned, the following options are also supported.

- **Click**: The editor will be opened as single click actions.
- **DbClick**: The editor will be opened as double-click actions and it is not applicable for edit icon.
- **EditIconClick**: Disables the editing of event action of input and allows user to edit only through edit icon.

Note: In-place Editor get focus by pressing the **tab** key from previous focusable DOM element and then by pressing **enter** key, the editor will be opened.

In the following sample, when switching drop-down item, the selected value assigned to the **EditableOn** property. If you changed to **DbClick**, the editor will open when making a double click on the input.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">
        <tr>
            <td> EditableOn: </td>
            <td>
                @Html.EJS().DropDownList("dropDown").Width("auto").DataSource(ViewBag.editableOnData).Value(ViewBag.text).Change("onChange").Placeholder("Select edit type").Render()
            </td>
        </tr>
        <tr>
            <td class="sample-td"> Enter your name: </td>
            <td class="sample-td">
                @Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Value(ViewBag.textValue).Locale("fr-BE").Model(ViewBag.modelData).Render()
            </td>
        </tr>
    </table>
</div>
```

```

        </td>
    </tr>
</table>
</div>
<style>
    .table-section {
        margin: 0 auto;
    }
    tr td:first-child {
        text-align: right;
        padding-right: 20px;
    }
    .sample-td {
        padding-top: 10px;
        min-width: 230px;
        height: 100px;
    }
</style>
<script>
    function onChange(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        var editType = e.itemData.value;
        editObj.editableOn = editType;
        editObj.dataBind();
    }
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller

Action on focus out

Action to be performed when the user clicks outside the container, that means focusing out of editable content and it can be handled by the [ActionOnBlur](#) property, by default **Submit** assigned. It also has the following options.

- **Cancel:** Cancels the editing and resets the old content.
- **Submit:** Submits the edited content to the server.
- **Ignore:** No action is performed with this type and allows to edit multiple editors.

In the following sample, when switching drop-down item, the selected value assigned to the **ActionOnBlur** property.

CSHTML

```
<div id='container'>
  <table class="table-section">
    <tr>
      <td> ActionOnBlur: </td>
      <td>

@Html.EJS().DropDownList("dropDown").DataSource(ViewBag.blurActionData).Width("auto").Value(ViewBag.text).Change("onChange").Placeholder("Select blur action").Render()
      </td>
    </tr>
    <tr>
      <td class="sample-td"> Enter your name: </td>
      <td class="sample-td">

@Html.EJS().InPlaceEditor("element").Mode(Syncfusion.EJ2.InPlaceEditor.RenderMode.Inline).Value(ViewBag.textValue).Model(ViewBag.modelData).Render()
      </td>
    </tr>
  </table>
</div>
<style>
  .table-section {
    margin: 0 auto;
  }
  tr td:first-child {
    text-align: right;
    padding-right: 20px;
  }
  .sample-td {
    padding-top: 10px;
    min-width: 230px;
    height: 100px;
  }
</style>
<script>
  function onChange(e) {
    var editObj = document.getElementById('element').ej2_instances[0];
    let editType = e.itemData.value;
    editObj.actionOnBlur = editType;
    editObj.dataBind();
  }
</script>
```

```
}
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.blurActionData = new string[] { "Submit", "Cancel", "Ignore"
    };

        ViewBag.modelData = new { placeholder = "Enter some text" };
        ViewBag.text = "Submit";
        ViewBag.textValue = "Andrew";
        return View();
    }
}
```

The output will be as follows.

Buttons

The In-place Editor had an action for save and cancel using buttons. The [SaveButton](#) and [CancelButton](#) properties accept the `ButtonModel` objects for customizing the save and cancel button properties.

Buttons can be show or hide by sets a Boolean value to the [ShowButtons](#) property.

Note: Without buttons value will be processed via the following ways.

- **ActionOnBlur:** By clicking out side the editor control get focus out and do action based on this property value.
- **SubmitOnEnter:** Pressing `Enter` key it performs the submit action, if this property set to `true`.

In the following sample, the `content` and `cssClass` properties of `Button` value assigned to the `SaveButton` and `CancelButton` properties to customize its appearance. Also check or uncheck a checkbox buttons render or removed from the editor.

To restrict either save or cancel button rendering into a DOM, simply pass empty object `{}` in the `SaveButton` or `CancelButton` properties.

Note: For more details about buttons, refer this documentation section.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">

```

```

extValue).Model(ViewBag.modelData).SaveButton(ViewBag.saveButton).CancelButt
on(ViewBag.cancelButton).Render()
        </td>
    </tr>
</table>
</div>
<style>

    .table-section {
        margin: 0 auto;
    }
    tr td:first-child {
        text-align: right;
        padding-right: 20px;
    }
    .sample-td {
        padding-top: 10px;
        min-width: 230px;
        height: 100px;
    }
</style>
<script>
    function onChange(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        editObj.showButtons = e.checked;
        editObj.dataBind();
    }
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.modalData = new { placeholder = "Enter some text" };
        ViewBag.saveButton = new { content = "Ok", cssClass = "e-outline" };
        ViewBag.cancelButton = new { content = "Cancel", cssClass = "e-
outline" };
        ViewBag.textValue = "Andrew";
        return View();
    }
}

```

The output will be as follows.

Server actions

By passing In-place Editor control value to the server, the [PrimaryKey](#) property value must require, otherwise action not performed for remote data.

If the [Url](#) property value is empty, data passing will handled at local and also the [ActionSuccess](#) event will trigger with `null` as argument value.

Note: The following arguments are passed to the server when submit actions perform.

Arguments	Explanations
value	For processing edited value, like DB value updating.
primaryKey	For value mapping to the server, like selecting DB.
name	For field mapping to the server, like DB column field mapping.

Find the following sample server codes for defining models and controller functions to configure processing data.

```
`csharp
public class SubmitModel
{
    public string Name { get; set; }
    public string PrimaryKey { get; set; }
    public string Value { get; set; }
}
`

`csharp
public void UpdateData([FromBody]SubmitModel model)
{
    // User can process data here
}
```

- Server actions successfully done, the [ActionSuccess](#) event will be fired with returned server data.
- If the server is not responding, the [ActionFailure](#) event will be fired with data, but value not updated in the Editor.

In the following sample, the `ActionSuccess` event will trigger once the value submitted successfully into the server. In this sample, both `ActionSuccess` and `ActionFailure` were configured and resulted value will be converted to chips.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor
<div id='container'>
    <span class="content-title"> Select frameworks: </span>

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Type(Syncfusion
.EJ2.InPlaceEditor.InputType.MultiSelect).Value(ViewBag.value).Name("skill")
.Url(Url.Action("UpdateData",
"Home")).PrimaryKey("FrameWork").Adaptor(AdaptorType.WebApiAdaptor).Model(Vi
ewBag.model).ActionSuccess("actionSuccess").ActionFailure("actionFailure").C
reated("created").Render()
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
        align-items: center;
        height: 80px;
    }
    #element {
        width: 150px;
    }

Data Binding

The Syncfusion ASP.NET MVC controls load the data either from local data sources or remote data services using the `dataSource` property and it supports the data type of an array or `DataManager`. Also supports different kind of data services such as OData, OData V4, Web API, and data formats such as XML, JSON, JSONP with the help of `DataManager` adaptors.

Local

To bind local data to the Syncfusion ASP.NET MVC controls, you can assign a JavaScript array of object or string to the `dataSource` property. The local data source can also be provided as an instance of the `DataManager`.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <span class="content-title"> Select customer name: </span>

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Type(Syncfusion
.EJ2.InPlaceEditor.InputType.DropDownList).Value(ViewBag.value).Model(ViewBa
g.model).Render()
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
        align-items: center;
        height: 80px;
    }
    #element {
        width: 150px;
    }
    .content-title {
        font-weight: 500;
        margin-right: 20px;
        display: flex;
        align-items: center;
    }
</style>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    List<gameList> game = new List<gameList>();
    public ActionResult Index()
    {
        game.Add(new gameList { Id = "1", Name = "Maria Anders" });
        game.Add(new gameList { Id = "2", Name = "Ana Trujillo" });
        game.Add(new gameList { Id = "3", Name = "Antonio Moreno" });
        game.Add(new gameList { Id = "4", Name = "Thomas Hardy" });
        game.Add(new gameList { Id = "5", Name = "Chiristina Berglund" });
        game.Add(new gameList { Id = "6", Name = "Hanna Moos" });
        ViewBag.value = "Maria Anders";
        ViewBag.model = new { dataSource = game, fields = new { text =
"Name" }, Placeholder = "Select a customer" };
        return View();
    }
    public class gameList
    {
        public string Id { get; set; }
        public string Name { get; set; }
    }
}

```

The output will be as follows.

Select customer name: Maria Anders

Remote

To bind remote data to the Syncfusion ASP.NET MVC control, assign service data as an instance of **DataManager** to the **dataSource** property. To interact with remote data source, provide the endpoint URL.

OData V4

The OData V4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData V4 services. To fetch data from the server by using **DataManager** with the adaptor property configure as **ODataV4Adaptor**.

In the following sample, In-place Editor renders a **DropDownList** control and its **dataSource** property configured for fetching a data from the server by using **ODataV4Adaptor** with **DataManager**.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <span class="content-title"> Select customer name: </span>

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Type(Syncfusion
.EJ2.InPlaceEditor.InputType.DropDownList).Value(ViewBag.value).Model(ViewBa
g.model).Created("created").Render()
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
        align-items: center;
        height: 80px;
    }

    #element {
        width: 150px;
    }

    .content-title {
        font-weight: 500;
        margin-right: 20px;
        display: flex;
        align-items: center;
    }
</style>
<script>
    function created() {
        var editObj = document.getElementById('element').ej2_instances[0];
        editObj.model.dataSource = new ej.data.DataManager({
            url: "https://services.odata.org/V4/Northwind/Northwind.svc/",
            adaptor: new ej.data.ODataV4Adaptor,
            crossDomain: true
        });
    };
</script>
```

```

        editObj.model.query = new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6);
    }
</script>

```

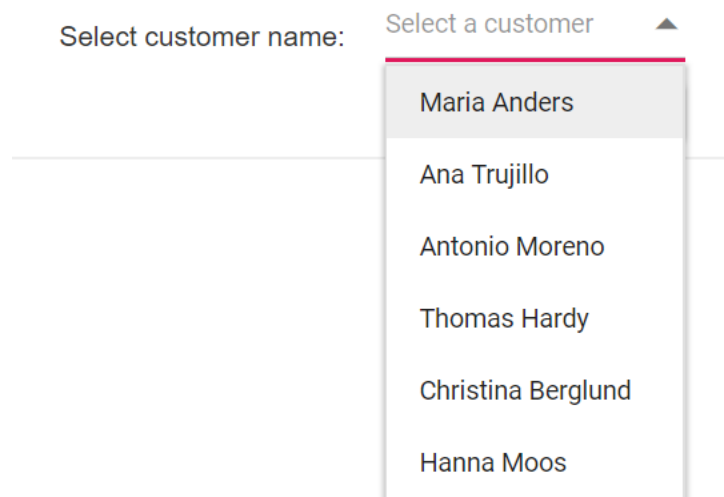

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.model = new
        {
            placeholder = "Select a customer",
            fields = new { text = "ContactName", value = "CustomerID" }
        };
        ViewBag.value = "Maria Anders";
        return View();
    }
}

```

The output will be as follows.

Web API

Data can fetch from the server by using **DataManager** with the adaptor property configure as **WebApiAdaptor**.

In the following sample, In-place Editor render a **DropDownList** control and its **dataSource** property configured for fetching a data from the server by using **WebApiAdaptor** with **DataManager**.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <span class="content-title"> Select customer name: </span>

```

```

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Type(Syncfusion
.EJ2.InPlaceEditor.InputType.DropDownList).Value(ViewBag.value).Model(ViewBa
g.model).Render()
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
        align-items: center;
        height: 80px;
    }
    #element {
        width: 150px;
    }
    .content-title {
        font-weight: 500;
        margin-right: 20px;
        display: flex;
        align-items: center;
    }
</style>
<script>
    new ej.data.DataManager({
        url:
'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Customers/',
        adaptor: new ej.data.WebApiAdaptor
    }).executeQuery(new ej.data.Query().take(8)).then((e) => {
        var editObj = document.getElementById('element').ej2_instances[0];
        editObj.model.dataSource = e.result.d;
    });
</script>

```

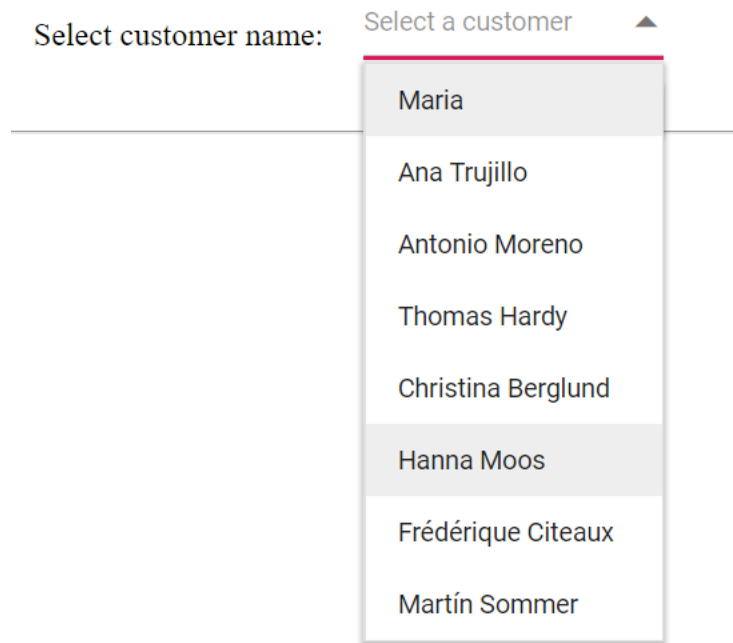

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.model = new { placeholder = "Select a customer", fields =
new { text = "ContactName", value = "CustomerID" } };
        ViewBag.value = "Maria Anders";
        return View();
    }
}

```

The output will be as follows.

Integrate HTML5 controls (Template)

The In-place Editor supports adding HTML5 input controls using the [Template](#) property. The **Template** property can be given as either a **string** or a **query selector**.

As a string

The HTML element tag can be given as a string for the [Template](#) property. Here, the input is rendered as an HTML template.

```
`typescript
```

```
template: "<div><input type='text' id='name'></input></div>"
```

```
,
```

As a selector

The [Template](#) property also allows getting template content through query **selector**. Here, the input wrapper element 'ID' attribute is specified in the template.

```
`typescript
```

```
template: "#date"
```

```
,
```

Template mode, the [Value](#) property not handled by the In-place Editor control. So, before sending a value to the server, you need to modify at [ActionBegin](#) event, otherwise, an empty string will pass. In the following template sample, before submitting a data to the server, event argument and **Value** property content updated in the **ActionBegin** event handler.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <span class="content-title"> Select date: </span>
```

```

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Template("#date")
.Value(ViewBag.dateValue).ActionBegin("actionBegin").Render()
</div>
<div id="html-template" style="display: none">
    <input id="date" value="2018-05-23" type="date">
</div>

<style>
    #container {
        display: flex;
        justify-content: center;
    }
    #element {
        width: 150px;
    }
    .content-title {
        font-weight: 500;
        margin-right: 20px;
        display: flex;
        align-items: center;
    }
</style>
<script>
    function actionBegin(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        var value = editObj.element.querySelector('#date').value;
        editObj.value = value;
        e.value = value;
    }
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.dateValue = "2018-05-23";
        return View();
    }
}

```

The output will be as follows.

Select date: 2018-05-23

Validation

In-place Editor control supports validation and it can be achieved by adding rules to the [ValidationRules](#) property, its child property **key** must be same as **name** property, otherwise validation not performed. Submitting data to the server or calling the **validate** method validation executed.

Note: In-place editor is not a form component and it does not support `ejs-for` because the component has embedded into many other components like calendar, textboxes, etc.

Validation Rules

In-place Editor has following validation rules, which are used to perform validation.

Rules	Description	Example
----- ----- -----		
required	The input element must have any input values	a or 1 or -
email	The input element must have valid email format values	<inplace@syncfusion.com>
url	The input element must have valid url format values	http://syncfusion.com/
date	The input element must have valid date format values	12/25/2019
dateIso	The input element must have valid dateIso format values	2019-12-25
number	The input element must have valid number format values	1.0 or 1
maxLength	Input value must have less than or equal to maxLength character length	if maxLength : 5, [check] is valid and [checking] is invalid
minLength	Input value must have less than or equal to minLength character length	if minLength : 5, [testing] is valid and [test] is invalid
rangeLength	Input value must have value between rangeLength character length	if rangeLength : [4,5], [test] is valid and [key] is invalid
range	Input value must have value between range number	if range : [4,5], [4] is valid and [6] is invalid
max	Input value must have less than or equal to max number	if max : 3, [3] is valid and [4] is invalid
min	Input value must have less than or equal to min number	if min : 4, [5] is valid and [2] is invalid

CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the In-place Editor text

Use the following CSS to customize the default In-place Editor's text content properties like font-family, font-size, color and border bottom.

```
`CSS
/ To change color, font family and font size /
.e-inplaceeditor .e-editable-value-wrapper .e-editable-value {
border-bottom: 2px dotted green;
color: red;
font-size: 12px;
```

font-family: Segoe UI

}

,

Customizing the In-place Editor action buttons

Use the following CSS to customize the default In-place Editor's action buttons.

`CSS

/ To change icon color for save button /

```
.e-inplaceeditor .e-editable-action-buttons .e-btn-save.e-icon-btn .e-btn-icon.e-icons,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-save.e-icon-btn .e-btn-icon.e-icons{
color: green;
}
```

/ To change icon color for cancel button /

```
.e-inplaceeditor .e-editable-action-buttons .e-btn-cancel.e-icon-btn .e-btn-icon.e-icons, .e-
inplaceeditor-tip .e-editable-action-buttons .e-btn-cancel.e-icon-btn .e-btn-icon.e-icons {
color: red;
}
```

/ To change background color for save button /

```
.e-inplaceeditor .e-editable-action-buttons .e-btn-save.e-icon-btn,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-save.e-icon-btn {
background-color: antiquewhite;
}
```

/ To change background color for cancel button /

```
.e-inplaceeditor .e-editable-action-buttons .e-btn-cancel.e-icon-btn,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-cancel.e-icon-btn {
background-color: antiquewhite;
}
```

,

Globalization

Localization

Localization library allows you to localize the default text content of the In-place Editor to different cultures using the [Locale](#) property. In-place Editor following keys will be localize based on culture.

| Locale key | en-US (default) |

|-----|-----|

| save | Close |

| cancel | Cancel |

| loadingText | Loading... |

| editIcon | Click to edit |

| editAreaClick | Click to edit |

| editAreaDoubleClick | Double click to edit |

To load translation object in an application use `load` function of `L10n` class. In the following sample, `French` culture is set to In-place Editor and change the tooltip text.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">
        <tr>
            <td> EditableOn: </td>
            <td>
                @Html.EJS().DropDownList("dropDown").Width("auto").DataSource(ViewBag.editableOnData).Value(ViewBag.value).Change("onChange").Placeholder("Select edit type").Render()
            </td>
        </tr>
        <tr>
            <td class="sample-td"> Enter your name: </td>
            <td class="sample-td">
                @Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Value(ViewBag.inplaceValue).Locale("fr-BE").Model(ViewBag.model).Render()
            </td>
        </tr>
    </table>
</div>
<style>
    .table-section {
        margin: 0 auto;
    }
    tr td:first-child {
        text-align: right;
        padding-right: 20px;
    }
    .sample-td {
        padding-top: 10px;
        min-width: 230px;
        height: 100px;
    }
</style>
<script>
    ej.base.L10n.load({
        'fr-BE': {
            'inplace-editor': {
                'save': 'enregistrer',
                'cancel': 'Annuler',
                'loadingText': 'Chargement...',
            }
        }
    });
</script>
```

```

        'editIcon': 'Cliquez pour éditer',
        'editAreaClick': 'Cliquez pour éditer',
        'editAreaDoubleClick': 'Double-cliquez pour éditer'
    }
}
});
function onChange(e) {
    var editObj = document.getElementById('element').ej2_instances[0];
    var editType = e.itemData.value;
    editObj.editableOn = editType;
    editObj.dataBind();
}
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.model = new { placeholder = "Enter some text" };
        ViewBag.editableOnData = new string[] { "Click", "DbClick",
        "EditIconClick" };
        ViewBag.value = "Click";
        ViewBag.inplaceValue = "Andrew";
        return View();
    }
}

```

The output will be as follows.

EditableOn: Click ▼

Enter your name: Andrew 

Cliquez pour éditer

Right to left

Specifies the direction of the In-place Editor control using the [EnableRtl](#) property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

Note: It will not change based on the locale property.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <span class="content-title"> Enter your name: </span>

```

```
@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Value(ViewBag.v
alue).EnableRtl(true).Render()
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
        align-items: center;
        height: 80px;
    }
    #element {
        width: 150px;
    }
    .content-title {
        font-weight: 500;
        margin-right: 20px;
        display: flex;
        align-items: center;
    }
</style>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.value = "Andrew";
        return View();
    }
}
```

The output will be as follows.

Enter your name:

Format

Formatting is a way of representing the value in different format. You can format the following mentioned controls with its `format` property, when it passed through the In-place Editor [Model](#) property.

- DatePicker
- DateRangePicker
- DateTimePicker
- NumericTextBox
- Slider
- TimePicker

CSHTML

```

<div id='container'>
    <span class="content-title"> Select date: </span>

@Html.EJS().InPlaceEditor("element").Type(Syncfusion.EJ2.InPlaceEditor.Input
Type.Date).Value(ViewBag.value).Model(ViewBag.model).Render()
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
    }
    .content-title {
        font-weight: 500;
        margin-right: 20px;
        display: flex;
        align-items: center;
    }
</style>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.value = new DateTime(2018, 11, 23);
        ViewBag.model = new { placeholder = "Select date", format = "yyyy-
MM-dd" };
        return View();
    }
}

```

The output will be as follows.

Select date: 11/23/2018

**How To****Dynamically move input to edit mode**

At control initial load, if you want to open editor state without interacting In-place Editor input element, it can be achieved by configuring the [EnableEditMode](#) property to `true`.

In the following sample, editor opened at initial load and when toggling a checkbox, it will remove or open the editor.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">
        <tr>
            <td> Disabled: </td>
            <td>
                @Html.EJS().CheckBox("enable").Change("onChange").Label("Disable").Checked(false).Render()
            </td>
        </tr>
        <tr>
            <td class="sample-td"> Enter your name: </td>
            <td class="sample-td">
                @Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Value(ViewBag.value).Model(ViewBag.model).Render()
            </td>
        </tr>
    </table>
</div>
<style>
    .table-section {
        margin: 0 auto;
    }
    tr td:first-child {
        text-align: right;
        padding-right: 20px;
    }
    .sample-td {
        padding-top: 10px;
        min-width: 230px;
        height: 100px;
    }
</style>
<script>
    function onChange(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        editObj.disabled = e.checked;
        editObj.dataBind();
    }
</script>

```

CONTROLLER.CS

```

Enter your name: ✕

✓ ✕

Disable the edit mode specifically

The edit mode of In-place Editor can be disabled by setting the [Disabled](#) property value to `true`. In the following sample, when check or uncheck the checkbox, In-place Editor control will disable or enable the edit mode.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">
        <tr>
            <td> Disabled: </td>
            <td>

@Html.EJS().CheckBox("enable").Change("onChange").Label("Disable").Checked(false).Render()

            </td>
        </tr>
        <tr>
            <td class="sample-td"> Enter your name: </td>
            <td class="sample-td">

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Value(ViewBag.value).Model(ViewBag.model).Render()

            </td>
        </tr>
    </table>
</div>
<style>

#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.table-section {
    margin: 0 auto;
}
tr td:first-child {
    text-align: right;
```

```

padding-right: 20px;
}
.sample-td {
padding-top: 10px;
min-width: 230px;
height: 100px;
}
</style>
<script>
function onChange(e) {
    var editObj = document.getElementById('element').ej2_instances[0];
    editObj.disabled = e.checked;
    editObj.dataBind();
}
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.model = new { placeholder = "Enter some text" };
        ViewBag.value = "Andrew";
        return View();
    }
}

```

The output will be as follows.

Disabled: ☒ Disable

Add custom indication to unsaved value

You can add custom indication to unsaved input value by using the [ActionSuccess](#) event, when data not submitted to the server.

In this sample, the `ActionSuccess` event configured and the `Url` property not included. Then submit button clicked, the current editor value saved into input and data sending to server action prevented due to the `Url` property not configured.

But `ActionSuccess` event will trigger the handler function with `null` argument values. In handler function data property `PrimaryKey` value checked, whether it empty or not. If it is empty custom class, added in the `e-value-wrapper` element to customize its styles.

Note: To send input value to local, set the `Url` property as empty.

CSHTML

```

@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <span class="content-title"> Enter your name: </span>
    <div id='element'></div>

@Html.EJS().InPlaceEditor("element").Mode(RenderMode.Inline).Value(ViewBag.v
alue).Model(ViewBag.model).ActionSuccess("actionSuccess").Render()
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
        align-items: center;
        height: 80px;
    }
    #element {
        width: 150px;
    }
    .content-title {
        font-weight: 500;
        margin-right: 20px;
        display: flex;
        align-items: center;
    }
    .e-inplaceeditor .e-editable-value-wrapper .e-editable-value.e-send-
error {
        color: red;
    }
</style>
<script>
    function actionSuccess(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        var pk = e.data['PrimaryKey'];
        if (ej.base.isNullOrUndefined(pk) || pk === '') {
            document.querySelector('.e-editable-value').classList.add('e-
send-error');
        }
    }
</script>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.model = new { placeholder = "Enter some text" };
        ViewBag.value = "Andrew";
        return View();
    }
}

```

The output will be as follows.

Enter your name: Andrew

Set custom animation for popup mode

In popup mode, the In-place Editor rendered with the Syncfusion ASP.NET MVC **Tooltip** control. You can use tooltip properties and events to customize the popup by configure properties into the [Model](#) property inside the [PopupSettings](#) API.

In the following sample, popup animation can be customized by passing animation effect using the **Model** property and the dynamic animation effect changes configured from the Syncfusion ASP.NET MVC **DropDownList** control **change** event.

CSHTML

```
@using Syncfusion.EJ2.InPlaceEditor;
<div id='container'>
    <table class="table-section">
        <tr>
            <td> Open Animation: </td>
            <td>
                @Html.EJS().DropDownList("openDropDown").DataSource(ViewBag.openAnimateData)
                .Value(ViewBag.textValue).Change("onChange").Placeholder("Select a animate
                type").PopupHeight("150px").Render()
            </td>
        </tr>
        <tr>
            <td class="sample-td"> Enter your name: </td>
            <td class="sample-td">
                @Html.EJS().InPlaceEditor("element").Mode(RenderMode.Popup).Value(ViewBag.va
                lue).PopupSettings(ViewBag.popupSettings).Model(ViewBag.model).Render()
            </td>
        </tr>
    </table>
</div>
<style>
    #container {
        display: flex;
        justify-content: center;
    }
    .table-section {
        margin: 0 auto;
    }
    tr td:first-child {
        text-align: right;
        padding-right: 20px;
    }
    .sample-td {
        padding-top: 10px;
        min-width: 230px;
        height: 100px;
    }
</style>
```

```
<script>
    function onChange(e) {
        var editObj = document.getElementById('element').ej2_instances[0];
        editObj.popupSettings.model.animation.open.effect = e.value;
        editObj.dataBind();
    }
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.model = new { placeholder = "Enter some text" };
        ViewBag.openAnimateData = new string[] { "None", "FadeIn",
        "FadeZoomIn", "ZoomIn" };
        ViewBag.textValue = "ZoomIn";
        ViewBag.value = "Andrew";
        ViewBag.popupSettings = new
        Syncfusion.EJ2.InPlaceEditor.InPlaceEditorPopupSettings { Model = new {
        animation = new { open = new { effect = "ZoomIn", duration = 1000, delay = 0
        } } } };
        return View();
    }
}
```

The output will be as follows.

Open Animation:

Enter your name:

Image Editor

End User Capabilities in the ASP.NET MVC Image Editor control

The following operations are available for end-users and the same is explained briefly in these sections.

Open an image

To open an image in the image editor, do the following steps.

- Click the Open icon from the left side of the toolbar.
- The file explorer lists only JPEG, PNG, JPG format files.
- Select the image from the list of the images from the file explorer window.

Zooming

Image zooming can be performed in the following ways.

- Using toolbar
- Using pinch zoom in touch enabled devices
- Using mouse wheel
- Using keyboard

Using toolbar

To zoom in or out the image in the image editor, do the following steps.

- The Zoom In/ Out option only enabled after opening the image.

Using pinch

To zoom in or out the image in the image editor, do the following steps.

- Touch with two fingers to perform zooming.
- Zoom in and out controlled by touch gestures.

Using Mouse wheel

To zoom in or out the image in the image editor, do the following steps.

- Press the ctrl key and scroll the mouse wheel to perform zooming.

- The zoom in and out controlled by the mouse wheel.

Using keyboard

To zoom in or out the image in the image editor, do the following steps.

- Press the ctrl key with '+' button from the keyboard to zoom in an image.
- Press the ctrl key with '-' button from the keyboard to zoom out an image.

Panning

To pan an image in the image editor, do the following steps.

- Click on the image and do dragging to move or pan the image.
- Panning option will be enabled in the following two cases.
- If the selection is applied for cropping an image.
- If the image size exceeds the canvas size while zooming an image.

Cropping and image transformation

To crop an image in the image editor, do the following steps.

- Cropping can be performed based on the selection in an image editor.
- To perform selection, click the crop button in the toolbar which opens the contextual toolbar that shows crop selection options, rotate options, and flip options.
- Click the crop selection button and select the type of selection such as custom, circle, square, and ratio selection from the popup.
- Once selection is completed, do panning to move the image to get the cropped region.
- Utilize the rotate or flip buttons to execute the image transformation, including any inserted annotations.
- Once the cropping region is finalized in the image click the tick icon at the top right of the toolbar to crop the image.

Annotations

To add annotations to an image in the image editor, do the following steps.

- To add annotation, click the annotation button in the toolbar and select the type of annotations such as Line, Rectangle, Ellipse, Path, Arrow, Text, or Freehand drawing to be inserted to the image editor.
- Once the annotation is added to the image, that can be repositioned by clicking and dragging the annotations using mouse as well as resized by clicking and resizing the selection circle to be placed around the annotations.
- To rotate annotations, you can simply grab the circle located at the bottom of the annotation. The rotation can be applicable to all the annotations except text annotation.
- Customize the annotations by changing their color, stroke width, font family, and font size through the contextual toolbar. The contextual toolbar will be enabled whenever the annotations are selected.
- When annotations are selected in the Image Editor, the quick access toolbar becomes active, providing convenient access to various actions such as duplicating, deleting, or editing text associated with the selected annotation. This toolbar enables users to perform these common operations quickly and efficiently, streamlining their workflow and enhancing the overall editing experience.

Filtering and fine-tune

To perform fine-tuning on an image in the image editor, do the following steps.

- Click the fine-tune button which displays the list of fine-tuning available in the image editor.
- Click one of the fine-tune options from the list of options which shows a slider to adjust the corresponding filter.
- Click on the canvas or tick icon at the right corner of the toolbar in the image editor to apply the modifications.

To apply filters on an image in the image editor, do the following steps.

- Click the filter button which displays the list of filters available in the image editor.
- Click the filter from list of options to apply the corresponding filter to an image.
- Click on the canvas or tick icon at the right corner of the toolbar in the image editor to apply the modifications.

The Filters and Fine-tunes feature are not accessible within Safari due to compatibility limitations.

Undo and redo the operations

To undo and redo the actions performed in an image editor, do the following steps.

- The undo button will be enabled once the action is performed in an image editor.
- The redo button will be enabled once the undo action is performed in an image editor.
- Click the undo or redo button at the left side of the toolbar to perform undo and redo operation.
- Ctrl + Z and Ctrl + Y facilitates this process by allowing users to undo and redo actions, respectively.

Reset an image

To revert all the changes done in an image editor, do the following steps.

- Click the reset button which is located on the right side of the toolbar.
- This will revert all the changes performed in the image editor.

Export an image

To save the modified image in an image editor, do the following steps.

- Click the save button which is located on the right side of the toolbar.
- Ctrl + S facilitates this process by providing users with the ability to save the image.
- Select the type of file to be saved from the popup to save with current modification done in an image.

Getting Started with ASP.NET MVC Image Editor Control

This section briefly explains about how to include [ASP.NET MVC Image Editor](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in nuget.org. Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Image Editor control

Now, add the Syncfusion ASP.NET MVC Image Editor control in **~/Views/Home/Index.cshtml** page.

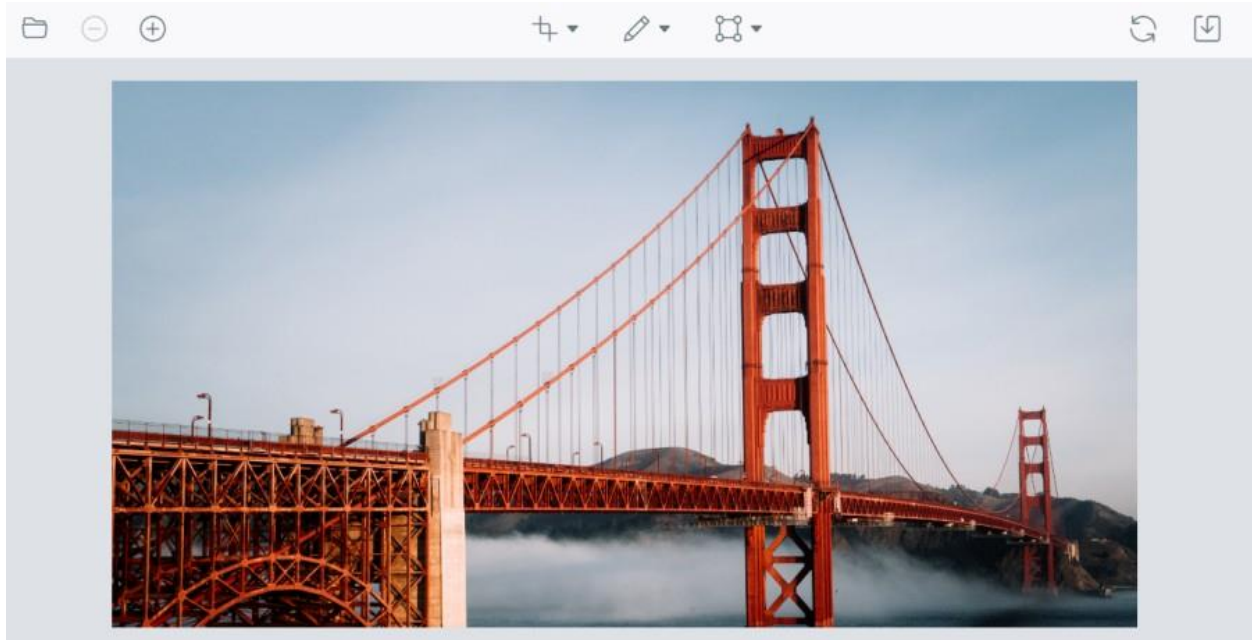

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Render()
```

```
</div>
<style>
    .image-editor {
        margin: 0 auto;
    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {
            height: 75vh;
            width: 100%;
        }
    }
    .control-wrapper {
        height: 100%;
    }
</style>
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Image Editor control will be rendered in the default web browser.

Open and Save in the ASP.NET MVC Image Editor control

To import an image into the canvas, it must first be converted into a blob object. The Uploader component can be used to facilitate the process of uploading an image from the user interface. Once the image has been uploaded, it can then be converted into a blob and drawn onto the canvas.

To save an edited image in the Image Editor control, use the `toBlob` method to convert it to a blob object. This will save the image with any annotations or filters that have been applied during the editing process. The saved image can be stored as raw image data or as an image file.

Open

The **open** method in the Image Editor control offers the capability to open an image by providing it in different formats. This method accepts various types of arguments, such as a base64-encoded string, raw image data, or a hosted/online URL. You can pass either the file name or the actual image data as an argument to the **open** method, and it will load the specified image into the Image Editor control. This flexibility allows you to work with images from different sources and formats, making it easier to integrate and manipulate images within the Image Editor control.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {
            height: 75vh;
            width: 100%;
        }
    }
    .control-wrapper {
        height: 100%;
    }
</style>
```

DEFAULT.CS

```
public ActionResult Default()
{
    return View();
}
```

Output be like the below.

Supported image formats

The Image Editor control supports three common image formats: PNG, JPEG, and SVG. These formats allow you to work with a wide range of image files within the Image Editor.

When it comes to saving the edited image, the default file type is set as PNG. This means that when you save the edited image without specifying a different file type, it will be saved as a PNG file. However, it's important to note that the Image Editor typically provides options or methods to specify a different file type if desired. This allows you to save the edited image in formats other than the default PNG, such as JPEG or SVG, based on your specific requirements or preferences.

Save as image

The `export` method in the Image Editor control enables you to save the modified image as a file on the local device. This method accepts two parameters: the file name and the file type.

By providing a file name, you can specify the desired name for the saved image file. Additionally, you can also specify the file type to determine the format in which the image should be saved. This allows you to save the image according to your specific requirements or preferences, such as PNG, JPEG, or SVG.

By utilizing the `export` method with the appropriate file name and file type, you can conveniently save the modified image as a file on the local device, ensuring that it is easily accessible and shareable.

In the following example, the `export` method is used in the button click event.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("btnClick").CssClass("e-
primary").Content("Click").Click("clickHandler").Render()
<script>
    function created() {
```

```
var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
    if (ej.base.Browser.isDevice) {
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
    } else {
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
    }
}
function clickHandler() {
    var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
    imageEditorObj.export("PNG", "Syncfusion"); // File type, file name
}
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {
            height: 75vh;
            width: 100%;
        }
    }
    .control-wrapper {
        height: 100%;
    }
</style>
```

DEFAULT.CS

```
public ActionResult Default()
{
    List<object> items = new List<object>();
    items.Add(new
    {
        text = "Png"
    });
    items.Add(new
    {
        text = "Jpeg"
    });
    items.Add(new
    {
        text = "Svg"
    });
    ViewBag.datasource = items;
    return View();
}
```

```
}
```

Output be like the below.

File opened event

The **FileOpened** event is triggered in the Image Editor control after an image is successfully loaded. It provides the **FileOpenEventArgs** as the event argument, which contains two specific arguments:

- **FileName**: This argument is a string that contains the file name of the opened image. It represents the name of the file that was selected or provided when loading the image into the Image Editor.
- **FileType**: This argument is a string that contains the type of the opened image. It specifies the format or file type of the image that was loaded, such as PNG, JPEG, or SVG.

By accessing these arguments within the **FileOpened** event handler, you can retrieve information about the loaded image, such as its file name and file type. This can be useful for performing additional actions or implementing logic based on the specific image that was opened in the Image Editor control.

Saving event

The **saving** event is triggered in the Image Editor control when an image is being saved to the local disk. It provides the **SaveEventArgs** as the event argument, which includes the following specific arguments:

- **FileName**: This argument is a string that holds the file name of the saved image. It represents the name of the file that will be used when saving the image to the local disk.
- **FileType**: This argument is a string indicating the type or format of the saved image. It specifies the desired file type in which the image will be saved, such as PNG, JPEG, or SVG.
- **Cancel**: This argument is a boolean value that can be set to true in order to cancel the saving action. By default, it is set to false, allowing the saving process to proceed. However, if you want to prevent the saving action from occurring, you can set **Cancel** to true within the event handler.

By accessing these arguments within the Saving event handler, you can retrieve information about the file name and file type of the image being saved. Additionally, you have the option to cancel the saving action if necessary.

Created event

The `created` event is triggered once the Image Editor control is created. This event serves as a notification that the component has been fully initialized and is ready to be used. It provides a convenient opportunity to render the Image Editor with a predefined set of initial settings, including the image, annotations, and transformations.

Destroyed event

The `destroyed` event is triggered once the Image Editor control is destroyed or removed from the application. This event serves as a notification that the component and its associated resources have been successfully cleaned up and are no longer active.

Reset an image

The `reset` method in the Image Editor control provides the capability to undo all the changes made to an image and revert it back to its original state. This method is particularly useful when multiple adjustments, annotations, or transformations have been applied to an image and you want to start over with the original, unmodified version of the image.

By invoking the `reset` method, any modifications or edits made to the image will be undone, and the image will be restored to its initial state. This allows you to easily discard any changes and begin again with the fresh, unaltered image.

Selection cropping in the ASP.NET MVC Image Editor control

The cropping feature in the Image Editor allows you to select and crop specific regions of an image. It offers different selection options, including custom shapes, squares, circles, and various aspect ratios such as 2:3, 3:2, 3:4, 4:3, 4:5, 5:4, 5:7, 7:5, 9:16, and 16:9.

To perform a selection, you can use the `select` method, which allows you to define the desired selection area within the image. Once the selection is made, you can then use the `crop` method to crop the image based on the selected region. This enables you to extract and focus on specific parts of the image while discarding the rest.

Insert custom / square / circle region

The `select` method allows to perform selection based on the type of selection. Here, the `select` method is used to perform the selection as custom, circle, or square. The selection region can also be customized using the `select` method based on the parameters below.

- `type` - Specify the type of selection
- `startX` - Specify the x-coordinate of the selection region's starting point
- `startY` - Specify the y-coordinate of the selection region's starting point
- `width` - Specify the width of the selection region
- `height` - Specify the height of the selection region

Here is an example of square selection using the `select` method.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
```

```

    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("customClick").CssClass("e-
primary").Content("Custom").Click("customClick").Render()
@Html.EJS().Button("squareClick").CssClass("e-
primary").Content("Square").Click("squareClick").Render()
@Html.EJS().Button("circleClick").CssClass("e-
primary").Content("Circle").Click("circleClick").Render()
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function customClick() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        imageEditorObj.select("Custom");
    }
    function squareClick() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        imageEditorObj.select("Square");
    }
    function circleClick() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        imageEditorObj.select("Circle");
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {

}
```

Output be like the below.

Click

Cropping event

The **cropping** event is triggered when performing cropping on the image. This event is passed an object that contains information about the cropping event, such as the start and end point of the selection region. And this event uses **CropEventArgs** to handle the cropping action in the image.

The parameter available in the **cropping** event is,

CroppingEventArgs.startPoint – The x and y coordinates of a start point as **ImageEditorPoint** of the selection region.

CroppingEventArgs endPoint - The x and y coordinates of an end point as ImageEditorPoint of the selection region.

CroppingEventArgs cancel - To cancel the cropping action.

Annotation in the ASP.NET MVC Image Editor control

The Image Editor allows adding annotations to the image, including text, freehand drawings, and shapes like rectangles, ellipses, arrows, paths, and lines. This gives the flexibility to mark up the image with notes, sketches, and other visual elements as needed. These annotation tools can help to communicate and share ideas more effectively.

Text annotation

The text annotation feature in the Image Editor provides the capability to add and customize labels, captions, and other text elements directly onto the image. With this feature, you can easily insert text at specific locations within the image and customize various aspects of the text to meet your requirements.

You have control over the customization options including text content, font family, font style and font size for the text annotation.

Add a text

The `drawText` method in the Image Editor allows you to insert a text annotation into the image with specific customization options. This method accepts the following parameters:

- `x`: Specifies the x-coordinate of the text, determining its horizontal position within the image.
- `y`: Specifies the y-coordinate of the text, determining its vertical position within the image.
- `text`: Specifies the actual text content to be added to the image.
- `fontFamily`: Specifies the font family of the text, allowing you to choose a specific typeface or style for the text.
- `fontSize`: Specifies the font size of the text, determining its relative size within the image.
- `bold`: Specifies whether the text should be displayed in bold style. Set to true for bold text, and false for regular text.
- `italic`: Specifies whether the text should be displayed in italic style. Set to true for italic text, and false for regular text.
- `color`: Specifies the font color of the text, allowing you to define the desired color using appropriate color values or names.

By utilizing the DrawText method with these parameters, you can precisely position and customize text annotations within the image. This provides the flexibility to add labels, captions, or other text elements with specific font styles, sizes, and colors, enhancing the visual presentation and clarity of the image.

Here is an example of adding a text in a button click using `drawText` method.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("btnClick").CssClass("e-
primary").Content("Click").Click("clickHandler").Render()
<script>
    function created() {
```

```
var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
    if (ej.base.Browser.isDevice) {
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
    } else {
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
    }
    function clickHandler() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        imageEditorObj.drawText(500, 500, 'Syncfusion', 'Arial', 100, true,
true, '#000');
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {

```

Output be like the below.

Multiline text

The `drawText` method in the Image Editor control is commonly used to insert text annotations into an image. If the provided text parameter contains a newline character (`\n`), the text will be automatically split into multiple lines, with each line appearing on a separate line in the annotation.

Here is an example of adding a multiline text in a button click using `drawText` method.

CSHTML

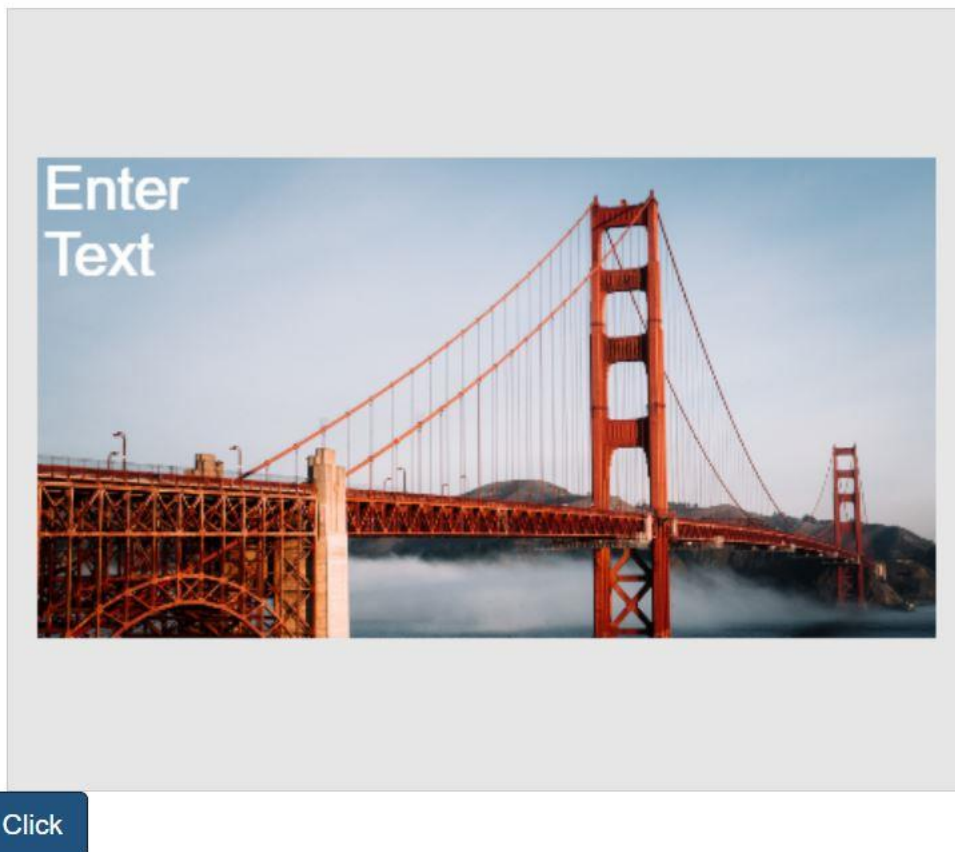

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
    string[] { }).Render()
</div>
@Html.EJS().Button("btnClick").CssClass("e-
primary").Content("Click").Click("clickHandler").Render()
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function clickHandler() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        var dimension = imageEditorObj.getImageDimension();
        imageEditorObj.drawText(dimension.x, dimension.y, 'Enter\nText');
    }
</script>
<style>
```

```
.image-editor {  
    margin: 0 auto;  
}

        width: 100%;  
    }  
}  
.control-wrapper {  
    height: 100%;  
}  
</style>
```

DEFAULT.CS

```
public ActionResult Default()  
{  
    return View();  
}
```

Output be like the below.

Delete a text

The `deleteShape` method in the Image Editor control allows you to remove a text annotation from the image editor. To use this method, you need to pass the `shapeld` of the annotation as a parameter.

The `shapeld` is a unique identifier assigned to each text annotation within the image editor. It serves as a reference to a specific annotation, enabling targeted deletion of the desired text element. By specifying the `shapeld` associated with the text annotation you want to remove, you can effectively delete it from the image editor.

To retrieve the inserted text annotations, you can utilize the `getShapeSetting` method, which provides a collection of annotations represented by `ShapeSettings`. This method allows you to access and work with the annotations that have been inserted into the image.

Here is an example of deleting a text in a button click using `deleteShape` method.

CSHTML

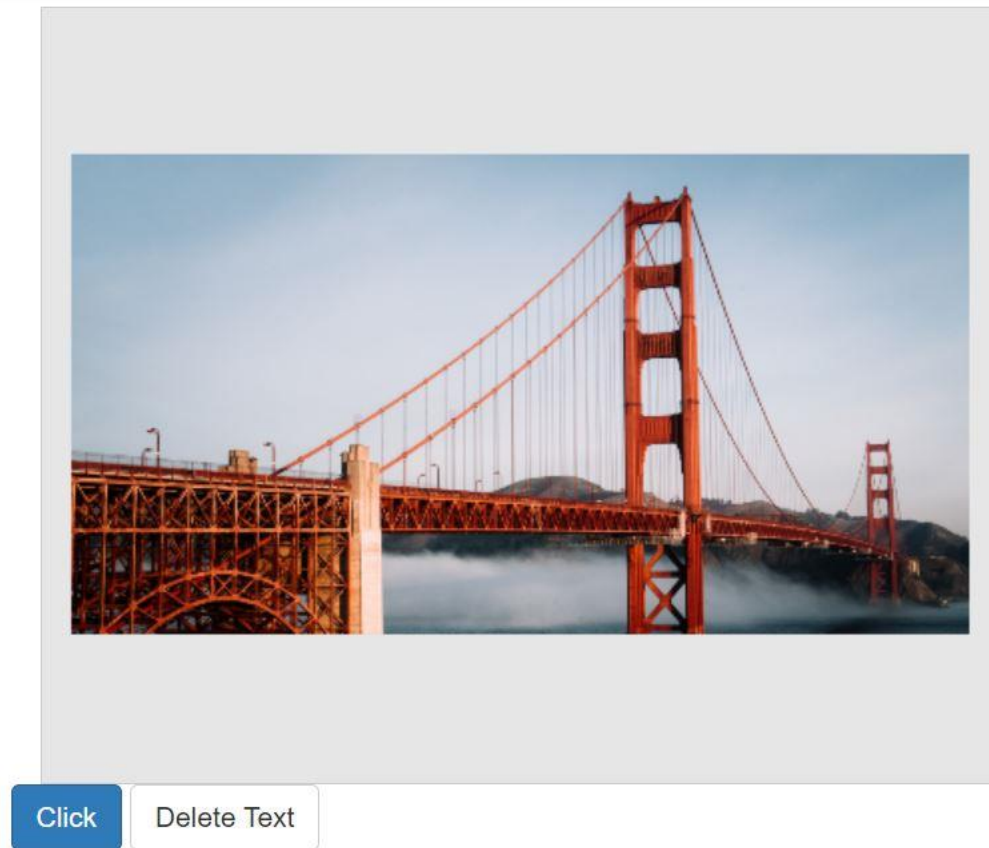

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("btnClick").CssClass("e-
primary").Content("Click").Click("clickHandler").Render()
@Html.EJS().Button("delBtnClick").CssClass("e-primary").Content("Delete
Text").Click("deleteBtnClickHandler").Render()
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function clickHandler() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        var dimension = imageEditorObj.getImageDimension();
        imageEditorObj.drawText(dimension.x, dimension.y, 'Enter\nText');
    }
    function deleteBtnClickHandler() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        imageEditorObj.deleteShape('shape_1');
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }
</style>
```

```

Add Additional font family

The FontFamily property in the Image Editor control provides the flexibility to incorporate supplementary font families, expanding your options for text styling and ensuring a broader range of fonts can be utilized within your design or content. The font value will be determined by the 'id' property.

By leveraging the FontFamily property, you can elevate the scope of customization for text annotations, enriching the user experience within the Image Editor control. This enhancement offers a more personalized and dynamic interaction, empowering users to tailor their text styles for a truly engaging editing experience.

Here is an example of adding additional font family to the text annotation using the FontFamily property.

CSHTML

```

<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-
editor").Created("created").FontFamily(@ViewBag.fontFamily).Render()
</div>

</style>
```

DEFAULT.CS

```
public ActionResult Default()  
{  
    return View();  
}
```

Output be like the below.

Adjust the stroke width and color

The `shapeChanging` event in the Image Editor control is triggered when a freehand annotation is being modified or changed through the toolbar interaction. This event provides an opportunity to make alterations to the freehand annotation's color and stroke width by adjusting the relevant properties.

By leveraging the `ShapeChanging` event, you can enhance the customization options for freehand annotations and provide a more tailored and interactive experience within the Image Editor control.

Here is an example of changing the freehand draw stroke width and color using the `ShapeChanging` event.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-
editor").Created("created").ShapeChanging("ShapeChanging").Render()
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function ShapeChanging(args) {
        if (args.currentShapeSettings.type === 'FreehandDraw') {
            args.currentShapeSettings.strokeColor = 'red';
        }
    }
</script>
<style>
```

```

.image-editor {
    margin: 0 auto;

```

public ActionResult Default()
{
    return View();
}

```

Delete a freehand drawing

The `deleteShape` method in the Image Editor allows you to remove a freehand annotation from the image editor. To use this method, you need to pass the `shapeId` of the annotation as a parameter.

The `shapeId` is a unique identifier assigned to each freehand annotation within the image editor. It serves as a reference to a specific annotation, enabling targeted deletion of the desired annotation. By specifying the `shapeId` associated with the freehand annotation you want to remove, you can effectively delete it from the image editor.

To retrieve the inserted freehand annotations, you can utilize the `getShapeSetting` method, which provides a collection of annotations represented by `ShapeSettings`. This method allows you to access and work with the annotations that have been inserted into the image.

Here is an example of deleting a freehand annotation in a button click using `DeleteShape` method.

CSHTML

```

<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Render()
</div>

Shape annotation

The Image Editor control provides the ability to add shape annotations to an image. These shape annotations include rectangles, ellipses, arrows, paths, and lines, allowing you to highlight, emphasize, or mark specific areas or elements within the image.

Add a rectangle / ellipse / line / arrow / path

The `drawRectangle` method is used to insert a rectangle to the Image Editor control. Rectangle annotations are valuable tools for highlighting, emphasizing, or marking specific areas of an image to draw attention or provide additional context.

The `drawRectangle` method in the Image Editor control takes seven parameters to define the properties of the rectangle annotation:

- `x`: Specifies the x-coordinate of the top-left corner of the rectangle.
- `y`: Specifies the y-coordinate of the top-left corner of the rectangle.
- `width`: Specifies the width of the rectangle.
- `height`: Specifies the height of the rectangle.
- `strokeWidth`: Specifies the stroke width of the rectangle's border.
- `strokeColor`: Specifies the stroke color of the rectangle's border.
- `fillColor`: Specifies the fill color of the rectangle.

The `drawEllipse` method is used to insert an ellipse to the Image Editor control. Ellipse annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The `drawEllipse` method in the Image Editor control takes seven parameters to define the properties of the ellipse annotation:

- `x`: Specifies the x-coordinate of the center of the ellipse.
- `y`: Specifies the y-coordinate of the center of the ellipse.
- `radiusX`: Specifies the horizontal radius (radiusX) of the ellipse.
- `radiusY`: Specifies the vertical radius (radiusY) of the ellipse.
- `strokeWidth`: Specifies the width of the ellipse's stroke (border).
- `strokeColor`: Specifies the color of the ellipse's stroke (border).
- `fillColor`: Specifies the fill color of the ellipse.

The `drawLine` method is used to insert a line to the Image Editor control. Line annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The `drawLine` method in the Image Editor control takes seven parameters to define the properties of the ellipse annotation:

- `startX` - Specifies the x-coordinate of the start point.
- `startY` - Specifies the y-coordinate of the start point.
- `endX` - Specifies the x-coordinate of the end point.
- `endY` - Specifies the y-coordinate of the end point.
- `strokeWidth` - Specifies the stroke width of the line.
- `strokeColor` - Specifies the stroke color of the line.

The `drawArrow` method is used to insert an arrow to the Image Editor control. Arrow annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The `drawArrow` method in the Image Editor control takes three parameters to define the properties of the ellipse annotation:

- startX - Specifies the x-coordinate of the start point.
- startY - Specifies the y-coordinate of the start point.
- endX - Specifies the x-coordinate of the end point.
- endY - Specifies the y-coordinate of the end point.
- strokeWidth - Specifies the stroke width of the arrow.
- strokeColor - Specifies the stroke color of the arrow.
- arrowStart - Specifies the arrowhead as ImageEditorArrowHeadType at the start of arrow.
- arrowEnd - Specifies the arrowhead as ImageEditorArrowHeadType at the end of the arrow.

The `drawPath` method is used to insert a path to the Image Editor control. Path annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The `drawPath` method in the Image Editor control takes three parameters to define the properties of the ellipse annotation:

- points - Specifies collection of x and y coordinates as ImageEditorPoint to draw a path.
- strokeWidth - Specifies the stroke width of the path.
- strokeColor - Specifies the stroke color of the path.

Here is an example of inserting rectangle, ellipse, arrow, path, and line in a button click event.

CSHTML

```

Image annotation

The image annotation feature in the Image Editor provides the capability to add and customize images directly onto the image. With this feature, you can easily insert image or icons at specific locations

within the image and customize various aspects of the image to meet your requirements. You have control over the customization options including rotate, flip, transparency for the image annotation.

Add an image annotation

The `drawImage` method serves the purpose of inserting an image into the Image Editor control, allowing for image annotations to be added. These image annotations can be used for various purposes, such as adding logos, watermarks, or decorative elements to the image.

The `drawImage` method in the Image Editor control takes six parameters to define the properties of the image annotation:

- `data`: Specified the image data or url of the image to be inserted.
- `x`: Specifies the x-coordinate of the top-left corner of the image.
- `y`: Specifies the y-coordinate of the top-left corner of the image.
- `width`: Specifies the width of the image.
- `height`: Specifies the height of the image.
- `isAspectRatio`: Specifies whether the image is rendered with aspect ratio or not.

In the following example, you can use the `drawImage` method in the button click event.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("btnClick").CssClass("e-primary").Content("Add
Image").Click("btnClick").Render()
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {

Output be like the below.

Transform in the ASP.NET MVC Image Editor control

The Image Editor provides a range of transformation options for manipulating both the image and its annotations. These options include rotation, flipping, zooming, and panning. These transformations offer flexibility in adjusting the image and enhancing its visual appearance.

Rotate an image

The Image Editor allows to rotate the image and its annotations by a specific number of degrees clockwise or anti-clockwise using `rotate` method. This method takes a single parameter: the angle of rotation in degrees. A positive value will rotate the image clockwise, while a negative value will rotate it anti-clockwise.

Here is an example of rotating an image in a button click event.

CSHTML

```

<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("btnClick").CssClass("e-
primary").Content("Click").Click("clickHandler").Render()

Output be like the below.

Flip an image

The Image Editor provides the `flip` method, which allows you to flip both the image and its annotations either horizontally or vertically. This method takes a single parameter of type `ImageEditorDirection`, which specifies the direction in which the flip operation should be applied.

The `Direction` parameter accepts two values: 'Horizontal' and 'Vertical'. When you choose 'Horizontal', the image and annotations will be flipped along the horizontal axis, resulting in a mirror effect. On the other hand, selecting 'Vertical' will flip them along the vertical axis, producing a vertical mirror effect.

Here is an example of flipping an image in a button click event.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new

{
    return View();
}
```

Output be like the below.

Straighten an image

The straightening feature in an Image Editor allows users to adjust an image by rotating it clockwise or counter clockwise. The rotating degree value should be within the range of -45 to +45 degrees for accurate straightening. Positive values indicate clockwise rotation, while negative values indicate

counter clockwise rotation. The Image Editor control includes a `straightenImage` method, which allows you to adjust the degree of an image. This method takes one parameter that define how the straightening should be carried out:

- **degree:** Specifies the amount of rotation for straightening the image. Positive values indicate clockwise rotation, while negative values indicate counterclockwise rotation.

Here is an example of straightening the image.

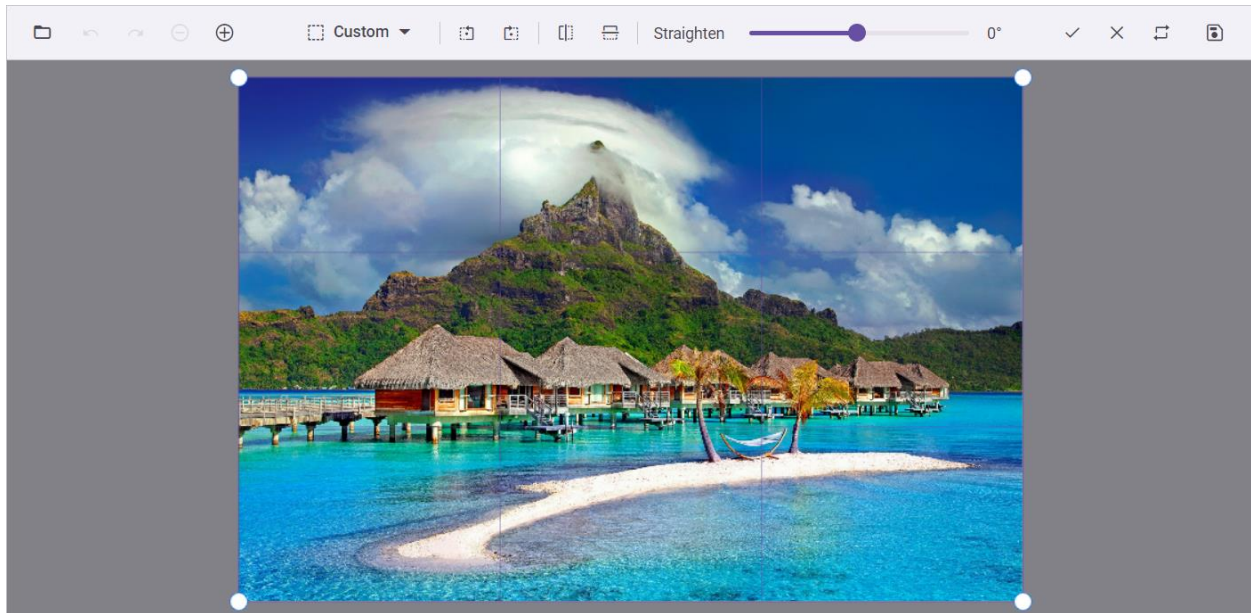

CSHTML

```

Output be like the below.

Maximum and Minimum zoom level

The `maxZoomFactor` property is a useful feature in the Image Editor that allows you to define the maximum level of zoom permitted for an image. This property sets a limit on how much the image can be magnified, preventing excessive zooming that may result in a loss of image quality or visibility.

By default, the `minZoomFactor` value is set to 10, meaning that the image can be zoomed in up to 10 times its original size. This ensures that the zooming functionality remains within reasonable bounds and maintains the integrity of the image.

The `maxZoomFactor` property allows you to specify the minimum level of zoom that is allowed for an image. By setting this property, you can prevent the image from being zoomed out beyond a certain point, ensuring that it remains visible and usable even at the smallest zoom level.

By default, the `maxZoomFactor` value is set to 0.1, meaning that the image can be zoomed out up to 10 times its original size.

Here is an example of specifying `minZoomFactor` and `maxZoomFactor` property in `zoomSettings` options in an image editor.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
```

```

    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("zoomIn").CssClass("e-primary").Content("Zoom
In").Click("zoomInClick").Render()
@Html.EJS().Button("zoomOut").CssClass("e-primary").Content("Zoom
Out").Click("zoomOutClickHandler").Render()
<script>
    var zoomSettings = { maxZoomFactor: 30, minZoomFactor: 0.1 };
    var zoomLevel = 1;
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');

Panning an image

The Image Editor allows to pan an image when the image exceeds the canvas size or selection range. When zooming in on an image or applying a selection for cropping, it is common for the image to exceed the size of the canvas or exceed the selection range. So, the panning is used to view the entire image, by clicking on the canvas and dragging it in the direction they want to move.

CSHTML

```

<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new

}
```

Panning event

The **panning** event is activated when the user begins dragging the image within the canvas. This event provides an opportunity to perform specific actions, like adjusting the position of an image, in response to the gesture of panning. And this event uses **panEventArgs** to handle the panning action when the user starts dragging the image.

The parameter available in the **panEventArgs** events are,

- **PanEventArgs.startPoint** - The x and y coordinates as **ImageEditorPoint** for the start point.
- **PanEventArgs.endpoint** - The x and y coordinates as **ImageEditorPoint** for the end point.
- **PanEventArgs.cancel** - Specifies the boolean value to cancel the panning action.

Zooming event

The **zooming** event is triggered when performing zooming the image. This event can be used to perform certain actions, such as updating the position of the image. This event is passed an object that contains information about the zooming event, such as the amount of zooming performed. And this event uses **ZoomEventArgs** to handle the zooming action in the image.

The parameter available in the Zooming event is,

- **ZoomEventArgs.zoomPoint** - The x and y coordinates as **ImageEditorPoint** for the zoom point.
- **ZoomEventArgs.previousZoomFactor** - The previous zoom factor applied in the image editor.
- **ZoomEventArgs.currentZoomFactor** - The current zoom factor to be applied in the image editor.
- **ZoomEventArgs.cancel** - Specify a boolean value to cancel the zooming action.
- **ZoomEventArgs.zoomTrigger** - The type of zooming performed in the image editor.

Rotating event

The **rotating** event is triggered when performing rotating the image. This event is passed an object that contains information about the rotating event, such as the amount of rotation performed. And this event uses **RotateEventArgs** to handle the rotating action in the image.

The parameter available in the Rotating event is,

- **RotateEventArgs.previousDegree**: The degree of rotation before the recent rotation action was applied in the Image Editor.

- `RotateEventArgs.currentDegree`: The current degree of rotation after the rotation action has been performed in the Image Editor.

`RotateEventArgs.cancel` – Specifies a boolean value to cancel the rotating action.

Flipping event

The `flipping` event is triggered when performing flipping the image. This event is passed an object that contains information about the flipping event, such as the amount of flip performed. And this event uses `FlipEventArgs` to handle the flipping action in the image.

The parameter available in the `flipping` event is,

- `FlipEventArgs.direction` - The flip direction as `ImageEditorDirection` to be applied in the image editor.
- `FlipEventArgs.cancel` - Specifies a boolean value to cancel the flip action.

Toolbar in the ASP.NET MVC Image Editor control

The toolbars in the Image Editor are a key component for interacting with and editing images. They provide a range of tools and options that can be customized to suit the needs and preferences. Add or remove items from the toolbar to create a personalized set of tools, or they can even create their own custom toolbar from scratch. This flexibility and customization allow them to create a unique image editing experience that is tailored to their specific needs and workflow.

In the Image Editor, the toolbar property provides the ability to customize the toolbar by adding or removing items, as well as defining a completely custom toolbar. This feature is valuable for creating a personalized image editing experience that aligns with specific requirements and workflows.

Built-in toolbar items

Specifies the toolbar items to perform UI interactions. Refer to the built-in toolbar items for the default value.

- Crop
- Transform
- Annotate
- ZoomIn
- ZoomOut
- Open
- Reset
- Save
- Pan

Add a custom toolbar items

The `toolbar` property in the Image Editor allows to add or remove toolbar items to include only the tools they frequently use, streamlining the editing process and reducing clutter.

Here is an example of adding custom toolbar items to rotate and flip transformation using `toolbar` property.

CSHTML

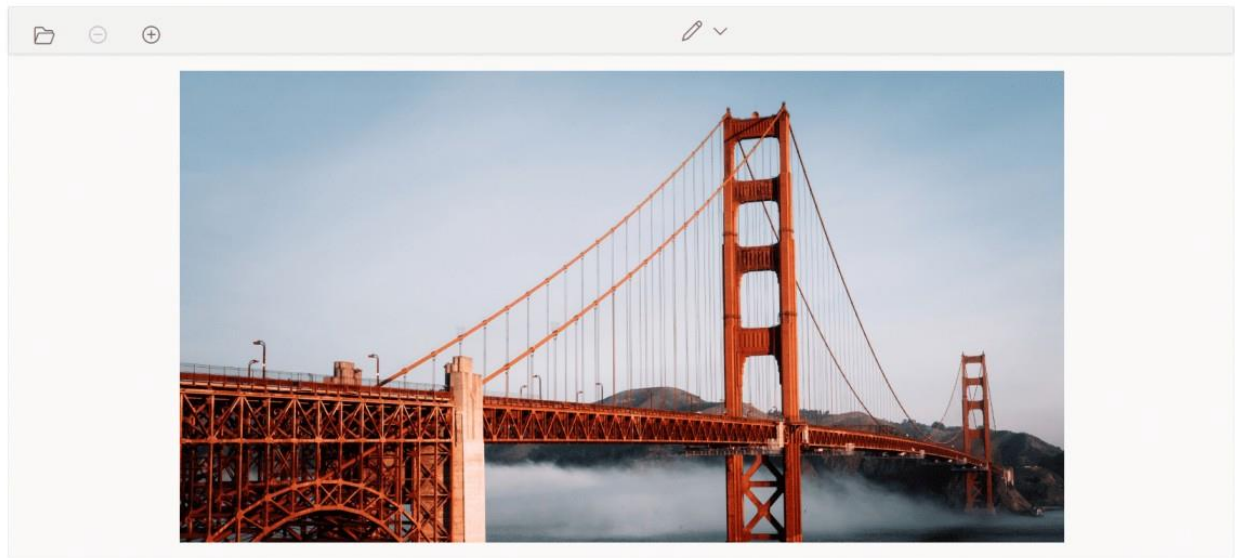

```
<div class="col-lg-12 control-section e-img-editor-sample">
```

```
@Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { "Annotate", "Line", "Rectangle", "Text", "ZoomIn", "ZoomOut"
}).Render()
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {
            height: 75vh;
            width: 100%;
        }
    }
    .control-wrapper {
        height: 100%;
    }
</style>
```

DEFAULT.CS

```
public ActionResult Default()
{
    return View();
}
```

Output be like the below.

Show or hide a toolbar

The **toolbar** property controls the visibility of the toolbar in the Image Editor. When the toolbar property is set to an empty list, the toolbar is hidden. Conversely, if the toolbar property contains a list of items, the toolbar is shown, displaying the specified items. This feature provides flexibility for users to personalize their image editing experience.

Here is an example of hiding the toolbar of the image editor using **toolbar** property.

CSHTML

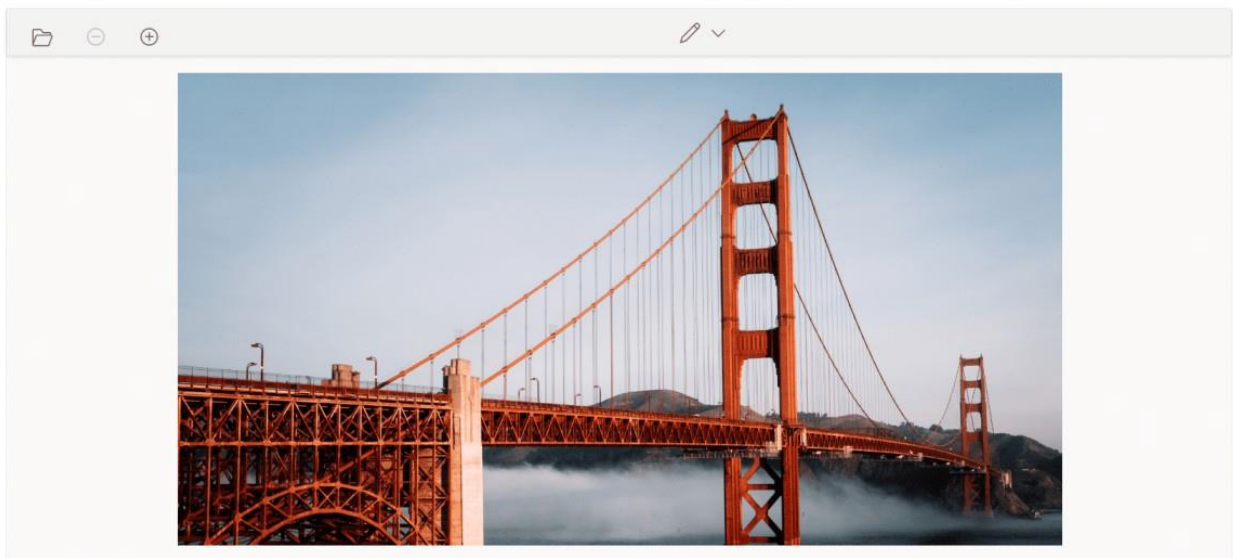

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { "Annotate", "Line", "Rectangle", "Text", "ZoomIn", "ZoomOut"
}).Render()
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;

Output be like the below.

Show or hide a toolbar item

The **toolbar** property is utilized to control the visibility of toolbar items in the Image Editor. By default, the toolbar property includes the default toolbar items. So, if you wish to hide the default toolbar items then you need to explicitly define the required items using **toolbar** property. This allows you to customize the toolbar by displaying only the specific items you require, tailoring the editing experience to your preferences.

Here is an example of hiding the cropping and selection toolbar items using **toolbar** property.

CSHTML

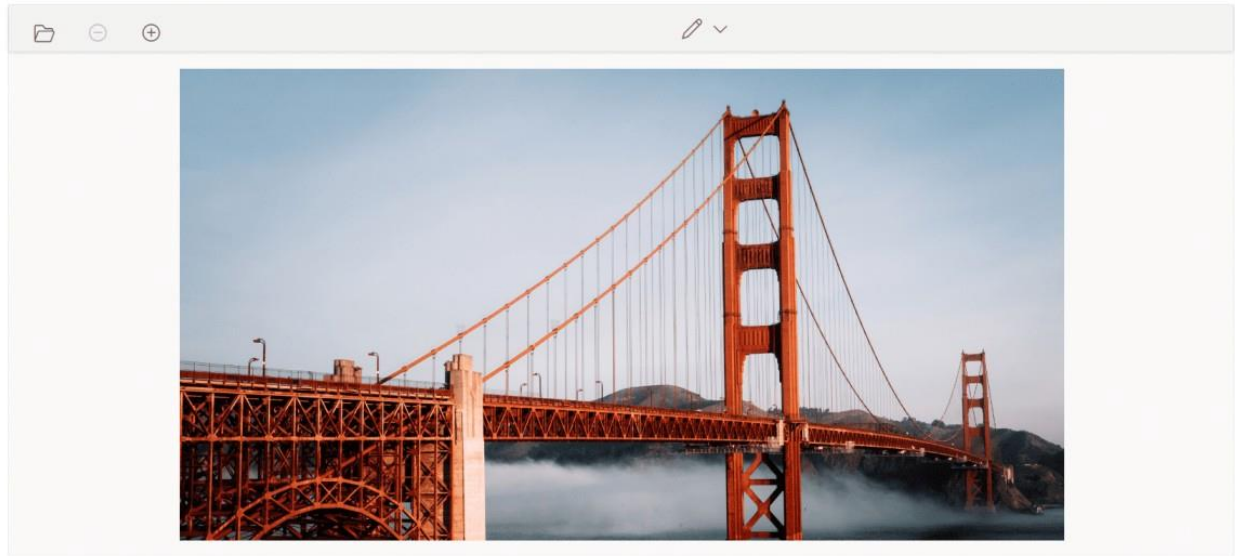

```
<div class="col-lg-12 control-section e-img-editor-sample">  
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new  
        string[] { "Annotate", "Line", "Rectangle", "Text", "ZoomIn", "ZoomOut"  
    }).Render()  
</div>
```

```
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }

            height: 75vh;
            width: 100%;
        }
    }
    .control-wrapper {
        height: 100%;
    }
</style>
```

DEFAULT.CS

```
public ActionResult Default()
{
    return View();
}
```

Output be like the below.

Enable or disable a toolbar item

The `toolbar` property is employed to enable or disable toolbar items in the Image Editor. By default, the `toolbar` property includes the default toolbar items, and these items cannot be disabled. However, if you have defined custom toolbar items using the `toolbarItemModel`, you can enable or disable them by configuring their respective properties within the `toolbar` property. This provides the flexibility to control the availability and functionality of custom toolbar items based on your specific requirements.

Here is an example of disabling the custom toolbar item using `toolbar` property.

Enable or disable a contextual toolbar item

The `toolbarItems` property in the `toolbarEventArgs` is used to enable or disable contextual toolbar items in the Image Editor. To enable or disable the default toolbar items, you can accomplish this by setting the `Disabled` property to `true` in the `ImageEditorToolbarItemModel` within the `ToolbarItems` property. This allows you to selectively enable or disable specific default toolbar items based on your requirements, providing a customized toolbar experience in the Image Editor.

Toolbar created event

The `toolbarCreated` event is triggered after the toolbar is created in the Image Editor. This event can be useful when you need to perform any actions or make modifications to the toolbar once it is fully initialized and ready for interaction. By subscribing to the `toolbarCreated` event, you can access the toolbar object and perform tasks such as adding event handlers, customizing the appearance, or configuring additional functionality.

Toolbar item clicked event

The `toolbarItemClicked` event is triggered when a toolbar item is clicked in the Image Editor. This event is particularly useful when you have added custom options to both the main toolbar and contextual toolbar, as it allows you to capture the user's interaction with those custom options. By subscribing to the `toolbarItemClicked` event, you can execute specific actions or handle logic based on the toolbar item that was clicked.

Here is an example of toolbar item clicking event using `toolbarItemClicked` property.

CSHTML

```

<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-
editor").Created("created").ToolBarItemClicked("toolbarItemClicked").ToolBar(
new string[] { "Annotate", "Line", "Rectangle", "Text", "ZoomIn", "ZoomOut"
}).Render()
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function toolbarItemClicked (args) {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (args.item.text === 'Text') {
            imageEditorObj.rotate(90);
        }
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }

Toolbar template

The `toolbarTemplate` property in the Image Editor provides the capability to fully customize the toolbar by supplying a custom template. This feature is valuable when you want to create a distinct and personalized image editing experience that goes beyond the default toolbar or the customizable toolbar options offered by the Image Editor. By defining a custom template for the toolbar, you have complete control over its layout, appearance, and functionality. This empowers you to design a unique and tailored toolbar that aligns perfectly with your specific requirements and desired user experience.

Here is an example of using `toolbarTemplate` to render only the button to toggle the freehand draw option.

The toolbar of the Image Editor can be replaced with the user specific UI using the `toolbarTemplate` property.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-
editor").Created("created").ToolbarTemplate("#toolTemplate").Render()
</div>
<script id="toolTemplate" type="text/x-template">
    <button id='custombtn' class="e-btn"
onclick="clickHandler()">Custom</button>
</script>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function clickHandler() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        imageEditorObj.freeHandDraw(true);
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {
            height: 75vh;
            width: 100%;
        }
    }
</style>
```

```

    }
    }
    .control-wrapper {
        height: 100%;
    }
</style>

```

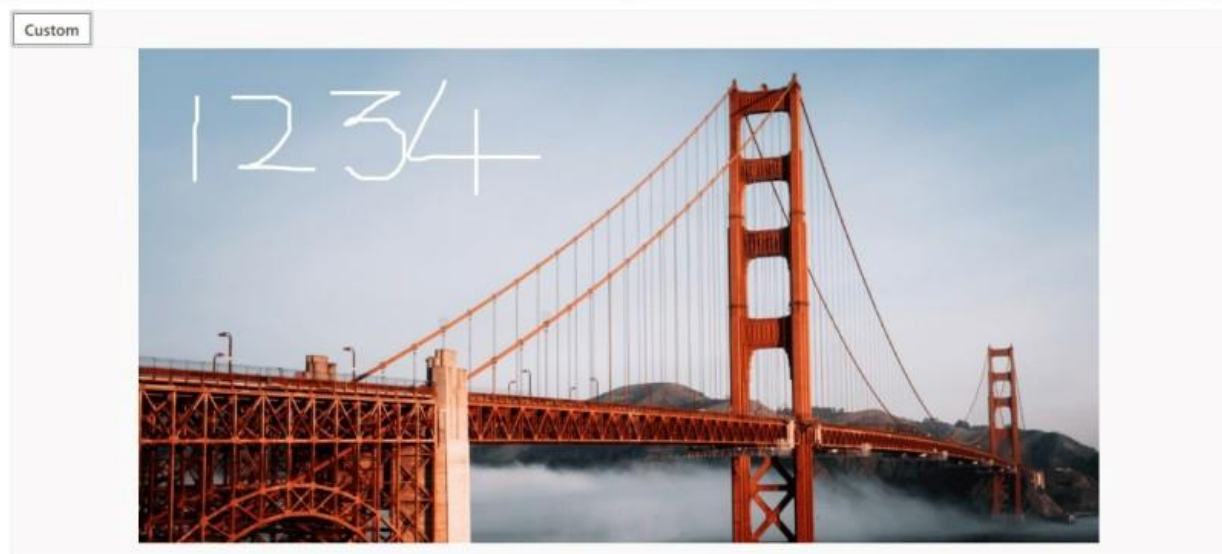

DEFAULT.CS

```

public ActionResult Default()
{
    return View();
}

```

Output be like the below.

Customize contextual toolbar

The `toolbarUpdating` event is triggered when inserting or selecting annotations, which opens the contextual toolbar in the Image Editor. Within this event, the `toolbarItems` property in the `ToolbarEventArgs` is utilized to add or remove contextual toolbar items.

In the following example, the contextual toolbar for rectangle will be rendered with only stroke color by excluding fill color and stroke width using `toolbarUpdating` event.

CSHTML

```

<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-
editor").Created("created").ToolbarUpdating("clickHandler").Render()
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {

```

```
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-  
editor/images/flower.png');  
    } else {  
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-  
editor/images/bridge.png');  
    }  
}  
function clickHandler(args) {  
    if (args.toolbarType === 'shapes') {  
        args.toolbarItems = ['strokeColor'];  
    }  
}  
</script>  
<style>  
    .image-editor {

Quick access toolbar in the ASP.NET MVC Image Editor control

The quick access toolbars in the Image Editor play a vital role in facilitating interactions with annotations like Rectangle, Ellipse, Line, Arrow, and Path. These toolbars offer a diverse array of tools and options that can be tailored to match the specific requirements and preferences associated with each annotation type. The toolbar is only displayed when an annotation is selected, ensuring a focused and contextual user experience. Users have the flexibility to add or remove items from the toolbar, allowing them to create a personalized set of tools. Additionally, users can also build a completely custom toolbar from the ground up, providing them with complete control over the available options and functionality.

Add a custom toolbar item

The quick access toolbar that appears when inserting annotations in the Image Editor is customizable using the `QuickAccessToolbarOpening` event. This event is triggered when the quick access toolbar is opened, allowing you to modify its contents. To add additional toolbar items to the quick access toolbar, you can access the `ToolbarItems` property of the `QuickAccessToolbarEventArgs` object within the event handler. By adding or removing items from the `ToolbarItems` property based on the `Item` property, you can customize the options available in the quick access toolbar according to your needs. This gives you the ability to extend the functionality of the quick access toolbar and provide additional tools and options for working with inserted annotations.

Here is an example of adding the custom toolbar item to the quick access toolbar.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-
editor").Created("created").QuickAccessToolbarOpen("quickAccessToolbarOpen")
.Render()
</div>
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        dh(ej.dbaseBrowser.isDevice) {
```

```
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-  
editor/images/flower.png');  
    } else {  
        imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-  
editor/images/bridge.png');  
    }  
}  
function quickAccessToolbarOpen(args) {  
    args.toolbarItems = ['Clone'];  
}  
</script>  
<style>  
    .image-editor {  
        margin: 0 auto;  
    }

Undo Redo in the ASP.NET MVC Image Editor control

The undo and redo functionalities provide a way to reverse and repeat editing actions performed on an image. These features are essential for maintaining control and flexibility during the editing process.

In an image editor, the undo and redo history typically have a limited capacity, and the number of steps that can be stored is 16 steps, meaning that the editor keeps track of the most recent 16 actions performed on the image. Once the history reaches its maximum capacity, any new actions beyond the 16th step will result in the removal of the oldest action from the history.

Undo the action

The undo action in an image editor allows users to revert the most recent editing action or a series of actions back to their previous state. When the undo command is triggered, the image editor undoes the last applied modification, effectively restoring the image to its state before the action was performed. The undo action is useful for correcting mistakes, removing unwanted changes, or exploring different editing options without permanently altering the image.

Redo the Action

The redo action in an image editor allows users to reapply previously undone actions or modifications to the image. When the redo command is triggered, the image editor reapplies the last action that was undone, bringing the image back to the state it was in after the action was initially applied. The redo is useful when users want to repeat an action that was previously undone or restore changes that were temporarily reversed.

Here is an example of undoing and redoing the action using the `undo` and `redo` method.

CSHTML

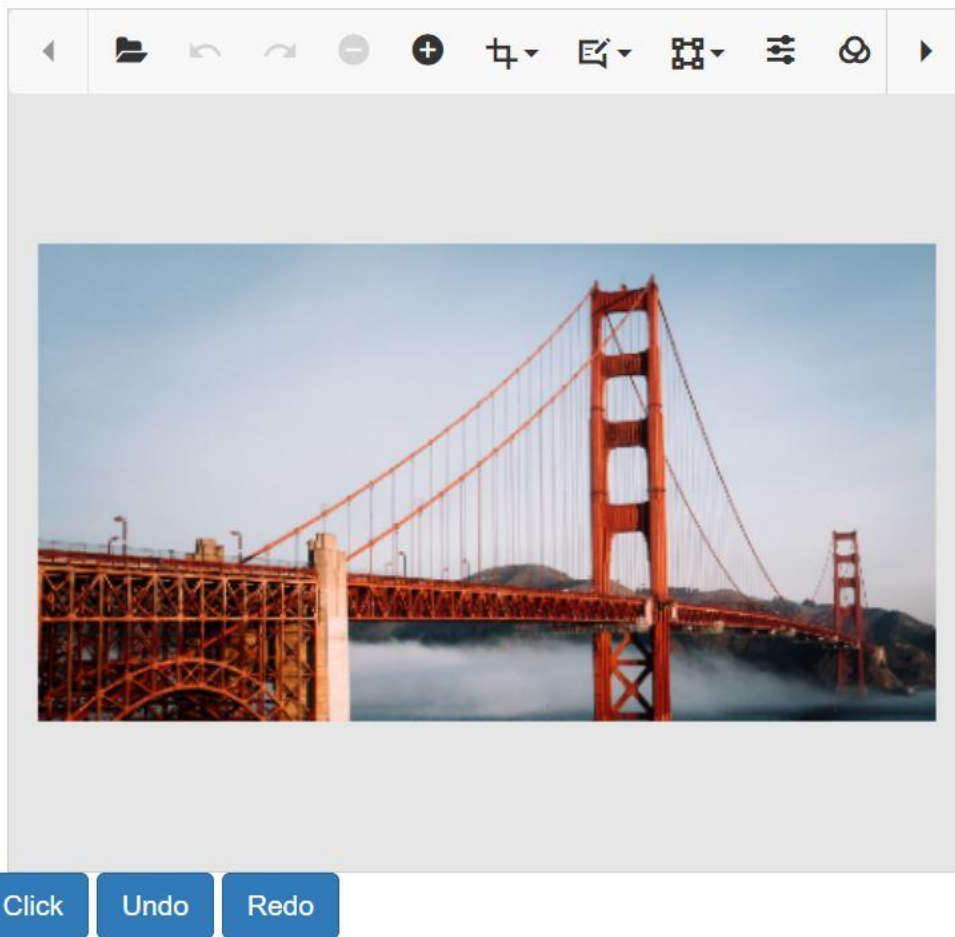

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Render()
</div>
@Html.EJS().Button("undoClick").CssClass("e-
primary").Content("Undo").Click("undoClick").Render()
@Html.EJS().Button("redoClick").CssClass("e-
primary").Content("Redo").Click("redoClick").Render()
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function undoClick() {
        var imgObj = ej.base.getComponent(document.getElementById('image-
editor'), 'image-editor');
        imgObj.undo();
    }
    function redoClick() {
        var imgObj = ej.base.getComponent(document.getElementById('image-
editor'), 'image-editor');
        imgObj.redo();
    }
</script>

Filters in the ASP.NET MVC Image Editor control

Filters are pre-defined effects that can be applied to an image to alter its appearance or mood. Image filters can be used to add visual interest or to enhance certain features of the image. Some common types of image filters include cold, warm, chrome, sepia, and invert. This can be done by either using the toolbar or the `applyImageFilter` method which takes a single parameter: the filter applied to an image.

Apply filter effect

The `applyImageFilter` method is utilized to apply filters to an image. By passing the desired filter type as the first parameter of the method, specified as `ImageFilterOption` the method applies the corresponding filter to the image. This allows for easy and convenient application of various filters to enhance or modify the image based on the chosen filter type.

The `applyImageFilter` method is used to perform filtering by specifying the type of filter as `ImageFilterOption` and send it a first parameter of the method.

Here is an example of filtering using the `applyImageFilter` method.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()

Output be like the below.

[Image filtering event](#)

The `[imageFiltering]` event is triggered when applying filtering on the image. This event is passed an object that contains information about the filtering event, such as the type of filtering.

The parameter available in the `ImageFilterEventArgs` event is,

`ImageFilterEventArgs.filter` - The type of filtering as `ImageFilterOption` to be applied in the image editor.

`ImageFilterEventArgs.cancel` – Specifies to cancel the filtering action.

[Finetune in the ASP.NET MVC Image Editor control](#)

Fine-tuning involves making precise adjustments to the settings of an image filter in order to achieve a specific desired effect. It provides control over the intensity and specific aspects of the filter's impact on the image. For example, fine-tuning allows you to modify parameters like brightness, saturation, or other relevant properties to fine-tune the level or quality of the filter's effect. This level of control enables you to achieve the exact look or outcome you want for your image.

[Adjust the brightness, contrast, or sharpness](#)

The `finetuneImage` method is designed to facilitate fine-tuning operations on an image. It accepts two parameters: the first parameter is `ImageFinetuneOption` which determines the type of fine-tuning to be applied (brightness, contrast, or sharpness), and the second parameter represents the fine-tuning value, indicating the degree or intensity of the adjustment. This method allows for convenient adjustment of brightness, contrast, or sharpness by specifying the desired type and corresponding value.

The `finetuneImage` method is used to perform brightness, contrast, or sharpness fine-tuning by specifying this type as a first parameter and specifying the fine-tuning value as the second parameter of the method.

Here is an example of brightness, contrast, and sharpness fine-tuning using the `finetuneImage` method.

```

Output be like the below.

Finetune value changing event

The `finetuneValueChanging` event is triggered when performing fine-tuning on the image. This event is passed an object that contains information about the fine-tuning event, such as the type of fine-tuning and the value of fine-tuning performed.

The parameter available in the `FinetuneEventArgs` event is,

`FinetuneEventArgs.finetune` - The type of fine-tuning as `ImageFinetuneOption` to be applied in the image editor.

`FinetuneEventArgs.value` - The fine-tuning value to be applied in the image editor.

FinetuneEventArgs.cancel – Specifies a boolean value to cancel the fine-tuning action.

Frames

The frame feature in an Image Editor provides users with the capability to add decorative borders or frames around their images. Frames are a visual design element that can enhance the overall appearance and appeal of an image.

Apply frame to the Image

The `drawFrame` method is a function designed to enable the application of various frame options to an image. This method simplifies the process of adding decorative frames, such as mat, bevel, line, hook, and inset, to an image by allowing users to specify their desired frame type.

Depending on the frame type selected, users may have additional customization options, such as adjusting the frame's thickness, color, texture, or other attributes. This allows for fine-tuning the appearance of the frame to match the image's theme or the user's preferences

The `drawFrame` method in the Image Editor control takes nine parameters to define the properties of the frame to the image:

- `frameType` - Specified the image data or url of the image to be inserted.
- `Color` - Specifies the color for the frame.
- `gradientColor` - Specifies the gradient color for the frame.
- `size` - Specifies the size of the frame.
- `inset` - Specifies the inset value for line, hook, and inset type frames.
- `offset` - Specifies the offset value for line and inset type frames.
- `borderRadius` - Specifies the border radius for line type frame.
- `frameLineStyle` - Specifies the frame line style for line type frame.
- `lineCount` - Specifies the line count for the line type frame.

Here is an example of Frame using the `drawFrame` method.

CSHTML

```

**Frame changing event**

The **frameChanging** event is triggered when applying frame on the image. This event provides information encapsulated within an object, which includes details about the frame applied in an image. This information encompasses:

Frame Type: This indicates the specific type of frame being applied, whether it's a mat, bevel, line, or hook.

Customization Values: These values contain information about any adjustments or modifications made to the frame. For instance, if the frame can be customized with attributes like color, size, or style, these details are conveyed within the event object.

The parameter available in the **FrameChangeEventArgs** is

- **FrameChangeEventArgs.previousFrameSetting** - The frame settings including size, color, inset, offset, gradient color which is applied before changing the frame.
- **FrameChangeEventArgs.currentFrameSetting** - The frame settings including size, color, inset, offset, gradient color which is going to apply after changing the frame.
- **FrameChangeEventArgs.cancel** - Specifies a boolean value to cancel the frame changing action.

Resize

The resize feature in an Image Editor is a valuable tool that empowers users to modify the size or dimensions of an image to meet their specific requirements. Whether it's for printing, web display, or any other purpose, this feature allows users to tailor images to their desired specifications.

Apply resize to the image

The Image Editor control includes a `resize` method, which allows you to adjust the size of an image. This method takes three parameters that define how the resizing should be carried out:

- **width:** Specifies the resizing width of the image.
- **height:** Specifies the resizing height of the image.
- **isAspectRatio:** Specifies a boolean value indicating whether the image should maintain its original aspect ratio during resizing. When set to true, the image will be resized while preserving its aspect ratio

Here is an example of resizing the image using the `resize` method.

CSHTML

```
<div class="col-lg-12 control-section e-img-editor-sample">
    @Html.EJS().ImageEditor("image-editor").Created("created").Toolbar(new
string[] { }).Render()
</div>
@Html.EJS().Button("aspectbtnClick").CssClass("e-primary").Content("Aspect
ratio").Click("aspectClick").Render()
@Html.EJS().Button("nonaspectbtnClick").CssClass("e-primary").Content("Non
Aspect Ratio").Click("nonaspectClick").Render()
<script>
    function created() {
        var imageEditorObj =
ej.base.getComponent(document.getElementById('image-editor'), 'image-
editor');
        if (ej.base.Browser.isDevice) {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/flower.png');
        } else {
            imageEditorObj.open('https://ej2.syncfusion.com/demos/src/image-
editor/images/bridge.png');
        }
    }
    function aspectClick() {
        var imgObj = ej.base.getComponent(document.getElementById('image-
editor'), 'image-editor');
        imgObj.resize(300, 400, true);
    }
    function nonaspectClick() {
        var imgObj = ej.base.getComponent(document.getElementById('image-
editor'), 'image-editor');
        imgObj.resize(300, 400, false);
    }
</script>
<style>
    .image-editor {
        margin: 0 auto;
```

```

    }
    .e-img-editor-sample {
        height: 80vh;
        width: 100%;
    }
    @@media only screen and (max-width: 700px) {
        .e-img-editor-sample {
            height: 75vh;
            width: 100%;
        }
    }
    .control-wrapper {
        height: 100%;
    }
</style>

```

DEFAULT.CS

```

public ActionResult Default()
{
    return View();
}

```

Output be like the below.

![ImageEditor Sample](images/image-editor-resize.png)

Resizing event

The **resizing** event is triggered when resizing the image. This event provides information encapsulated within an object, which includes details about the previous and current height and width of an image.

The parameter available in **ResizeEventArgs** is,

- **ResizeEventArgs.previousWidth** - The width of the image before resizing is performed.
- **ResizeEventArgs.previousHeight** - The height of the image before resizing is performed.
- **ResizeEventArgs.width** - The width of the image after resizing is performed.
- **ResizeEventArgs.height** - The width of the image after resizing is performed.
- **ResizeEventArgs.isAspectRatio** - The type of resizing performed such as aspect ratio or non-aspect ratio.
- **ResizeEventArgs.cancel** - Specifies a boolean value to cancel the resizing action.

Accessibility in Image editor control

The Image Editor component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Image Editor component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

Keyboard interaction

The Image Editor component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Image Editor component.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + Z** | **Undo the last user action.** |

| **Ctrl + Y** | **Redo the last user action.** |

| **Ctrl + S** | **To save the Image.** |

| Ctrl + O | To open the Image. |

| Delete | To delete the shape once the shape got selected through mouse click . |

Ensuring accessibility

The Image Editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Image Editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Image Editor component with accessibility tools.
